

## Enterprise Architect User Guide

*Enterprise Architect is an intuitive, flexible and powerful UML analysis and design tool for building robust and maintainable software. From requirements gathering, through analysis, modeling, implementation and testing to deployment and maintenance, Enterprise Architect is a fast, feature-rich, multi-user UML modeling tool, driving the long-term success of your software project.*

# Enterprise Architect User Guide

## Introduction

---

*by Geoffrey Sparks*

*Enterprise Architect is a complete UML-based solution for analysing, designing, managing, sharing and building software systems.*

# Foreword

This user guide provides an introduction to the features contained in Enterprise Architect - a UML modeling tool for developing and building software systems with UML.

**Part**

# 1 Introduction

Welcome to Sparx Systems **Enterprise Architect**, a UML based modeling tool for designing and constructing software systems, business modeling, systems modeling and generalized modeling purposes such as visualizing existing systems and processes.

The *Enterprise Architect User Guide* provides reference materials, guidance and tutorials for using the features and facilities of Enterprise Architect in your modeling and in related work.

## General Topics:

Topic	Link
Enterprise Architect is very flexible and has many features; the Overview provides a summary of <b>what Enterprise Architect can do</b> and what you can use it for	<a href="#">What You Can Do</a> <sup>[ 5 ]</sup> <a href="#">Key Benefits</a> <sup>[ 7 ]</sup> <a href="#">Key Features</a> <sup>[ 10 ]</sup>
<p>If you are <b>new to modeling and UML</b> as well as Enterprise Architect, or otherwise want a rapid review of the process of modeling with Enterprise Architect, the <i>User Guide</i> provides a tutorial to help you get working quickly</p> <p>The tutorial is not just a theoretical description - the first things you do are start Enterprise Architect and immediately create a model project</p>	<a href="#">Getting Started</a> <sup>[ 34 ]</sup> <a href="#">A Quickstart Tutorial</a> <sup>[ 37 ]</sup>
When working through the Quickstart tutorial you should see many links to more extensive <b>descriptions of features, functions, tasks and procedures</b> ; you can follow any of these immediately if you require more information	<a href="#">User Interface Guide</a> <sup>[ 69 ]</sup>
You should also read the <b>Sparx Systems Formal Statements</b> , including the Copyright Notice and our End User Licensing Agreement.	<a href="#">Formal Statements</a> <sup>[ 19 ]</sup>
The <i>User Guide</i> provides a <b>glossary of terms</b> that you can refer to for definitions of various terms and concepts used in this guide	<a href="#">Glossary</a> <sup>[ 207 ]</sup>
<p><b>Feedback</b> - Sparx Systems likes to stay in touch with what Enterprise Architect users require in order to accomplish their tasks efficiently and effectively.</p> <p>We value any suggestions, feedback and comments you might have regarding this product, documentation or install process</p> <p>You can provide your feedback:</p> <ul style="list-style-type: none"> <li>• Using a fault (bug) report or feature request, or</li> <li>• By email</li> </ul>	<a href="http://www.sparxsystems.com/bug_report.htm">www.sparxsystems.com/bug_report.htm</a> <a href="http://www.sparxsystems.com/feature_request.htm">www.sparxsystems.com/feature_request.htm</a> <a href="mailto:support@sparxsystems.com">support@sparxsystems.com</a>
If you are evaluating the <b>free trial version of Enterprise Architect</b> and have not yet purchased an edition, but would like to, you can refer to the information we provide to help you <b>make your purchase</b>	<a href="#">Order Enterprise Architect</a> <sup>[ 26 ]</sup>

## Specific Topics:

Topic	Link
<b>Setting up</b> , configuring, managing and maintaining <b>modeling projects</b> , including storage mechanisms, team development environments, managing changes and monitoring progress	<a href="#">Projects and Teams</a> <small>[136]</small>
<b>Creating and maintaining model structures</b> in Enterprise Architect, including how to work with the model structure and components, their properties, and the reference data with which you populate the model	<a href="#">Modeling Basics</a> <small>[517]</small>
Understanding the Enterprise Architect <b>implementation of UML concepts and specifications</b> , how those concepts are <b>extended</b> in Enterprise Architect's support of other modeling languages, and how you can extend the concepts yourself by creating your own modeling languages	<a href="#">Define a Modeling Language</a> <small>[1040]</small>
<b>Navigating</b> through your model, <b>searching</b> for information you require on the model, selecting aspects of the model to extract and review, and <b>tracing</b> developmental relationships in both the structure and the development timeframe	<a href="#">Navigate, Search &amp; Trace</a> <small>[442]</small>
<b>Transforming</b> model elements and fragments from one domain to another, using standard and customized Model Driven Architecture transformations	<a href="#">Model Transformation</a> <small>[1307]</small>
<b>Generating code</b> from the model (forward engineering), generating model structures from imported code ( <b>reverse engineering</b> ) synchronizing code and model, controlling how these operations take place and controlling what output results from the processes	<a href="#">Software Engineering</a> <small>[1392]</small>
Performing <b>visual analysis of executing code</b> - debugging, recording the stack trace and generating Sequence diagrams from the trace	<a href="#">Visual Execution Analyzer</a> <small>[1644]</small>
Developing models for <b>specific modeling domains</b> , such a business process analysis or systems engineering	<a href="#">Analysis and Business Modeling</a> <small>[1193]</small> <a href="#">Database Engineering</a> <small>[1351]</small> <a href="#">Systems Engineering</a> <small>[1557]</small> <a href="#">SOA and XML Engineering</a> <small>[1589]</small>
Ensuring <b>quality control</b> of your models and code through <b>model validation</b> and running your own <b>test scripts</b>	<a href="#">Testing</a> <small>[1699]</small>
Managing the <b>maintenance</b> of model elements and <b>changes and issues</b> across the project	<a href="#">Maintenance</a> <small>[1722]</small>
<b>Documenting</b> your model in either RTF or HTML output format	<a href="#">Reporting</a> <small>[1736]</small>
Using the <b>Technology Developer's tools</b> , which enable you to access Enterprise Architect facilities through your own interface, in your own implementation	<a href="#">Automation</a> <small>[1831]</small>
Managing your private or shared <b>Enterprise Architect product license keys</b>	<a href="#">License Management</a> <small>[2109]</small>

## 1.1 Overview

Enterprise Architect is a powerful CASE tool for specifying, documenting and building software projects. Using Enterprise Architect's support for UML and its related standards, you can model new complex software and business systems, or visualize and maintain existing systems.

### Topics:

Topic	Link
<p>Enterprise Architect is a <b>comprehensive UML analysis and design tool</b>, covering all aspects of the software development cycle from requirements gathering through analysis, model design, testing, change control and maintenance to implementation, with full traceability</p> <p>Enterprise Architect combines the power of the latest <b>UML 2.3 specification</b> with a high performance, intuitive interface, to bring advanced modeling to the <b>whole development team</b></p> <p>It is a multi-user, visual tool with a great feature set, helping analysts, testers, project managers, quality control staff and deployment staff around the world to <b>build and document</b> robust, maintainable systems and processes</p>	<p><a href="#">Key Benefits of Enterprise Architect</a> <sup>[7]</sup></p> <p><a href="#">Enterprise Architect Key Features</a> <sup>[10]</sup></p>
<p>With over 250,000 licenses sold, Enterprise Architect has proven <b>highly popular</b>, being used by thousands of companies <b>world-wide</b></p> <p>From large, well-known, multi-national organizations to smaller independent companies and consultants, Enterprise Architect has become the <b>UML modeling tool of choice</b> for developers, consultants and analysts in over 130 countries</p> <p>Sparx Systems software is used in the development of many kinds of application and system in a <b>wide range of industries</b> including:</p> <ul style="list-style-type: none"> <li>• aerospace</li> <li>• banking</li> <li>• web development</li> <li>• engineering</li> <li>• finance</li> <li>• medicine</li> <li>• military</li> <li>• research</li> <li>• academia</li> <li>• transport</li> <li>• retail</li> <li>• utilities (such as gas and electricity) and</li> <li>• electrical engineering</li> </ul> <p>It is also used effectively for UML and enterprise architecture <b>training</b> in many prominent colleges, training companies and universities around the world</p>	

### 1.1.1 What You Can Do

This topic introduces the fundamental processes that Enterprise Architect supports.

Topic	Detail	See also
<b>Modeling</b>	Enterprise Architect is a comprehensive model analysis and design tool	<a href="#">Modeling Fundamentals</a> <sup>[51]</sup>

	<p>To <b>create models</b> with Enterprise Architect, you therefore should become familiar with:</p> <ul style="list-style-type: none"> <li>• How Enterprise Architect <b>implements the UML standards</b> and</li> <li>• How you <b>apply UML in Enterprise Architect</b> to develop your models</li> </ul>	
<b>Managing Models</b>	<p>To <b>manage</b> the models in your projects, you both</p> <ul style="list-style-type: none"> <li>• Protect and manage the <b>model data</b> itself, and</li> <li>• Communicate information on the data in the form of RTF and HTML <b>documentation and reports</b></li> </ul>	<a href="#">Projects and Teams</a> <sup>[136]</sup> <a href="#">Reporting</a> <sup>[1736]</sup>
<b>Code Engineering</b>	<p>In Enterprise Architect, UML modeling both depends on and supports code engineering - you <b>generate</b> and <b>update code</b> from a model, and you <b>create and update models</b> from code</p> <p>In this broad sense, Enterprise Architect enables you to:</p> <ul style="list-style-type: none"> <li>• <b>Forward engineer, reverse engineer, round-trip</b> and synchronize code in a range of programming languages</li> <li>• <b>Debug and profile</b> code</li> <li>• Model and generate code for <b>XML Technologies</b></li> <li>• Perform <b>database modeling</b> and <b>design</b> for a range of database management systems</li> <li>• Convert model components from one domain to another using <b>Model Driven Architecture (MDA) Transformations</b>.</li> </ul>	<a href="#">Overview Of Development</a> <sup>[1395]</sup>
<b>Managing Projects</b>	<p>Enterprise Architect provides strong support for Project Management, particularly in the following areas:</p> <ul style="list-style-type: none"> <li>• <b>Project estimation</b> - working out how much time and effort is required to build and deploy a solution, using the Use Case metrics facility and carefully-calibrated metrics</li> <li>• Defining, assigning and managing <b>resources</b></li> <li>• Communicating Project Management <b>discussions</b> and decisions to the project</li> <li>• Monitoring and managing <b>problems, changes, issues and tasks</b> that affect both individual elements and the project as a whole</li> <li>• Managing the development, execution and results of <b>testing</b>, from Integration through to User Acceptance, and</li> <li>• Maintaining a project glossary of terms, procedures and policies applied to the project</li> </ul> <p>The scope of your project management might include upgrades to Enterprise Architect and installation of related technologies</p>	<a href="#">Projects and Teams</a> <sup>[136]</sup> <a href="#">Testing</a> <sup>[1699]</sup> <a href="#">Maintenance</a> <sup>[1722]</sup> <a href="#">License Management</a> <sup>[2109]</sup>
<b>Extending Enterprise Architect Facilities</b>	<p>Experienced Technology Developers can develop customized additions to the functionality already present within Enterprise Architect. These additions include:</p> <ul style="list-style-type: none"> <li>• UML Profiles and Stereotypes</li> <li>• UML Patterns</li> <li>• Code Templates</li> </ul>	<a href="#">Build Your Own Modeling Language</a> <sup>[1040]</sup> <a href="#">Automation</a> <sup>[1831]</sup>

	<ul style="list-style-type: none"> <li>• Tagged Value Types</li> <li>• MDG Technologies and</li> <li>• Enterprise Architect Add-Ins.</li> </ul> <p>By creating these extensions the Technology Developer can customize the Enterprise Architect modeling process to specific tasks and speed up development.</p>	
--	--	--

### 1.1.2 Key Benefits

Enterprise Architect is a powerful tool for specifying, documenting and building your software and business process projects. Using Enterprise Architect's **support for UML** and its related standards, you can model new complex software and business systems, or visualize and maintain existing systems.

Topic	Detail	See also
<b>Design and Build Diverse Systems Using UML</b>	<p>UML 2.3 is an open standard that provides a rich language for describing, documenting and designing software, business and IT systems in general</p> <p>Enterprise Architect enables you to leverage the full expressive power of UML 2.3 to model, design and build diverse systems in an open and well understood manner</p> <p>You can generate code, database structures, documentation and metrics; transform models; or specify behavior and structure as the basis for contractual agreements</p>	<a href="#">Standard UML Models</a> <sup>[795]</sup> <a href="#">Modeling Basics</a> <sup>[517]</sup>
<b>Model and Manage Complexity</b>	<p>Enterprise Architect helps individuals, groups and large organizations model and manage complex information.</p> <p>Often this relates to software development and IT systems design and deployment, but it can also relate to business analysis and business process modeling</p> <p>Enterprise Architect integrates and connects a wide range of structural and behavioral information, helping to build a coherent and verifiable architectural model, either what-is or what-will-be</p> <p>Tools to manage version control, track and compare differences, audit changes and enforce security, help control project development and enforce compliance to standards</p>	<a href="#">Configure User Security</a> <sup>[195]</sup> <a href="#">Change Management</a> <sup>[242]</sup>
<b>Structured Use Case Scenarios</b>	<p>Enterprise Architect's Structured Scenario editor enables you to develop structured Use Case Scenarios, to capture vital analysis information in the form of natural language descriptions</p> <p>The editor helps you use this information to drive downstream development and maximize traceability across the development life-cycle</p> <p>The editor also helps you to dynamically link scenario steps to associated model elements, such as domain elements, business rules and glossary terms</p> <p>From structured scenarios, you can automatically generate test case descriptions, and Activity and other UML behavioral diagrams</p> <p>You can even reverse engineer existing process diagrams</p>	<a href="#">Scenarios</a> <sup>[669]</sup>

Topic	Detail	See also
	into structured, textual specifications to produce documentation deliverables	
<b>Share Models</b>	<p>Enterprise Architect enables you to share complete models or specific aspects of a model between members of a team, including (through the 'Lite', read-only edition) stakeholders who can study a model but not change or manage it</p> <p>You can make your project .EAP file available on a shared network drive, or replicate the .EAP file for complex distributed development</p> <p>Alternatively, you can develop the project in one of several shared DBMS repositories</p> <p>You can import and export data as XMI files to distribute and update frameworks and other package-based model structures; you control changes through the version control repository</p> <p>Enterprise Architect provides a data transfer wizard that enables you to upsize or downsize the complete model for maximum flexibility, and it enables you to export and import reference data so that you do not have to recreate it for related projects</p>	<p><a href="#">The Read-only 'Lite' Edition</a> <sup>[18]</sup></p> <p><a href="#">Project Sharing</a> <sup>[186]</sup></p> <p><a href="#">Server Based Repositories</a> <sup>[149]</sup></p> <p><a href="#">XMI Import and Export</a> <sup>[320]</sup></p> <p><a href="#">Version Control</a> <sup>[243]</sup></p> <p><a href="#">Perform a Project Data Transfer</a> <sup>[345]</sup></p> <p><a href="#">Sharing Reference Data</a> <sup>[237]</sup></p>
<b>Model, Manage and Trace Requirements</b>	<p>Enterprise Architect enables you to capture requirements and use full traceability from base requirements to design, build, deployment and beyond</p> <p>You can use impact analysis to trace from proposed changes to original requirements, and build the 'right' system</p>	<p><a href="#">Requirements</a> <sup>[115]</sup></p> <p><a href="#">Trace: Tracking Dependencies</a> <sup>[495]</sup></p>
<b>Develop Personal Views and Extracts of the Model</b>	<p>Enterprise Architect enables you to develop any number of different views of your model, or parts of it, either for your personal use or for the use of your team</p> <p>These <b>Model Views</b> are generated by reports, so they can be set up to always show the current status of the selected view</p> <p>The facility also enables you to create Favorites folders of hyperlinks to frequently-used data structures</p>	<p><a href="#">Model Views</a> <sup>[466]</sup></p>
<b>Track and Trace Model Structures</b>	<p>In even a small model, it can be difficult to locate specific packages, diagrams or elements, even if you apply a rigorous naming and structure policy</p> <p>Enterprise Architect has a wealth of facilities that enable you to locate structures quickly and easily, through the Model Search, Package Browser, Diagram List, Auditing facility, Traceability window, Relationship Matrix and reports</p> <p>The Element menu, Diagram menu and Project Browser context menus also enable you to locate elements in diagrams and in the Project Browser, and you can store hyperlinks to important or commonly-used elements and diagrams in the Model Views</p> <p>Finally, having located one element you can import any related elements into a diagram in a single operation</p>	<p><a href="#">Navigate, Search &amp; Trace</a> <sup>[442]</sup></p> <p><a href="#">Auditing</a> <sup>[300]</sup></p> <p><a href="#">Other Documents</a> <sup>[179]</sup></p> <p><a href="#">Main Menu</a> <sup>[73]</sup></p> <p><a href="#">Project Browser Context Menus</a> <sup>[445]</sup></p> <p><a href="#">Insert Related Elements</a> <sup>[654]</sup></p>

Topic	Detail	See also
<b>Generate Documentation</b>	<p>Enterprise Architect provides powerful document generation and reporting tools with a full WYSIWYG template editor for RTF or HTML output</p> <p>You can generate complex and detailed reports from Enterprise Architect with the information you require in the format your company or client demands</p>	<a href="#">Reporting</a> <sup>[1736]</sup>
<b>Generate and Reverse Engineer Source Code</b>	<p>Enterprise Architect supports generation and reverse engineering of source code for many popular languages</p> <p>With a built in 'syntax highlighting' source code editor, Enterprise Architect enables you to quickly navigate and explore your model source code in the same environment</p> <p>Code generation templates enable you to customize the generated source code to your company specifications</p>	<a href="#">Generate Source Code</a> <sup>[1499]</sup> <a href="#">Importing Source Code</a> <sup>[1517]</sup> <a href="#">The Source code Viewer</a> <sup>[1417]</sup> <a href="#">Code Templates</a> <sup>[1491]</sup>
<b>Visualize, Inspect and Understand Complex Software</b>	<p>Software is complex and often hard to understand; you can use Enterprise Architect to reverse engineer code in a wide range of software development languages and database repository schema, to understand static structure</p> <p>To complete the picture, use the unique built-in profiling and debugging tools to capture and visualize executing software at run-time</p> <p>Create run-time instances of model elements and invoke methods using the built in Object Workbench</p> <p>You can also bring in complete frameworks from source code or Java .jar files - or even .Net binary assemblies!</p> <p>By importing frameworks and library code, you can maximize re-use and understanding of your existing investment</p>	<a href="#">Importing Source Code</a> <sup>[1517]</sup> <a href="#">Execution Analysis</a> <sup>[1644]</sup> <a href="#">Object Workbench</a> <sup>[1674]</sup> <a href="#">Import Source Code</a> <sup>[1519]</sup> <a href="#">Import Binary Module</a> <sup>[1522]</sup>
<b>Perform MDA Transformations</b>	<p>Model Driven Architecture (MDA) is an open standard designed to facilitate rapid application development in a platform independent manner</p> <p>Models can be built at a high level of abstraction and, using MDA based tools, transformed into models and code targeting a specific platform or domain</p> <p>Enterprise Architect supports advanced MDA transformations using easily edited and developed transformation templates</p> <p>With built-in transformations for DDL, C#, Java, EJB and XSD, you can quickly develop complex solutions from simple platform independent models (PIMs) targeted at platform specific models (PSMs); one PIM can be used to generate and synchronize multiple PSMs, providing a significant productivity boost</p>	<a href="#">Model Transformation</a> <sup>[1307]</sup> <a href="#">Built-in Transformations</a> <sup>[1313]</sup>
<b>SOA (Service Oriented Architecture) Support</b>	<p>Enterprise Architect enables you to rapidly model and forward- and reverse-engineer two key W3C XML technologies:</p> <ul style="list-style-type: none"> <li>• XML Schema (XSD) and</li> <li>• Web Service Definition Language (WSDL)</li> </ul> <p>XSD and WSDL support is critical for the development of a complete Service Oriented Architecture (SOA), and the</p>	<a href="#">XML Schema - XSD</a> <sup>[1590]</sup> <a href="#">Web Services - WSDL</a> <sup>[1620]</sup>

Topic	Detail	See also
	coupling of UML 2.3 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization	
<b>Systems Engineering support</b>	<p>Integrating many high-end features for Systems Engineers, the Ultimate and Systems Engineering editions of Enterprise Architect provide built-in support for:</p> <ul style="list-style-type: none"> <li>• SysML</li> <li>• Parametric model simulation</li> <li>• Executable code generation</li> <li>• Model to code transformations for Hardware Description Languages and Ada 2005</li> </ul>	<a href="#">Editions Available</a> <sup>[14]</sup> <a href="#">SysML</a> <sup>[156]</sup> <a href="#">Behavior</a> <sup>[708]</sup> <a href="#">State Machine Modeling For HDLs</a> <sup>[1511]</sup> <a href="#">Ada 2005</a> <sup>[1468]</sup>
<b>Model Databases</b>	<p>Enterprise Architect enables you to reverse engineer from many popular DBMS systems</p> <p>You can model database tables, columns, keys, foreign keys and complex relationships using UML and an inbuilt data modeling profile, and forward generate DDL scripts to create target database structures</p>	<p>Supported Databases</p> <a href="#">Data Models</a> <sup>[1279]</sup>
<b>Customize Enterprise Architect</b>	<p>Enterprise Architect also includes facilities that enable experienced tool developers to customize and extend Enterprise Architect to suit the specific requirements of their organization with, for example, in-house UML Profiles, Add-Ins and Code Templates</p> <p>The very detailed Automation Interface gives you access to most element features, major functions such as XML import/export, and attached information; most properties are fully writable from the automation client</p> <p>The Automation Interface provides great support for plug-ins, with the ability to embed automation client windows in the main diagram view</p> <p>The Interface is accessible from any automation-aware client language, such as VB, C#, C++ and Delphi</p>	<a href="#">Developing Profiles</a> <sup>[104]</sup> <a href="#">Enterprise Architect Add-In Model</a> <sup>[1982]</sup> <a href="#">Code Template Framework</a> <sup>[1117]</sup> <a href="#">Using the Automation Interface</a> <sup>[1837]</sup>
<b>Link Enterprise Architect to IDEs</b>	<p>Using Sparx Systems Model Driven Generation (MDG) <i>Link</i> plug-ins, you can develop source code in your preferred Integrated Development Environment such as Visual Studio .NET or Eclipse, while you use Enterprise Architect to locate the source code for Classes, attributes and operations, and to model, navigate, track, reverse engineer, build and run your project</p> <p>The MDG Integration products for Eclipse and Visual Studio 2008 provide an even closer, seamless integration of Enterprise Architect and UML 2.3 with your IDE, bringing the functionality required of a fully fledged modeling platform right inside the IDE</p>	<a href="#">Visual Studio .NET</a> <a href="#">Eclipse (Link)</a> <a href="#">Eclipse (Integration)</a> <a href="#">Visual Studio 2008</a>

### 1.1.3 Key Features

Enterprise Architect is renowned for its rich feature set. Some of the key features are highlighted in the following list:

- Model complex information, software and hardware systems using UML-compliant notation (comprehensive **UML 2.3** support for all 14 UML diagrams)
- Extended modeling for **Requirements, User Interface Design, Mind Mapping, Data Modeling, SysML,**

**SPEM, BPMN 1.1 and more**

- Generate **BPEL** scripts automatically from **Business Process** models
- Built-in **Requirements Management** enables you to specify, trace and verify requirements directly against the design, right through to the deployed solution
- Comprehensive and flexible MS Word-compatible **HTML and RTF report options**
- Leverage industry-standard **Enterprise Architecture** frameworks (**Zachman, TOGAF, DoDAF-MODAF**)
- Support in **forward and reverse code engineering** for many software and hardware languages 'out of the box': ActionScript 3.0, Java, C#, C++, VB.Net, Delphi, Visual Basic, Python, PHP, Verilog, VHDL and SystemC
- Ability to perform **database modeling**, to **reverse engineer** from a range of DBMSs via ODBC, and to **forward generate DDL scripts** to create database structures
- Connect to **shared database repositories** using MS SQL Server, MySQL, Oracle and more
- **Manage, track and control change** using **baseline** model merge and **auditing** capabilities
- **Centralize enterprise-wide documentation** of processes and information systems
- **Model dependencies** between elements, system dynamics and state
- **Model class hierarchies**, deployment, components and implementation details
- **Record project issues, tasks** and system glossary
- **Assign resources** to model elements and **track effort expended** against required effort
- **Testing support** for test cases, JUnit and NUnit
- Integrated **Debug Workbench** for visualizing executable Java and .Net applications, instantiating runtime model objects and generating Sequence diagrams from a stack trace
- **Migrate changes** across a distributed environment using **Controlled XMI Packages**
- Manage **Version control** through XMI using **SCC CVS** and **Subversion** configurations
- Inbuilt user and group **security** and access control management
- **Distributed development** through shareable files, use of **shared repositories** in a range of major Database Management Systems, file replication, data transfer, and import and export of reference data
- **Share models** using the latest **XMI 2.1** format
- **Import models** in XMI format from other tools
- Built-in Model Driven Architecture (**MDA**) **Transformations**, and facilities to import or create others
- Facilities to **import database schema, XSD and WSDL source, .NET and Java binaries**
- Use **UML Profiles** to create custom extensions for domain-specific modeling
- Save and load complete diagrams as **UML Patterns**
- Create and share dynamic views of model elements and diagram sets using **Model Views**
- Analyze and trace relationships between elements using the tabular **Relationship Matrix**
- Generate **executable business logic** from **rule tasks** and trace to natural language **business rules**
- Transform **behavioral models** into executable source code for software and **hardware description languages** (HDLs) such as Verilog, VHDL, and SystemC
- **Simulate SysML parametric models**
- Script and automate common tasks using a detailed **Automation Interface** and **Model Scripts**
- A range of internal and external commercial MDG Add-Ins to integrate the facilities of Enterprise Architect with IDEs and other technologies, and templates to write your own
- **Read-only Viewer** enables stakeholders to view but not change milestone deliverables
- **Price**: Enterprise Architect is priced to outfit the entire team, making collaboration and team development a real possibility
- **Speed**: Enterprise Architect is quick to load and a spectacularly fast performer, even with large models
- **Scalability**: Enterprise Architect supports single users and the development of small models, or many concurrent users developing extremely large models, with equal ease
- **Usability**: many of our users agree, Enterprise Architect gets you started and productive quickly, with a rich user interface and the ability to create **templates, model views** and 'favorites' collections of commonly-used elements and diagrams.

For a complete list of the new features of the latest version of Enterprise Architect, click on the **Help | Read Me** menu option.

Enterprise Architect is available in six editions: **Ultimate**, **Business and Software Engineering**, **Systems Engineering**, **Corporate**, **Professional**, and **Desktop**, each of which offers a different range of features.

## 1.2 Enterprise Architect Editions

Enterprise Architect is available in a number of different editions, each tailored to support a particular business case.

Topic	Detail	See also
<b>Before Purchase</b>	Test the product in a number of configurations in the Trial Version	<a href="#">The Trial Version</a> <sup>[13]</sup>
<b>Using the Trial</b>	Explore the specific features of the six work environment editions available	<a href="#">Editions Available</a> <sup>[14]</sup>
<b>Reviews and other Read-only tasks</b>	Use the free, read-only or 'Lite' edition	<a href="#">The Read-only 'Lite' Edition</a> <sup>[18]</sup>

### 1.2.1 The Trial Version

The fully functional 30 day trial version of Enterprise Architect is available free of charge on the Sparx Systems website [www.sparxsystems.com/bin/easetup.exe](http://www.sparxsystems.com/bin/easetup.exe). The trial version is identical to the registered edition with the exception that all diagrams are output to files with an embedded watermark.

	<p>the Sparx Systems website; for more information, contact Sparx Systems by email</p> <p>When you order and pay for an edition of Enterprise Architect, you receive installation instructions and the location of the executable files for download</p>	
<b>Extend Trial Period</b>	<p>If you are testing the trial version and require more than 30 days to evaluate it, you can apply to Sparx Systems Sales for an extension of the trial period; Sparx Systems Sales send you an extension key by email</p> <p>The extension can be an additional 30 to 150 days; if you do not request a long enough extension in the first place, you can submit further requests</p> <p>The trial period must expire before you can enter the extension key.</p>	<a href="mailto:sales@sparxsystems.com">sales@sparxsystems.com</a>

**How to:**

To extend the trial period, after receipt of your extension key, follow the steps below:

Step	Action	See also
1	<p>Open the Enterprise Architect trial version</p> <p>The Evaluation Version of Enterprise Architect dialog displays; once the trial period has expired, you cannot proceed beyond this dialog without extending the trial period</p>	
2	<p>Press ( <b>Ctrl</b> ) whilst you click on the <b>Continue Trial</b> button</p> <p>The Upgrade Key dialog displays</p>	
3	<p>In the <b>Upgrade Key</b> field, type or copy-and-paste the extension key you received from Sparx Systems Sales</p>	
4	<p>Click on the <b>OK</b> button</p> <p>Enterprise Architect confirms that your trial period has been extended</p> <p>Your trial period is extended by the period of days stated in the email from Sparx Systems Sales; you can now restart and use the Trial version of Enterprise Architect</p>	

### 1.2.2 Editions Available

Enterprise Architect is available in six editions: the **Ultimate**, **Business and Software Engineering**, and **Systems Engineering 'suite'** editions, and the **Corporate**, **Professional** and **Desktop** editions.

Topic	Detail	See also
<b>Comparison</b>	<p>The functionality for each edition is described below; the features of and differences between the editions are listed in the table provided on the Sparx Systems website</p> <p>To help you understand the differences between these editions</p>	<p><a href="#">Sparx Systems website</a></p> <p><a href="#">The Trial Version</a></p>

Topic	Detail	See also
	and the advantages and limitations of each, you can open and use the Trial version of Enterprise Architect to mimic any of the editions	
<p><b>Ultimate Edition</b></p> 	<p>The Ultimate edition is designed for power users and those working across multiple domains, providing deep support for Business, for Software Engineering and for Systems Development seamlessly integrated into a single development environment</p> <p>It enables you to drill down to the lowest levels of systems design and construction, with SysML and executable code generation for standard and hardware description languages</p> <p>Business users can leverage BPEL, the Rules Composer and executable UML, in addition to all the advanced features of the other editions of Enterprise Architect</p> <p>Software developers can integrate their Eclipse and Visual Studio projects with their UML models and leverage the advanced executable code generators to target different domains</p> <p>The Ultimate edition enables end to end traceability throughout a global vision of your enterprise - unifying strategy, business process, interfaces, software, rules, data and fine grained systems; powerful tools, domain-specific technologies, frameworks, integration platforms and a consistent, scalable, and robust interface work in unison to help you deliver on the promise of Model Driven Development</p> <p>The Ultimate edition incorporates a number of MDG Technologies and Add-Ins; the Ultimate edition and MDG Technologies are all available in either Fixed License or Floating License form</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently</p> <p>The Ultimate edition provides:</p> <ul style="list-style-type: none"> <li>• Executable Code Generation - support for generating functional source code for State Machines, Interactions and Activities in C, C++, C#, Java and VB.NET</li> <li>• Full round trip support for Hardware Description Languages (Verilog, VHDL and SystemC) including support for generating State Machine code</li> <li>• SysML Simulation Support - including support for simulating SysML 1.2 constraint models with results graphing capabilities</li> <li>• BPEL Generation – transform BPMN 1.1 and BPMN 2.0 Business process models down to BPEL 1.1 and BPEL 2.0 code respectively</li> <li>• Business Rules – trace from abstract business rules down to automatically generated behavioral code</li> </ul>	<p><a href="#">MDG Technologies</a> </p>
<p><b>Business and Software Engineering Edition</b></p>	<p>The Business and Software Engineering edition is aimed at software development professionals, business modelers, architects, requirements experts, project managers and others involved in the design and construction of quality software and business services</p> <p>It combines powerful new features such as executable code generation from UML models, BPEL, advanced scripting and a</p>	<p><a href="#">MDG Technologies</a> </p>

Topic	Detail	See also
	<p>multi-purpose Rules Composer targeting executable code from Business Domain models; it also bundles licenses for integration products and frameworks such as DoDAF-MODAF, TOGAF and Zachman, to provide advanced model-driven construction tools to tightly bind your code development in Eclipse or Visual Studio</p> <p>The Business and Software Engineering edition incorporates a number of MDG Technologies and Add-Ins; the Business and Software Engineering edition and MDG Technologies are all available in either Fixed License or Floating License form</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently</p> <p>The Business and Software Engineering edition provides:</p> <ul style="list-style-type: none"> <li>• Generation of Behavioral Code from State, Sequence and Activity models, supporting standard programming languages such as Java and .NET</li> <li>• Advanced math functions within the scripting engine</li> <li>• BPEL Generation from BPMN 1.1 and BPMN 2.0 models - including validation and WSDL support</li> <li>• A Business Rules Composer that enables you to build Business Domain models and generate code to implement complex business rules in standard programming languages</li> </ul>	
<p><b>Systems Engineering Edition</b></p> 	<p>The Systems Engineering edition is designed for systems and software development professionals working on real-time, embedded and systems solutions</p> <p>It combines new features such as executable code generation from UML models (including support for hardware languages such as Verilog and VHDL), Ada, SysML 1.2, executable SysML Parametric diagrams and advanced scripting</p> <p>It also bundles licenses for DoDAF-MODAF, SysML, DDS, TcSE and integration products to provide powerful model-driven construction tools for the Systems Engineering domain to tightly bind your code development in Eclipse or Visual Studio with the UML/SysML models developed in Enterprise Architect</p> <p>The Systems Engineering edition incorporates a number of MDG Technologies and Add-Ins; the Systems Engineering edition and MDG Technologies are all available in either Fixed License or Floating License form</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently</p> <p>This edition provides:</p> <ul style="list-style-type: none"> <li>• Executable Code Generation - support for generating functional source code for State Machines, Interactions and Activities in C, C++, C#, Java and VB.NET</li> <li>• Full round trip support for Hardware Description Languages, including Verilog, VHDL and SystemC, with support for generating State Machine code</li> </ul>	<p><a href="#">MDG Technologies</a> </p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• SysML Simulation Support - Includes support for simulating SysML 1.2 constraint models with results graphing capabilities</li> </ul>	
<p><b>Corporate Edition</b></p> 	<p>Aimed at larger development teams, the Corporate edition enables you to connect to the following DBMS back ends as the shared repository:</p> <ul style="list-style-type: none"> <li>• MySQL</li> <li>• SQL Server</li> <li>• PostgreSQL,</li> <li>• Sybase Adaptive Server Anywhere</li> <li>• Access 2007 and</li> <li>• Oracle 9i, 10g or 11g</li> </ul> <p>This provides additional scalability and improved concurrency over the shared .EAP file approach to model sharing</p> <p>User security, user logins, user groups and user level locking of elements, user/group based security (with locking at diagram and element levels) are also supported</p> <p>Security comes in two modes: in the first mode, all elements are considered 'writeable' until explicitly locked by a user or group; in the second mode, all elements are considered locked until checked out with a user lock</p> <p>The Corporate edition forms the base for the three extended editions described above; like those editions, it is available in either Fixed License or Floating License form</p> <p>The Floating License arrangement is particularly useful for companies that manage a central store of license keys, which can be used by different employees over time, temporarily or permanently</p>	
<p><b>Professional Edition</b></p> 	<p>Aimed at work groups and developers, the Professional edition supports shared projects through replication and shared network files</p> <p>This edition has an ActiveX interface for interrogating Enterprise Architect projects and extracting information in XML format</p> <p>The Professional edition fully supports code import/export and synchronization of model elements with source code; it enables reverse engineering of SQL Server; MS Access 97, 2000 and 2003; and Oracle 9i, 10g or 11g databases</p> <p>Support for MDG Technologies and MDG Link (sold separately) is included with the Professional version</p> <p>The shared repository available in the Professional edition is restricted to the .EAP file format (JET database)</p>	
<p><b>Desktop Edition</b></p> 	<p>The Desktop edition is targeted at single analysts and developers producing UML analysis and design models</p> <p>It provides facilities for:</p> <ul style="list-style-type: none"> <li>• UML modeling</li> <li>• XML import/export</li> <li>• Document generation</li> <li>• Version control integration and</li> </ul>

## Scintilla and SciTE

Copyright 1998-2003 by Neil Hodgson <[neilh@scintilla.org](mailto:neilh@scintilla.org)> All Rights Reserved.

Permission to use and distribute this (Scintilla) software and its documentation for any purpose and without fee is hereby granted, provided that the above copyright notice appears in all copies and that both that copyright notice and this permission notice appear in supporting documentation.

### 1.3.2 End User License Agreement

**Enterprise Architect Modeling Tool Version 9.0**

**Desktop, Professional, Corporate, Business and Software Engineering, Systems Engineering & Ultimate Editions**

**Copyright (C) 1998-2011 Sparx Systems Pty Ltd. All Rights Reserved**

**IMPORTANT- READ CAREFULLY:** This End User License Agreement ("EULA") is a legal agreement between YOU as Licensee and SPARX SYSTEMS ("SPARX") for the SOFTWARE PRODUCT identified above. By installing, copying, or otherwise using the SOFTWARE PRODUCT, YOU agree to be bound by the terms of this EULA. If YOU do not agree to the terms of this EULA, promptly return the unused SOFTWARE PRODUCT to the place of purchase for a full refund.

The copyright in the SOFTWARE PRODUCT and its documentation is owned by Sparx Systems Pty Ltd A.C.N 085 034 546. Subject to the terms of this EULA, YOU are granted a non-exclusive right for the duration of the EULA to use the SOFTWARE PRODUCT. YOU do not acquire ownership of copyright or other intellectual property rights in any part of the SOFTWARE PRODUCT by virtue of this EULA.

Your use of this software indicates your acceptance of this EULA and warranty.

## DEFINITIONS

In this End User License Agreement, unless the contrary intention appears:

- "ACADEMIC EDITION" means an edition of the SOFTWARE PRODUCT purchased for educational purposes at an academic discount price.
- "EULA" means this End User License Agreement.
- "SPARX" means Sparx Systems Pty Ltd A.C.N 085 034 546.
- "Licensee" means YOU, or the organization (if any) on whose behalf YOU are taking the EULA.
- "Registered Edition of Enterprise Architect" means the edition of the SOFTWARE PRODUCT which is available for purchase from the web site: [http://www.sparxsystems.com/ea\\_purchase.htm](http://www.sparxsystems.com/ea_purchase.htm).
- "SOFTWARE PRODUCT" or "SOFTWARE" means Enterprise Architect, UML Case Tool, Desk Top, Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, which includes computer software and associated media and printed materials, and may include online or electronic documentation.
- "Support Services" means email based support provided by SPARX, including advice on usage of Enterprise Architect, investigation of bugs, fixes, repairs of models if and when appropriate, and general product support.
- "SPARX support engineers" means employees of SPARX who provide on-line support services.
- "Trial edition of Enterprise Architect" means the edition of the SOFTWARE PRODUCT which is available free of charge for evaluation purposes for a period of thirty (30) days.
- "EALITE" means the LITE version of Enterprise Architect that is distributed free of charge as a read-only viewer of .EAP files.

## GRANT OF LICENSE

In accordance with the terms of this EULA YOU are granted the following rights:

- a) To install and use one copy of the SOFTWARE PRODUCT or, in its place, any prior version for the same operating system, on a single computer. As the primary user of the computer on which the SOFTWARE PRODUCT is installed, YOU may make a second copy for your exclusive use on either a home or portable computer.
- b) To store or install a copy of the SOFTWARE PRODUCT on a storage device, such as a network server, used only to install or run the SOFTWARE PRODUCT over an internal network. If YOU want to increase the number of users entitled to concurrently access the SOFTWARE PRODUCT, YOU must notify SPARX and agree to pay an additional fee.
- c) To make copies of the SOFTWARE PRODUCT for backup and archival purposes only.

## EVALUATION LICENSE

The Trial version of Enterprise Architect is not free software. Subject to the terms of this agreement, YOU are hereby licensed to use this software for evaluation purposes without charge for a period of thirty (30) days.

Upon expiration of the thirty (30) days, the SOFTWARE PRODUCT must be removed from the computer. Unregistered use of Enterprise Architect after the 30-day evaluation period is in violation of Australian, U.S. and international copyright laws.

SPARX may extend the evaluation period on request and at their discretion.

If YOU choose to use this software after the 30 day evaluation period a license must be purchased (as described at [http://www.sparxsystems.com/ea\\_purchase.htm](http://www.sparxsystems.com/ea_purchase.htm)). Upon payment of the license fee, YOU will be sent details on where to download the registered edition of Enterprise Architect and will be provided with a suitable software 'key' by email.

## EALITE

Subject to the terms of this Agreement [EALITE](#) may be installed on any machine indefinitely and free of charge. There are no fees or Sparx support services in relation to EALITE.

## ADDITIONAL RIGHTS AND LIMITATIONS

YOU hereby undertake not to sell, rent, lease, translate, adapt, vary, modify, decompile, disassemble, reverse engineer, create derivative works of, modify, sub-license, loan or distribute the SOFTWARE PRODUCT other than as expressly authorized by this EULA.

YOU further undertake not to reproduce or distribute license key-codes except under the express and written permission of SPARX.

If the Software Product purchased is an Academic Edition, YOU ACKNOWLEDGE THAT the license is limited to use in an educational context, either for self-education or use in a registered teaching institution. The Academic Edition may not be used to produce commercial software products or be used in a commercial environment, without the express written permission of SPARX.

## ASSIGNMENT

YOU may only assign all your rights and obligations under this EULA to another party if YOU supply to the transferee a copy of this EULA and all other documentation including proof of ownership. Your license is then terminated.

## TERMINATION

Without prejudice to any other rights, SPARX may terminate this EULA if YOU fail to comply with the terms and conditions. Upon termination YOU or YOUR representative shall destroy all copies of the SOFTWARE PRODUCT and all of its component parts or otherwise return or dispose of such material in the manner directed by SPARX.

## WARRANTIES AND LIABILITY

### WARRANTIES

SPARX warrants that the SOFTWARE PRODUCT will perform substantially in accordance with the accompanying written materials for a period of ninety (90) days from the date of receipt, and any Support Services provided by SPARX shall be substantially as described in applicable written materials provided to YOU by SPARX, and SPARX support engineers will make commercially reasonable efforts to solve any problems associated with the SOFTWARE PRODUCT.

### EXCLUSIONS

To the maximum extent permitted by law, SPARX excludes, for itself and for any supplier of software incorporated in the SOFTWARE PRODUCT, all liability for all claims, expenses, losses, damages and costs made against or incurred or suffered by YOU directly or indirectly (including without limitation lost costs, profits and data) arising out of:

- YOUR use or misuse of the SOFTWARE PRODUCT
- YOUR inability to use or obtain access to the SOFTWARE PRODUCT
- Negligence of SPARX or its employees, contractors or agents, or of any supplier of software incorporated in the SOFTWARE PRODUCT, in connection with the performance of SPARX' obligations under this EULA, or
- Termination of this EULA by either party for any reason.

### LIMITATION

The SOFTWARE PRODUCT and any documentation are provided "AS IS" and all warranties whether express, implied, statutory or otherwise, relating in any way to the subject matter of this EULA or to this EULA generally, including without limitation, warranties as to: quality, fitness; merchantability; correctness; accuracy; reliability; correspondence with any description or sample, meeting your or any other requirements; uninterrupted use; compliance with any relevant legislation and being error or virus free are excluded. Where any legislation implies in this EULA any term, and that legislation avoids or prohibits provisions in a contract excluding or modifying such a term, such term shall be deemed to be included in this EULA. However, the liability of SPARX for any breach of such term shall if permitted by legislation be limited, at SPARX's option to any one or more of the following upon return of the SOFTWARE PRODUCT and a copy of the receipt:

- If the breach relates to the SOFTWARE PRODUCT:
  - the replacement of the SOFTWARE PRODUCT or the supply of an equivalent SOFTWARE PRODUCT
  - the repair of such SOFTWARE PRODUCT
  - the payment of the cost of replacing the SOFTWARE PRODUCT or of acquiring an equivalent SOFTWARE PRODUCT, or
  - the payment of the cost of having the SOFTWARE PRODUCT repaired.
- If the breach relates to services in relation to the SOFTWARE PRODUCT:
  - the supplying of the services again, or
  - the payment of the cost of having the services supplied again.

## TRADEMARKS

All names of products and companies used in this EULA, the SOFTWARE PRODUCT, or the enclosed documentation may be trademarks of their corresponding owners. Their use in this EULA is intended to be in compliance with the respective guidelines and licenses.

Windows®, Windows 98, Windows NT, Windows ME, Windows XP, Windows Vista, Windows 2000 and Windows 2003 Server are trademarks of Microsoft®.

## GOVERNING LAW

This agreement shall be construed in accordance with the laws of the Commonwealth of AUSTRALIA, in the state of Victoria.

## 1.4 Order Enterprise Architect

Enterprise Architect is designed, built and published by Sparx Systems, and available through the Sparx Systems website as either a:

- Free, 30-day trial version (although you can extend the evaluation period)
- Registered purchase version that provides the facilities of the edition you require, as unlocked by the license keys that you purchase from Sparx Systems

The trial version of Enterprise Architect is identical to the registered version with the exception that all diagrams are output to files with an embedded watermark. The trial software stops working after the trial period has elapsed.

On purchase of a suitable license or licenses, the registered version is made available for download.

The latest information on pricing and purchasing is available on the Purchase and Pricing page of the Sparx Systems website, and from Sparx Sales.

### Purchase Options

- On-line using a secure credit-card transaction
- Fax
- Check or equivalent
- Bank transfer

### Learn More:

## 1.5 Installation

Enterprise Architect is distributed as a single executable setup file (.exe). After you execute this file, Enterprise Architect is immediately available to create projects as .EAP files.

The latest evaluation and registered versions of Enterprise Architect are always available from the Sparx Systems website.

The registered version is available through the registered user area of the web site, which requires a username and password to access. These are provided upon purchase of a license.

Topic	Detail	See also
<b>System Requirements</b>	The system requirements for installing Enterprise Architect are defined on the Enterprise Architect System Requirements page of the Sparx Systems website.	<a href="#">Enterprise Architect System Requirements</a>
<b>Windows Vista</b>	<p>Under Windows Vista (with User Account Control turned on) an application starts with only Standard permissions, regardless of what level of authority the current user has. As a result, an installer run normally with an Admin account under Vista only has Standard privileges and either is not able to write to certain critical areas of the registry/file system, or redirects the write requests to a per-user virtualized registry/file system.</p> <p>Sparx Systems recommend that if you are installing on Windows Vista, always run the Enterprise Architect installer with Administrator privileges (right-click on the downloaded installer icon and select the <b>Run as administrator</b> menu option).</p>	
<b>Install Enterprise Architect</b>	<p>Run the Enterprise Architect setup program. Generally you can accept all the default options without change.</p> <p>To place Enterprise Architect in a directory other than the default, enter the name of the destination when prompted.</p> <p>You might be prompted to restart your computer when the installation completes. Although this is not always necessary (if you already have the components Enterprise Architect requires installed on your computer), you should restart just to be certain.</p>	
<b>Installation on Linux</b>	<p>If you intend to run Enterprise Architect on Linux, refer to the page "<i>Installing Enterprise Architect inside Wine</i>", on the Sparx Systems website.</p> <p>To support the Scripting facility in the Corporate and extended editions of Enterprise Architect, you must also install Internet Explorer 6.0 or later revisions.</p>	<a href="#">Installation inside Wine</a>
<b>Using a Third Party DBMS as Model Repository</b>	If you plan to use SQL Server, MySQL, PostgreSQL, Access 2007, Sybase Adaptive Server Anywhere or Oracle 9i, 10g or 11g as a model repository, then you must use the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions of Enterprise Architect.	<a href="#">Corporate Edition Resources Page</a> <a href="#">Trial Corporate Edition Resources Page</a>

Topic	Detail	See also
	<p>You also require additional files and supplementary installation processes. Please note that installation and maintenance of these database management systems is not covered under the support agreement.</p> <p>Users planning to use SQL Server, MySQL, PostgreSQL, Sybase Adaptive Server Anywhere, Access 2007 or Oracle 9i, 10g or 11g as their model repository can access scripts that create the required data structures for the choice of DBMS, from the Sparx Systems website. To access these scripts, please follow the links at right.</p>	

**Notes:**

- Enterprise Architect requires **Read/Write** access to the program files directory where Enterprise Architect has been installed

## 1.6 Register a Full License

The **trial** version of Enterprise Architect available for download is an evaluation version only. For the **full** version you must first purchase one or more *licenses*.

The license supplied determines which edition (Enterprise Architect Desktop, Professional, Corporate, Business and Software Engineering, System Engineering or Ultimate) is activated after installation.

The Corporate, Business and Software Engineering, System Engineering and Ultimate editions can be activated by either a private license key or a shared (floating) license key. Shared license keys, for a user population that includes temporary users, are checked out of and in to a Sparx Systems key store.

### Use To:

- Obtain and activate the registered version of Enterprise Architect

### How To:

Step	Action	See also
1	Purchase one or more licenses  Once you have paid for a licensed version of Enterprise Architect, you receive (via email or other suitable means): <ul style="list-style-type: none"> <li>• a license key or keys</li> <li>• a web site address from which to download the full version</li> <li>• if you have purchased a Sparx Systems key store, a web site address from which to download the key store</li> </ul>	<a href="#">Editions Available</a> 
2	Save the license key(s) and download the latest full install package from the address supplied	
3	Run the setup program to install the full version	
4	Open Enterprise Architect from the Start Menu or desktop icon  The License Management dialog displays	
5	Click on the <b>Add Key</b> button  The Add Registration Key dialog displays; register your key	<a href="#">Add License Key</a> 
6	Click on the <b>OK</b> button  The full version is now activated on your PC, and Enterprise Architect displays the message:  Registration succeeded! Thank you for purchasing Enterprise Architect <type> Edition	

### Notes:

- Private license keys and shared license keys have different formats, so you cannot use one in place of the other.

### Learn More:

## 1.7 Help and Support

Enterprise Architect has three main help and information systems to assist you in using the product:

- Learning Center
- Enterprise Architect Help
- The Sparx Systems website.

In addition Sparx Systems recommend that you fully explore the sample project supplied with Enterprise Architect. It assists you in learning to use Enterprise Architect and offers tips on getting the most out of Enterprise Architect's features. Click on the **EAExample** option on the Enterprise Architect Start Page.

Topic	Detail	See also
<b>Learning Center</b>	<p>The Enterprise Architect Learning Center provides context-sensitive guidance, tools, demonstrations and other online resources to help you understand any area of Enterprise Architect that you are interested in.</p> <p>The Learning Center automatically displays on the right of the screen when you first open Enterprise Architect, showing the Getting Started topics. You can select other task areas by clicking on the drop-down arrow in the toolbar.</p>	<a href="#">Learning Center</a> <sup>[72]</sup>
<b>Enterprise Architect Help</b>	<p>Enterprise Architect Help provides comprehensive documentation of Enterprise Architect and covers every aspect and facility of the product. To access Help within Enterprise Architect:</p> <ul style="list-style-type: none"> <li>• Click on the Help icon (  ) in the various toolbars</li> <li>• Select the <b>Help   Help Contents</b> menu option</li> <li>• Click on the <b>Help</b> button on a dialog (for Help specific to that dialog).</li> </ul> <p>Enterprise Architect Help is extensive; if you cannot quickly locate the topic you require in the online contents list, you can use one of two search facilities:</p> <ul style="list-style-type: none"> <li>• Click on the Index tab, type in a keyword or key phrase appropriate to the subject you require help for, and press ( <b>Enter</b> ); double-click on the appropriate index item</li> <li>• Click on the Search tab, type in a word or phrase to search for, and click on the <b>List Topics</b> button; double-click on the required topic.</li> </ul> <p>The Enterprise Architect Help is also available separately from the product, in different formats.</p>	<a href="#">Available Help File Formats</a> <sup>[31]</sup>
<b>Sparx Systems Web Site</b>	<p>The Sparx Systems web site is also extensive, and provides information and announcements concerning the company and its full range of products, as well as tutorials, white papers, templates and solutions.</p>	<a href="#">Sparx Systems Web Site</a> <a href="#">Enterprise Architect User Forum</a>

Topic	Detail	See also
	<p>It also provides a user forum, community site (see below) and support network; Sparx Systems are highly responsive to user feedback and requirements, and the web site enables rapid communication concerning problems, solutions and enhancements.</p> <p>You can access the web page and user forum within Enterprise Architect from the <b>View   More Project Tools   Internal Web Browser</b> menu option, and through the Online Resources topics in the Learning Center.</p>	<a href="#">Learning Center</a> <sup>[72]</sup>
<b>Community Site</b>	<p>The Sparx Systems website also hosts the Sparx Systems Enterprise Architect Community Site. This is a central location for the Enterprise Architect community to publish resources and share experiences.</p> <p>From this site you can download the latest news, tutorials, resources, best practices, tips, techniques and user-generated content for Enterprise Architect. You can also, as a registered author, contribute content and share your expertise with the wider community.</p>	<a href="#">Sparx Systems Enterprise Architect Community Site</a>

**1.7.2 Support**

Technical support for Enterprise Architect is available to registered users. Responses to support queries are sent by email.

Sparx Systems endeavors to provide a rapid response to all product-related questions or concerns.

- Registered users can lodge a support request, by visiting: [http://www.sparxsystems.com/registered/reg\\_support.html](http://www.sparxsystems.com/registered/reg_support.html)

- Trial users can contact Sparx Systems with questions regarding their evaluation at: [support@sparxsystems.com](mailto:support@sparxsystems.com)
- An online user forum is also available for your questions and perusal, at <http://www.sparxsystems.com/cgi-bin/yabb/YaBB.cgi>

**Part**

## 2 Getting Started

This guide helps you to understand the options available when you start Enterprise Architect, and to quickly gain an understanding of how to use these options to create models.

Topic	Link
After starting Enterprise Architect, use the Quick Start tutorial to immediately create a project	<a href="#">A Quickstart Tutorial</a> <sup>[37]</sup>
Read about work areas applicable to certain Project Roles	<a href="#">Project Roles</a> <sup>[57]</sup>
Review the Enterprise Architect User Interface, or workspace	<a href="#">Enterprise Architect User Interface</a> <sup>[69]</sup>

At various points throughout the Enterprise Architect Help, there are further Quick Start topics and sections to help you use the system immediately to experiment with a feature of Enterprise Architect. Use the Help Index tab and search for *Quick Start* to locate these topics.

### Learn More:

- [Start Enterprise Architect](#) <sup>[35]</sup>

## 2.1 Basics

When you install Enterprise Architect on your computer, a new program folder called *Enterprise Architect* is created in your **Start** menu (unless you changed the default name during installation).

You can start Enterprise Architect from the icon created on your Windows desktop during installation, or alternatively:

1. Open the Windows **Start** menu
2. Locate the Enterprise Architect program folder
3. Select **Enterprise Architect**

After a short pause, the Start Page displays. From this page you can:

Topic	Link
Open a project file (.EAP file)	<a href="#">Open a project file</a> <sup>[139]</sup>
Create a new project (.EAP file)	<a href="#">Create a new project</a> <sup>[146]</sup>
Connect to a DBMS repository(Corporate and extended editions)	<a href="#">Connect to a DBMS repository</a> <sup>[162]</sup>

### Notes:

- By default, when you install Enterprise Architect, an empty 'starter' project called *EABase.EAP* is installed, as well as an example project named *EAExample.EAP*. We recommend that new users select the EAExample file and explore it in some detail while you become familiar with UML and software engineering using Enterprise Architect
- Enterprise Architect.EAP files default to use Jet 3.5 as the database engine. This does not support unicode character sets. If you want to use unicode character sets (for example, to provide user interface texts in languages other than your Windows-defined native language), you must either upsize to a DBMS repository or set JET 4.0 as the database engine. Resetting the database engine ensures compatibility with .EAP files that support unicode character sets and that are in turn compatible with versions of MS Access later than Access 97

If your .EAP project is not in a Jet 4.0 database, you should also download a copy of the Jet 4.0 EABase model from the Sparx Systems website, and do an EAP to EAP transfer of your model into the Jet 4.0 file

### Learn More:

## 2.2 Common Tasks

Enterprise Architect is a powerful modeling tool that can be used by project managers, business analysts, developers and testers alike to build business, real-time and software systems.

The following list outlines some of the common tasks performed by Enterprise Architect and describes some of the tools that you might be required to use.

Topic	Detail
<b>Manage Projects Effectively</b>	Enterprise Architect provides all the tools necessary for the planning, execution and successful completion of a project <ul style="list-style-type: none"> <li>• Create a shared vision of your project, improve communication and help team members agree upon the design of a proposed system</li> <li>• Evaluate project risk factors, report any changes or defects and develop strategies to tackle potential problems</li> <li>• Help estimate the amount of time and effort required to complete a project and maximize staff utilization</li> <li>• Use Auditing, Project Baselines and User Access Controls to better manage change in a collaborative environment</li> </ul>
<b>Analyze Strategic Business Needs</b>	A Business Analyst is responsible for gathering requirements, modeling potential solutions and evaluating the business needs of an organization <ul style="list-style-type: none"> <li>• Build a coherent picture of how a business operates through requirements gathering, Use Case analysis and modeling business rules</li> <li>• Help achieve business process improvement and implement change using tools such as Strategic Models, Use Case Scenarios, Business Rule Models, Flow Charts, Auditing and the Team Review window</li> </ul>
<b>Build and Develop Systems</b>	The developer is responsible for implementing a solution using a range of tools <ul style="list-style-type: none"> <li>• Bring the power and benefits of Enterprise Architect into your favorite Integrated Development Environment</li> <li>• Use Enterprise Architect's in-built support for writing code, including syntax highlighting, line numbering, auto completion, bookmarking and automatic indentation</li> <li>• Create breakpoints to step through code execution, examine variables and view error messages via the debug output</li> <li>• Apply Visual Execution Analysis to identify costly function calls, explain system behavior and establish the sequence of events that occur immediately prior to system failure</li> <li>• Use Enterprise Architect's support for round trip engineering and synchronizing source code with a corresponding model</li> <li>• In addition to many popular programming languages, create powerful database solutions that automatically generate DDL scripts for more than 10 different Database Management Systems</li> </ul>
<b>Test and Investigate</b>	Quality Assurance teams test software to identify defects, verify that it satisfies all requirements and ensure that it produces expected results <ul style="list-style-type: none"> <li>• In addition to the integrated JUnit and NUnit testing capabilities, Enterprise Architect enables you to create and manage test scripts for model elements, covering unit, integration, scenario, system and acceptance tests</li> <li>• Visualize the execution of code to better understand how applications work and the sequence of events that leads to program failure</li> </ul>

## 2.3 A Quickstart Tutorial

### Welcome to Enterprise Architect!

This quick-start tutorial is designed to help you get up to speed with Enterprise Architect.

As you read through this tutorial, it is recommended that you have Enterprise Architect open so that you can try out the tasks described. By the end you should be able to begin modeling your own business/software projects with Enterprise Architect.

The tutorial guides you through a number of important basic tasks:

Topic	Link
Creating a new Project	<a href="#">Creating a New Project</a> <sup>[37]</sup>
Adding Views to your Model	<a href="#">Views</a> <sup>[38]</sup>
Adding Packages to your Model	<a href="#">Packages</a> <sup>[39]</sup>
Adding Diagrams	<a href="#">Adding Diagrams</a> <sup>[40]</sup>
Adding elements to your model packages	<a href="#">Elements</a> <sup>[41]</sup>
Creating links between model elements	<a href="#">Links</a> <sup>[42]</sup>
Refining the model	<a href="#">Refining the Model</a> <sup>[44]</sup>

Throughout the descriptions there are hyperlinks to more detailed information on a range of topics.

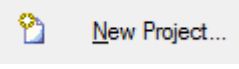

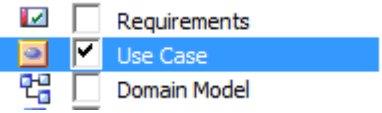

### 2.3.1 Create Project Scenario

A project is a single file or repository-based store for one or more Models.

The first step in getting started with Enterprise Architect is to either open an existing project, or create a new one.

In this example we create a new file-based project and add some template-based models to kick-start our modeling.

Step	Action	Result
1	Start Enterprise Architect	The Open Project dialog displays (If the dialog does not appear, press <b>(Ctrl+O)</b> to invoke it)
2	Click the <b>New Project</b> button to select a suitable location and name for your new project	The standard Windows file browser dialog displays. File-based Enterprise Architect projects are

Step	Action	Result
		named with a .EAP extension
3	Locate a suitable folder for your project and enter a distinctive name  Press the <b>Save</b> button to continue	Enterprise Architect creates a new project file and places it in the specified location  The project is then opened automatically and the New Model Wizard displays
4	In the left hand column ensure that <b>Default</b> is selected - and in the right hand side tick the <b>Use Case View</b> check box    Click on the <b>OK</b> button	The Model Wizard automatically creates a new Use Case model for you, with an initial diagram, some notes and default elements to help get you started  At this stage all your changes have been saved to file and do not require further action

Your new project has now been created, with a simple Use Case View added for you to explore and tailor to your requirements. You can re-open your project at any time by double-clicking on it in a file browser. It should also appear in your **Recent Projects** list on the Start page.

### 2.3.2 Add a View To Your Model

A View is a top level package, within a model. It can be categorized by purpose using different icon types, such as Use Case View, Component View or Deployment View. Views are used to contain packages, diagrams and elements - the building blocks of your model.

#### Use To:

- Create a new View in your project

#### How To:

Step	Action	See also
1	Select a model root node in the Project Browser, then either: <ul style="list-style-type: none"> <li>• Click the <b>Add a Package</b> button  on the Project Browser toolbar.</li> <li>• Select <b>Project   New Package</b></li> <li>• Right-click the model root node, from the context menu select <b>New View</b></li> <li>• Press ( <b>Ctrl + W</b> )</li> </ul> The Create New View dialog displays	<a href="#">Views</a> <sup>[532]</sup>
2	Enter an appropriate name for the new View	
3	Click the appropriate radio button to select an icon for the View	
4	Click on the <b>OK</b> button  The Create New View dialog closes  The new View is created as a child of the selected model root node	

**Learn More:**

- [Add a package to your model](#) <sup>[39]</sup>
- [Create a new diagram](#) <sup>[40]</sup>
- [Add an element](#) <sup>[41]</sup>
- [Read more about views](#) <sup>[532]</sup>

**Notes:**

- There are six types of View, which represent conventional ways of categorizing the purpose of a Model View; these Views represent different structural or behavioral aspects of the same model

**2.3.3 Add Packages**

A Package is a container of model elements, and is displayed in the Project Browser as a 'folder' icon. A Package is required to hold the model building blocks, such as diagrams, elements and other packages.

So, to begin developing your Model, you must create an initial package for your first diagrams.

**Use To:**

- Add new packages to your model

**How To:**

Step	Action	See also
1	Select a Package or View in the Project Browser, then either: <ul style="list-style-type: none"> <li>• Click the <b>Add a Package</b> button  on the Project Browser toolbar.</li> <li>• Press ( <b>Ctrl + W</b> )</li> <li>• Select <b>Project   New Package</b></li> <li>• Right-click the Package or View and, from the context menu, select <b>Add   Add Package</b></li> </ul> The New Model Package dialog displays	
2	Enter a suitable name for the package	
3	Optionally, clear the check mark from <b>Automatically add new diagram</b>	
4	Click on the <b>OK</b> button The New Model Package dialog closes A new package is created as a child of the selected package or View	

**Notes:**

- When the **Automatically add new Diagram** option is selected, Enterprise Architect also creates a default diagram within the new package, to speed your development

**Learn More:**

- [Creating Diagrams](#) <sup>[40]</sup>
- [Add Elements](#) <sup>[41]</sup>
- [Move Components](#) <sup>[44]</sup>

- [Learn more about the Project Browser](#)<sup>[443]</sup>

### 2.3.4 Creating Diagrams

A diagram is a visual representation of the elements of your model, their attributes and characteristics, and how they are connected and/or interact with each other.

Different diagram types show different aspects of the model and the relationships between elements.

#### Use To:

- Add new diagrams to your model

#### How To:

Step	Action	See also
1	<p>Select a package or View in the Project Browser, then either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>Add a Diagram</b> button  on the Project Browser toolbar</li> <li>• Press ( <b>Ctrl + Insert</b> )</li> <li>• Select <b>Project   New Diagram</b></li> <li>• Right-click the package or View and, from the context menu, select <b>Add   Add Diagram</b></li> </ul> <p>The New Diagram dialog displays</p>	
2	<p>Enterprise Architect provides a default diagram name, that is the same name as the parent package</p> <p>Update the diagram name as required</p>	
3	<p>Select a category of diagrams in the left hand pane</p> <p>The list of available diagram types in the right hand pane is updates according to your selection</p>	
4	<p>Select the type of diagram to add from the right hand pane</p>	
5	<p>Click on the <b>OK</b> button</p> <p>The New Diagram dialog closes</p> <p>A new diagram is created as a child of the currently selected package</p> <p>The new diagram is opened in the Diagram View, ready for editing</p>	

#### Notes:

- When you create a package, if you leave the **Automatically add new Diagram** option selected, the New Diagram dialog displays automatically

#### Learn More:

- [Add Elements](#)<sup>[41]</sup>
- [Move Elements](#)<sup>[44]</sup>
- [Learn more about UML diagrams](#)<sup>[797]</sup>

### 2.3.5 Creating New Elements on Diagrams

Models are constructed from elements, each of which has its own meaning, rules and notation. Generally, when you create a new element in your model, you want to use that element on a diagram. The simplest way to do this is to create the element directly on the diagram.

#### Use To:

- Create new elements on diagrams in your model

#### How To:

Step	Action	See also
1	Ensure that the Diagram Toolbox is visible To display the Diagram Toolbox, either: <ul style="list-style-type: none"> <li>• Select <b>View   Diagram Toolbox</b></li> <li>• Press ( <b>Alt + 5</b> )</li> </ul>	
2	Ensure that the diagram on which the elements are to be created is open in the Diagram View To open the diagram, double-click on the diagram name in the Project Browser The diagram opens and the Toolbox is updated to display the categories of elements and relationships that are applicable to that type of diagram	<a href="#">Diagram View</a> <sup>[542]</sup>
3	Click on the appropriate icon in the Toolbox to select the type of element to create The element type is highlighted in the Toolbox	
4	Click on the diagram at the location where you want to place the element The new element is created as a child of the package that contains the diagram, and is placed onto the diagram at the cursor position The element Properties dialog displays	
5	Use the Properties dialog to define characteristics of the element as required	<a href="#">Properties Dialog</a> <sup>[662]</sup>
6	Click on the <b>OK</b> button The Properties dialog closes	

#### Notes:

- You can also drag or paste existing elements onto a diagram from the Project Browser
- If you are creating several elements of one type, after creating the first just press ( **Shift+F3** ) or ( **Ctrl +Click** ) to create the next element of that type

#### Learn More:

- [Paste From the Project Browser](#) <sup>[578]</sup>
- [Add connectors](#) <sup>[42]</sup>
- [The Quick Linker](#) <sup>[624]</sup>
- [Move elements](#) <sup>[44]</sup>
- [UML elements](#) <sup>[866]</sup>

### 2.3.6 Adding Connectors

Connectors define specific relationships between specific elements, so you usually create them directly on the diagram by dragging the required relationship type from the Diagram Toolbox. As for elements, the Toolbox automatically presents the connector or relationship types appropriate to the type of diagram.

#### Use To:

- Define a relationship between two model elements on a diagram

#### How To:

Step	Action	See also
1	Ensure that the Diagram Toolbox is visible To display the Diagram Toolbox, either: <ul style="list-style-type: none"> <li>• Select <b>View   Diagram Toolbox</b> or</li> <li>• Press ( <b>Alt + 5</b> )</li> </ul>	
2	Ensure that the diagram containing the elements to be connected, is open in the Diagram View To open the diagram, double-click on the diagram name in the Project Browser The selected diagram opens and the Toolbox is updated to display the categories of elements and relationships that are applicable to that diagram type	<a href="#">Diagram View</a> <sup>[542]</sup> <a href="#">Creating Elements on Diagrams</a> <sup>[41]</sup>
3	Click on the required connector in the Toolbox to select the type of connector to draw The connector type is highlighted in the Toolbox	
4	Click on the source element in the relationship, then drag across to the target element The selected connector is drawn between the two elements The connector Properties dialog displays	
5	Use the Properties dialog to define the characteristics of the connector as required	<a href="#">Properties Dialog</a> <sup>[662]</sup>
6	Click on the <b>OK</b> button The Properties dialog closes	

#### Notes:

- If you are creating several connectors of one type, after creating the first just click on the appropriate source element and press ( **F3** ) to create the next connector of that type
- As you drag a connector, you can press ( **Shift** ) to create a bend in the connector; if necessary, you can put several bends in the connector line, pressing ( **Shift** ) every time you want to change direction
- To roll back the bends, keep holding the left mouse button down and press ( **Backspace** ) as many times as is necessary
- To find out more about the type of connector you have dragged on to a diagram, right-click on the connector and select the **UML Help** menu option, which displays a Help page on the connector type

**Learn More:**

- [Quick Linker - Create Connectors](#) <sup>[626]</sup>
- [Create Connector in Project Browser](#) <sup>[750]</sup>
- [UML Connections](#) <sup>[968]</sup>

**2.3.7 Modify Properties**

When you create an element and connect it to another element, you usually have to define various characteristics of both the element and the connector to identify the purpose and function they represent. You do this using a Properties dialog.

When you create elements, Enterprise Architect automatically names and numbers them by type - for example, Class1, Class2 - so you should at least change the **Name** field to more easily identify each element. Enterprise Architect does not automatically name connectors, but for many connector types you should provide a name that describes the purpose of the connection.

**Use To:**

- Modify the characteristics of a model element or connector

**How To:**

Step	Action	See also
1	Either: <ul style="list-style-type: none"> <li>• Double-click on an element or connector in the diagram</li> <li>• Right-click an element in the Project Browser and, from the context menu, select <b>Properties</b></li> <li>• Right-click a connector in a diagram and, from the context menu, select <b>Properties</b></li> </ul> The appropriate Properties dialog displays	
2	Modify the element or connector characteristics as required	<a href="#">Element Properties Dialog</a> <sup>[662]</sup> <a href="#">Connector Properties Dialog</a> <sup>[758]</sup>
3	Click on the <b>OK</b> button The Properties dialog closes The modifications are saved; the Project Browser and diagrams that contain the element are updated as necessary	

**Notes:**

- Enterprise Architect is initially configured to display the Properties dialog automatically when you create an element or connector, but it is easy (and often convenient) to turn the dialog display off
- If the default display has been turned off, you can display the Properties dialog by either double-clicking on the element or connector in the diagram or by right-clicking on it in the Project Browser and selecting the **Properties** menu option

**Learn More:**

- [Element Properties Dialog](#)<sup>[662]</sup>
- [Connector Properties Dialog](#)<sup>[758]</sup>

**2.3.8 Moving Elements, Diagrams and Connectors**

You have created a project containing packages, diagrams and elements, and you have connected the elements. You might have arranged your components in the wrong project structure. How do you change where things are?

Topic	Link
Changing the Project Browser list order - re-arrange the order of items in the Project Browser	<a href="#">Move Elements Within a Package</a> <sup>[44]</sup>
Moving elements between packages - move diagram, elements and child packages, from one parent package to another	<a href="#">Move Elements Between Packages</a> <sup>[45]</sup>
Moving elements on a diagram - re-arrange the position of diagram elements	<a href="#">Move Elements in a Diagram</a> <sup>[45]</sup>
Moving elements between diagrams - cut an element from one diagram and paste it onto another	<a href="#">Move Elements Between Diagrams</a> <sup>[46]</sup>
Moving connectors on a diagram - re-link a source element to a different target element	<a href="#">Move Connectors on a Diagram</a> <sup>[48]</sup>

**Learn More:**

- [Delete Components](#)<sup>[48]</sup>
- [Arrange Connectors](#)<sup>[746]</sup>
- [Order Package Contents](#)<sup>[457]</sup>

**2.3.8.1 Move Elements Within a Package**

In the Project Browser, the contents of a package are listed in the order: diagrams, child packages, elements. Elements are further arranged in order of type.

Within a type, components are initially listed in alphabetical or numerical order. You can change the order in which items are listed within their groups.

**Use To:**

- Adjust the order in which items are listed in the Project Browser

**How To:**

Step	Action	See also
1	<p>Click on an item in the Project Browser, then click on  or  in the toolbar at the top of the window</p> <p>The selected item is moved up or down in the Project Browser accordingly, but remains within its particular group of items</p>	

Step	Action	See also
2	To revert to listing components in alphabetical order, in the Project Browser right-click on the package and from the context menu select <b>Contents   Reset Sort Order</b>	

### 2.3.8.2 Move Elements Between Packages

When creating the various diagrams, elements and packages that make up your model, at some point you might create an item under the wrong parent package.

In Enterprise Architect it is quite simple to relocate a model item from one parent package to another. Items can be relocated to a higher level package, a lower level package or a different package at the same level.

#### Use To:

- Move a diagram from one package to another
- Move an element from one package to another
- Move a package from one parent package to another

#### How To:

Step	Action	See also
1	In the Project Browser, click and drag the model item to be relocated from its existing position, and drop it onto the new parent package  The dragged item and all of its child items are relocated to the target package	

#### Notes:

- Moving elements in the Project Browser does not affect the use of elements in diagrams
- Moving an element or package has no effect on any relationships that the element, package, or elements within the package have
- Moving a diagram generally does not affect the location of elements in packages
- However, elements of certain types, such as Initial Node, Decision and Final Node, are used only within one diagram and have no meaning outside that diagram; if you move a diagram containing these elements, they are moved to the new parent package with the diagram

#### Learn More:

- [Initial Node](#)<sup>[905]</sup>
- [Decision](#)<sup>[888]</sup>
- [Final Node](#)<sup>[897]</sup>

### 2.3.8.3 Move Elements in a Diagram

To improve the understanding of a diagram or to simply improve the presentation, you might want to adjust the position of the elements on your diagram.

#### Use To:

- Adjust the position of the elements on your diagram

**How To:**

For coarse adjustments:

Step	Action	See also
1	Click on a diagram element and drag it to its new position	

For fine adjustments:

Step	Action	See also
1	Click on a diagram element to select it	
2	While holding down the ( <b>Shift</b> ) key, press the arrow keys to move the selected element one pixel at a time in the direction of the arrow ( <b>Shift + ↑, ↓, →, ←</b> )	

### 2.3.8.4 Move Elements Between Diagrams

If an element is in the wrong diagram, Enterprise Architect offers functionality that simplifies the process of moving the element from one diagram to another.

**Use To:**

- Move elements from one diagram to another
- Copy elements from one diagram to another

**How To:**

To move elements from one diagram to another, follow the steps below:

Step	Action	See also
1	In the Project Browser, double-click the name of the diagram that contains the element to be moved  The diagram opens in the Diagram View	
2	Click on the element in the diagram to select it	
3	Either: <ul style="list-style-type: none"> <li>• Click on the <b>Cut</b> button (  ) in the Default Tools toolbar, or</li> <li>• Press ( <b>Ctrl + X</b> )</li> </ul> The selected element is copied to the clipboard  However, the element remains visible on the current diagram until the clipboard content is pasted onto a different diagram  The model element itself is not affected in any way	
4	In the Project Browser, double-click on the name of the diagram into which the element is to be moved  The diagram opens in the Diagram View	

Step	Action	See also
5	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Paste</b> button () in the Default Tools toolbar, or</li> <li>Press ( <b>Ctrl + V</b> ) or ( <b>Shift + Insert</b> )</li> </ul> <p>The element is pasted from the clipboard onto the current diagram and removed from the original (source) diagram</p> <p>Again, the model element itself is not affected in any way</p>	

To copy elements from one diagram to another, follow the steps below:

Step	Action	See also
1	<p>In the Project Browser, double-click the name of the diagram that contains the element to be moved</p> <p>The diagram opens in the Diagram View</p>	
2	Click on the element in the diagram to select it	
3	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Copy</b> button () in the Default Tools toolbar, or</li> <li>Press ( <b>Ctrl + C</b> )</li> </ul> <p>The selected element is copied to the clipboard</p> <p>Neither the current diagram, nor the model element itself are affected in any way</p>	
4	<p>In the Project Browser, double-click on the name of the diagram into which the element is to be copied</p> <p>The diagram opens in the Diagram View</p>	
5	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the <b>Paste</b> button () in the Default Tools toolbar, or</li> <li>Press ( <b>Ctrl + V</b> ) or ( <b>Shift + Insert</b> )</li> </ul> <p>The element is pasted from the clipboard onto the current diagram</p> <p>Again, neither the source diagram nor the model element itself are affected in any way</p>	

**Notes:**

- By selecting more than one element at a time, you can move or copy multiple elements in the same operation
- You can remove an element from a diagram by selecting it, then pressing the **Delete** key
- You can place an element onto an open diagram by locating the element in the Project Browser, then dragging it onto the diagram

### 2.3.8.5 Connect a Different Element on a Diagram

When creating connectors in your diagrams, at some point you might connect the wrong pair of elements. Enterprise Architect provides a simple method to enable you to move the end of a connector from one element to another.

#### Use To:

- Change the source element of a connector from the current element to another
- Change the target element of a connector from the current element to another

#### How To:

Step	Action	See also
1	In the diagram, click on the connector to select it The connector is highlighted with 'handles' at each connector end	
2	Move the cursor over the 'handle' at the end of the connector to reconnect The cursor changes to a small arrow (  ) pointing upwards to the right	
3	Click and drag the connector end to the other element to connect to When you release the mouse button, the connector breaks from the original element and reconnects to the new element	

#### Notes:

- You can also tidy up a connection by dragging the end of the connector to a better position on the edge of the element, or move both ends at once by dragging the middle of the connector

### 2.3.9 Delete Elements

You can delete the elements of a model from a diagram or from the Project Browser.

Topic	Link
Remove elements from a diagram: this is essentially 'hiding' the element in that particular view of the model	<a href="#">Remove Elements from a Diagram</a> <sup>[49]</sup>
Delete elements from a model - the element, its properties and any child elements or diagrams it has are all deleted; the element is removed from all diagrams on which it appears	<a href="#">Delete Elements from your Model</a> <sup>[49]</sup>

#### Learn More:

- [Delete Connectors](#) <sup>[51]</sup>

### 2.3.9.1 Remove Elements From a Diagram

Removing an element from a diagram does not delete the element from the model and therefore does not alter the structure of the underlying model. When you remove an element from a diagram, you are essentially 'hiding' the element in that particular view of the model.

#### Use To:

- Remove one or more elements from a diagram

#### How To:

To remove elements from a diagram, follow the steps below:

Step	Action	See Also
1	Open the diagram that is to be modified Either: <ul style="list-style-type: none"> <li>• Double-click on the diagram name in the Project Browser, or</li> <li>• Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+A</b> ) to select all of the elements in the diagram, or</li> <li>• Click on an element in the diagram to select it (and use ( <b>Ctrl + Click</b> ) to add further elements to your selection, or to remove elements from the selection)</li> </ul> The selected elements are highlighted in the diagram	
3	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Delete</b> ), or</li> <li>• Press ( <b>Ctrl + D</b> ), or</li> <li>• Right-click a selected element and from the context menu select <b>Delete &lt;element name&gt;</b> or <b>Delete Selected Elements</b>.</li> </ul> The selected elements are removed from the diagram.	

#### Notes:

- You can 'undo' the removal of a diagram element, by pressing ( **Ctrl + Z** ), or by clicking the **Undo** button , in the Default Tools toolbar

### 2.3.9.2 Delete Elements From Your Model

You can delete elements from your model, working either from the Project Browser or from a diagram.

When you delete an element from your model, the element, its properties and any child elements or diagrams it contains are all deleted. The deleted element is removed from all diagrams on which it appears and all relationships that it was involved in are also deleted from the model.

#### Use To:

- Delete one or more packages, elements or diagrams from your model

**How To:**

To delete one or more items from your model using the Project Browser, follow the steps below:

Step	Action	See Also
1	In the Project Browser, click on an item to select it To select additional items, or to remove items from the selection, use ( <b>Ctrl + Click</b> ) or ( <b>Shift + Click</b> ) The selected items are highlighted in the Project Browser	
2	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl + Delete</b> ) or</li> <li>• Right-click on one of the selected elements, then select the <b>Delete selected item(s)</b> context menu option</li> </ul> A confirmation dialog is displayed	
3	Click on the <b>Yes</b> button The selected items are deleted from your model	

To delete one or more items from your model using a diagram, follow the steps below:

Step	Action	See Also
1	To open the diagram containing the items to be deleted from your model, either: <ul style="list-style-type: none"> <li>• Double-click on the diagram name in the Project Browser, or</li> <li>• Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+A</b> ) to select all of the elements in the diagram, or</li> <li>• Click on an element in the diagram to select it, then use ( <b>Ctrl + Click</b> ) to add or remove specific elements to and from the selection</li> </ul> The selected elements are highlighted in the diagram	
3	Press ( <b>Ctrl+Delete</b> ) A confirmation dialog is displayed	
4	Click on the <b>Yes</b> button The selected elements are removed from the model	

**Notes:**

- Deleting a package completely removes the package and all its contents - diagrams, child packages and elements - from the model
- Deleting an element completely removes the element and its properties, connectors, child elements and child diagrams from the model, and from every diagram that contains it
- Deleting a diagram completely removes the diagram from the model, but not the diagram's component elements; they remain in the parent package

### 2.3.10 Delete Connectors

It is possible to hide a connector on a diagram, or to delete it entirely from the model, removing the relationship between the previously connected elements.

Displaying all of the connectors on a complex diagram can make the diagram somewhat confused, so it can be useful to hide some of the connectors, to clarify a specific aspect of a more complex picture.

#### Use To:

- Hide a connector on a diagram
- Delete a relationship between two elements in your model

#### How To:

To hide or remove a connector between two elements, follow the steps below:

Step	Action	See also
1	Open the diagram containing the connector of interest Either: <ul style="list-style-type: none"> <li>• Double-click the diagram name in the Project Browser, or</li> <li>• Make an already open diagram the 'active' diagram, by clicking on its tab in the Diagram View</li> </ul>	
2	Click on the connector in the diagram to select it The selected connector is highlighted in the diagram	
3	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl + Delete</b> )</li> <li>• Right-click on the connector and, from the context menu, select <b>Delete Connector</b></li> <li>• Press ( <b>Delete</b> )</li> </ul> If you press ( <b>Ctrl + Delete</b> ), a dialog displays prompting you to confirm that you want to delete the connector (and the relationship it describes) from the model Otherwise, the Remove Connector dialog displays	
4	On the Remove Connector dialog, choose one of the options: <ul style="list-style-type: none"> <li>• <b>Hide the connector</b></li> <li>• <b>Delete the connector from the model</b></li> </ul> <b>Hide the connector</b> obscures the connector on the current diagram; you cannot see it but the relationship between the two elements still exists and is shown on other diagrams containing the two elements together, and on all reports of connectors between the elements <b>Delete the Connector from Model</b> removes the relationship that exists between the two elements; the connector is removed from the current diagram, from all other diagrams on which it is shown, and from all reports on connectors between the two elements	<a href="#">Hiding the Connector</a> <sup>[753]</sup> <a href="#">Relationships</a> <sup>[506]</sup>
5	Optionally, tick the checkbox <b>Don't ask again</b> Selecting this option prevents the Remove Connector dialog from being displayed next time you select the Delete Connector command; the command uses the setting you last used on the dialog	

Step	Action	See also
	Make sure that you have selected the right option to use as your default	
6	<p>Click on the <b>OK</b> button</p> <p>The connector disappears from the diagram</p> <p>If you selected <b>Delete the connector from the model</b>, the relationship represented by the connector is also deleted from your model</p>	

**Notes:**

- You cannot select multiple connectors - it is only possible to select one connector at a time
- If you select the **Don't ask again** checkbox on the Remove Connector dialog, you can reset this option on the Links page of the Options dialog (**Tools | Options | Links**)
- Selecting the **Hide the connector** option in the Remove Connector dialog, has the same effect as hiding the connector on the Links tab of the source element Properties dialog, or using the **Visibility | Hide Connector** context menu option

**Learn More:**

- To identify and reveal hidden connectors, see the [Links](#) <sup>[668]</sup> topic

**2.3.11 Save Changes**

Throughout much of your work in Enterprise Architect, any changes you make are automatically saved when you close the *dialog* (data entry window) on which you made the changes. In some cases the dialog contains a **Save** or **Apply** button, which enables you to save your changes and then keep working on the dialog.

If there is no specific dialog, such as when you create a diagram, you can save your work by:

- Clicking on the **Save** icon in the Diagram toolbar ()
- Pressing the ( **Ctrl + S** ) keyboard keys, or
- Selecting the **Diagram | Save** menu option

Often, Enterprise Architect does not let you close a screen without confirming that you want to save or discard your changes.

You can also save your diagram changes automatically, by selecting the **Auto Save Changes** checkbox on the Diagram Behavior page of the Options dialog.

**Learn More:**

- So far you have been using the Project Browser and Diagram View to develop your project; at this point you should find out a bit more about the other facilities of the Enterprise Architect [User Interface](#) <sup>[69]</sup> or Application Workspace
- When you have finished exploring the User Interface topics, go to the [Summary of Typical Tasks](#) <sup>[57]</sup> to identify areas of Enterprise Architect that provide particular support for your job role
- Explore other options for managing the way your diagrams display and function, on the [Diagram Behavior](#) <sup>[432]</sup> page

### 2.3.12 Create Requirements

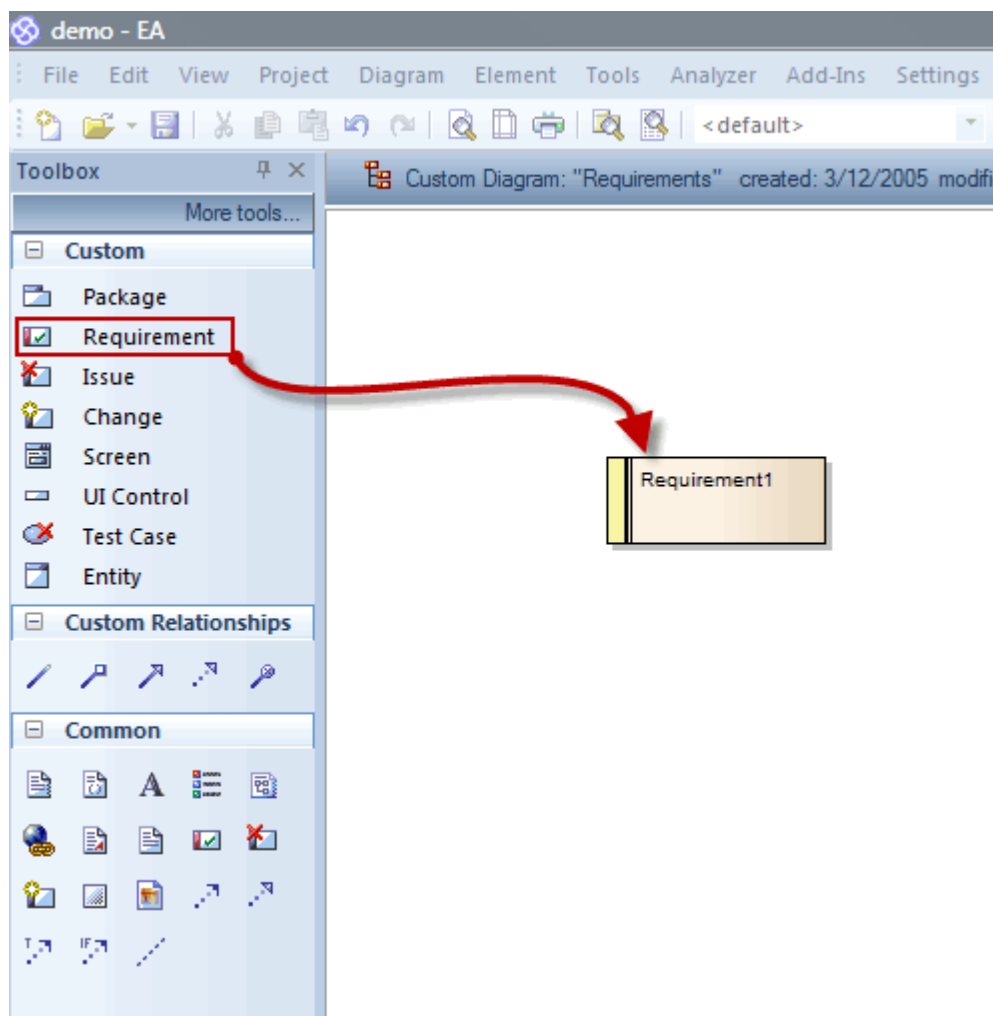

The following example illustrates how to create a requirement, name that element and provide appropriate notes.

#### Use To:

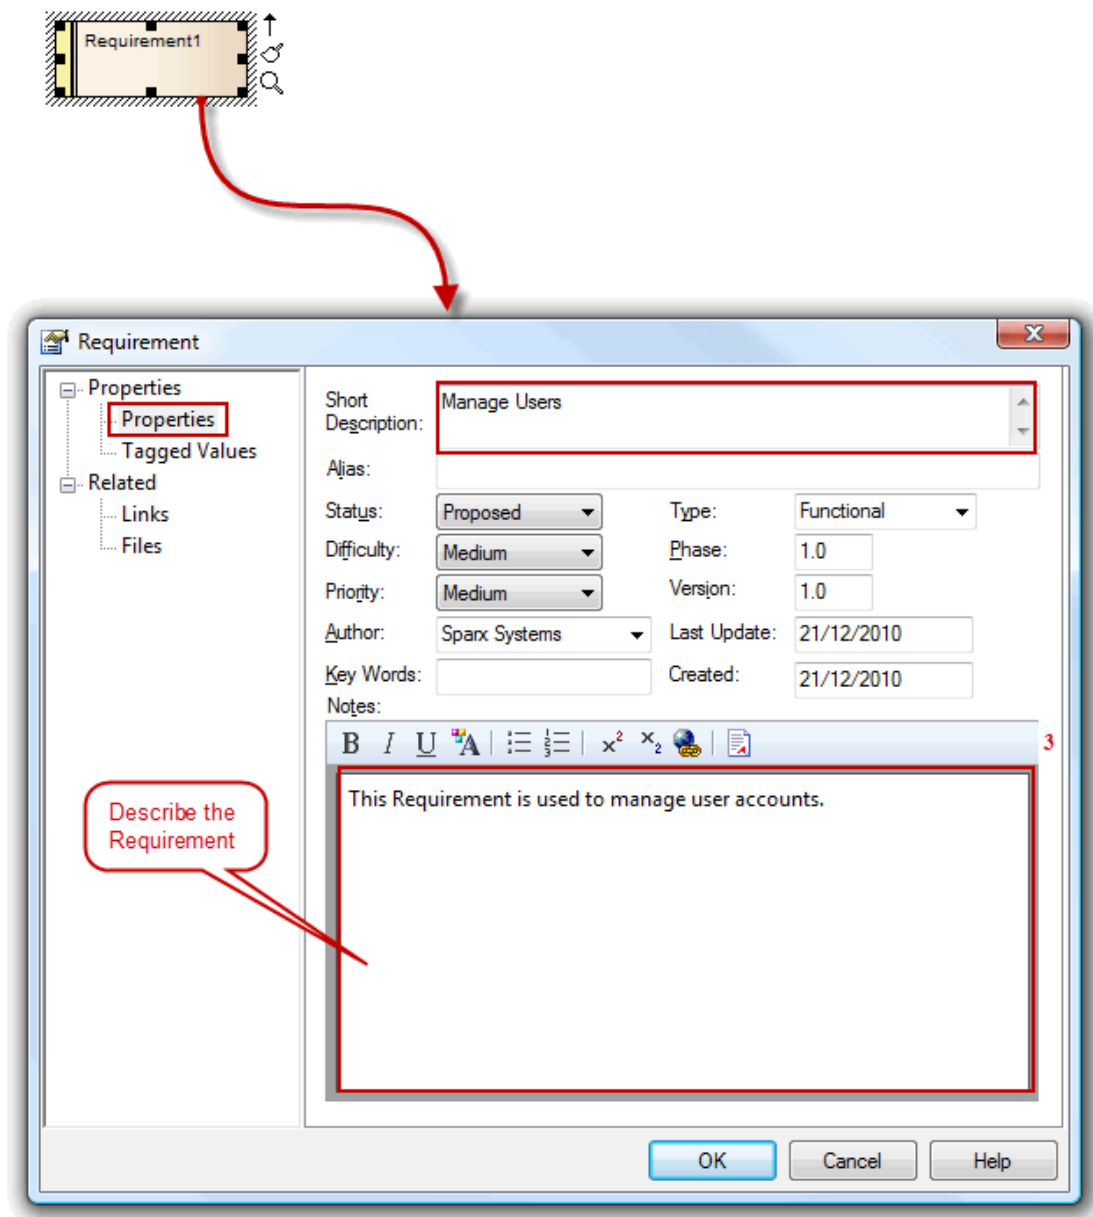

- Create a new Requirement element on a Requirements diagram.

#### How To:

The following images illustrate how to create a requirement, name that element and provide appropriate notes.

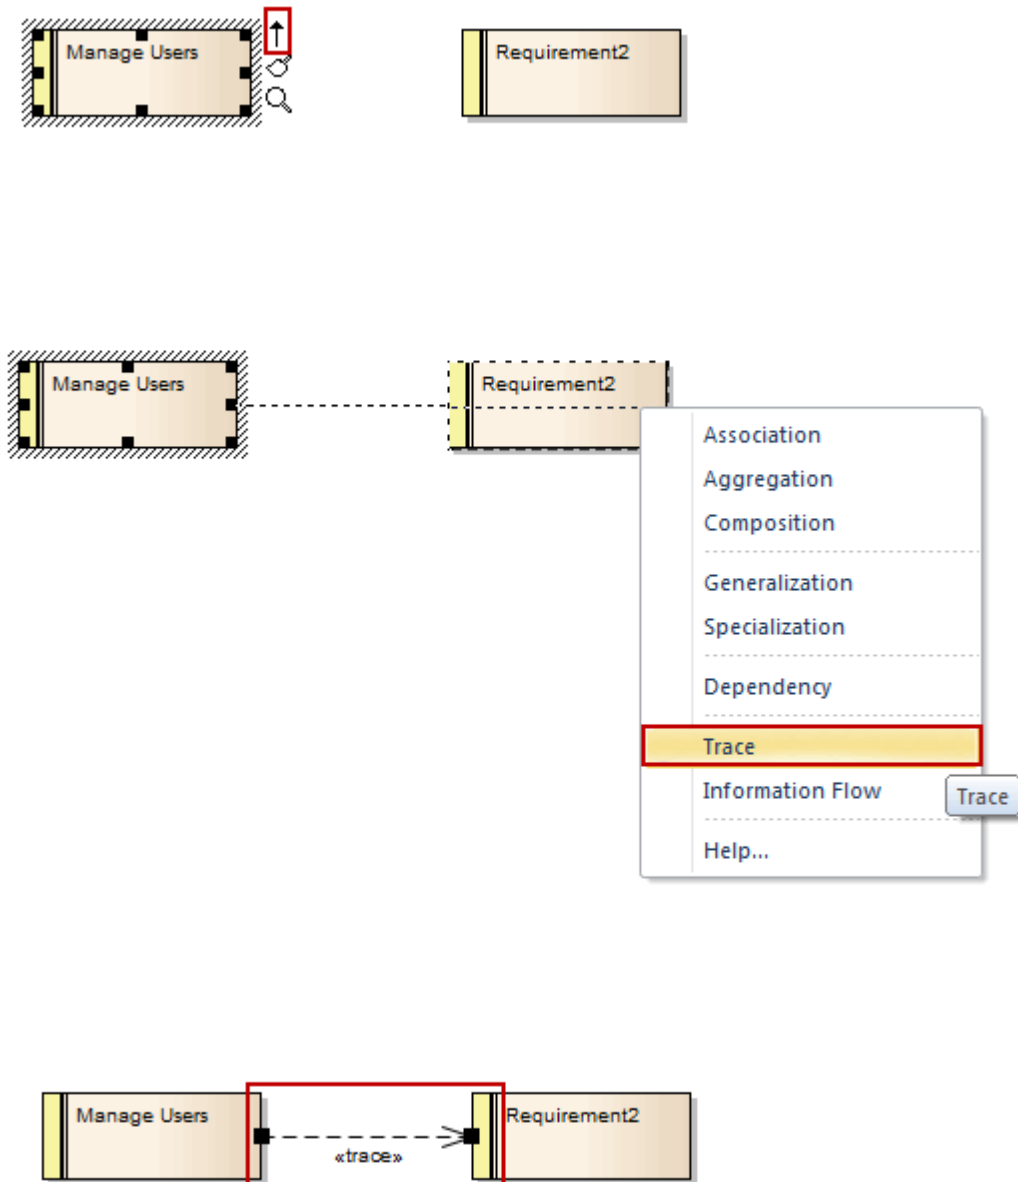

To access the Properties dialog, press **(Alt + Enter)**.

### 2.3.13 Requirement Trace Connector

Use the Quick Linker to create an appropriate connector between two Requirement elements.

## 2.4 Typical Project Roles

Enterprise Architect performs a number of tasks that are suited to a variety of professions. This topic describes some common working practices with Enterprise Architect for a range of project roles. There are tools for the roles of:

Topic	Link
Business Analyst, to create high-level models of business processes	<a href="#">Business Analyst</a> <sup>[58]</sup>
Software Architect, to map functional requirements, perform real time modeling of objects, design the Deployment model and detail the deliverable components	<a href="#">Software Architect</a> <sup>[59]</sup>
Software Engineer, to map Use Cases onto Class diagrams, detail the interactions between Classes, define the system deployment and define software packages	<a href="#">Software Engineer</a> <sup>[60]</sup>
Developer, to perform round trip code engineering, including reverse engineering of existing code and generation of code from Class elements	<a href="#">Developer</a> <sup>[61]</sup>
Project Manager, to assign resources to elements, measure risk and effort, estimate project sizes, and manage element status, change control and maintenance	<a href="#">Project Manager</a> <sup>[63]</sup>
Tester, to create test scripts against elements in the modeling environment	<a href="#">Tester</a> <sup>[64]</sup>
Implementation Manager, to track and assign maintenance-related items to elements within Enterprise Architect, to rapidly capture and keep records of maintenance tasks such as issues, changes, defects and tasks, and to trace the maintenance of the items and processes involved in system deployment	<a href="#">Implementation Manager</a> <sup>[65]</sup>
Technology Developer, to create customized additions to the functionality already present within Enterprise Architect	<a href="#">Technology Developer</a> <sup>[65]</sup>
Database Developer, to develop databases, including modeling database structures, importing database structures from an existing database and generating DDL for rapidly creating databases from a model	<a href="#">Database Developer</a> <sup>[67]</sup>

You can review a summary of the **typical tasks** supported for each role, or click on the appropriate role title to explore how Enterprise Architect can assist you in carrying out that role within a model driven project.

### Learn More:

- [Summary of Typical Tasks](#)<sup>[57]</sup>

## 2.4.1 Summary of Typical Tasks

Throughout a design and development project there are many different tasks to be performed, which could be carried out either by one person or - more probably - by members of a team with different responsibilities. In either case, Enterprise Architect supports most - if not all - of the responsibilities you might have on your project.

Therefore, the next topics to explore depend on the work you normally do on a project.

The descriptions below cover a number of job roles that Enterprise Architect supports. For those that most resemble your role on a project, follow the job title hyperlink to display a description of how that role might use Enterprise Architect, then follow links within those topics to explore some of the Enterprise Architect features of importance to the role.

### Job Roles:

Role	Responsibilities	See also
<b>Business Analyst</b>	For modeling: <ul style="list-style-type: none"> <li>• Requirements</li> <li>• High-level business processes</li> <li>• Business activities</li> <li>• Work flows</li> <li>• System behavior</li> </ul>	<a href="#">Business Analyst</a> <sup>[58]</sup>
<b>Database Developer</b>	<ul style="list-style-type: none"> <li>• Developing databases</li> <li>• Modeling database structures</li> <li>• Creating logical data models</li> <li>• Generating schema</li> <li>• Reverse engineering databases</li> </ul>	<a href="#">Database Developer</a> <sup>[67]</sup>
<b>Software Architect</b>	<ul style="list-style-type: none"> <li>• Mapping functional requirements of the system</li> <li>• Mapping objects in real time</li> <li>• Mapping the deployment of objects</li> <li>• Defining deliverable components</li> </ul>	<a href="#">Software Architect</a> <sup>[59]</sup>
<b>Tester</b>	<ul style="list-style-type: none"> <li>• Developing test cases</li> <li>• Importing requirements, constraints and scenarios</li> <li>• Creating Quality Test documentation</li> <li>• Tracking element defects and changes</li> </ul>	<a href="#">Tester</a> <sup>[64]</sup>
<b>Software Engineer</b>	<ul style="list-style-type: none"> <li>• Mapping Use Cases into detailed Classes</li> <li>• Defining the interaction between Classes</li> <li>• Defining system deployment</li> <li>• Defining software packages and the software architecture</li> </ul>	<a href="#">Software Engineer</a> <sup>[60]</sup>
<b>Project Manager</b>	<ul style="list-style-type: none"> <li>• Providing project estimates</li> <li>• Resource Management</li> <li>• Risk Management</li> <li>• Maintenance Management</li> </ul>	<a href="#">Project Manager</a> <sup>[63]</sup>
<b>Developer</b>	<ul style="list-style-type: none"> <li>• Forward, reverse and round-trip engineering</li> <li>• Visualizing the system states</li> <li>• Visualizing package arrangements</li> <li>• Mapping the flow of code</li> </ul>	<a href="#">Developer</a> <sup>[61]</sup>

Role	Responsibilities	See also
<b>Implementation Manager</b>	<ul style="list-style-type: none"> <li>Modeling the tasks in rolling-out a project, including network and hardware deployment</li> <li>Assigning and tracking maintenance items on elements (issues, changes, defects and tasks)</li> </ul>	<a href="#">Implementation Manager</a> <sup>[65]</sup>
<b>Technology Developer</b>	For creating or customizing: <ul style="list-style-type: none"> <li>UML Profiles</li> <li>UML Patterns</li> <li>Code Templates</li> <li>Tagged Value Types</li> <li>MDG Technologies</li> <li>Add-Ins</li> </ul>	<a href="#">Technology Developer</a> <sup>[65]</sup>

Most of these roles work with specific types of diagram, so you might want to learn more about diagram types in general and specific types of diagram in particular.

Several types of project team member might want to generate documentation on their work and reports on how the project is developing and changing. Enterprise Architect enables you to generate project documentation in either RTF or HTML format.

#### Notes:

- The Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect have a user security feature that can be applied or turned off. If security is turned on, you require the appropriate access permissions to use many of the Enterprise Architect facilities listed above

#### Learn More:

- [List of Available Permissions](#) <sup>[206]</sup>
- [UML Diagrams](#) <sup>[79]</sup>
- [Report Generation](#) <sup>[173]</sup>

## 2.4.2 Business Analysts

A Business Analyst can use Enterprise Architect to create high-level models of business processes. These include business requirements, activities, work flow, and the display of system behavior.

Using Enterprise Architect, a Business Analyst can describe the procedures that govern what a particular business does. Such a model is intended to deliver a high-level overview of a proposed system.

#### Topics:

Topic	Detail	See also
<b>Model High Level Business Processes</b>	With Enterprise Architect the Business Analyst can model high level processes of the business with Analysis diagrams  Analysis diagrams are a subset of UML 2.3 Activity diagrams and are less formal than other diagram types, but they provide a useful means for expressing essential business characteristics and requirements	<a href="#">Analysis Diagram</a> <sup>[1190]</sup>  <a href="#">Example Analysis Diagram</a> <sup>[1192]</sup>

Topic	Detail	See also
<b>Model Requirements</b>	Gathering requirements is typically the first step in developing a solution, be it for developing a software application or for detailing a business process; it is an important step in the implementation of a project  Enterprise Architect enables you to define the Requirement elements, connect Requirements to the model elements for implementation, connect Requirements together into a hierarchy, report on Requirements, and move Requirements out of model element responsibilities	<a href="#">Requirements Management</a> <sup>[115]</sup>
<b>Model Business Activities</b>	The Business Analyst can use Activity diagrams to model the behavior of a system and the way in which these behaviors are related to the overall flow of the system  Activity diagrams do not model the exact internal behavior of the system but show instead the general processes and pathways at a high level	<a href="#">Activity Diagram</a> <sup>[813]</sup>
<b>Model Work Flow</b>	To visualize the cooperation between elements involved in the work flow, the Business Analyst can use an Interaction Overview diagram, which provides an overview of sub activities that are involved in a system	<a href="#">Interaction Overview Diagram</a> <sup>[863]</sup>
<b>Display System Behavior</b>	In displaying the behavior of a system as a Use Case diagram, Enterprise Architect gives the Business Analyst an easily understood tool for mapping the functional requirements and behavior of a system	<a href="#">Use Case Diagram</a> <sup>[815]</sup>

**Learn More:**

- [Business Modeling](#) <sup>[119]</sup>

**2.4.3 Software Architects**

Software Architects can use Enterprise Architect to map functional requirements with Use Cases, perform real time modeling of objects using *Interaction diagrams* (Sequence, Timing, Communication or Interaction Overview), design the Deployment model and detail the deliverable components using Component diagrams.

**Topics:**

Topic	Detail	See also
<b>Map Functional Requirements of the System</b>	With Enterprise Architect the Software Architect can take the high level business processes that have been modeled by the Business Analyst and create detailed Use Cases  Use Cases describe the proposed functionality of a system and are only used to detail a single unit of discrete work	<a href="#">Use Cases</a> <sup>[937]</sup>
<b>Map Objects in Real Time</b>	The Software Architect can use Interaction	<a href="#">Sequence Diagram</a> <sup>[851]</sup>

Topic	Detail	See also
	<p>diagrams (Sequence and Communication diagrams) to model the dynamic design of the system</p> <p>Sequence diagrams are used to detail the messages that are passed between objects and the lifetimes of the objects</p> <p>Communication diagrams are similar to Sequence diagrams, but are used instead to display the way in which the object interacts with other objects</p>	<p><a href="#">Example Sequence Diagram</a> <sup>[853]</sup></p> <p><a href="#">Timing Diagram</a> <sup>[832]</sup></p> <p><a href="#">Communication Diagram</a> <sup>[861]</sup></p> <p><a href="#">Interaction Overview Diagram</a> <sup>[863]</sup></p>
<b>Map Deployment of Objects</b>	<p>The Software Architect can use Deployment diagrams to provide a static view of the run-time configuration of processing nodes and the components that run on the nodes</p> <p>Deployment diagrams can be used to show the connections between hardware, software and any middleware that is used on a system</p>	<p><a href="#">Deployment Diagram</a> <sup>[806]</sup></p>
<b>Detail Deliverable Components</b>	<p>Component diagrams enable the Software Architect to model the physical aspects of a system</p> <p>Components can be executables, libraries, data files or another physical resource that is part of a system</p> <p>The component model can be developed from scratch from the Class model or can be brought in from existing projects and from third-party vendors.</p>	<p><a href="#">Component Diagram</a> <sup>[809]</sup></p>

### 2.4.4 Software Engineers

Software Engineers using Enterprise Architect can map Use Cases onto Class diagrams, detail the interactions between Classes, define the system deployment with Deployment diagrams and define software packages with Package diagrams.

#### Topics:

Topic	Detail	See also
<b>Map Use Cases into Detailed Classes</b>	<p>In Enterprise Architect the Software Engineer can study the Use Cases developed by the Software Architect, and with that information create Classes that fulfill the objectives defined in the Use Cases</p> <p>A Class is one of the standard UML constructs that is used to detail the pattern from which objects are produced at run time; to record the</p>	<p><a href="#">Use Cases</a> <sup>[815]</sup></p> <p><a href="#">Example Use Case Diagram</a> <sup>[817]</sup></p>

Topic	Detail	See also
	<p>relationships between Use Cases and Classes, the Software Engineer can create diagrams linking the elements with Realize connectors, and/or map the Realize connectors in the Relationship Matrix</p> 	<p><a href="#">Class Diagram</a><sup>[800]</sup></p> <p><a href="#">Realization</a><sup>[1008]</sup></p> <p><a href="#">Relationship Matrix</a><sup>[498]</sup></p>
<p><b>Detail Interaction Between Classes</b></p>	<p>Interaction diagrams (Sequence and Communication diagrams) enable the Software Engineer to model the dynamic design of the system</p> <p>Sequence diagrams are used to detail the messages passed between objects and the lifetimes of the objects</p> <p>Communication diagrams are similar to Sequence diagrams, but are used instead to display the way in which objects interact with other objects</p>	<p><a href="#">Sequence</a><sup>[85]</sup></p> <p><a href="#">Communication</a><sup>[86]</sup></p>
<p><b>Define System Deployment</b></p>	<p>Deployment diagrams can be used to provide a static view of the run-time configuration of processing nodes and the components that run on the nodes</p> <p>Deployment diagrams can be used to show the connections between hardware, software and any middleware that is used on a system, to explain the connections and relationships of the components</p>	<p><a href="#">Deployment</a><sup>[806]</sup></p>
<p><b>Define Software Packages</b></p>	<p>The Software Engineer can use Package diagrams to detail the software architecture</p> <p>Package diagrams are used to organize diagrams and elements into manageable groups, declaring the dependencies</p>	<p><a href="#">Package</a><sup>[798]</sup></p>

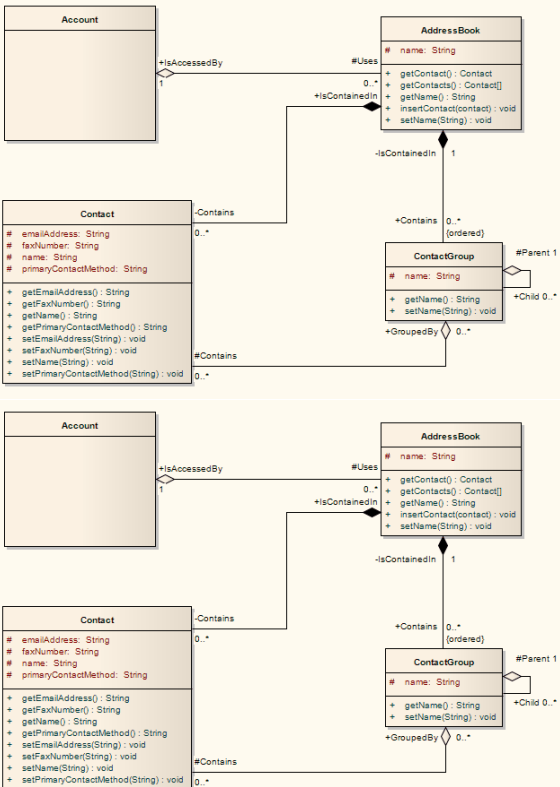

**Learn More:**

- [Modeling Fundamentals](#)<sup>[517]</sup>

## 2.4.5 Developers

Developers can use Enterprise Architect to perform round trip code engineering, which includes reverse engineering of existing code and generation of code from Class elements.

**Topics:**

Topic	Detail	See also
<b>Round Trip Engineering</b>	<p>Enterprise Architect gives the developer unparalleled flexibility, with the ability to round trip software from existing source code to UML 2.3 models and back again</p> <p>Round trip engineering involves both forward and reverse engineering of code; keeping the model and code synchronized is an important aspect of this</p>	<p><a href="#">Code Engineering</a> <sup>[1392]</sup></p> <p><a href="#">Synchronization</a> <sup>[1515]</sup></p> <p><a href="#">Estimation</a> <sup>[402]</sup></p>
<b>Reverse Engineering</b>	<p>Enterprise Architect enables developers to reverse engineer code from a number of supported languages and view the existing code as Class diagrams, which illustrate the static design view of the system</p> <p>Class diagrams consist of Classes and interfaces and the relationships between them; the Classes defined in UML Class diagrams can have direct counterparts in the implementation of a programming language</p>  <p>The diagram shows the following classes and relationships:</p> <ul style="list-style-type: none"> <li><b>Account</b>: <ul style="list-style-type: none"> <li>Operations: +isAccessedBy</li> <li>Relationships: 1 Account --&gt; 0..* AddressBook (labeled #isAccessedBy)</li> </ul> </li> <li><b>AddressBook</b>: <ul style="list-style-type: none"> <li>Attributes: # name: String</li> <li>Operations: + getContact(): Contact, + getContacts(): Contact[], + getName(): String, + insertContact(contact): void, + setName(String): void</li> <li>Relationships: 1 AddressBook --&gt; 0..* Contact (labeled #isContainedIn), 1 AddressBook --&gt; 1 ContactGroup (labeled #isContainedIn)</li> </ul> </li> <li><b>Contact</b>: <ul style="list-style-type: none"> <li>Attributes: # emailAddress: String, # faxNumber: String, # name: String, # primaryContactMethod: String</li> <li>Operations: + getEmailAddress(): String, + getFaxNumber(): String, + getName(): String, + getPrimaryContactMethod(): String, + setEmailAddress(String): void, + setFaxNumber(String): void, + setName(String): void, + setPrimaryContactMethod(String): void</li> <li>Relationships: 0..* Contact --&gt; 0..* ContactGroup (labeled #Contains), 0..* Contact --&gt; 0..* ContactGroup (labeled #Contains)</li> </ul> </li> <li><b>ContactGroup</b>: <ul style="list-style-type: none"> <li>Attributes: # name: String</li> <li>Operations: + getName(): String, + setName(String): void</li> <li>Relationships: 1 ContactGroup --&gt; 0..* Contact (labeled #Parent), 1 ContactGroup --&gt; 0..* ContactGroup (labeled #Child), 0..* ContactGroup --&gt; 0..* ContactGroup (labeled #GroupedBy)</li> </ul> </li> </ul>	<p><a href="#">Reverse Engineering</a> <sup>[1517]</sup></p> <p><a href="#">Class Diagram</a> <sup>[800]</sup></p> <p><a href="#">Class Element</a> <sup>[943]</sup></p> <p><a href="#">Resources</a> <sup>[350]</sup></p>
<b>Forward Engineering</b>	<p>As well as the ability to reverse engineer code, Enterprise Architect offers the developer the option of forward engineering code (code generation)</p> <p>This enables the developer to make changes to their model with Enterprise Architect and have these changes implemented in the source code</p>	<p><a href="#">Code Engineering</a> <sup>[1392]</sup></p> <p><a href="#">Risk</a> <sup>[353]</sup></p> <p><a href="#">Risk Types</a> <sup>[357]</sup></p>
<b>Determine the System State</b>	<p>To visualize the state of the system the developer can use State Machine diagrams to describe how elements move between states, classifying their behavior</p>	<p><a href="#">State Machine</a> <sup>[817]</sup></p>

Topic	Detail	See also
	<p>according to transition triggers and constraining guards</p> <p>State Machine diagrams are used to capture system changes over time, typically being associated with particular Classes (often a Class can have one or more State Machine diagrams used to fully describe its potential states)</p>	
<b>Visualize Package Arrangement</b>	Package diagrams are used to help design the architecture of the system; they are used to organize diagrams and elements into manageable groups, and to declare their dependencies	<a href="#">Package</a> <sup>[798]</sup>
<b>Follow the Flow of Code</b>	<p>Activity diagrams are used to enable a better understanding of the flow of code</p> <p>Activity diagrams illustrate the dynamic nature of the system, which enables modeling of the flow of control between Activities and represents the changes in state of the system</p>	<a href="#">Activity</a> <sup>[813]</sup>

**Notes:**

- State Machine, Package and Activity diagrams can be used by the developer to better understand the interaction between code elements and the arrangement of the code

**2.4.6 Project Managers**

Enterprise Architect provides support for the management of projects. Project Managers can use Enterprise Architect to assign resources to elements, measure risk and effort, and estimate project sizes. Enterprise Architect also helps them manage element status, change control and maintenance.

**Topics:**

Topic	Detail	See also
<b>Provide Project Estimates</b>	With Enterprise Architect the Project Manager has access to a comprehensive project estimation tool that calculates effort from Use Case and Actor objects, coupled with project configurations defining the technical and environmental complexity of the work environment	<a href="#">Estimation</a> <sup>[402]</sup>
<b>Resource Management</b>	Managing the allocation of resources in the design and development of system components is an important and difficult task; Enterprise Architect enables the Project Manager or Development Manager to assign resources directly to model elements and track progress over time	<a href="#">Resources</a> <sup>[350]</sup>
<b>Risk Management</b>	The Project Management window can be used to assign Risk to an element within a project; the risk types enable the Project	<a href="#">Risk</a> <sup>[353]</sup>

Topic	Detail	See also
	Manager to name the risk, define the type of risk, and give it a weighting	<a href="#">Risk Types</a> <sup>[357]</sup>
<b>Maintenance</b>	Enterprise Architect enables the Project Manager to track and assign maintenance-related items to elements within Enterprise Architect; this enables rapid capture and record keeping for items such as issues, changes, defects, and tasks  A Project Manager can also create and maintain a project glossary of processes, procedures, terms and descriptions	<a href="#">Issues</a> <sup>[360]</sup> <a href="#">Changes</a> <sup>[1731]</sup> <a href="#">Defects</a> <sup>[1731]</sup> <a href="#">Tasks</a> <sup>[358]</sup> <a href="#">Project Glossary</a> <sup>[364]</sup>

**Learn More:**

- [Projects Management](#) <sup>[348]</sup>
- [Element Status](#) <sup>[413]</sup>
- [Maintenance](#) <sup>[1725]</sup>

**2.4.7 Testers**

Enterprise Architect provides support for design testing by enabling you to create test scripts against elements in the modeling environment.

**Topics:**

Topic	Detail	See also
<b>Test Cases</b>	With Enterprise Architect, Quality Assurance personnel can set a series of tests for each model element  The test types include Unit testing, Acceptance testing, System testing and Scenario testing	
<b>Import requirements, constraints and scenarios</b>	To help ensure that testing maintains integrity with the entire business process, Enterprise Architect enables the tester to import requirements, constraints and scenarios defined in earlier iterations of the development life cycle  Requirements indicate contractual obligations that elements must perform within the model  Constraints are conditions that must be met in order to pass the testing process; constraints can be: <ul style="list-style-type: none"> <li>• Pre-conditions (states which must be true before an event is processed)</li> <li>• Post Conditions (events that must occur after the event is processed) or</li> <li>• Invariant constraints (which must remain true through the duration of the event)</li> </ul> Scenarios are textual descriptions of an object's action over time and can be used to describe the way a test works	<a href="#">Requirements</a> <sup>[1155]</sup> <a href="#">Constraints</a> <sup>[668]</sup>
<b>Create quality test documentation</b>	Enterprise Architect provides the facility to generate high quality test documentation in the industry-standard .RTF file format	
<b>Element defect</b>	Defect tracking enables you to allocate defect reports to any	<a href="#">Element</a>

Topic	Detail	See also
<b>changes</b>	element within the Enterprise Architect model; this enables all who are involved in the project to quickly view the status of defects, to see which defects have to be addressed and which have been dealt with	<a href="#">Defects</a> <sup>[1727]</sup>

**Learn More:**

- [Introduction to Testing](#) <sup>[1708]</sup>

**2.4.8 Implementation Managers**

Enterprise Architect provides support for the management of project implementation. Enterprise Architect enables you to track and assign maintenance-related items to elements within Enterprise Architect. This enables you to rapidly capture and keep records of maintenance tasks such as issues, changes, defects and tasks. By providing a centralized facility for each element involved in the deployment process Enterprise Architect offers a powerful solution for tracing the maintenance of the items and processes involved in system deployment.

**Topics:**

Topic	Detail	See also
<b>Deployment Diagram</b>	<p>Using Deployment diagrams in Enterprise Architect, you can model the roll out of a project, including network deployment and workstation deployment</p> <p>Users involved in project deployment can add maintenance tasks to the diagram elements</p> <p>Deployment diagrams provide a static view of the run-time configuration of nodes on the network or of workstations, and the components that run on the nodes or are used in the workstations</p>	<p><a href="#">Deployment Diagram</a> <sup>[808]</sup></p> <p><a href="#">Example Deployment Diagram</a> <sup>[808]</sup></p>

**Learn More:**

- [Project Maintenance](#) <sup>[1725]</sup>

**2.4.9 Technology Developers**

Technology Developers are Enterprise Architect users who create customized additions to the functionality already present within Enterprise Architect.

Additions include UML Profiles, UML Patterns, Code Templates, Tagged Value Types, Scripts, Custom Queries, Transformations, MDG Technologies and Enterprise Architect Add-Ins. By creating these extensions the Technology Developer can customize the Enterprise Architect modeling process to specific tasks and speed up development.

**Topics:**

Topic	Detail	See Also
-------	--------	----------

<b>UML Profiles</b>	<p>By creating UML Profiles the technology developer can create a customized extension for building UML models that are specific to a particular domain</p> <p>Profiles are stored as XML files and can be imported into any model as required</p>	<a href="#">UML Profiles</a> <sup>[1028]</sup>
<b>UML Patterns</b>	<p>Patterns are sets of collaborating Objects and Classes that provide a generic template for repeatable solutions to modeling problems</p> <p>As patterns are discovered in any new project, the basic pattern template can be created</p> <p>Patterns can be re-used with the appropriate variable names modified for any future project</p>	<a href="#">Patterns</a> <sup>[1023]</sup>
<b>Code Templates</b>	<p>Code templates are used to customize the output of source code generated by Enterprise Architect; this enables the generation of code languages not specifically supported by Enterprise Architect and enables you to define the way Enterprise Architect generates source code to comply with your own company style guidelines</p>	<a href="#">Code Templates</a> <sup>[1491]</sup>
<b>Tagged Value Types</b>	<p><i>Tagged Values</i> are used in Enterprise Architect to extend the information relating to an element in addition to the information directly supported by the UML language</p> <p>A Tagged Value, strictly, is the value of a property of a modeling item, the property being called a tag; for example: a Class element called Person might have a tag called Age with the Tagged Value of <b>42</b></p> <p>More loosely, the combination of tag and value can be referred to as a Tagged Value</p> <p>A Tagged Value type is a group of parameters that define and/or limit the possible values of a tag and, in many instances, how a specific value is assigned to the tag; for example, the tag <b>Age</b> might have a Tagged Value Type of Integer, so the user simply types in a numeric value</p> <p>Alternatively, the type could be <b>Spin</b>, with lower and upper limits of, say, <b>20</b> and <b>120</b>, so the user sets a value by clicking on arrows in the field to increment or decrement the value within the limits of <b>20</b> and <b>120</b></p> <p>Typically, Tagged Values are used during the code generation process, or by other tools to pass on information that is used to operate on elements in particular ways</p>	<a href="#">Tagged Values</a> <sup>[764]</sup> <a href="#">Tagged Value Type</a> <sup>[777]</sup>
<b>MDG Technologies</b>	<p>MDG Technologies can be used to create a logical collection of resources that can contain UML Profiles, Patterns, Code Templates, Image files and Tagged Value types that are accessed through a technology file</p>	<a href="#">MDG Technologies</a> <sup>[1033]</sup>
<b>Enterprise Architect Add-Ins</b>	<p>Add-Ins enable you to build your own functionality into Enterprise Architect, creating your own mini programs that can extend the capabilities of Enterprise Architect, defining your own menus, and creating your own Custom Views</p>	<a href="#">Enterprise Architect Add-Ins</a> <sup>[1982]</sup>

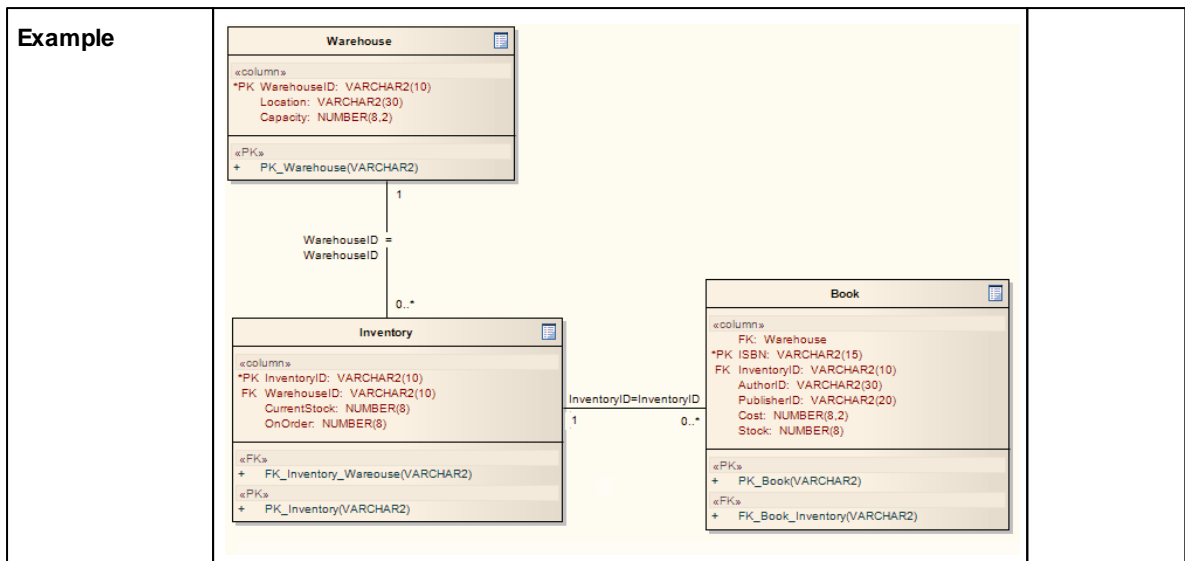

**Learn More:**

- [Extending UML](#) <sup>[1040]</sup>
- [MDG Technology SDK](#) <sup>[1040]</sup>

**2.4.10 Database Developers**

Enterprise Architect supports a range of features for the development of databases, including modeling database structures, importing database structures from an existing database and generating DDL for rapidly creating databases from a model.

Topic	Detail	See Also
<b>Create Logical Data Models</b>	<p>With Enterprise Architect the Database developer can build database diagrams using the built-in UML Data Modeling Profile</p> <p>This supports the definition of Primary and Foreign keys, cardinality, validation, triggers, constraints and indexes</p>	<a href="#">Logical Data Model</a> <sup>[1282]</sup>
<b>Generate Schema</b>	<p>By using Enterprise Architect's DDL generation function the Database Administrator can create a DDL script for creation of the database table structure from the model</p> <p>Enterprise Architect currently supports:</p> <ul style="list-style-type: none"> <li>• JET-based databases</li> <li>• DB2</li> <li>• InterBase</li> <li>• Informix</li> <li>• Ingres</li> <li>• MySQL</li> <li>• SQL Server</li> <li>• PostgreSQL</li> <li>• Sybase Adaptive Server Anywhere and Adaptive Server Enterprise, and</li> <li>• Oracle 9i, 10g and 11g</li> </ul>	<a href="#">Schema</a> <sup>[1287]</sup>
<b>Reverse Engineer Database</b>	<p>Using an ODBC data connection the Database Administrator can import a database structure from an existing database to create a model of the database</p> <p>Generating the model directly from the database enables the DBA to quickly document their work and create a diagrammatic account of a complex database through the graphical benefits of UML</p>	<a href="#">Reverse Engineering</a> <sup>[1517]</sup>

## 2.5 User Interface Guide

This section describes the *Enterprise Architect Application Workspace*, which provides a powerful and flexible analysis, modeling, design and construction environment. The workspace is built from familiar Windows components, such as toolbars, docking windows, dialogs and menus. Together these elements provide a **rich set of tools** for working with diagrams, models, **UML**, source code, executing applications (debugging and visualization), rich text documents, collaborative tools, extension technologies and much more.

### Topics:

Topic	Link
The <b>Enterprise Architect</b> workspace, the interface through which you create and display your models; the main workspace component is the central <b>Diagram View</b> , which is where you create model diagrams, view reports, scroll through lists of model elements, access the internet and even edit and debug source code	<a href="#">The Start Page</a> <sup>[70]</sup> <a href="#">Diagram View</a> <sup>[542]</sup> <a href="#">The Web Browser</a> <sup>[129]</sup>
The <b>Main Menu</b> , which provides access both to high-level functions related to the project life cycle, and to project and system administration functions; throughout Enterprise Architect you can also access functions and operations using <b>context menus</b>	<a href="#">The Main Menu</a> <sup>[73]</sup> <a href="#">Project Browser</a> <a href="#">Context Menus</a> <sup>[445]</sup> <a href="#">Diagram Context Menu</a> <sup>[540]</sup>
The <b>windows</b> that are used to enter and display information on your project and models; you can rearrange windows to adapt the screen space to your work habits	<a href="#">Standard Windows</a> <sup>[102]</sup>
<b>Toolbars</b> are small sets of buttons that provide quick access to perform common operations both on your project as a whole and on the individual modeling units	<a href="#">Standard Toolbars</a> <sup>[107]</sup>
The <b>Enterprise Architect Diagram Toolbox</b> provides all the components and connectors that you use to create models using whatever diagrams are appropriate; the Toolbox automatically matches the kind of diagram you have open, and whichever technology is currently active in your model	<a href="#">The Diagram Toolbox</a> <sup>[548]</sup>
The <b>key combinations</b> that you can use throughout Enterprise Architect to quickly initiate a wide range of actions	<a href="#">Keyboard Shortcuts</a> <sup>[129]</sup>
The <b>customization tools</b> that enable you to tailor the menus, toolbars and function keys that you use in Enterprise Architect, to set the <b>visual style</b> of the application, and to customize the <b>workspace layout</b>	<a href="#">Customization</a> <sup>[119]</sup> <a href="#">Visual Styles</a> <sup>[126]</sup> <a href="#">Manage Workspace Layout</a> <sup>[127]</sup>
The <b>navigation and search tools</b> , which enable you to search for, track and locate information in your project, and filter the information so that you can explore particular views of your project rather than the entire contents	<a href="#">Navigate, Search and Trace</a> <sup>[442]</sup> <a href="#">The Project Browser</a> <sup>[443]</sup>

**Learn More:**

- [A Demonstration of Enterprise Architect in use](#)

**2.5.1 Start Page**

The Start Page provides some useful navigation tools and jumping off points when you first open Enterprise Architect - including the **recent files list**, commands to **create or copy projects**, connect to **repository servers** and useful **Help topics** to get you started. Links to online resources and to the Sparx Systems Enterprise Architect Community website can also help you get up to speed and explore the possibilities of Enterprise Architect.

If you have no projects of your own to open yet, open the *EAExample* project or use the *QuickStart Tutorial* to create a project to explore.

**Actions:**

Action	Usage	See Also
<b>Search</b>	Locate an object in Enterprise Architect; type the name of the object in this field and click on the ( ... ) button  Enterprise Architect displays the results of the search on the Model Search screen  Click on an item in the search results to highlight it in the Project Browser	<a href="#">Model Search</a> <sup>[47]</sup> <a href="#">Project Browser</a> <sup>[44]</sup>
<b>Open a Project File</b>	Display the Select Enterprise Architect Project to Open dialog, which you use to open an existing project (where you have more project files than can be listed in the Recent panel)	<a href="#">Open a Project</a> <sup>[139]</sup>
<b>Create a New Project</b>	Save a new project and open the Model Wizard dialog	<a href="#">Create a New Project</a> <sup>[146]</sup> <a href="#">Model Wizard</a> <sup>[520]</sup> dialog
<b>Copy a Base Project</b>	Select a different Base Project to generate a new project from	<a href="#">Copy a Base Project</a> <sup>[147]</sup>
<b>Connect to Server</b>	Specify a Data Source name to connect to; the supported repositories are listed on the right  This feature is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions	<a href="#">Connect to Server</a> <sup>[162]</sup> <a href="#">MySQL</a> <sup>[150]</sup> <a href="#">SQL Server</a> <sup>[151]</sup> <a href="#">Oracle 9i, 10g and 11g</a> <sup>[152]</sup> <a href="#">PostgreSQL</a> <sup>[152]</sup> <a href="#">MSDE</a> <sup>[153]</sup> <a href="#">Adaptive Server Anywhere</a> <sup>[153]</sup> <a href="#">Access 2007</a> <sup>[150]</sup> <a href="#">Progress OpenEdge</a> <sup>[154]</sup>
<b>Getting Started</b>	Open the Learning Center, to display useful topics and guides for various areas of work in Enterprise Architect	<a href="#">Learning Center</a> <sup>[72]</sup>

Action	Usage	See Also
<b>Configure Options</b>	Display the Help on the Options dialog, which enables you to define how Enterprise Architect displays and processes information.	<a href="#">Options</a> <sup>[423]</sup> dialog
<b>Online Resources &amp; Tutorials</b>	Open the Resources page of the Sparx Systems website, which provides access to a wide range of Enterprise Architect and UML tutorials, demonstrations, examples, Add-Ins and advice	<a href="#">The Web Browser</a> <sup>[129]</sup>
<b>Enterprise Architect Community</b>	Access the Sparx Systems Enterprise Architect Community Site, which contains a range of articles, discussions, tools and resources provided by both Sparx Systems and the Enterprise Architect user community  You must register to use the facilities of the site; you can also register as an author and submit material yourself, for others to read and use	<a href="#">Sparx Systems Enterprise Architect Community Site</a>
<b>Recent</b>	Select from a list of hyperlinks to the most recently used Enterprise Architect projects (both .EAP files and DBMS connections)  If necessary, you can remove the hyperlink to a project from this list	<a href="#">Remove Recent Projects</a> <sup>[71]</sup>

**Notes:**

- If your model has a default diagram set, that diagram opens immediately, hiding the Start Page; you can still access the Start Page from the diagram tabs below the diagram
- If you have set a shortcut view profile, that overrides the default diagram setting
- You can also hide the Start Page, and show it again, by de-selecting and selecting the **Window | Show Start Page** option; the setting persists though shut down and restart, until you specifically change the option again

**Learn More:**

- [Quickstart Tutorial](#) <sup>[37]</sup>
- [Set the Default Diagram](#) <sup>[587]</sup>
- [Diagram Tabs](#) <sup>[545]</sup>

**2.5.1.1 Remove Recent Projects**

Removing the hyperlink to a project from the Start Page only removes the link to the project and does not remove the project from the file system or repository.

**Access:** **File | Open Project > Open Enterprise Architect Project > Recent Projects: Remove Selection from List (Ctrl+O)**

**How to:**

To remove a project hyperlink from the Recent list on the Start Page, follow the steps below:

Step	Action	See Also
1	On the Open Enterprise Architect Project dialog, in the Recent Projects panel, click on the project to remove	
2	Click on the <b>Remove Selection from List</b> button	

## 2.5.2 Learning Center

The Learning Center window provides quick access to a range of context-specific Enterprise Architect help topics, online resources and facilities in a number of specific work areas in Enterprise Architect, such as Getting Started, Modeling or Testing.

These topic areas can include topics specific to any MDG Technologies being used with Enterprise Architect.

**Access:** **View | Learning Center (Ctrl + Shift + 9)**

(Also, when you first open Enterprise Architect, the Learning Center automatically displays on the right of the screen)

**Uses:**

- Initiate a task or process within a specific work area
- Display topics from Enterprise Architect Help that describe either procedures or facilities to achieve objectives in a work area
- Display web pages or documents that provide conceptual information or examples within a work area
- Run selected reports or data collation tools
- Run demonstrations of functions within a work area

**Actions:**

To display information listed in the Learning Center, click on the required item. The types of item are indicated by the list titles and by the following icons:

Icon	Action
	Open appropriate topics from the Enterprise Architect Help file
	Open web pages or documents on the Sparx Systems web site
	Begin Enterprise Architect tasks appropriate to the Learning Center topic area; you must be in an appropriate functional area of Enterprise Architect in order for these tasks to function, such as in an open diagram
	Begin Add-In tasks appropriate to the Learning Center topic area; you must be in an appropriate functional area in order for these tasks to function
	Open report facilities to provide information or data collation tools
	Start demonstrations of Enterprise Architect functions in action

The selected information, web page or demonstration displays on a Browser tab in the main view, or the appropriate task or report window opens.

To switch between the topic areas, either:

- Click on the drop-down arrow at the right of the Learning Center toolbar and select the required area from the list, or
- Click on the left or right arrow buttons in the toolbar

The 'Home' icon returns you to the Getting Started topic area.

### 2.5.3 Main Menu

The Enterprise Architect **Main Menu**, at the top of the Enterprise Architect workspace, opens a range of subordinate menus that provide mouse-driven access to many high-level functions related to the project life cycle, as well as administration functions.

Each subordinate menu is described in the following table:

Usage	See Also
<b>File</b> - provides options to create, open, close and save projects, and also to perform print tasks	<a href="#">File</a> <sup>[74]</sup>
<b>Edit</b> - provides a range of functions to apply to diagram elements for the currently open diagram or view	<a href="#">Edit</a> <sup>[74]</sup>
<b>View</b> - enables you to display each of the windows or toolbars, and to set the visual style of your Enterprise Architect workspace	<a href="#">View</a> <sup>[76]</sup>
<b>Project</b> - provides access to tasks related to the management of your project, such as adding to the project structure, importing and exporting data, generating documentation, version control and security	<a href="#">Project</a> <sup>[80]</sup>
<b>Diagram</b> - enables you to configure diagram properties and options and to save diagram images to file	<a href="#">Diagram</a> <sup>[83]</sup>
<b>Element</b> - provides options to configure and access element features and details and control element layout, and to generate documentation and work on source code for the element	<a href="#">Element</a> <sup>[85]</sup>
<b>Tools</b> - provides access to tools related to code engineering, model management, spell checking, customization of features and setting operational options	<a href="#">Tools</a> <sup>[90]</sup>
<b>Analyzer</b> - provides access to a range of functions to perform build, debug and profiling operations on your model code	<a href="#">Analyzer</a> <sup>[94]</sup>
<b>Add-Ins</b> - enables you to connect to, display information on, work with and manage your Add-Ins	<a href="#">Add-Ins</a> <sup>[97]</sup>
<b>Settings</b> - enables you to configure various settings for your overall project, such as stereotypes, Tagged Values, cardinality values, datatypes, language macros, local directories, image management	<a href="#">Settings</a> <sup>[98]</sup>
<b>Window</b> - provides various functions for managing open system windows.	<a href="#">Window</a> <sup>[100]</sup>
<b>Help</b> - provides access to the Enterprise Architect help files, the Read Me file, the Enterprise Architect End User License Agreement, the Enterprise Architect Example model and various features on the Sparx Systems website; it also enables you to manage your license keys	<a href="#">Help</a> <sup>[101]</sup>

Additionally, if you right-click on the **Toolbar** area just under the menu bar, a composite context menu displays providing options to display the toolbars and all significant windows and views.

### 2.5.3.1 File

The **File** menu provides options to create, open, close and save projects, and also to perform print tasks.

**Access:** **File**

Option	Usage	Shortcut	See also
<b>New Project</b>	Create a new Enterprise Architect project	<b>Ctrl + N</b>	<a href="#">File Based Repositories</a> <sup>[146]</sup>
<b>Open Project</b>	Open a project	<b>Ctrl + O</b>	<a href="#">Open a project</a> <sup>[139]</sup>
<b>Reload Current</b>	Reload the current project (use in a multi-user environment to refresh the Project Browser)	<b>Ctrl + Shift + F11</b>	<a href="#">Refresh View of Shared Project</a> <sup>[188]</sup>
<b>Close Project</b>	Close the current project		
<b>Save Project Copy</b>	Save the current model with a new name		<a href="#">Copy Existing Project</a> <sup>[148]</sup>
<b>Save Project Shortcut</b>	Create a desktop shortcut to the current model (This option is also active in the 'Lite', read-only edition of Enterprise Architect)		<a href="#">Project Shortcuts</a> <sup>[141]</sup> <a href="#">The Read-Only 'Lite' Edition</a> <sup>[18]</sup>
<b>Print Setup</b>	Configure your printer's settings		
<b>Page Setup</b>	Configure the page settings to print the current diagram		<a href="#">Set Diagram Page Size</a> <sup>[602]</sup>
<b>Print Preview</b>	Preview <sup>[542]</sup> how the currently displayed diagram prints		<a href="#">Print Preview</a> <sup>[542]</sup>
<b>Print</b>	Print the currently displayed diagram Enterprise Architect provides facilities to change the scale of the printed diagram (the number of pages it takes up) and to print or omit page headers and footers on the diagram	<b>Ctrl + P</b>	<a href="#">Scale Image To Page Size</a> <sup>[604]</sup> <a href="#">Diagram Tab</a> <sup>[574]</sup>
<b>Recent Files List</b>	Select from a list of the most recently opened projects		
<b>Exit</b>	Exit Enterprise Architect		

### 2.5.3.2 Edit

The **Edit** menu provides a range of functions to apply to diagram elements for the currently open diagram or view.

**Access:** **Edit**

Option	Usage	Shortcut	See also
<b>Model Search</b>	Display the Model Search window, to search for particular phrases or words	<b>Ctrl + Alt + A</b>	<a href="#">Model Search</a> <sup>[477]</sup>
<b>File Search</b>	Display the File Search window, to search for text in code files and scripts		<a href="#">Find In Files</a> <sup>[1465]</sup>

Option	Usage	Shortcut	See also
<b>Copy</b>	<ol style="list-style-type: none"> <li>Copy the selected elements to the MS Windows clipboard. (To paste the selected elements use the <b>Paste Element(s)</b> option, below)</li> <li>Copy an image of the selected elements to the clipboard. If no elements are selected, the entire diagram is copied</li> </ol> <p>The image can be saved as a bitmap or a metafile; you set the format on the Options dialog</p>	<b>Ctrl + C</b>	<a href="#">General</a> <sup>[42]</sup> (page of the Options dialog)
<b>Project Clipboard</b>	<p>Offers two sub-options:</p> <ul style="list-style-type: none"> <li><b>Add to Project clipboard</b> - Add the current element to the Enterprise Architect clipboard</li> <li><b>Clear Project Clipboard</b> - Clear any elements from the Enterprise Architect clipboard</li> </ul>	<b>Ctrl + Space</b>  ---	
<b>Paste Element (s)</b>	Display the <b>Paste Elements</b> submenu, which enables you to paste elements on the clipboard into the current diagram.		<a href="#">Paste Elements Submenu</a> <sup>[75]</sup>
<b>Paste Image From Clipboard</b>	<p>Paste the element in the Enterprise Architect Clipboard into the same diagram or a different diagram, as a metafile (that is, a definition of the element) as many times as is necessary</p> <p>If you paste the element into a different diagram, its classifier identifies the source diagram for the element</p>	<b>Ctrl + Shift + Insert</b>	
<b>Redo</b>	Re-apply the last undone action	<b>Ctrl + Y</b>	<a href="#">Redo Last Action</a> <sup>[605]</sup>
<b>Undo</b>	Undo the last action performed; note that some actions cannot be undone	<b>Ctrl + Z</b>	<a href="#">Undo Last Action</a> <sup>[605]</sup>
<b>Select All</b>	Select all elements concurrently on the current diagram		
<b>Select By Type</b>	Specify a particular type of element to select on the diagram		
<b>Clear Selection</b>	Deselect all elements		
<b>Bookmark Selected</b>	Bookmark the selected element(s). If the selected element is already bookmarked, this option removes the bookmark	<b>Shift + Space</b>	<a href="#">Manage Bookmarks</a> <sup>[41]</sup>
<b>Clear All Bookmarks</b>	Clear bookmarks from any bookmarked elements in the current diagram		<a href="#">Manage Bookmarks</a> <sup>[41]</sup>
<b>Delete Selected Element(s)</b>	Delete the selected elements from the diagram	<b>Ctrl + D</b>	

### 2.5.3.2.1 Paste Elements Submenu

You can paste an element from the Enterprise Architect Clipboard or the MS Windows clipboard into a diagram, either as a hyperlink to the original element or as a new element. The Enterprise Architect clipboard takes precedence, so you must clear that clipboard before you can paste from the MS Windows clipboard.

**Access:** **Edit | Paste Element(s)**

Option	Usage	Shortcut	See also
<b>as Link</b>	<p>Paste the element in the buffer as a link (that is, a reference) to the element</p> <p>If there are images in the MS Windows clipboard and none in the Enterprise Architect clipboard, you can:</p> <ul style="list-style-type: none"> <li>• Paste an image from the MS Windows clipboard into a new element as the appearance of the new element, or</li> <li>• Paste an image from the MS Windows clipboard into the diagram as a new boundary's appearance</li> </ul>	<b>Shift + Insert</b>	<a href="#">Paste from Project Browser</a> <sup>[578]</sup>
<b>as New</b>	Paste the element in the buffer as a completely new <sup>[579]</sup> element	<b>Ctrl + Shift + V</b>	

### 2.5.3.3 View

The **View** menu enables you to display and/or focus on each of the windows or toolbars, and to set the visual style of your Enterprise Architect workspace.

**Access:** **View**

Option	Usage	Shortcut	See also
<b>Workspace Layouts</b>	Show the Workspace Layout dialog for changing the content and layout of the Enterprise Architect workspace		<a href="#">Manage Workspace Layout</a> <sup>[127]</sup>
<b>Learning Center</b>	Show the Learning Center, providing context-specific help topics, online resources and facilities in a number of specific work areas in Enterprise Architect	<b>Ctrl + Shift + 9</b>	<a href="#">Learning Center</a> <sup>[72]</sup>
<b>Project Browser</b>	Display the Project Browser, for browsing and exploring your model; this displays the hierarchical arrangement of packages, elements and features within the model	<b>Alt + 0</b>	<a href="#">The Project Browser</a> <sup>[443]</sup>
<b>Package Browser</b>	Display the elements of the current package in the Package Browser, as a context-sensitive, editable table	<b>Ctrl + Alt + R</b>	<a href="#">Package Browser</a> <sup>[458]</sup>
<b>Model Views</b>	Show the Model Views window, through which you can create filtered views of selected areas or aspects of your model	<b>Ctrl + Shift + 5</b>	<a href="#">Model Views</a> <sup>[466]</sup>
<b>More Project Tools</b>	Display a submenu containing options for the Resources and Project Information windows, and the internal Web Browser		<a href="#">View Submenus</a> <sup>[78]</sup>
<b>Personal Information</b>	Display the Personal Information window, which enables you to email project team members		<a href="#">Personal Information</a> <sup>[379]</sup>

Option	Usage	Shortcut	See also
	and report on the work and tasks assigned to you		
<b>Team Review</b>	Show the Team Review window, the portal for a discussion forum within your development team community	<b>Ctrl + Alt + U</b>	<a href="#">Team Review Tools</a> <sup>[217]</sup>
<b>Task Allocations</b>	Show the Project Task Allocation window, through which you manage work tasks allocated within the project and run reports on the components associated with the tasks		<a href="#">Project Task Allocation</a> <sup>[368]</sup>
<b>Project Calendar</b>	Display the Calendar, to monitor work across the project in terms of the resources involved, the tasks being performed, the events occurring and the elements being worked on		<a href="#">Project Calendar</a> <sup>[392]</sup>
<b>Diagram Toolbox</b>	Show the Diagram Toolbox, a panel of icons for creating elements and connectors on a diagram; there are pages of icons for each UML, Extended and MDG Technology diagram type	<b>Alt + 5</b>	<a href="#">Diagram Toolbox</a> <sup>[548]</sup>
<b>Diagram Filters</b>	Display the Diagram Filters window, for selecting the elements to show or hide on a diagram		<a href="#">Diagram Filters</a> <sup>[497]</sup>
<b>Diagram Layout</b>	Display the Layout Tools window, for reformatting your diagram in one of a range of layouts		<a href="#">Layout Diagrams</a> <sup>[606]</sup>
<b>Pan and Zoom</b>	Display the Pan & Zoom window for panning across a diagram to display sections at greater magnification	<b>Ctrl + Shift + N</b>	<a href="#">The Pan &amp; Zoom Window</a> <sup>[475]</sup>
<b>Element Properties</b>	Show the Properties window for the selected element, which provides an editable table of the common properties of the selected element	<b>Alt + 1</b>	<a href="#">Properties Window</a> <sup>[697]</sup>
<b>Relationships</b>	List a selected element's connectors on the Relationships window	<b>Ctrl + Shift + 2</b>	<a href="#">The Relationships Window</a> <sup>[506]</sup>
<b>Traceability</b>	Show the Traceability <sup>[497]</sup> window, for tracing the relationships of an element through the model	<b>Ctrl + Shift + 4</b>	<a href="#">The Traceability Window</a> <sup>[497]</sup>
<b>More Element Tools</b>	Display a submenu containing options for the Scenarios & Requirements, Element Browser, Project Management, Maintenance, Testing and Source Code windows		<a href="#">View Submenus</a> <sup>[787]</sup>
<b>Relationship Matrix</b>	Display the Relationship Matrix, to cross reference elements to each other by connector type		<a href="#">Relationship Matrix</a> <sup>[498]</sup>
<b>Gap Analysis Matrix</b>	Display the Gap Analysis Matrix to analyze model artifacts for potential gaps in the solution		<a href="#">Gap Analysis Matrix</a> <sup>[512]</sup>
<b>Notes</b>	Show the Notes window, to create and review the explanatory text on a diagram, element, feature or connector	<b>Ctrl + Shift + 1</b>	<a href="#">Notes</a> <sup>[777]</sup>

Option	Usage	Shortcut	See also
<b>Tagged Values</b>	Show the Tagged Values window, to add further properties to a modeling object beyond those supported by UML	<b>Ctrl + Shift + 6</b>	<a href="#">Tagged Values</a> <sup>[76]</sup>
<b>System Output</b>	Show the Output window	<b>Ctrl + Shift + 8</b>	<a href="#">The System Output Window</a> <sup>[128]</sup>
<b>Scripting</b>	Show the Scripting window		<a href="#">Scripting</a> <sup>[183]</sup>
<b>Toolbars</b>	Show or hide individual toolbars		<a href="#">View Submenus</a> <sup>[78]</sup>
<b>Visual Style</b>	Set the Visual Style and a number of other display options		<a href="#">View Submenus</a> <sup>[79]</sup>

### 2.5.3.3.1 View Submenus

#### The More Project Tools Sub-Menu:

Select the windows to be visible and deselect those to be hidden. You can select from:

Option	Usage	Shortcut	See also
<b>Project Resources</b>	Show or hide the Resources window	<b>Alt+6</b>	<a href="#">Resources</a> <sup>[79]</sup>
<b>Project Information</b>	Show or hide the Project Information window	<b>Alt+2</b>	<a href="#">The Project Information Window</a> <sup>[35]</sup>
<b>Internal Web Browser</b>	Open the web browser page at the site you have specified on the Options dialog, in the <b>Web Home</b> field	<b>Ctrl+Alt+W</b>	<a href="#">Internal Web Browser</a> <sup>[129]</sup> <a href="#">Options</a> <sup>[42]</sup>

#### The More Element Tools Submenu:

Select the windows to be visible and deselect those to be hidden. You can select from:

Option	Usage	Shortcut	See also
<b>Scenarios &amp; Requirements</b>	Display the Scenarios, internal Constraints and Requirements for the selected element, as tabs of the main work space.	<b>Ctrl+Shift+3</b>	<a href="#">Scenarios, Internal Constraints and Requirements</a> <sup>[69]</sup>
<b>Element Browser</b>	Explore the components of the selected element, in the Element Browser window.	<b>Alt+9</b>	<a href="#">Element Browser</a> <sup>[68]</sup>
<b>Project Management</b>	Show or hide the Project Management window	<b>Ctrl+Shift+7</b>	<a href="#">Project Management</a> <sup>[34]</sup>
<b>Maintenance</b>	Show or hide the Maintenance window	<b>Alt+4</b>	<a href="#">Maintenance</a> <sup>[172]</sup>
<b>Testing</b>	Show or hide the Testing window	<b>Alt+3</b>	<a href="#">Testing</a> <sup>[170]</sup>
<b>Source Code</b>	Show or hide the Source Code window.	<b>Alt+7</b>	<a href="#">The Source Code Viewer</a> <sup>[141]</sup>

**The Toolbars Sub-Menu:**

Select the toolbars to be visible and deselect those to be hidden. You can select from:

Topic	Usage	Link
<b>Default Tools</b>	Show or hide the Default Tools toolbar	<a href="#">Default Tools</a> <sup>[108]</sup>
<b>Project</b>	Show or hide the Project toolbar	<a href="#">Project</a> <sup>[109]</sup>
<b>Code Generation</b>	Show or hide the Code Generation toolbar	<a href="#">Code Generation</a> <sup>[110]</sup>
<b>UML Elements</b>	Show or hide the UML Elements toolbar	<a href="#">UML Elements</a> <sup>[111]</sup>
<b>Diagram</b>	Show or hide the Diagram toolbar	<a href="#">Diagram</a> <sup>[112]</sup>
<b>Current Element</b>	Show or hide the Current Element toolbar	<a href="#">Current Element</a> <sup>[113]</sup>
<b>Current Connector</b>	Show or hide the Current Connector toolbar	<a href="#">Current Connector</a> <sup>[115]</sup>
<b>Workspace Layouts</b>	Show or hide the Workspace Layouts toolbar	<a href="#">Workspace Layouts</a> <sup>[116]</sup>
<b>Debug &amp; Record</b>	Show or hide the Debug & Record toolbar	<a href="#">Debug &amp; Record</a> <sup>[117]</sup>
<b>Status Bar</b>	Show or hide the Status Bar	<a href="#">Status Bar</a> <sup>[118]</sup>

**The Visual Style Sub-Menu:**

Option	Usage	Shortcut	See also
<b>Select Visual Style</b>	Select different visual styles or <i>themes</i> for the Enterprise Architect user interface		<a href="#">Visual Styles</a> <sup>[126]</sup>
<b>Animate Autohide Windows</b>	Animate windows that have been automatically hidden		<a href="#">Automatically Hidden</a> <sup>[106]</sup>
<b>Show Toolbar Customize Button</b>	Toggle the down-arrow on the end of each toolbar that enables you to customize the toolbar buttons, as shown below:  		
<b>Hide Diagram Caption Bar</b>	Hide or redisplay the diagram caption bar at the top or bottom of a diagram		<a href="#">Caption Bar</a> <sup>[542]</sup>

### 2.5.3.4 Project

The **Project** menu gives access to tasks related to the management of your project, such as adding to the project structure, importing and exporting data, generating documentation, version control and security.

**Access:** **Project**

Action	Usage	Shortcut	See also
<b>New Model</b>	Display the Model Wizard, to add models to your project		<a href="#">Model Wizard</a> <sup>[520]</sup>
<b>New Package</b>	Create a new package	<b>Ctrl + W</b>	<a href="#">Create a new package</a> <sup>[536]</sup>
<b>New Diagram</b>	Create a new diagram in the current package	<b>Ctrl + Insert</b>	<a href="#">Create a new diagram</a> <sup>[570]</sup>
<b>Documentation</b>	Display the Documentation Submenu		<a href="#">Documentation Submenu</a> <sup>[80]</sup>
<b>Model Validation</b>	Display the Model Validation Submenu		<a href="#">Model Validation Submenu</a> <sup>[81]</sup>
<b>Baselines</b>	Store a model branch as a snapshot or baseline Available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions	<b>Ctrl + Alt + B</b>	<a href="#">Baseline</a> <sup>[813]</sup>
<b>Audit View</b>	Display the Audit View, which shows the information that has been recorded by auditing		<a href="#">Audit View</a> <sup>[304]</sup>
<b>Model Import/Export</b>	Display the Import/Export Submenu		<a href="#">Import/Export Submenu</a> <sup>[81]</sup>
<b>Version Control</b>	Display the Version Control Submenu		<a href="#">Version Control Submenu</a> <sup>[82]</sup>
<b>Security</b>	Display the Security Submenu		<a href="#">Security Submenu</a> <sup>[82]</sup>
<b>Use Case Metrics</b>	Set Use Case Metrics to assist in estimating project size		<a href="#">Use Case Metrics</a> <sup>[406]</sup>
<b>Project Statistics</b>	View some basic project statistics		

#### 2.5.3.4.1 Documentation Submenu

**Access:** **Project | Documentation**

Action	Usage	Shortcut	See also
<b>Rich Text Format (RTF) Report</b>	Generate a report for the currently selected package in Rich Text Format <sup>[1738]</sup>	<b>F8</b>	<a href="#">RTF Documents</a> <sup>[1738]</sup>
<b>HTML Report</b>	Generate a report for the currently selected package in HTML format	<b>Shift + F8</b>	<a href="#">HTML Reports</a> <sup>[1817]</sup>

Action	Usage	Shortcut	See also
<b>Diagrams Only Report</b>	Generate an RTF report containing only diagrams	<b>Ctrl + Shift + F8</b>	<a href="#">Diagrams Only Report</a> <sup>[1798]</sup>
<b>Testing Report</b>	Generate an RTF report of the model's existing tests		<a href="#">Test Documentation</a> <sup>[1720]</sup>
<b>Issues</b>	Generate an RTF report of the model's issues		<a href="#">Project Issues</a> <sup>[360]</sup>
<b>Glossary</b>	Generate an RTF report of the model's Glossary		<a href="#">Generate a (Glossary) Report</a> <sup>[366]</sup>
<b>Implementation Details</b>	Show a list of the elements in the package (selected in the Project Browser) that require implementers, together with any source elements in Realize (Implements) relationships with those elements		<a href="#">Implementation Report</a> <sup>[1799]</sup>
<b>Dependency Details</b>	Show a list of any elements in the package (selected from the Project Browser) that are dependent on another element for their specification		<a href="#">Dependency Report</a> <sup>[1797]</sup>
<b>Testing Details</b>	Show the testing details for the elements in a package, for tests that meet specific criteria		<a href="#">Testing Details Report</a> <sup>[1800]</sup>

#### 2.5.3.4.2 Model Validation Submenu

**Access:** **Project | Model Validation**

Action	Usage	Shortcut	See also
<b>Validate Selected</b>	Validate a selected element, diagram or package from the Project Browser	<b>Ctrl + Alt + V</b>	<a href="#">Model Validation</a> <sup>[1700]</sup>
<b>Cancel Validation</b>	Cancel the validation process		
<b>Configure</b>	Configure the Validation rules from the list of available rules		<a href="#">Configure Model Validation</a> <sup>[1701]</sup>

#### 2.5.3.4.3 Import/Export Submenu

To perform import and export to XML and CSV.

**Access:** **Project | Model Import/Export**

Action	Usage	Shortcut	See also
<b>Import Package from XMI</b>	Import a package from an XMI (XML based) file	<b>Ctrl + Alt + I</b>	<a href="#">Import From XMI</a> <sup>[324]</sup>
<b>Export Package to XMI</b>	Export the currently selected package to an XMI (XML based) file	<b>Ctrl + Alt + E</b>	<a href="#">Export To XMI</a> <sup>[322]</sup>
<b>Batch XMI Export</b>	Export a group of controlled packages in one		<a href="#">Batch XMI Export</a>

Action	Usage	Shortcut	See also
	action		<a href="#">[334]</a>
<b>Batch XMI Import</b>	Run a batch import of multiple packages		<a href="#">Batch XMI Import</a> <a href="#">[335]</a>
<b>CSV Import/Export</b>	Import or Export information on Enterprise Architect elements in CSV format	<b>Ctrl + Alt + C</b>	<a href="#">CSV Import</a> <sup>[344]</sup> <a href="#">CSV Export</a> <sup>[342]</sup>
<b>CSV Import/Export Specifications</b>	Set up CSV import Export Specifications		<a href="#">CSV Specifications</a> <a href="#">[340]</a>
<b>Export Reference Data</b>	Export reference data to XML files for convenient model updating		<a href="#">Export Reference Data</a> <sup>[238]</sup>
<b>Import Reference Data</b>	Import reference data from XML files for convenient model updating		<a href="#">Import Reference Data</a> <sup>[240]</sup>

#### 2.5.3.4.4 Version Control Submenu

Access: **Project | Version Control**

Action	Usage	Shortcut	See also
<b>Configure Current Package</b>	Specify whether this package (and its children) is controlled and, if so, which file it is controlled through	<b>Ctrl + Alt + P</b>	<a href="#">Configure Controlled Package</a> <a href="#">[283]</a>
<b>Version Control Settings</b>	Specify the options required to connect to a Source Code Control (SCC) provider		<a href="#">Version Control Settings Dialog</a> <sup>[27]</sup>
<b>Validate Package Configurations</b>	Validate the version control configuration of each package in the model		<a href="#">Validate Package Configurations</a> <sup>[297]</sup>
<b>Resynch Statuses of All Packages</b>	Resynchronize the status of all version controlled packages within your project with the status of the version control provider		<a href="#">Resynchronize the Status of Version Controlled Packages</a> <sup>[298]</sup>
<b>Work Offline</b>	Toggle between 'offline' version control and online version control		<a href="#">Offline Version Control</a> <sup>[25]</sup>

#### 2.5.3.4.5 Security Submenu

To configure security settings for your project.

Access: **Project | Security**

Action	Usage	Shortcut	See also
<b>Manage Users</b>	Add, modify and remove users, including maintaining permissions.		<a href="#">Maintain Users</a> <sup>[199]</sup>
<b>Manage Groups</b>	Add, modify and remove security groups,		<a href="#">Maintain Groups</a>

Action	Usage	Shortcut	See also
	including maintaining permissions.		<a href="#">[204]</a>
<b>Manage Locks</b>	View and manage element locks.		<a href="#">View and Manage Locks</a> <a href="#">[208]</a>
<b>Require User Lock to Edit</b>	Toggle the security policy in force.		<a href="#">Security Policy</a> <a href="#">[198]</a>
<b>Manage My Locks</b>	View and delete your own locks.	<b>Ctrl + Shift + L</b>	<a href="#">Manage Your Own Locks</a> <a href="#">[216]</a>
<b>Login as Another User</b>	Switch the login to a different user ID.		
<b>Change Password</b>	Change current security password.		<a href="#">Change Password</a> <a href="#">[210]</a>
<b>Encrypt Password</b>	Add encryption to your password (prior to Enterprise Architect Release 7.1).		<a href="#">Password Encryption</a> <a href="#">[209]</a>
<b>Enable Security</b>	Enable or disable user security to limit access to update functions in the model.		<a href="#">Enable Security</a> <a href="#">[197]</a>

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions

**2.5.3.5 Diagram**

The **Diagram** menu enables you to configure diagram properties and options and to save diagram images to file.

Action	Usage	Shortcut	See also
<b>Properties</b>	View and edit the <type> Diagram: <name> dialog for the current diagram	<b>F5</b>	
<b>Find in Project Browser</b>	Locate the current diagram in the Project Browser window	<b>Shift + Alt + G</b>	
<b>Layout Diagram</b>	Automatically layout the current diagram (not available for Behavioral diagrams)		<a href="#">Layout a Diagram Automatically</a> <a href="#">[627]</a>
<b>Switch to</b>	Change the presentation of the diagram to the Diagram List format or the GANTT Chart format		<a href="#">Diagram List</a> <a href="#">[464]</a>
<b>Advanced</b>	Display the diagram Advanced menu		<a href="#">Diagram Advanced Menu</a> <a href="#">[84]</a>
<b>Save</b>	Save the current position of all diagram elements	<b>Ctrl + S</b>	
<b>Save as Image</b>	Save the diagram as a bitmap file (.BMP), Graphics Interchange Format file (.GIF) or Windows Metafile (.WMF)	<b>Ctrl + T</b>	
<b>Copy Image to Clipboard</b>	Copy an image of the current diagram to the clipboard. The image can be in metafile or bitmap format; you set the format on the Options	<b>Ctrl + B</b>	<a href="#">General</a> <a href="#">[424]</a> (page of Options dialog)

Action	Usage	Shortcut	See also
	dialog		
<b>Swimlanes and Matrix</b>	Add, modify and delete swimlanes or the swimlanes matrix for the current diagram		<a href="#">Swimlanes</a> <sup>[592]</sup> <a href="#">Swimlanes Matrix</a> <sup>[594]</sup>
<b>Repeat Last Element</b>	Create an instance of the same type as the last element created	<b>Shift + F3</b>	
<b>Repeat Last Connector</b>	Create an instance of the same type as the last connector created	<b>F3</b>	
<b>Property Note</b>	Display the properties note for the current diagram on screen		<a href="#">Insert Diagram Properties Note</a> <sup>[589]</sup>
<b>Show Grid</b>	Show or hide the diagram grid		
<b>Snap To Grid</b>	Position elements on the diagram grid; there are two options: <ul style="list-style-type: none"> <li>Standard Grid - constrains elements to the grid when they are added to diagrams</li> <li>Smart Placement - places elements even distances away from other elements and spaces elements evenly</li> </ul> <p>If neither of these options are enabled, the elements can be placed freely on the diagram</p>		
<b>Zoom</b>	Change the zoom factor on the current diagram		<a href="#">Pan and Zoom a Diagram</a> <sup>[601]</sup>

### 2.5.3.5.1 Diagram Advanced Menu

The Diagram **Advanced** menu enables you to perform a number of very useful operations, such as hiding connectors on the diagram or creating a UML Pattern from the diagram.

Action	Usage	Shortcut	See also
<b>Lock Diagram</b>	Prevent the diagram from being edited, or release the locked diagram for editing  This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, if security is enabled		<a href="#">Lock Model Elements</a> <sup>[211]</sup>
<b>Make Model Default</b>	Make the current diagram the default diagram opened when the current model is re-opened (unless you set a User Default diagram, which overrides the model default; see below)  This option is also overridden by a project shortcut, which defines displays to present on opening the project  To cancel a Model Default diagram, either: <ul style="list-style-type: none"> <li>Create a dummy diagram, set it as the Model Default and delete it, or</li> <li>Delete the original diagram (if it is no longer relevant)</li> </ul>		<a href="#">Set the Default Diagram</a> <sup>[587]</sup> <a href="#">Project Shortcuts</a> <sup>[141]</sup>

Action	Usage	Shortcut	See also
<b>Make User Default</b>	<p>(Use in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled)</p> <p>Make the current diagram the default diagram opened when you re-open this model</p> <p>The User Default diagram overrides the Model Default diagram (see <b>Make Model Default</b>, above); this option is itself overridden by a project shortcut, which defines displays to present on opening the project</p> <p>To cancel a User Default diagram, either:</p> <ul style="list-style-type: none"> <li>• Create a dummy diagram, set it as the User Default and delete it, or</li> <li>• Delete the original diagram (if it is no longer relevant)</li> </ul> <p>This still blocks the Model Default diagram, whilst Security is enabled; to re-establish the Model Default diagram, set it as the User Default</p>		<a href="#">Project Shortcuts</a> <sup>[14]</sup>
<b>Visible Relations</b>	Hide or show individual connectors for the current diagram	<b>Ctrl + Shift + I</b>	<a href="#">Relationship Visibility</a> <sup>[75]</sup>
<b>Sequence Messages</b>	Change <sup>[100]</sup> the order of the communication messages in the current diagram		<a href="#">Message (Communication Diagrams)</a> <sup>[99]</sup>
<b>Change Type</b>	Change the type of the current diagram		<a href="#">Change Diagram Type</a> <sup>[58]</sup>
<b>Save UML Pattern</b>	Save the current diagram as a UML pattern		<a href="#">Create a Pattern</a> <sup>[102]</sup>

### 2.5.3.6 Element

The **Element** menu enables you to configure and access element features and details and control element layout, and to generate documentation and work on source code for the element

Action	Usage	Shortcut	See also
<b>Properties</b>	View the Properties dialog of the selected element	<b>Alt + Enter</b>	<a href="#">Properties Dialog</a> <sup>[66]</sup>
<b>Linked Document</b>	Link the element to a rich text document	<b>Ctrl + Alt + D</b>	<a href="#">Link the element</a> <sup>[73]</sup>
<b>Advanced</b>	Display the element <b>Advanced</b> submenu		<a href="#">Advanced Submenu</a> <sup>[86]</sup>
<b>Find in Project Browser</b>	<p>Find the currently selected element in the Project Browser</p> <p>If no element is selected, find the current diagram in the Project Browser</p>	<b>Alt + G</b>	
<b>Find in Diagrams</b>	Display all occurrences of the currently selected	<b>Ctrl + U</b>	

Action	Usage	Shortcut	See also
	element in any diagram		
<b>Attributes</b>	View and edit the attributes for the selected element	<b>F9</b>	<a href="#">Element attributes</a> <sup>[698]</sup>
<b>Operations</b>	View and edit the operations (methods) for the selected element	<b>F10</b>	<a href="#">Operations</a> <sup>[710]</sup>
<b>Feature Visibility</b>	Select which features and characteristics of the selected element are visible on a diagram	<b>Ctrl + Shift + Y</b>	<a href="#">Visible</a> <sup>[587]</sup>
<b>Inline Features</b>	Display the element <b>Inline Features</b> submenu		<a href="#">Inline Features Submenu</a> <sup>[87]</sup>
<b>Source Code Engineering</b>	Display the element <b>Source Code Engineering</b> submenu		<a href="#">Source Code Engineering Submenu</a> <sup>[88]</sup>
<b>Open Source in External Editor</b>	Open the source code of the selected Class in the default external editor for that language  Source code must have been generated, and the selected element must be a Class	<b>F12</b>	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>
<b>Appearance</b>	Display the element <b>Appearance</b> submenu		<a href="#">Appearance Submenu</a> <sup>[88]</sup>
<b>Alignment</b>	Display the element <b>Position</b> submenus		<a href="#">Position Submenus</a> <sup>[88]</sup>
<b>Make Same</b>			
<b>Z Order</b>			
<b>Size</b>			
<b>Move</b>			
<b>Space Evenly</b>			

### 2.5.3.6.1 Advanced Submenu

The **Advanced** sub-menu provides various options to choose from to customize the appearance of model elements. Select the **Element | Advanced** menu option to display this submenu.

Action	Usage	Shortcut	See also
<b>Add Tagged Value</b>	Add a Tagged Value to the currently selected element	<b>Ctrl + Shift + T</b>	<a href="#">Quick Add - Tagged Value To Elements</a> <sup>[765]</sup>
<b>Custom References</b>	Show model element cross references	<b>Ctrl + J</b>	<a href="#">Set Up Cross References</a> <sup>[632]</sup>
<b>Rich Text Format (RTF) Report</b>	Generate a report for the currently selected package in rich text format		<a href="#">RTF Documents</a> <sup>[1738]</sup>
<b>Set Parents and Interfaces</b>	Manually set the element's parents or an interface that it realizes	<b>Ctrl + I</b>	<a href="#">Set Element Parent</a> <sup>[630]</sup>
<b>Embedded</b>	Attach elements to the currently selected element	<b>Ctrl + Shift +</b>	<a href="#">Embedded</a>

Action	Usage	Shortcut	See also
Elements		<b>B</b>	<a href="#">Elements Window</a> [656]
Overrides & Implementations	Automatically override methods from parent Classes and from realized interfaces	<b>Ctrl + Shift + O</b>	<a href="#">Override Parent Operations</a> [714]
Change Type	Change the element type of the selected element		<a href="#">Change Element Type</a> [637]

### 2.5.3.6.2 Inline Features Submenu

**Access:** **Element | Inline Features**

Action	Usage	Shortcut	See also
<b>Edit Selected</b>	Type over or delete the text of the highlighted feature.	<b>F2</b>	
<b>View Properties</b>	Open the dialog containing details of the selected element feature, or the element if no feature is selected.		
<b>Insert New After Selected</b>	Insert a new item in the element.		
<b>Create Linked Note</b>	Add a Note element linked to the selected item, reflecting the content of that item.		
<b>Add Attribute</b>	Add an attribute to the current element.	<b>Ctrl + Shift + F9</b>	Add an <a href="#">attribute</a> [697]
<b>Add Operation</b>	Add an operation to the element.	<b>Ctrl + Shift + F10</b>	Add an <a href="#">operation</a> [709]
<b>Add Other</b>	Insert other features such as Maintenance and Testing items.	<b>Ctrl + F11</b>	
<b>Delete Selected from Model</b>	Delete the selected item from the model.	<b>Ctrl + Shift+ Delete</b>	

Active keys in this mode include:

Key	Action
<b>Enter</b>	Save current changes.
<b>Ctrl+Enter</b>	Save current changes and open a new slot to add a new item.
<b>Esc</b>	Cancel editing.
<b>Shift+F10</b>	Display the context menu for in-place editing.

### 2.5.3.6.3 Source Code Engineering Submenu

To forward and reverse engineer code using the language of your choice, select the **Element | Source Code Engineering** menu option.

Action	Usage	Shortcut	See also
<b>Generate Current Element</b>	Generate source code <a href="#">[1500]</a> for the currently selected element.	<b>F11</b>	<a href="#">Generate source code [1500]</a>
<b>Synchronize Current Element</b>	Synchronize the selected Class with the source code.	<b>F7</b>	
<b>Batch Generate Selected Element (s)</b>	Batch generate source code for the currently selected element(s).	<b>Shift + F11</b>	
<b>Batch Synchronize Selected Element (s)</b>	Batch synchronize the currently selected element (s) with source code.	<b>Ctrl + R</b>	
<b>Open Source Directory</b>	Open the directory containing the source for this element.	<b>Ctrl + Alt + Y</b>	

### 2.5.3.6.4 Appearance Submenu

The **Appearance** sub-menu provides various options to choose from to customize the appearance of model elements.

Action	Usage	Shortcut	See also
<b>Default Appearance</b>	Set border, font and background color and border thickness for the selected element, as its default appearance <a href="#">[406]</a> .	<b>Ctrl + Shift + E</b>	<a href="#">Default appearance [643]</a>
<b>Autosize</b>	Auto-size a group of elements in a diagram to a best fit.	<b>Alt + Z</b>	
<b>Set Font</b>	Change the font <a href="#">[1367]</a> of the text displayed on the element in a diagram.		Text <a href="#">font [659]</a>
<b>Alternate Image</b>	Select an alternative image for the selected element.	<b>Ctrl + Shift + W</b>	
<b>Apply Image From Clipboard</b>	Insert the image currently held on the clipboard.		

### 2.5.3.6.5 Position Submenus

These Element menu submenus enable you to size and position elements on the diagram, relative to each other.

#### The Alignment Sub-Menu:

Use the **Alignment** sub-menu to align the selected element(s) to each other.

Action	Usage	Shortcut	See also
<b>Left</b>	Align left edges of elements	<b>Ctrl + Alt + Left</b>	
<b>Right</b>	Align right edges of elements	<b>Ctrl + Alt + Right</b>	
<b>Top</b>	Align top edges of elements	<b>Ctrl + Alt + Up</b>	
<b>Bottom</b>	Align bottom edges of elements	<b>Ctrl + Alt + Down</b>	
<b>Centers</b>	Align centers of elements, horizontally or vertically		

#### The Make Same Sub-Menu:

Use the **Make Same** sub-menu to make the selected elements the same width, the same height or both.

In Use Case diagrams, these options are blocked if the **Allow Elongated Use Cases** option is turned off on the Options dialog Objects page.

Action	Usage	Shortcut	See also
<b>Width</b>	Make all selected elements the same width		<a href="#">Objects</a> [434]
<b>Height</b>	Make all selected elements the same height		
<b>Both</b>	Make all selected elements the same height and width		

#### The Z Order Sub-Menu:

Use the **Z Order** sub-menu to move the selected element(s) back, forward, to the front of all other elements or behind all other elements.

Action	Usage	Shortcut	See also
<b>Forward</b>	Move selected element forward one position in the Z order		<a href="#">Z Order Elements</a> [586]
<b>Back</b>	Move selected element back one position in the Z order		
<b>To Bottom</b>	Send selected element behind all other elements		
<b>To Top</b>	Bring selected element in front of all other elements		

#### The Size Sub-Menu

Use the **Size** sub-menu to make the selected element(s) wider, narrower, taller or shorter by one increment.

Action	Usage	Shortcut	See also
<b>Wider</b>	Make all selected elements wider	<b>Ctrl + →</b>	
<b>Narrower</b>	Make all selected elements narrower	<b>Ctrl + ←</b>	

Action	Usage	Shortcut	See also
Shorter	Make all selected elements shorter	Ctrl + ↑	
Taller	Make all selected elements taller	Ctrl + ↓	

### The Move Sub-Menu

Use the **Move** sub-menu to move the selected element(s) left, right, up or down by one increment.

Action	Usage	Shortcut	See also
Right	Move all selected elements to the right	Shift + →	
Left	Move all selected elements to the left	Shift + ←	
Up	Move all selected elements upwards	Shift + ↑	
Down	Move all selected elements downwards	Shift + ↓	

### The Space Evenly Sub-Menu

Use the **Space Evenly** sub-menu to distribute the selected elements evenly.

Action	Usage	Shortcut	See also
Across	Space elements evenly, horizontally	Alt + -	
Down	Space elements evenly, vertically	Alt + =	

## 2.5.3.7 Tools

The **Tools** menu provides access to various tools including those related to code engineering, model management, spell checking, customization of features and setting operational options.

Action	Usage	Shortcut	See also
Open Source File	Open any type of external source file (code, XML, DDL) for editing	Ctrl + Alt + O	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>
Source Code Engineering	Display the Source Code Engineering submenu		<a href="#">Source Code Engineering</a> <sup>[917]</sup>
Database Engineering	Display the Database Engineering submenu		<a href="#">Database Engineering</a> <sup>[927]</sup>
Web Services	Display the Web Services submenu		<a href="#">Web Services</a> <sup>[927]</sup>
XML Schema	Display the XML Schema submenu		<a href="#">XML Schema</a> <sup>[927]</sup>
Model Transformation (MDA)	Display the Model Transformation submenu		<a href="#">Model Transformation</a> <sup>[937]</sup>
Spelling Tools	Configure and run the spelling checker		<a href="#">Configure and Run</a> <sup>[937]</sup>

Action	Usage	Shortcut	See also
<b>Data Management</b>	Manage your project's data		<a href="#">Data Management Submenu</a> <sup>[93]</sup>
<b>MDG Technology Import</b>	Import an MDG Technology file to APPDATA (Not available in the Desktop edition)		<a href="#">Import</a> <sup>[103]</sup> a file
<b>Generate MDG Technology File</b>	Display the MDG Technology Wizard (Not available in the Desktop edition)		<a href="#">MDG Technology Wizard</a> <sup>[106]</sup>
<b>Wordpad</b>	Open Wordpad		
<b>Windows Explorer</b>	Open Windows Explorer (different options might be listed, to open other applications)		
<b>Customize</b>	Customize the operation of Enterprise Architect		<a href="#">The Customize Dialog</a> <sup>[119]</sup>
<b>Options</b>	Customize your general settings through the Options dialog	<b>Ctrl + F9</b>	<a href="#">Options dialog</a> <sup>[424]</sup>

### 2.5.3.7.1 Source Code Engineering Submenu

To forward and reverse engineer code using the language of your choice select the **Tools | Source Code Engineering** menu option (Professional, Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions).

Action	Usage	Shortcut	See also
<b>Generate Package Source Code</b>	Generate source code for the currently selected package	<b>Ctrl + Alt + K</b>	<a href="#">Generate source code</a> <sup>[1502]</sup>
<b>Synchronize Package Contents</b>	Synchronize the selected package with the source code	<b>Ctrl + Alt + M</b>	
<b>Import Source Directory</b>	Import and reverse engineer an entire directory structure	<b>Ctrl + Shift + U</b>	<a href="#">Import</a> <sup>[1522]</sup> an directory structure
<b>Import Binary Module</b>	Import a binary module		<a href="#">Import a binary module</a> <sup>[1522]</sup>
<b>Import ActionScript Files</b>	Import code written in ActionScript with the file extension .AS		<a href="#">ActionScript</a> <sup>[1520]</sup> code
<b>Import C Files</b>	Import code written in ANSI C with the file extension .C or .H		<a href="#">ANSI C</a> <sup>[1520]</sup> source code
<b>Import C# Files</b>	Import code written in the C# programming language with the file extension .CS		<a href="#">C#</a> <sup>[1520]</sup> source code
<b>Import C++ Files</b>	Import code written in the C++ programming language with the file extension .H, .HPP or .HH		<a href="#">C++</a> <sup>[1520]</sup> source code
<b>Import Delphi Files</b>	Import code written in the Delphi programming language with the file extension .PAS		<a href="#">Delphi</a> <sup>[1520]</sup> source code
<b>Import Java Files</b>	Import code written in the Java programming		<a href="#">Java</a> <sup>[1520]</sup> source

Action	Usage	Shortcut	See also
	language with the file extension .JAVA		code
<b>Import PHP Files</b>	Import code written in PHP with the file extensions .INC, .PHP, .PHP4		<a href="#">PHP</a> <sup>[152]</sup> source code
<b>Import Python Files</b>	Import code written in Python with the file extension .PY		<a href="#">Python</a> <sup>[152]</sup> source code
<b>Import Visual Basic Files</b>	Import code written in the Visual Basic programming language with the file extension .FRM, .CLS, .BAS or .CTL		<a href="#">Visual Basic</a> <sup>[152]</sup> source code
<b>Import VB.NET Files</b>	Import code written in the VB.NET programming language with the file extension .VB		<a href="#">VB.NET</a> <sup>[152]</sup> source code

### 2.5.3.7.2 Database Engineering Submenu

**Access:** **Tools | Database Engineering**

Action	Usage	Shortcut	See also
<b>Import DB Schema from ODBC</b>	Import a database schema from an ODBC data source		<a href="#">Import a database schema from an ODBC</a> <sup>[138]</sup>
<b>Generate Package DDL</b>	Generate a Package DDL script to create the tables in the currently selected package		<a href="#">Generate a Package DDL</a> <sup>[138]</sup>

### 2.5.3.7.3 Web Services Submenu

**Access:** **Tools | Web Services**

Action	Usage	Shortcut	See also
<b>Import WSDL</b>	Reverse engineer <sup>[163]</sup> a Web Service Definition Language (WSDL) file as a UML Class model		<a href="#">Reverse engineer</a> <sup>[163]</sup>
<b>Generate WSDL</b>	Forward <sup>[163]</sup> engineer a UML Class model to a WSDL file		<a href="#">Forward</a> <sup>[163]</sup> engineer

### 2.5.3.7.4 XML Schema Submenu

**Access:** **Tools | XML Schema**

Action	Usage	Shortcut	See also
<b>Import XML Schema</b>	Reverse engineer a W3C XML Schema (XSD) file as a UML Class model		<a href="#">Reverse</a> <sup>[160]</sup> engineer
<b>Generate XML</b>	Forward engineer a UML Class model to a W3C		<a href="#">Forward</a> <sup>[160]</sup>

Action	Usage	Shortcut	See also
Schema	XML Schema (XSD) file		engineer

### 2.5.3.7.5 Model Transformation (MDA) Submenu

**Access:** **Tools | Transformations**

Command	Action	Shortcut	See also
Transform Selected Elements	Perform an MDA-style transformation on the currently selected elements	Ctrl + H	Selected <a href="#">elements</a> [131]
Transform Current Package	Perform an MDA-style transformation on the currently selected package	Ctrl + Shift + H	Selected <a href="#">package</a> [131]

### 2.5.3.7.6 Spelling Tools

**Access:** **Tools | Spelling Tools**

Action	Usage	Shortcut	See also
Spell Check Project	Spell check the whole project	Ctrl + F7	<a href="#">Spell check</a> [378]
Spell Check Current Package	Spell check the current package, selected in the Project Browse	Ctrl + Shift + F7	<a href="#">Spell check</a> [378]
Spelling Options	Specify a range of options to configure how the spell checker operates		Configure <a href="#">options</a> [378]

### 2.5.3.7.7 Data Management Submenu

Use the options on the **Data Management** submenu to manage your project's data.

Action	Usage	Shortcut	See also
Project Transfer	Move a complete project from one repository to another  You cannot move a project from a source .EAP file of a version earlier than 3.5.0		<a href="#">Perform a Project Data Transfer</a> [345]
Reset IDs	Reset the table auto increment column values		<a href="#">Reset Table Auto Increment or Identity Columns</a> [418]
Project Compare	Compare the total project sizes of two projects		<a href="#">Compare Projects</a> [339]
Project Integrity Check	Check the data integrity of a project	Shift + F9	<a href="#">Check Project Data integrity</a> [416]

Action	Usage	Shortcut	See also
Run Patch	Execute an SQL Patch		<a href="#">Execute an SQL Patch</a> <sup>[420]</sup>
Manage .EAP File	Repair, compact or replicate your .EAP file		<a href="#">Repair, compact or replicate</a> <sup>[94]</sup>

### 2.5.3.7.1 Manage .EAP File Submenu

Use the options on this submenu to repair, compact or replicate your .EAP file.

Action	Usage	See also
Repair .EAP File	Repair an Enterprise Architect project If a project has not been closed properly, in rare cases it might not open correctly; this option attempts to repair such projects All users must be logged off the project while it is being repaired	<a href="#">Repair</a> <sup>[421]</sup> a project
Compact .EAP File	Compact an Enterprise Architect project Eventually projects might benefit from compacting to conserve space Ensure everyone is logged off the target project, then select this option to compact the project.	<a href="#">Compact</a> <sup>[420]</sup> a project
Make Design Master	Make a design master project; this is the master project for creating replicas	<a href="#">Make a design master</a> <sup>[191]</sup> project
Create New Replica	Create a new replica from the Design Master	New <a href="#">replica</a> <sup>[189]</sup> <a href="#">Design Master</a> <sup>[191]</sup>
Synchronize Replicas	Copy changes from one replica set member to another	<a href="#">Copy changes</a> <sup>[192]</sup>
Remove Replication	Remove all replication features if you no longer require a model to be replicable	<a href="#">Remove</a> <sup>[193]</sup> all replication features
Resolve Replication Conflicts	Resolve any conflicts caused when multiple users have changed the same element between synchronization points	<a href="#">Resolve any conflicts</a> <sup>[194]</sup>

### 2.5.3.8 Analyzer

The **Analyzer** menu enables you to perform build, debug and profiling operations on your model code.

Action	Usage	Shortcut	See also
Execution Analyzer	Display the <b>Package Scripts</b> window, which enables you to create and export Package Build Scripts.		
Build	Build <sup>[1423]</sup> the application for your current script, and execute the Build command in the <b>Build Scripts</b> dialog.	<b>Ctrl + Shift + F12</b>	<a href="#">Build</a> <sup>[1423]</sup> the application
Debug	Display the Debug <sup>[95]</sup> menu, which provides a		<a href="#">Debug</a> <sup>[95]</sup> menu

Action	Usage	Shortcut	See also
	set of debugging commands.		
<b>Record</b>	Display the Record <a href="#">[96]</a> menu, which provides various options for recording a debug session.		<a href="#">Record <a href="#">[96]</a></a> menu
<b>Profile</b>	Display the Profiler <a href="#">[1672]</a> window, which enables you to report on runtime aspects such as what functions are most-frequently called in an application, which tasks are taking longer than expected, and which tasks are taking the longest time to execute.		<a href="#">Profiler <a href="#">[1669]</a></a> window
<b>Test</b>	Display the Test <a href="#">[97]</a> submenu, which provides access to the <b>Testpoint Manager</b> and executing a Test script		<a href="#">Test <a href="#">[97]</a></a> submenu
<b>Simulation</b>	Display the Simulation window, which enables you to simulate the debugging of an application during the design of that application		
<b>Breakpoints &amp; Markers</b>	Display the <b>Breakpoints &amp; Markers</b> window, which you use to manage breakpoints and markers <a href="#">[144]</a> for debugging.		<a href="#">Manage breakpoints and markers <a href="#">[144]</a></a>
<b>Call Stack</b>	View the currently-running threads in a debugging session, on the Call Stack.		Capture Current Work Environment <a href="#">[143]</a>
<b>Locals</b>	View the local variables and their values for the current local thread, on the Locals window		<a href="#">Locals <a href="#">[1451]</a></a> window
<b>Watches</b>	Evaluate data items that are not available as local variables - such as data items with static Class member items, on the Watches window		<a href="#">Watches <a href="#">[1452]</a></a> window
<b>More Analyzer Windows</b>	Display the <b>More Analyzer Windows</b> submenu, which provides access to the Package Build Scripts dialog, the Workbench window, the Modules window and the Memory Viewer window		<a href="#">More Analyzer Windows <a href="#">[97]</a></a> submenu
<b>Run</b>	Execute the Run <a href="#">[1459]</a> command you configured in the <b>Build Scripts</b> dialog.	<b>Ctrl + Alt + N</b>	<a href="#">Run <a href="#">[1459]</a></a> command
<b>Deploy</b>	Execute the Deploy <a href="#">[1462]</a> command you configured in the <b>Build Scripts</b> dialog.	<b>Ctrl + Shift + Alt + F12</b>	<a href="#">Deploy <a href="#">[1462]</a></a> command

### 2.5.3.8.1 Debug Menu

The **Debug** menu provides a range of options for running a debug session.

Action	Usage	Shortcut	See also
<b>Debugger</b>	Display the Debug <a href="#">[117]</a> window, which enables you to control debugging and shows output from a debug session	<b>Alt + 8</b>	
<b>Debug Run</b>	Start or resume the debugger If no debug session is in progress, the active	<b>F6</b>	

Action	Usage	Shortcut	See also
	Analyzer Script is used to determine which application to run or whether the debugger should attach to an already running process		
<b>Debug Pause</b>	Suspend execution of process being debugged		
<b>Step Into</b>	Step into the current function	<b>Shift + F6</b>	<a href="#">Step Into Function Calls</a> <sup>[1457]</sup>
<b>Step Over</b>	Step over the current function	<b>Alt + F6</b>	<a href="#">Step Over Lines of Code</a> <sup>[1457]</sup>
<b>Step Out</b>	Step out of the current function	<b>Ctrl + F6</b>	<a href="#">Step Out of Functions</a> <sup>[1457]</sup>
<b>Debug Stop</b>	Stop the current debug session	<b>Ctrl + Alt + F6</b>	<a href="#">Start &amp; Stop Debugger</a> <sup>[1456]</sup>
<b>Generate Sequence Diagram From Stack</b>	Create a Sequence diagram from the Stack Trace History		<a href="#">Create Sequence Diagram Of Call Stack</a> <sup>[1458]</sup>

### 2.5.3.8.2 Record Menu

The **Record** menu provides various options for recording a debug session.

Action	Usage	Shortcut	See also
<b>Recorder</b>	Display the Record & Analyze window, which enables you to review the information recorded during a debug session		<a href="#">The Recording History</a> <sup>[1662]</sup>
<b>Start Debug Recording</b>	Enabled when the program is at a breakpoint Enter manual record mode; each time you step into a function, the call is captured When you step out, the return is captured		
<b>Stop Debug Recording</b>	Enabled when recording is in progress Stops recording		
<b>Auto Record Thread</b>	Enabled when the program is at a breakpoint The thread that is halted is recorded, and the program resumes execution; whenever the thread makes a function call or a function call exits, this information is captured to the History window  The Stack Trace History, Stack tab and Source Code Editor dynamically update to reflect the current execution sequence for the thread; Stack Trace Recording ends when the thread ends or when you click on the <b>Stop</b> button		
<b>Show/Hide Execution</b>	Display the executing code while the recording is in progress; this slows recording down considerably, and is not used when recording is being controlled by recording markers		<a href="#">View the Call Stack</a> <sup>[1450]</sup>

Action	Usage	Shortcut	See also
	The Call Stack is updated in realtime, even while recording is in progress  Watching this window while recording can give a quick picture of what is going on, even without producing a Sequence diagram		
<b>Generate Sequence Diagram from Recording History</b>	Create a Sequence diagram from the Record & Analyse window		<a href="#">Generate a Diagram</a> <small>[1663]</small>

### 2.5.3.8.3 Test Menu

This submenu provides access to the Testpoint Manager and enables you to run test scripts.

Action	Usage	Shortcut	See also
<b>Testpoint Manager</b>	Display the Testpoints window to execute test scripts and monitor or control the output		<a href="#">The Testpoints Window</a> <small>[1686]</small>
<b>Run Test Script</b>	Execute the Test command you configured in the Build Scripts dialog	<b>Ctrl + Alt + T</b>	<a href="#">Add Testing Command</a> <small>[1460]</small>

### 2.5.3.8.4 More Analyzer Windows

The **More Analyzer Windows** menu provides access to additional analysis tools.

Command	Action	Shortcut	See also
<b>Analyzer Scripts</b>	Create and configure Package Build compiler scripts.	<b>Shift + F12</b>	<a href="#">Managing Analyzer scripts</a> <small>[1400]</small>
<b>Workbench</b>	Display the Workbench window, which enables you to create your own workbench variables and invoke methods on them.		<a href="#">Object Workbench</a> <small>[1674]</small> <a href="#">Create workbench variables</a> <small>[1676]</small> <a href="#">Invoke methods</a> <small>[1677]</small>
<b>Modules</b>	Review details of the loaded modules, on the Modules window.		<a href="#">Show Loaded Modules</a> <small>[1455]</small>
<b>Memory Viewer</b>	Review a process memory debugging session, using the Memory Viewer window.		<a href="#">Inspect Process Memory</a> <small>[1453]</small>

### 2.5.3.9 Addins

The **Add-Ins** menu enables you to connect to, display information on, work with and manage your Add-Ins.

Action	Usage	Shortcut	See also
<b>&lt;Add-In Name(s)&gt;</b>	Access the facilities of the selected Add-In, through an Add-In submenu (below).  For example, if you have TOGAF enabled on your		

Action	Usage	Shortcut	See also
	system, you might click on the TOGAF menu option and display a submenu of options available to the TOGAF user in Enterprise Architect.		
<b>Add-In Windows</b>	Display a window, or list of windows, provided by any Add-Ins you have installed and enabled.  If no windows are provided, displays an empty, docked <b>Add-Ins</b> window.		
<b>Manage Add-Ins</b>	Display the Manage Add-Ins <a href="#">[414]</a> dialog, which you use to enable or disable Add-Ins for use.  Any technology loaded by an Add-In is automatically enabled; if you do not want to use it, you can disable it on the dialog.		<a href="#">Manage Add-Ins</a> <a href="#">[1989]</a> dialog

#### Add-In Submenu

Action	Usage	Shortcut	See also
<b>&lt;Add-In specific options&gt;</b>	List options to perform various functions specific to the Add-In. For example, the MDG Technology For Zachman Framework, as an Add-In, has the options Open Example Model and Insert New Framework Model.		
<b>Help</b>	Display the Help subsystem for the Add-In.		
<b>About</b>	Display information on the Add-In installation, such as version, registration details and copyright statement.		

#### 2.5.3.10 Settings

The **Settings** menu enables you to configure various settings for your overall project, such as stereotypes, Tagged Values, cardinality values, datatypes, language macros, local directories, image management.

Action	Usage	Shortcut	See also
<b>UML Types</b>	Configure stereotypes <a href="#">[775]</a> , Tagged Value Types <a href="#">[777]</a> and the cardinality list <a href="#">[778]</a> for your project.		<a href="#">Stereotypes</a> <a href="#">[775]</a> , <a href="#">Tagged Value Types</a> <a href="#">[777]</a> , <a href="#">cardinality list</a> <a href="#">[778]</a>
<b>Project Types</b>	Display the Project Types <a href="#">[805]</a> submenu.		<a href="#">Project Types</a> <a href="#">[99]</a>
<b>Namespace Roots</b>	Locate and delete model namespaces <a href="#">[1504]</a> .		Model <a href="#">namespaces</a> <a href="#">[1504]</a>
<b>Project Template Package</b>	Configure or change the default element template directory.		
<b>Auto Names and Counters</b>	Configure automatic naming <a href="#">[630]</a> for elements.		Configure <a href="#">automatic naming</a> <a href="#">[630]</a>
<b>MDG</b>	Display the <b>MDG Technologies</b> <a href="#">[1033]</a> dialog, which		<a href="#">MDG Technologies</a>

Action	Usage	Shortcut	See also
<b>Technologies</b>	enables you to activate and use MDG Technology files.		<a href="#">[1035]</a>
<b>Code Generation Templates</b>	Modify code generation templates using the Code Templates Editor <a href="#">[1491]</a> .	<b>Ctrl + Shift + P</b>	<a href="#">Code Templates Editor</a> <a href="#">[1491]</a>
<b>Local Directories and Paths</b>	Configure local directories and paths <a href="#">[1532]</a> .		<a href="#">Local directories and paths</a> <a href="#">[1532]</a>
<b>Code Datatypes</b>	Add, modify and delete programming languages datatypes <a href="#">[779]</a> .		<a href="#">Programming languages datatypes</a> <a href="#">[779]</a>
<b>Preprocessor Macros</b>	Add and delete preprocessor macros <a href="#">[1399]</a> .		<a href="#">Preprocessor macros</a> <a href="#">[1534]</a>
<b>Database Datatypes</b>	Add, modify and delete database datatypes <a href="#">[1281]</a> .		<a href="#">Database datatypes</a> <a href="#">[1359]</a>
<b>Transformation Templates</b>	Modify transformation templates using the Transformation Templates Editor <a href="#">[1339]</a> .	<b>Ctrl + Alt + H</b>	<a href="#">Transformation Templates Editor</a> <a href="#">[1336]</a>
<b>Images</b>	Open the <b>Image Manager</b> <a href="#">[1799]</a> .		<a href="#">Image Manager</a> <a href="#">[595]</a>
<b>Colors</b>	Configure the custom colors for the project. There are two options: <ul style="list-style-type: none"> <li>• <b>Get Project Custom Colors</b> - get the custom colors</li> <li>• <b>Set Project Custom Colors</b> - set the custom colors.</li> </ul> Custom colors are as used in the Appearance <a href="#">[578]</a> dialog.		<a href="#">Appearance</a> <a href="#">[643]</a> dialog

### 2.5.3.10.1 Project Types Submenu

The **Project Types** submenu enables you to create and manage project variables and definitions for use across the project.

Action	Usage	Shortcut	See also
<b>People</b>	Display the People dialog, which enables you to configure the authors, clients, resources and roles for your project.		<a href="#">People</a> <a href="#">[789]</a> dialog
<b>General Types</b>	Display the General Types dialog, which enables you to configure requirements, status types, constraints and scenarios for your project		<a href="#">General Types</a> <a href="#">[784]</a> dialog
<b>Project Indicators</b>	Define the project indicators (risks, efforts and metrics) used in Resource Management		<a href="#">Risks</a> <a href="#">[357]</a> <a href="#">Efforts</a> <a href="#">[355]</a> <a href="#">Metrics</a> <a href="#">[356]</a>
<b>Maintenance</b>	Display the Maintenance dialog, which enables you to track problem types and test types		<a href="#">Maintenance</a> <a href="#">[789]</a>

Action	Usage	Shortcut	See also
<b>Estimation Factors</b>	Display the Estimation factors dialog, which enables you to configure estimation factor types (Technical Complexity Factors, Environmental Complexity Factors, and Default Hour Rate) for your project		<a href="#">Estimation</a> <sup>[402]</sup> factor <a href="#">Technical Complexity Factors</a> <sup>[403]</sup> <a href="#">Environmental Complexity Factors</a> <sup>[404]</sup> <a href="#">Default Hour Rate</a> <sup>[406]</sup>

### 2.5.3.11 Window

The **Window** menu provides access to various actions related to configuring open windows.

Action	Usage	Shortcut	See also
<b>Full Screen</b>	Reset the display to full screen so that only the work area and main menu are shown - no toolbars or windows  To return to your normal working display, either click on the <b>Full Screen</b> option again or click on the <b>Close Full Screen</b> pop-up menu option  You can also restore individual menus and toolbars using the <b>View</b> menu options		
<b>Save All Modified</b>	Save all modified data		
<b>Reload Current View</b>	Refresh the current view		<a href="#">Refresh the current view</a> <sup>[188]</sup>
<b>Set Focus to Current View</b>	Make the current view the active one, so that key strokes immediately act on that view	<b>Ctrl + Shift + 0</b>	
<b>Close Current View</b>	Close the current view		
<b>Close All Except Current</b>	Close all except the currently selected view		
<b>Close All</b>	Close all opened windows in the main tab view		
<b>Autohide Active Window</b>	Autohide <sup>[106]</sup> the window that currently has focus	<b>Ctrl + Shift + F4</b>	<a href="#">Autohide</a> <sup>[106]</sup> windows
<b>Autohide All Docked Windows</b>	Autohide <sup>[106]</sup> all windows that are docked		<a href="#">Autohide</a> <sup>[106]</sup> windows
<b>Close Active Window</b>	Close the window that currently has focus	<b>Ctrl + F4</b>	
<b>Show Start Page</b>	Show or hide the Start Page  The setting of this option persists through shut down and restart, until you specifically change the		<a href="#">Start Page</a> <sup>[70]</sup>

Action	Usage	Shortcut	See also
	option again		
<b>Always on Top</b>	Force the main Enterprise Architect window to be on top of all other windows		

### 2.5.3.12 Help

The **Help** menu provides access to the Enterprise Architect help files, the Read Me file, the Enterprise Architect End User License Agreement and various features on the [Sparx Systems website](#).

Action	Usage	Shortcut	See also
<b>About EA</b>	View information about Enterprise Architect, including your registration details		
<b>Help Contents</b>	Display the Enterprise Architect Help, starting at the introductory page		
<b>On-Line Resources</b>	Display the <b>Online Resources</b> submenu; see below		
<b>Open Example Model</b>	Open the <i>EA.Example</i> model provided with the Enterprise Architect installer		
<b>Register and Manage License Key(s)</b>	Configure and manage the license keys used to register the name and keys for Enterprise Architect and its Add-Ins		<a href="#">License Management</a> <sup>[2109]</sup>
<b>View License Agreement</b>	View the Enterprise Architect End User License Agreement		
<b>Ordering Information</b>	View information on how to purchase Enterprise Architect		<a href="#">Order Enterprise Architect</a> <sup>[26]</sup>
<b>Read Me</b>	View the <i>Readme.txt</i> file, which details the changes and enhancements in Enterprise Architect, build by build		
<b>Keyboard Accelerator Map</b>	View the keyboard accelerator map You can customize your keyboard shortcuts, if required		<a href="#">Customize your keyboard shortcuts</a> <sup>[125]</sup>
<b>EA on the Web</b>	Visit the Sparx Systems website		<a href="#">Sparx Systems website</a>

#### The On-Line Resources Sub-Menu

Access help and resources on-line at the Sparx Systems website.

Action	Usage	Shortcut	See also
<b>User Forum and News</b>	Visit the Enterprise Architect user forum.		<a href="#">User forum</a>
<b>Request-a-Feature</b>	Request a feature you would like to see in Enterprise Architect.		<a href="#">Request a feature</a>

Action	Usage	Shortcut	See also
<b>Bug Report Page</b>	Report the details of a bug you have found in Enterprise Architect.		<a href="#">Report the details of a bug</a>
<b>Latest Version Details</b>	Display the <b>Announcements</b> folder of the user forum, providing details of the latest Enterprise Architect build.		<a href="#">Details of the latest Enterprise Architect build</a>
<b>Automation Interface</b>	Access the Enterprise Architect Automation Interface pages on the Sparx Systems website.		<a href="#">Automation Interface</a>
<b>Introducing UML</b>	Access the Sparx Systems online UML tutorials.		<a href="#">UML tutorials</a>
<b>Pricing and Purchase Options</b>	Purchase or upgrade Enterprise Architect over the internet.		<a href="#">Purchase or upgrade Enterprise Architect</a>

## 2.5.4 Standard Windows

There are many dockable windows available to use in Enterprise Architect. These can be accessed either:

- Through the **View** menu, or
- Through the context menu accessed by right-clicking on the main menu

Having displayed a window, you can also reduce it to a tab off to one side, or autohide it.

The dockable windows available include:

Topic	Link
Project Browser	<a href="#">Project Browser</a> <sup>[443]</sup>

**Learn More:**

- [Docking Windows](#) <sup>[103]</sup>
- [Autohide Windows](#) <sup>[106]</sup>

**Notes:**

- On the Testing, Maintenance and Project Management windows, any descriptive, history, input or results text for a selected item is also displayed in the Notes window; you cannot edit this text in the Notes window

**2.5.4.1 Dock Windows**

A number of Enterprise Architect windows can be freely positioned on the screen, or docked against any edge of the *application workspace*. These windows are collectively called dockable windows.

Drag the window around the application workspace until you find a comfortable way of working. The examples below describe a few ways you can rearrange the windows to suit your work habits.

**Floating Windows**

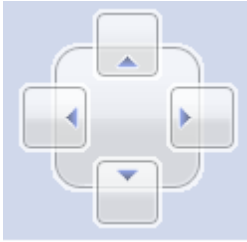

To float a window anywhere on the screen, just drag the window by its title bar to the required position.

**Dock a Window Against an Edge**

The *navigation compass* enables you to dock windows against an edge of the application workspace. You drag the window over one of the points of the compass to dock it into a tabbed location. The window does not overlap any other window, so if you are docking several windows you could cover the workspace; however, you can avoid this by combining them in a single tabbed frame.

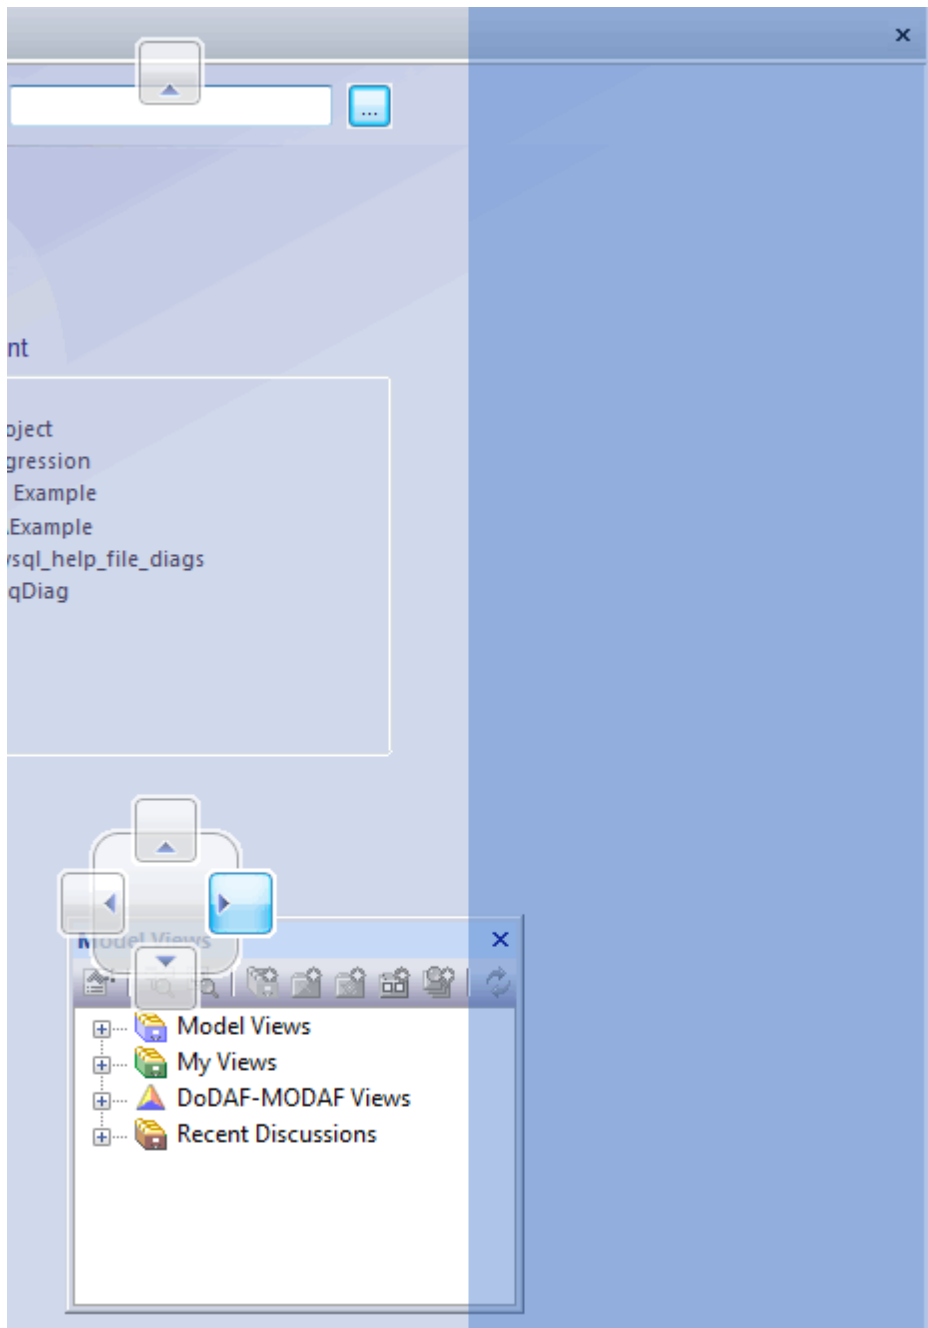

To dock a window against an edge, follow the steps below

Step	Action	See also
1	Click on the item to move and start dragging it towards the required position. This activates the navigation compass.	

Step	Action	See also
		
2	Drag the window onto a compass point. The screen display shades the area where the window is to be placed.	
3	Release the mouse button over the compass point to confirm the position; this docks the window.	

In the example below, when the mouse button is released the **Model Views** window is docked into the shaded area.

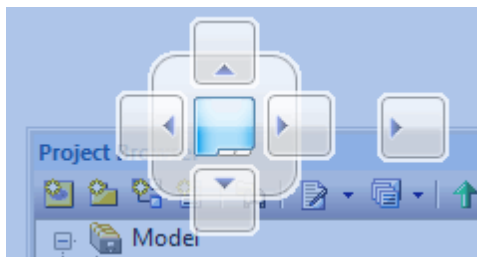

### **Dock Required Windows into One Frame**

You can also dock all of the windows you are using into a single frame, by either:

- Dragging the title bar of each window up to the title bar of the first docked window, or
- Dragging each window over the 'tabbed frame' icon in the middle of the compass, when another window is already docked.

You can do this with all dockable windows.

To separate a window from a combined frame, click on the window tab at the bottom of the frame and drag it away.

#### Learn More:

- [Dockable Windows](#) <sup>[102]</sup>

### 2.5.4.2 Autohide Windows

#### Autohide Using the Toggle Button

- You can automatically hide browser frames by clicking on the  button, located in the top right corner of the frame.
- To turn off the autohide for a particular set of windows within a frame, click on the  button.

#### Use Automatically Hidden Windows

When you automatically hide a set of windows in a frame, the tabs contract to the outside of the application workspace.

Hover the cursor over a window symbol to expand both the tab and the associated window.

You can also use the **View | Visual Style | Animate Autohide Windows** menu option to animate windows that have been automatically hidden.

## 2.5.5 Standard Toolbars

Enterprise Architect provides a set of toolbars containing convenient shortcuts to a wide range of common functions that you can perform on your project as a whole through to the individual modeling units. You can also customize the toolbars by deleting and reordering the default button set.

The toolbars are initially displayed in the toolbar banner at the top of the workspace, but you can display them at the foot of the workspace, drag and dock them within the workspace, or float them over the application; this is useful when you are using a certain set of functions a lot in a particular area.

You can also dock toolbars to the edge of the Enterprise Architect workspace by dragging them by the title bar and placing them against the appropriate edge.

The toolbars available include:

Topic	Link
Default Tools Toolbar	<a href="#">Default Tools Toolbar</a> <sup>[108]</sup>
Project Toolbar	<a href="#">Project Toolbar</a> <sup>[109]</sup>
Code Generation Toolbar	<a href="#">Code Generation Toolbar</a> <sup>[110]</sup>
UML Elements Toolbar	<a href="#">UML Elements Toolbar</a> <sup>[111]</sup>
Diagram Toolbar	<a href="#">Diagram Toolbar</a> <sup>[112]</sup>
Current Element Toolbar	<a href="#">Current Element Toolbar</a> <sup>[113]</sup>
Current Connector Toolbar	<a href="#">Current Connector Toolbar</a> <sup>[115]</sup>
Format Toolbar	<a href="#">Format Toolbar</a> <sup>[543]</sup>
Workspace Layouts Toolbar	<a href="#">Workspace Layouts Toolbar</a> <sup>[116]</sup>
Status Bar	<a href="#">Status Bar</a> <sup>[118]</sup>
Notes Toolbar	<a href="#">Notes Toolbar</a> <sup>[772]</sup>

Each toolbar has a drop-down arrow at the right-hand end, , which can be enabled or hidden from the Visual Style Sub-Menu. If you click on this drop-down arrow, the **Add or Remove Buttons** option displays. Select this option to show a context menu listing the toolbars that are currently displayed, and an option to customize both your own toolbars and the system-provided toolbars.

You can select one of the toolbars identified on the context menu to list the icons available through that toolbar. Click on the icons as necessary to hide or show them in the toolbar.

- [The Customize Window](#)<sup>[119]</sup>

### 2.5.5.1 Default Tools Toolbar

The Default Tools toolbar provides instant access to the most commonly used tools in Enterprise Architect including saving, printing and technology selection.

**Access:** [View](#) | [Toolbars](#) | [Default Tools](#)

#### Use To:

- Create new projects and open existing projects
- Save changes to the current diagram
- Edit, cut, copy and paste diagram objects
- Print preview, configure print settings and print the current diagram
- Open the Package Browser
- Define, manage and run Model Searches
- Select the working Technology for toolbox and element creation
- Access Enterprise Architect Help

#### Reference:

Action	Usage	Shortcut	See also
<b>New Project</b>	Create a new Enterprise Architect project (as EAP file)	<b>Ctrl + N</b>	<a href="#">New Enterprise Architect Project</a> <sup>[146]</sup>

<b>Open Model Search</b>	Model Search window - define, manage and run model searches	<b>Ctrl + Alt + A</b>	<a href="#">Use model search</a> <sup>[477]</sup>
<b>Technology List</b>	Sets the active technology for the Toolbox and the diagram space bar context element menu		<a href="#">Manage MDG Technologies</a> <sup>[1035]</sup>
<b>Help Contents</b>	Access the Enterprise Architect Help	<b>F1</b>	<a href="#">Help Menu</a> <sup>[107]</sup>

**Notes:**

- The **Cut** and **Copy** buttons are only enabled when an item is selected on the current diagram
- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Default Tools** menu option

**2.5.5.2 Project Toolbar**

The Project toolbar provides tools for performing routine tasks such as creating packages, diagrams and elements, searching the model and generating documentation.

**Access:** **View | Toolbars | Project**

**Use to:**

- Reload current project
- Create new diagrams, packages and elements
- Perform model searches
- Generate documentation
- Examine project issues
- Review glossary terms
- Set project options

**Reference:**

Action	Usage	Shortcut	See also
<b>Reload Project</b>	Reload the current project	<b>Ctrl + Shift + F11</b>	<a href="#">Reload current project</a> <sup>[188]</sup>
<b>New Diagram</b>	Create a new diagram in currently selected package	<b>Ctrl + Insert</b>	
<b>New Package</b>	Create a new package within the currently selected package	<b>Ctrl + W</b>	
<b>New Element</b>	Create a new model element under the currently selected package or element	<b>Ctrl + M</b>	
<b>Search Browser</b>	Run a simple search within the project browser	<b>Ctrl + Shift + F</b>	
<b>Search Model</b>	Search the entire project using pre-defined and customized searches	<b>Ctrl + F</b>	<a href="#">Model Search</a> <sup>[483]</sup>

<b>RTF Reports</b>	Define and generate RTF project reports	<b>F8</b>	
<b>Project Issues</b>	Review project issues		
<b>Project Glossary</b>	Define glossary terms		
<b>Set Options</b>	Configure display and behaviour options		

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Project** menu option

**2.5.5.3 Code Generation Toolbar**

The Code Generation toolbar can import, generate, synchronize and open source code. Convenient menus are provided to set the default language and default database type for each Project.

**Access:** **View | Toolbars | Code Generation**

**Use to:**

- Set the default language
- Set the default database type
- Import Classes and Interfaces from source files
- Generate code for a single selected Class
- Batch generate code for one or more selected Classes
- Synchronize selected Classes with source code
- View code in default editor

**Reference:**

Action	Usage	Shortcut	See also
<b>Set Default Language</b>	Set the language for all newly created elements		
<b>Set Default Database Type</b>	Set the database type for all newly created database elements		
<b>Import</b>	Choose files to import for reverse engineering source code into the current diagram.  Use the drop-down menu to override the project's default language for a particular import.		

			
<b>Generate Source Code</b>	Generate Source code for the currently selected element	<b>F11</b>	
<b>Batch Generate Source Code</b>	Generate Source code for multiple selected elements	<b>Shift + F11</b>	
<b>Synchronize Element with Source Code</b>	Synchronize selected element with its associated source code	<b>F7</b>	
<b>Open Source Code</b>	Open the source code of the selected Class in the default external editor for that language  Source code must have been generated, and the selected element must be a Class	<b>F12</b>	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Code Generation** menu option

**2.5.5.4 UML Elements Toolbar**

The UML Elements toolbar can quickly and easily insert UML elements onto a diagram, including Notes, text, hyperlinks and diagram specific UML elements.

**Access:** **View | Toolbars | UML Elements**

**Use to:**

- Insert a variety of elements onto the current diagram

**Reference:**

Action	Usage	Shortcut	See also
<b>New Element</b>	Add a new element to the current diagram. Displays a list of elements matching the content of the current Toolbox pages, with an Other option to list other elements	<b>Space bar</b>	<a href="#">Creating Objects</a> <sup>[628]</sup>
<b>New Boundary</b>	Add a simple boundary element to the current diagram		<a href="#">System Boundary</a> <sup>[933]</sup>
<b>New Note</b>	Add a new Note element to the current diagram		<a href="#">Note</a> <sup>[641]</sup>
<b>New Text Element</b>	Add a simple text element to the current diagram		<a href="#">Text element</a> <sup>[641]</sup>
<b>Diagram Note Element</b>	Add a diagram properties note to the current diagram		<a href="#">Diagram note</a> <sup>[589]</sup>
<b>Diagram Legend</b>	Add a diagram legend element to the current diagram		<a href="#">Diagram Legend</a> <sup>[690]</sup>
<b>New Hyperlink</b>	Add a hyperlink element (web page, file, help topic) to the current diagram		<a href="#">Hyperlink</a> <sup>[1295]</sup>
<b>New Note Link</b>	Create a note link connection from an element to a note in the current diagram		<a href="#">Note link</a> <sup>[1005]</sup>

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions

**2.5.5.5 Diagram Toolbar**

The Diagram toolbar provides tools to lay out and improve the appearance of diagrams, including zoom controls to better manage large diagrams and quickly identify key areas of interest. The Diagram toolbar can be docked to any main window edge or floated freely in a convenient location for quick access.

**Access:** [View | Toolbars | Diagram Tools](#)

**Use to:**

- Layout diagrams
- Set element Z-Order
- Navigate between current open diagrams
- Zoom in and out
- Access properties and delete elements

**Reference:**

Action	Usage	Shortcut	See also
--------	-------	----------	----------

<b>Align Left</b>	Align selected elements to the left	<b>Ctrl + Alt + ←</b>	
<b>Align Right</b>	Align selected elements to the right	<b>Ctrl + Alt + →</b>	
<b>Align Top</b>	Align selected elements to the top	<b>Ctrl + Alt + Up Arrow</b>	
<b>Align Bottom</b>	Align selected elements to the bottom	<b>Ctrl + Alt + ↓</b>	
<b>Z Order Top</b>	Bring selected element to top of Z order		<a href="#">Diagram Context Menu</a> <sup>[540]</sup>
<b>Z Order Bottom</b>	Move selected element to bottom of Z order		<a href="#">Diagram Context Menu</a> <sup>[540]</sup>

<b>Zoom In</b>	Zoom In		
<b>Zoom Out</b>	Zoom Out		
<b>Zoom to fit diagram</b>	Zoom to fit diagram		
<b>Zoom to fit page</b>	Zoom to fit page		
<b>Zoom to 100%</b>	Zoom to 100%		
<b>Diagram Auto-layout</b>	Auto-layout diagram (not for Behavioral diagrams) in the Digraph layout		<a href="#">Digraph</a> <sup>[614]</sup> layout
<b>Diagram Properties</b>	Show diagram properties	<b>F5</b>	
<b>Paste Appearance</b>	Paste appearance as copied into the Painter from an element's Appearance context menu		<a href="#">Appearance</a> <sup>[578]</sup> context menu
<b>Delete</b>	Delete selected element(s)	<b>Ctrl + D</b>	

**Notes:**

- Any actions that result in a change in diagram content and appearance (including Zoom) are saved as changes to the diagram
- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Diagram** menu option

**2.5.5.6 Current Element Toolbar**

The Current Element toolbar performs common operations on a selected element such as viewing properties, operations, attributes. It is also capable of specifying the visibility of element features and compartments and locking an element.

**Access:** [View](#) | [Toolbars](#) | [Current Element](#)

**Use to:**

- View and modify element properties
- Set an element's parent or implement interfaces
- View and modify Operations
- View and modify Attributes
- Specify the visibility of element features and compartments
- Specify the run state of an element (or, for Parts, property value)
- View use of element in other structures such as diagrams
- Locate the element in the Project Browser window
- View the cross reference list for this element
- Lock or unlock the current element
- Add a Tagged Value to the current element

**Reference:**

Action	Usage	Shortcut	See also
<b>Edit Properties</b>	View and edit properties of the selected element	<b>Alt + Enter</b>	
<b>Set Parent</b>	Set the current element's parent or implement interfaces	<b>Ctrl + I</b>	
<b>Operations</b>	Create and edit operations for the selected element	<b>F10</b>	
<b>Attributes</b>	Create and edit attributes for the selected element	<b>F9</b>	
<b>Show Features</b>	Specify which compartments and information to display for the selected element in the current diagram	<b>Ctrl + Shift + Y</b>	
<b>Set Run State</b>	Set the element run state or attribute initializers	<b>Ctrl + Shift + R</b>	
<b>Find Element Usage</b>	Find all diagrams in which the selected element is used.	<b>Ctrl + U</b>	
<b>Find in Project Browser</b>	Find the selected element in the Project Browser	<b>Alt + G</b>	
<b>Configure References</b>	Set and view custom references to other elements and diagrams	<b>Ctrl + J</b>	
<b>Lock Element</b>	Apply or release a lock on the selected element		<a href="#">Lock Model Elements</a> <sup>21</sup>
<b>Add Tagged Value</b>	Add a tagged value to the selected element	<b>Ctrl + Shift + T</b>	

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Current Element** menu option

**2.5.5.7 Current Connector Toolbar**

The Current Connector toolbar can easily modify the properties and style of a connector, show and hide labels/connectors and pin each end.

**Access:** **View | Toolbars | Current Connector**

**Use to:**

- View and modify properties for the current connector
- Set the connector line style
- Attach a note to the currently selected connector
- Set the visibility for labels of the connector
- Set the visible or hidden relations in the current diagram
- Reverse the direction of the currently selected connector
- Pin the start and/or connector ends to a position on the target element (drop menu)

**Reference:**

Action	Usage	Shortcut	See also
<b>Edit Properties</b>	View and edit properties of the selected connector	<b>Enter</b>	
<b>Set Style</b>	Set the connector line style - choose from list		
<b>Attach Note</b>	Attach a note or constraint to one or more connectors in the current diagram		
<b>Show Labels</b>	Set label visibility for the selected connector		
<b>Show Relationships</b>	Show and hide specific relationships within the current diagram	<b>Ctrl + Shift + I</b>	
<b>Reverse Direction</b>	Reverse the direction of the selected connector		
<b>Pin Connector Ends</b>	Pin end points of the selected connector		

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Current Connector** menu option

### 2.5.5.8 Workspace Layouts

The Workspace Layouts toolbar provides tools for quickly switching between pre-defined workspace layouts. It also provides tools for laying out your workspace then saving the resulting layout. The Workspace Layouts toolbar can be docked to any main window edge or floated freely in a convenient location for quick access.

**Access:** **View | Toolbars | Workspace Layouts**

**Use to:**

- Save the current workspace layout
- Manage workspace layouts
- Apply a selected workspace layout
- Switch to Views, such as Element List, Model Search and Relationship Matrix
- Activate or select main windows, such as Project Browser, Team Review, Element Properties and Execution Analyzer
- Toggle visibility of toolbars

**Reference:**

Action	Usage	Shortcut	See also
<b>Save As</b>	Save the current workspace layout to file		
<b>Manage Layouts</b>	Opens the Workspace Layouts dialog		
<b>Select Layout</b>	Select and apply a saved workspace layout		
<b>Views</b>	From a drop-down menu, choose one of several views to display <ul style="list-style-type: none"> <li>• Element list</li> <li>• Model Search</li> <li>• Relationship Matrix</li> <li>• Auditing</li> <li>• Web Browser</li> </ul>		
<b>Windows</b>	Choose from a drop-down menu, one of many main windows to display or select. Windows include; <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Team Review</li> <li>• Element Properties</li> <li>• Execution Analyzer</li> </ul>		
<b>Toolbars</b>	Toggle visibility of toolbars		
<b>Fullscreen</b>	Hide all docked windows and view the current view in full screen		

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Workspace Layouts** menu option

### 2.5.5.9 Debug & Record Toolbar

The Debug & Record toolbar provides tools for debugging program source code. The Debug & Record toolbar can be docked to any main window edge or floated freely in a convenient location for quick access.

**Access:** **View | Toolbars | Debug & Record**

**Use to:**

- Attach to running processes
- Run, pause or terminate program execution
- Step over, step into or step out of program statements
- Record program execution

**Reference:**

Action	Usage	Shortcut	See also
<b>Drop-down Command List</b>	Show drop-down menu containing commands for running and managing Analyzer scripts		
<b>Attach to Process</b>	Attach to a running process		
<b>Debug</b>	Begin or continue execution of the current program	<b>F6</b>	
<b>Pause-Resume</b>	Pause or resume program execution		
<b>Step Over</b>	Step over the next statement	<b>Alt + F6</b>	
<b>Step In</b>	Step into the next statement	<b>Shift + F6</b>	
<b>Step Out</b>	Step out of the current method	<b>Ctrl + F6</b>	
<b>Debug Stop</b>	Terminate execution of the current program	<b>Ctrl + Alt + F6</b>	
<b>Manual Record</b>	Manually step record the current thread		<a href="#">Recording Sequence Diagrams</a> <small>1648</small>
<b>Auto Record</b>	Auto record an execution trace for the current thread		
<b>Step Through</b>	<p>Step through</p> <p>This button is available when manually recording steps; it attempts to step into a function on the line of code</p> <p>If a function call is made, the function call is captured and the debugger steps back out of the function to either the same line or the next</p>	<b>Alt + ;</b>	

<b>Stop Recording</b>	End recording of program execution		
-----------------------	------------------------------------	--	--

**Notes:**

- You can move this toolbar to any dockable position and it retains that position in subsequent sessions
- You can hide or show the toolbar by clicking on the **View | Toolbars | Diagram** menu option

**2.5.5.10 Status Bar**

The Status bar displays at the bottom of the Enterprise Architect workspace. It provides feedback on current operations and other status information, and enables you to manipulate the scale of a diagram.

**Access:** **View | Toolbars | Status Bar**

**Use to:**

- Identify the type and name of the currently selected element in a diagram (or the status of a Model Search)
- Identify the name of the currently-selected feature, if one is selected
- View the current coordinates of the top left corner of the selected element, and its width and height
- Adjust the scale of the current diagram by up to 50%, through use of a zoom slider
- Check the status of ( **Caps Lock** ), ( **Num Lock** ), ( **ScrL Lock** ) and the WAN Optimizer (bold indicates 'in use', pale indicates 'off')
- Check, by the presence of a triangle in the bottom right corner, that the screen is not maximized; you can drag the screen corner to increase the size of the window

**Reference:**

Action	Usage	Shortcut	See also
<b>Right-click on Status Bar</b>	Configure the status bar; open a context menu that enables you to hide or show the element name, element coordinates, zoom slider or status indicators		
<b>Zoom Out</b>	Zoom out on the current diagram		
<b>Adjust Zoom</b>	Adjust the scale of the current diagram by moving the slider		
<b>Zoom In</b>	Zoom in on the current diagram		

**Notes:**

- This facility has no impact on other users who might view the diagram
- The facility has the same function as the **Scale view by** field on the [Diagram Appearance](#) <sup>429</sup> page of the Options dialog; changes in the 'zoomed' display scale of a diagram update this field and are applied to any other diagrams that you open
- The facility also has no impact any other diagram Zoom facility in Enterprise Architect
- You can hide or show the toolbar by clicking on the **View | Toolbars | Status Bar** menu option

## 2.5.6 Customization

You can configure various settings using the Options dialog, which you display by selecting the **Tools | Options** menu option. In addition, there are several options to change the overall look and feel of Enterprise Architect in the **View | Visual Style** submenu. Those settings and options are explored in this topic.

On occasion, you might want to use Enterprise Architect for two distinct types of operation at the same time. You can do this by adding the following command line argument when you run Enterprise Architect:

```
/regkey: <regkeyname>
```

This stores registry settings - such as window layouts - to a different path in the registry.

### Learn More:

- [Workspace Layouts](#) <sup>[116]</sup>
- [Local Options](#) <sup>[423]</sup>
- [Visual Styles](#) <sup>[126]</sup>

### 2.5.6.1 The Customize Dialog

The Customize dialog enables you to customize Enterprise Architect:

#### Access:

- Select the **Tools | Customize** option, or
- At the far right of any toolbar, click on the drop-down arrow and on the **Add or Remove buttons** option, then select the **Customize** option.

Topic	Link
Commands	<a href="#">Commands</a> <sup>[119]</sup>
Toolbars	<a href="#">Toolbars</a> <sup>[120]</sup>
Tools	<a href="#">Tools</a> <sup>[121]</sup>
Keyboard Keystrokes	<a href="#">Keyboard Keystrokes</a> <sup>[125]</sup>
Menus	<a href="#">Menus</a> <sup>[128]</sup>
Options.	<a href="#">Options</a> <sup>[126]</sup>

If a documented toolbar icon, keyboard combination or menu option does not appear to be available, select the appropriate tab and click on the **Reset** or **Reset All** button. This restores the toolbar, menu or key settings to the defaults.

**However:** Be aware that this also removes any customized icons, options or combinations you might have set, because it is possible that the customization itself has displaced or affected the default setting.

#### 2.5.6.1.1 Customize Commands

The Customize dialog Commands tab provides access to many of Enterprise Architect's functions, enabling you to place them into a toolbar.

To add a command to a toolbar, click on the category in the Categories: panel and select the command from the list for that category in the Commands: panel. Drag the command on top of the toolbar to add it to.

If you right-click on the command icon in the toolbar while the Customize dialog is open, a context-sensitive menu displays. This menu offers options for deleting commands from a toolbar, and for changing the appearance of commands.

To remove a command from the toolbar, right-click on the command graphic or text and select the **Delete** menu option.

To change the appearance of a command graphic, right-click on the command graphic or text and select the **Button Appearance** context menu option. The Button Appearance dialog displays, which you can use to add graphical icons to commands that do not have them by default.

Some commands do not come with a convenient icon, which results in an empty toolbar button. Either avoid placing these commands on toolbars or use the context-sensitive menu to select an appropriate icon for the command.

Read the [Create a New Toolbar and Populate it with Commands](#) <sup>[120]</sup> procedure of the *Customize Toolbars* topic.

### 2.5.6.1.2 Customize Toolbars

The Toolbars tab on the Customize dialog enables you to:

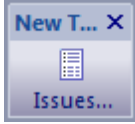

- Hide or show toolbars by selecting the appropriate checkbox
- Rename toolbars
- Create new toolbars
- Delete toolbars
- Modify toolbar contents by dragging commands onto a visible toolbar from the Commands tab or from another toolbar
- Reset a toolbar (or all toolbars) to the default contents and position, and
- Display text labels under the toolbar icons (perhaps temporarily, just to check what the icons do).

#### Create a New Toolbar and Populate it with Commands:

To create a new toolbar and populate it with commands, follow the steps below:

Step	Action	See also
1	Select the <b>Tools   Customize</b> menu option The Customize dialog displays	
2	Click on the Toolbars tab	
3	Click on the <b>New</b> button The Toolbar Name dialog displays	
4	In the <b>Toolbar Name</b> field, type a name for your new toolbar and click on the <b>OK</b> button Your new toolbar is created	
5	To add commands from another toolbar to your new toolbar, see step 8 To add menu commands to your toolbar, click on the Commands tab This forces the new toolbar behind the Customize dialog, so you might have to drag the Customize dialog to the side to find your new toolbar	
6	Find the command to add to your toolbar in the <b>Commands</b> list The <b>Categories</b> list on the left represents the Enterprise Architect menu structure	

Step	Action	See also
	and the <b>Commands</b> list updates each time you click on a different category	
7	<p>Drag the selected command from the list into the new toolbar</p> <p>If you selected the <b>Show text labels</b> checkbox, your toolbar should now look like this:</p>  <p>If you did not select the <b>Show text labels</b> checkbox, your toolbar should look like this:</p> 	
8	<p>If the command you require is on another toolbar, display that toolbar and drag it to position it near your new toolbar</p> <p>Press (<b>Ctrl</b>) and drag the required icon for the command from the existing toolbar onto your new toolbar</p>	

**Notes:**

- You can select the **Show text labels** checkbox to display textual descriptions of toolbar items
- You can add as many commands to your toolbar as required; your new toolbar behaves the same way as other toolbars - you can position it next to the other toolbars at the top of the application workspace, dock it to the side of the workspace or close it
- On the Customize dialog, you can customize all the listed toolbars except for the Format Tool toolbar (which is actually tied to displayed diagrams)

**Learn More:**

- [Customize Commands](#)<sup>[119]</sup>

**2.5.6.1.3 Custom Tools**

The Tools tab on the Customize dialog provides a means of extending the power of the Enterprise Architect desktop.

From this toolbar you can configure custom tools and make them accessible from the **Main Menu**. You can create menu options that hyperlink to different applications, compilers, batch scripts, automation scripts, URLs or documentation.

**How to:**

To add and configure custom tools, follow the steps below

Step	Action	See also
1	<p>Select the <b>Tools   Customize</b> menu option</p> <p>The Customize dialog displays</p>	

Step	Action	See also
2	Click on the Tools tab	
3	Click on the <b>New</b> icon (left of the red <b>X</b> ) A blank field displays in the <b>Menu contents</b> list	
4	Type in the name of the tool as it should appear in the menu	
5	In the <b>Command</b> field, type the name of the tool .exe file to use; the tool must be a valid filename	
6	Add any arguments required by the tool, and specify an initial directory if required	<a href="#">Opening External Tools</a> [122] <a href="#">Passing Parameters to External Applications</a> [124]
7	Close the Customize dialog Your tool should have now been added to the <b>Tools</b> menu	

### 2.5.6.1.3.1 Open External Tools

When configuring custom tools in Enterprise Architect, you can specify a file to be opened by the external application.

Select the **Tools | Customize** menu option. The **Customize** dialog displays; click on the **Tools** tab. Now you can:

- Specify a [custom tool](#) [122](application) using the **Command** field
- Define a file to open or [parameters to pass](#) [124] to this application, using the **Arguments** field.

#### Example 1

This example opens the file `c:\Temp\Customer Account.xls` using Wordpad. If you save from within Wordpad the initial directory is `c:\Temp`.

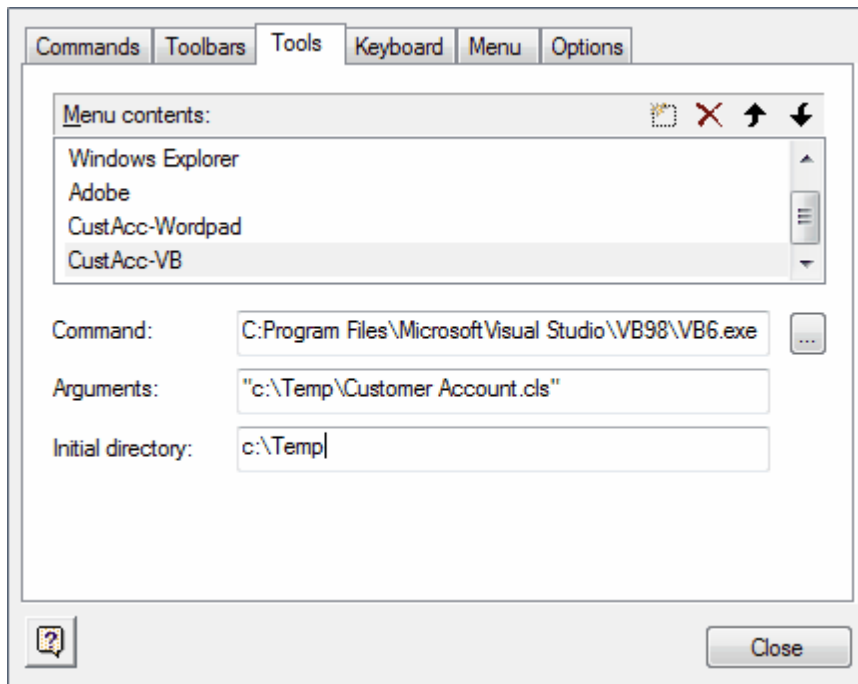

If there are any spaces in the paths in the **Command**, **Arguments** or Initial Directory fields, you must enclose the whole path in double quotes. For example:

" c : \ Temp \ Cust omer Account . cls " must have quotes but c:\Temp\CustomerAccount.cls does not have to have quotes.

### **Example 2**

This example opens the file c : \ Temp \ Cust omer Account . cls using VB. As VB is not installed with the operating system, the whole file path for VB must be included in the **Command** field; you can select this using the ( ... ) (Browse) button to locate the VB executable. If you save from within VB the initial directory is c : \ Temp .

#### 2.5.6.1.3.2 Pass Parameters to Applications

When configuring custom tools in Enterprise Architect, you can pass parameters to the application.

Select the **Tools | Customize** menu option. The Customize dialog displays; click on the Tools tab. Now you can:

- Specify a custom tool (application) using the **Command** field
- Define a file to open or parameters to pass to this application using the **Arguments** field

The available parameters for passing information to external applications are:

Parameter	Description	Notes
\$f	Project Name	For example, C:\projects\EAexample.eap.
\$F	Calling Application (Enterprise Architect)	Enterprise Architect.
\$p	Current Package ID	For example, 144.
\$P	Package GUID	GUID for accessing this package.
\$d	Diagram ID	ID for accessing associated diagram.
\$D	Diagram GUID	GUID for accessing associated diagram.
\$e	Comma separated list of element IDs	All elements selected in the current diagram.
\$E	Comma separated list of element GUIDs	All elements selected in the current diagram.

**Learn More:**

- [Custom Tools](#) 

- [Opening External Tools](#)<sup>[122]</sup>

For more information on using the Automation Interface, visit [www.sparxsystems.com/AutIntVB.htm](http://www.sparxsystems.com/AutIntVB.htm).

#### 2.5.6.1.4 Customize Keyboard

The Keyboard tab on the Customize dialog enables you to configure shortcuts used to access main menu options. This is convenient for creating additional shortcut keys or for changing the current configuration to match your work habits or other applications.

**Access:** **Tools | Customize**

#### **How To:**

To modify a keyboard shortcut, follow the steps below:

Step	Action	See also
1	Select the <b>Customize</b> menu option The Customize dialog displays	
2	Click on the Keyboard tab In the <b>Category</b> field click on the drop-down arrow and select the menu containing the command to modify	
3	In the <b>Command</b> field, click on the drop-down arrow and select the command The current shortcut key (if any) for the command is displayed in the <b>Current Keys</b> field	
4	Move the cursor to the <b>Press New Shortcut Key</b> field and press the required shortcut key(s) for this command  Press the actual keys to use; for example, to use ( <b>F5</b> ) press the ( <b>F5</b> ) key, don't type <b>F</b> then <b>5</b>  The <b>Assign</b> button might be disabled if the selected keyboard shortcut is already used for another command; if this occurs the already existing command is shown and you must select a different shortcut key	
5	Once you have selected an available shortcut, click on the <b>Assign</b> button to apply the change	
6	Adding a keyboard shortcut to a command that already has a keyboard shortcut creates multiple shortcuts for a single command  You can remove the previous shortcut by selecting it and clicking on the <b>Remove</b> button	

#### **Notes:**

- Modified shortcut keys are stored in the registry, so they only affect the current user
- You can revert to the default shortcut keys at any time, by clicking on the **Reset All** button

### 2.5.6.1.5 Customize Menu

The Menu tab on the Customize dialog enables you to customize the appearance of your menus.

Option	Description	See also
<b>Application Frame Menus</b>	Currently the <b>Show Menus For</b> feature is disabled as Enterprise Architect is not an MDI application	
<b>Context Menus</b>	Currently this feature is disabled	
<b>Menu Animations</b>	The following menu animations can be selected from the <b>Menu animations</b> drop-down list: <ul style="list-style-type: none"> <li>• None</li> <li>• Unfold</li> <li>• Slide</li> <li>• Fade</li> <li>• [Default]</li> </ul>	
<b>Menu Shadows</b>	Menu shadows can be toggled on or off by selecting or clearing the <b>Menu shadows</b> checkbox	
<b>Remove Menu Options</b>	Some menu options might not be of relevance to you If you prefer not to display such options, follow the steps below <ol style="list-style-type: none"> <li>1. Whilst the Menu tab of the Customize dialog is displayed, click on the appropriate chain of options in the main menu bar to display the option to delete</li> <li>2. Right-click on the option and select the <b>Delete</b> option from the context menu</li> </ol>	

#### Notes:

- When you perform a major upgrade of Enterprise Architect (such as from release 8.0 to 9.0) the menus are reset and deleted options are replaced.

### 2.5.6.1.6 Customize Options

The Options tab on the Customize dialog enables you to customize the appearance of toolbar items.

You can toggle the following options by selecting or clearing the checkboxes:

- **Show Screen Tips on toolbars**
- **Show shortcut keys in Screen Tips**
- **Use Large Icons.**

## 2.5.6.2 Visual Styles

You can configure the overall look and feel of Enterprise Architect to suit your working environment. Options include various Microsoft Office and Visual Studio styles, or themes.

**Access:** **View | Visual Style | Select Visual Style**

#### How to:

To reset the appearance of Enterprise Architect, follow the steps below:

Step	Action	See also
1	Select the <b>Select Visual Style</b> menu option The Application Look dialog displays	
2	Select the required style from the list If you select the <b>Microsoft Office 2007</b> or <b>Microsoft Office 2010</b> radio buttons, you can also select from a number of base-color options	
3	To try out styles, click on the <b>Apply</b> button To set the style and resume work, click on the <b>OK</b> button	

**Notes:**

- You can also enable customization of toolbars and menus, and animate auto-hidden windows

**Learn More:**

- [Customize Menu](#) [126]
- [Autohide Windows](#) [106]

**2.5.6.3 Manage Workspace Layout**

The **Manage Workspace Layouts** icon displays the **Workspace Layout** dialog, which lists the currently-available user-defined and system layouts.

In the **Existing Workspace Layout** panel at the bottom of the dialog, the **Based On:** field identifies the defined layout that the current workspace layout was derived from - you might have moved or closed windows since applying that layout. The highlighted (*Copy of existing Workspace Layout*) at the top of the **Workspace Layout** dialog is a capture of the workspace layout immediately before you opened the dialog.

Action	Description	See also
<b>Change Layout</b>	<p>You can now change the layout in the <b>Existing Workspace Layout</b> panel to:</p> <ul style="list-style-type: none"> <li>The original layout (as identified by the <b>Based On:</b> field), discarding any changes you might have made</li> <li>The <i>Copy of existing Workspace Layout</i>, preparatory to saving the changes in a new named layout</li> <li>One of the other named layouts.</li> </ul> <p>To change the layout in use, either:</p> <ul style="list-style-type: none"> <li>Double-click on the required layout name</li> <li>Click on the layout name and click on the <b>Apply</b> button or <b>OK</b> button, or</li> <li>Right-click on the layout name and select the <b>Apply</b> context menu option.</li> </ul> <p>When the layout in use changes, the layout name in the toolbar <b>Workplace Layout Selection</b> field also changes.</p>	
<b>Copy Layout</b>	<p>To copy a layout, either:</p> <ul style="list-style-type: none"> <li>Change the layout in use to the required layout and click on the <b>Save As</b> button, or</li> <li>Right-click on the layout name and select the <b>Save As</b></li> </ul>	

Action	Description	See also
	<p>context menu option.</p> <p>The <b>Save Custom Workspace Layout</b> dialog displays.</p> <p>In the <b>Custom Workspace Layout Name</b> field, type a name for the layout. Again, by selecting an existing name you can change an existing layout to something different. Click on the <b>Save</b> button.</p> <p>If you already have tailored windows or views that you want to include in your selected layout, select the <b>Include active custom views</b> checkbox.</p>	
<b>Delete Layout</b>	To delete a workspace layout, right-click on the layout name and select the <b>Delete</b> context menu option. Enterprise Architect prompts you to confirm or cancel the deletion.	

### Workspace Layout Selection

Enterprise Architect provides a number of layouts of windows and toolbars to suit particular areas of work, such as Requirements Management, Code Engineering and Debugging. As described above, you can also add your own layouts to the drop-down list; these custom layout names have a preceding asterisk in the drop-down list for the field (the system-provided layouts are not marked with an asterisk).

To switch to another layout, click on the drop-down arrow and click on the required layout.

## 2.5.7 Other Windows

Most of the windows in Enterprise Architect have a specific, task oriented purpose. Two windows have broader functions.

Window	Detail	See also
<b>System Output Window</b>	Displays data that Enterprise Architect generates during each of a range of processes	<a href="#">The System Output Window</a> <sup>[128]</sup>
<b>Web Browser</b>	Enables you to search for and use internet facilities within your Enterprise Architect work area.	<a href="#">The Web Browser</a> <sup>[129]</sup>

### 2.5.7.1 The Output Window

The System Output window is used to display information generated by internal Enterprise Architect processes, or by Add-Ins and other third-party tools. This window can provide useful information during long-running processes and batch operations. Many validation processes within Enterprise Architect write out their results to this window.

#### Access:

- **View | System Output** ( **Ctrl+Shift+6** )
- Element Context Menu
- Notes Window Context Menu

#### Use to:

- Validate information
- Progress information during launch of external processes

- Command line output from Build and Test
- Parse errors generated during import of various types of files
- Auditing Information \*
- Re-docking the [Model Search](#)<sup>[477]</sup> results into the Output window

#### **How to:**

Right-click on an item and select context menu options to:

- Copy the selected item to the clipboard
- Copy all items to the clipboard
- Save the output to an external file
- Clear the output from the window
- Rollback selected [Get All Latest](#)<sup>[279]</sup> updates to a version controlled package

Drag selected items/text out of the System Output window and onto a diagram to quickly create a named element.

Double-click on model validation errors or parsing errors to display the source of the error.

Switch between tabs to view different categories of information from different tools.

#### **Notes:**

- The System Output window can also be used by [Add-Ins](#)<sup>[1982]</sup>, if they are configured to do so.
- \* (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect) The [Audit History](#)<sup>[308]</sup> tab of the Output window shows a history of changes to any element or connector selected from the Audit View, the Package Browser, the Diagram List, the Project Browser or the current diagram ([Auditing](#)<sup>[300]</sup> must be turned on)

### **2.5.7.2 The Web Browser**

The Web Browser displays as a tab of the central work area, like the Start Page, Model Search, Package Browser and Diagram View. It provides access within Enterprise Architect to internet facilities such as email, websites and search engines.

To access the Web Browser:

- Press ( **Ctrl+Alt+W** ), or
- Select the **View | More Project Tools | Internal Web Browser** menu option.

The Web Browser opens at the default home web site; you define the default home website, search engine and email exchange address on the General page of the Options dialog.

To access the:

- Email exchange server, click on the 'envelope' icon in the toolbar; the email login window displays
- Web search engine (such as *Google*), click on the 'spyglass' icon in the toolbar; the search engine screen displays
- Home web site, after displaying other web pages, click on the 'house' icon in the toolbar.

To go directly to another website or email server (your internet security permitting), in the **Address** field type or select the website http address and click on the **Go** button.

### **2.5.8 Keyboard Shortcuts**

The table below lists the default keyboard shortcut functions within Enterprise Architect.

#### **Notes:**

- You can also display the key combinations on the Help Keyboard dialog (**Help | Keyboard Accelerator Map**; click on the drop-down arrow in the **Category** field and select the appropriate category)
- There are some additional shortcuts using the keyboard and mouse in combination; see the [Keyboard-Mouse Shortcuts](#)<sup>[134]</sup> topic
- If necessary, you can change these keyboard shortcuts using the Keyboard tab of the [Customize](#)<sup>[125]</sup> dialog

Action	Shortcut	Category
Create a new Enterprise Architect project	Ctrl + N	File
Open an Enterprise Architect project	Ctrl + O	File
Open Source File	Ctrl + Alt + O	File
<a href="#">Reload the current project</a> <sup>[188]</sup>	Ctrl + Shift + F11	File
Print the active diagram	Ctrl + P	File
Undo Change	Ctrl + Z	Edit
Redo Change	Ctrl + Y	Edit
Add a single element to the clipboard list	Ctrl + Space	Edit
Paste element as metafile from clipboard	Ctrl + Shift + Insert	Edit
Paste element as new	Ctrl + Shift + V	Edit
Paste element(s) from the clipboard	Shift + Insert	Edit
Bookmark current element with red marker	Shift + Space	Edit
Delete selected element(s) in diagram	Delete or Ctrl + D	Edit
Delete selected element(s) from model (through diagram OR Project Browser)	Ctrl + Delete	Edit

Spell check <b>Notes</b> text	F7	Object notes
Edit code generation templates	Ctrl + Shift + P	Settings
Edit transformation templates	Ctrl + Alt + H	Settings
Make text bullet list item	Ctrl + . (full stop)	Object notes

Action	Shortcut	Category
Make text numbered list item	<b>Ctrl + 1</b>	Object notes
Make text bold	<b>Ctrl + B</b>	Object notes
Make text italic	<b>Ctrl + I</b>	Object notes
Make text underlined	<b>Ctrl + U</b>	Object notes
Insert date and time in <b>Notes</b> text	<b>F5</b>	Object notes
Select line of text in <b>Notes</b> text	<b>F8</b>	Object notes
Copy text	<b>Ctrl + C</b>	Everywhere
Paste text	<b>Ctrl + V</b>	Everywhere
Cut text, or element in diagram	<b>Ctrl + X</b>	Everywhere

### 2.5.8.1 Keyboard-Mouse Shortcuts

The following table lists certain operations you can perform quickly using a combination of keyboard keys and the computer mouse.

Action	Shortcut
Create element of same type as last created on diagram	<b>Ctrl + click</b>
Display element Properties dialog for element in scenario Context References tab	<b>Ctrl + click</b>
Select a number of individual objects for an operation	<b>Ctrl + click</b> each object
Select a range of objects for an operation	<b>Shift + click</b> the first and last object in the range
Move elements along horizontal axis or vertical axis	<b>Shift + hold left mouse button and drag</b>
Create bend in and change direction of connector line	<b>Shift + hold left mouse button and drag</b>
Move elements in any direction, including diagonally	<b>Alt + hold left mouse button and drag</b>
Zoom in or zoom out of diagram	<b>Ctrl + mouse scroll wheel</b>
Pan diagram horizontally or vertically	<b>Ctrl + Shift + hold left mouse button and drag</b>

**Part**

### 3 Projects and Teams

Enterprise Architect helps you to create projects for development under a [range of work conditions](#)<sup>[137]</sup>, from single user/local access through to multiple-role teams working in a distributed environment. You both protect and manage the model data itself, and communicate information on the data in the form of documentation and reports, using facilities such as those listed below.

### 3.1 Introduction

An Enterprise Architect project is stored in a data repository. In Enterprise Architect Desktop and Professional editions, you work with a single file having a .EAP extension. In Enterprise Architect Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions you can also use a suitable DBMS database for project files.

#### Topics:

Topic	Detail	See also
<b>Project Files</b>	<p><b>.EAP Files</b></p> <p>In Enterprise Architect Desktop and Professional editions, a single file with a .EAP extension is used to store projects. A .EAP file is a Microsoft JET database, so you can also open it using MS Access 97, 2000 or 2003, or any other reporting tool that can work with JET databases.</p> <p><b>DBMS Repositories</b></p> <p>In Enterprise Architect Corporate Business and Software Engineering, Systems Engineering and Ultimate editions, you can use a suitable DBMS database for project files. DBMS project files have the same logical structure as .EAP files, but must be connected to using ADO/ODBC. See <a href="#">Connect to a Data Repository</a>, below</p>	<p><a href="#">File Based Repositories</a><sup>[146]</sup></p> <p><a href="#">Server Based Repositories</a><sup>[149]</sup></p>
<b>Creating Project Files</b>	<p>On creating a new project, the Model Wizard enables you to create a model containing various Model Packages.</p> <p>You can also add Model Packages to a project from the Project Browser by:</p> <ul style="list-style-type: none"> <li>• Right-clicking on an existing model and selecting the <b>New Model</b> or <b>Add a New Model using Wizard</b> context menu options</li> <li>• Right-clicking on a package and selecting the <b>Add   Add a New Model using Wizard</b> context menu option</li> <li>• Clicking on an existing model, pressing ( <b>Insert</b> ) and selecting the <b>New Model</b> or <b>Add a New Model using Wizard</b> context menu options</li> <li>• Clicking on a package, pressing ( <b>Insert</b> ) and selecting the <b>Add a New Model using Wizard</b> context menu option</li> </ul>	<p><a href="#">File Based Repositories</a><sup>[146]</sup></p> <p><a href="#">Model Wizard</a><sup>[520]</sup></p>
<b>Opening Existing Projects</b>	<p>There are various ways to open a project in Enterprise Architect. New users are advised to explore the EAExample file supplied with Enterprise Architect.</p>	<p><a href="#">Open a project</a><sup>[139]</sup></p>
<b>Connect to a Data Repository</b>	<p>Enterprise Architect enables you to connect to any of the following data repositories:</p>	<p><a href="#">Connect to a Data Repository</a><sup>[162]</sup></p>

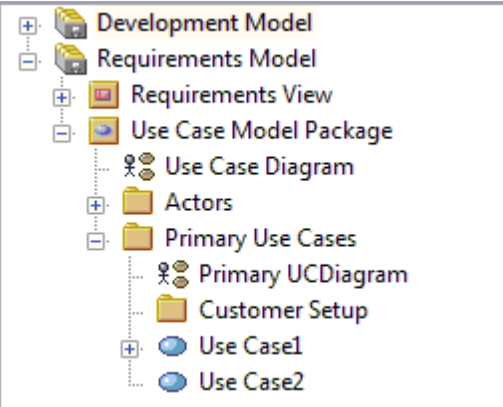

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• MS Access 97, 2000 and 2003 (in all editions - .EAP files are stored in Microsoft JET databases)</li> <li>• Access 2007</li> <li>• SQL Server 2000, 2005 and 2008</li> <li>• MySQL</li> <li>• Oracle 9i, 10g or 11g</li> <li>• PostgreSQL</li> <li>• MSDE</li> <li>• Adaptive Server Anywhere</li> <li>• Progress OpenEdge</li> </ul> <p>To create a new data repository, you must first create a new database with the DBMS management software, then run supplied scripts to create the logical structure. You should then use Enterprise Architect data transfer functions to move a project from a .EAP or DBMS model into the new project.</p>	

### 3.1.1 Projects Defined

An Enterprise Architect Project is a repository for storing, manipulating and managing one or more Models. A single repository can contain many models, and a repository can be either file based or hosted in a larger DBMS system.

#### Guide:

Topic	Detail	See also
<b>Project</b>	A project can contain a single model, or a number of models, each of which defines a particular system or process. A model contains the diagrams, elements, relationships and associated metadata that define the structure and function of the system or process. These components are organized into a hierarchy of packages, which help to group and manage related components.	<a href="#">Open a Project</a> <sup>[139]</sup> <a href="#">Model Shortcuts</a> <sup>[141]</sup> <a href="#">Project Management</a> <sup>[348]</sup> <a href="#">Team Development</a> <sup>[186]</sup>
<b>Model Package</b>	Different aspects of the process or system - or their development - are defined by Model Packages, which you generate from templates specifically structured to support the aspects that the Model Packages represent, such as requirements or deployment. You can generate these templated packages at any level of the hierarchy, but as they are created with their own content they are more useful at the top levels.	<a href="#">Model Wizard</a> <sup>[520]</sup> <a href="#">Model Templates</a> <sup>[521]</sup>
<b>View</b>	The top-level packages in a model can also be Views, which represent partitions of the model that you define yourself. You can start with standard Views such as Class or Component, or create whatever partitions are appropriate to your model.	<a href="#">Views</a> <sup>[532]</sup>

Topic	Detail	See also
<b>Example Project Structure</b>	 <p>Each View or Model Package contains packages. Use Case Model Package contains:</p> <ul style="list-style-type: none"> <li>• Actors and</li> <li>• Primary Use Cases.</li> </ul> <p>It also contains the diagram Use Case Diagram, which could be an overview of the package structure or function. Each package itself can contain one or more diagrams, one or more packages, and several elements. The Primary Use Cases package contains the:</p> <ul style="list-style-type: none"> <li>• Primary UCDiagram</li> <li>• Customer Setup package</li> <li>• Use Case 1 element</li> <li>• Use Case 2 element</li> </ul> <p>Each subordinate package also contains diagrams, elements and (if necessary) further packages. The elements are related by connectors created in the diagrams, and each element and connector has properties, attributes, operations and extensions defined in the respective Properties dialogs.</p>	
<b>Storage</b>	<p>A project can be a .EAP file in an MS Access database or (in the Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions) a structure of files in a database management system such as MySQL or Oracle.</p>	<p><a href="#">File Based Repositories</a> <sup>[146]</sup></p> <p><a href="#">Server Based Repositories</a> <sup>[149]</sup></p>

### 3.1.2 Open a Project

An Enterprise Architect project is used for storing and managing the components of one or more UML models. The Desktop and Professional versions of Enterprise Architect use an MS JET database as the model repository. If you are using the Corporate edition (or above), you can also use DBMSs such as Oracle and MySQL to host the model repository.

**Access:** **File | Open Project**

**Use to:**

- Create a new Enterprise Architect project file (the model repository is created as an MS Jet database file)
- Browse for an existing project file to open
- Specify connection details for opening a project hosted on a DBMS

- Select a recent project to open
- Remove items from the list of recent projects

**Reference:**

Field	Usage	See also
<b>New Project...</b>	Create a new project, as an EAP file	<a href="#">File Based Repositories</a> [146]
<b>Browse for Project</b>	Open a file browser dialog, to select an existing EAP file; the EAP file can be a project file or a shortcut to a project hosted on a DBMS	<a href="#">Model Shortcuts</a> [147]
<b>Connect to Server</b>	Specify connection details for opening an Enterprise Architect project that is hosted on a DBMS  If you double-click on the option, the Windows Data Link Properties dialog displays; start to define the connection to the project's server-based repository  If you click on the drop-down arrow and select the <b>Connection Wizard</b> option, the Data Link Properties dialog again displays  If you click on the drop-down arrow and select the <b>Connection String</b> option, the Connection String dialog displays; type in or paste the connection string and click on the <b>OK</b> button to connect directly to the project	<a href="#">Server-Based Repositories</a> [149]
<b>Recent Projects</b>	A list of the ten most recently opened projects  This list is also displayed: <ul style="list-style-type: none"> <li>• On the Start Page, under the <b>Recent</b> heading</li> <li>• As a drop-down menu under the <b>Open Project</b> button on the Default Tools toolbar</li> <li>• As part of the <b>File</b> menu</li> </ul> On the Open Enterprise Architect Project dialog, each project name is shown with its access path  You can edit the access path by right-clicking on it and selecting the <b>Edit Connection String</b> context menu option; make the changes on the Connection String dialog	
<b>Remove Selection from List</b>	Remove the currently selected project from the Recent Projects list	
<b>Show this Dialog at Startup</b>	Select whether or not to show the Open Enterprise Architect Project dialog upon starting Enterprise Architect	
<b>Open</b>	Open the currently selected project in the Recent Project list	
<b>Cancel</b>	Close this dialog without any further action	
<b>Help</b>	Display this Help topic	

**Notes:**

- Use of a DBMS for hosting the model repository is only available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- Enterprise Architect supports the following DBMS products for hosting model repositories; [SQL Server](#) <sup>[157]</sup>, [MySQL](#) <sup>[150]</sup>, [Oracle 9i, 10g or 11g](#) <sup>[152]</sup>, [Postgre SQL](#) <sup>[168]</sup>, [ASA](#) <sup>[170]</sup>, [MSDE Server](#) <sup>[171]</sup> and [Progress OpenEdge](#) <sup>[171]</sup>

#### Learn More:

### 3.1.3 Project Shortcuts

Enterprise Architect enables you to create a desktop shortcut (or *proxy* file) to a real Enterprise Architect project (DBMS or file-based). Each shortcut is a file containing the connection string for the model.

However, the shortcut also defines *views* that Enterprise Architect should open when it opens the model, as outlined below.

#### Topics:

View	Detail	See also
<b>Diagrams</b>	Define one or more specific diagram(s) to be loaded on Open	
<b>Model Search</b>	<p>Open the Model Search with a specific text string and search type</p> <p>For searches operating on the current tree selection, a diagram in the target package must be opened first.</p> <p>If you use a custom SQL search, the SQL must include <i>ea_guid AS CLASSGUID</i> and the object type</p> <p>You cannot define more than one Model Search to open</p>	<a href="#">Model Search</a> <sup>[477]</sup>
<b>The Relationship Matrix with a saved profile</b>	<p>Open the Relationship Matrix with a saved profile</p> <p>You cannot define more than one Relationship Matrix profile to open</p>	<a href="#">Relationship Matrix</a> <sup>[498]</sup>
<b>The default Team Review</b>	<p>Open the default Team Review document</p> <p>You cannot define more than one Team Review to open</p>	<a href="#">Team Review Tools</a> <sup>[217]</sup>
<b>An example shortcut</b>	<p>You might create a shortcut to open, in sequence:</p> <ul style="list-style-type: none"> <li>• A Development module</li> <li>• The Model Search for a simple search on the term <i>Issue</i></li> <li>• The module <i>Issues</i> diagram</li> <li>• The module <i>Changes</i> diagram</li> </ul> <p>Enterprise Architect opens the appropriate windows in the sequence in which you list the options, displaying the last view in the list</p> <p>In this example, the project opens with the Enterprise Architect work area showing the two diagram tabs and the Model Search tab, and with the <i>Changes</i> diagram displayed in the</p>	

View	Detail	See also
	Diagram View	

**Notes:**

- If specified, the shortcut views override any default diagram defined for the model or current user
- A shortcut does not affect the original Enterprise Architect .exe file or icon, or any other shortcut you might have defined; you can use all of these independently
- When you use a shortcut to access a project that you have recently opened in Enterprise Architect, the **Recent** list on the Enterprise Architect Start Page has two entries for the project - one created when you opened the project in Enterprise Architect and one created when you used the desktop shortcut
- If you are using a database repository other than MS Access 97, 2000 or 2003, you can configure the shortcut to encrypt the password used to set up the connection between Enterprise Architect and the repository; the Enterprise Architect user does not have the real password, thereby preventing them from accessing the repository using other tools such as Query Analyzer or SQLPlus

**Learn More:**

- [Create Project Shortcut](#)<sup>[142]</sup>
- [Capture Current Work Environment](#)<sup>[143]</sup>
- [Encrypt Repository Password](#)<sup>[144]</sup>
- [Default Diagram](#)<sup>[83]</sup>
- [Creating Search Filters](#)<sup>[486]</sup>

**3.1.3.1 Create Project Shortcut**

You can create a shortcut to an Enterprise Architect project (either a DBMS project or file based project). The shortcut can specify additional windows and diagrams to open up automatically every time the shortcut is run.

Shortcuts are stored with a .EAP extension, but are actually small text files that tell Enterprise Architect what project to open and what initial views and windows to display.

**Access:** **File | Save Project Shortcut**

**Use To:**

- Specify a working environment in advance, for other users

**How to:**

To create a project shortcut, follow the steps below:

Step	Action	See also
1	Open Enterprise Architect	
2	Open the required project	
3	Select the <b>Save Project Shortcut</b> menu option The Save Project Shortcut dialog displays	
4	Click on the ( ... ) (Browse) button at the end of the <b>Target File</b> field	

Step	Action	See also
	The Save Project As dialog displays	
5	Browse for the appropriate file location and, in the <b>File name</b> field, type an appropriate filename  All shortcuts are .EAP files, regardless of whether the model itself is a .EAP file or a DBMS model	
6	Click on the <b>Save</b> button to return to the Save Project Shortcut dialog	
7	Click on the <b>Add Other</b> button and select the required option to define: <ul style="list-style-type: none"> <li>• A diagram to open</li> <li>• A Relationship Matrix profile to open</li> <li>• The Team Review</li> <li>• A Model Search to perform</li> </ul>	
8	The appropriate browser or dialog displays to define the view to display; enter the details and click on the <b>OK</b> button  The view is added to the <b>Actions when model is opened</b> field; the entry is automatically selected, with a tick in the checkbox	
9	Repeat steps 7 and 8 for as many additional views as you require	
10	Review the items in the <b>Actions when model is opened</b> field <ul style="list-style-type: none"> <li>• If you decide not to have an item in the shortcut, deselect its checkbox</li> <li>• If you want to clear all selected items, click on the <b>Include None</b> button</li> </ul> Unselected entries are deleted when you save the shortcut	
11	If you decide to change the sequence and/or make a different view display first in the Diagram View: <ul style="list-style-type: none"> <li>• Click on the appropriate entry</li> <li>• Click on the <b>'Up Hand'</b> or <b>'Down Hand'</b> buttons</li> </ul>	
12	Click on the <b>OK</b> button to save the shortcut	

**Notes:**

- When you subsequently open the Save Project Shortcut dialog, it lists the currently-opened views in the order in which they were opened; you can add further views or remove them from the shortcut

**Learn More:**

- [Capture Current Work Environment](#)<sup>[143]</sup>
- [Encrypt Repository Password](#)<sup>[144]</sup>

**3.1.3.2 Capture Current Work Environment**

You can capture the current Enterprise Architect work environment in your shortcut.

**Access:** **File | Save Project Shortcut**

**Use To:**

- Capture the current Enterprise Architect work environment, to access the model at exactly the same

point in exactly the same environment when you resume work

#### How to:

To capture your current work environment, follow the steps below:

Step	Action	See also
1	Open Enterprise Architect	
2	Open the required project and work in it	
3	At the point at which you decide to capture your work environment in a shortcut, ensure that: <ul style="list-style-type: none"> <li>You have opened all diagrams you require</li> <li>If necessary, you have opened the Team Review, Model Search (with appropriate search term and type) and/or Relationship Matrix (at the appropriate profile)</li> <li>The view you want to resume work on is the last one opened</li> </ul>	
4	Select the <b>Save Project Shortcut</b> menu option The Save Project Shortcut dialog displays, showing a list of actions derived from the views you currently have open	
5	If you accessed Enterprise Architect via a shortcut, the <b>Target File</b> field displays the file location of that shortcut Otherwise, click on the ( ... ) (Browse) button at the end of the <b>Target File</b> field The Save Project As dialog displays	
6	Browse for the appropriate file location and, in the <b>File name</b> field, type an appropriate filename All shortcuts are .EAP files, regardless of whether the model itself is a .EAP file or a DBMS model	
7	Click on the <b>Save</b> button to return to the Save Project Shortcut dialog	
8	In the <b>Actions when model is opened</b> field, click on the <b>Include All</b> button	
9	Click on the <b>OK</b> button to save the shortcut	

#### Learn More:

- [Encrypt Repository Password](#)<sup>[144]</sup>

### 3.1.3.3 Encrypt Repository Password

If your model is developed on a DBMS repository, the Save Project Shortcut dialog has an **Encrypt Connection String** check box.

You can create the shortcut actions and, if necessary, select the checkbox to encrypt the database connection string.

You distribute the shortcut file to the database users who are to access the model. The users then have an encrypted string that prevents them from directly accessing the database using other tools.

**Learn More:**

- [Create Project Shortcut](#)<sup>142</sup>

## 3.2 File Based Repositories

In the Desktop and Professional editions of Enterprise Architect, you create Enterprise Architect projects as .eap files. If you prefer, you can also create your projects as .eap files in the Corporate and suite editions of Enterprise Architect.

A default project file (*EABase.EAP*) is supplied in the Enterprise Architect installer and is automatically stored in your Enterprise Architect installation directory; you can copy this as the base for your own projects. You can also create your own base projects, and copy existing operational projects.

Topic	Detail	See also
<b>Create .EAP Project Files</b>	<p>Select one of:</p> <ul style="list-style-type: none"> <li>• <b>File   New Project</b> option</li> <li>• <b>New Project</b> option on the Open Enterprise Architect Project dialog</li> <li>• <b>Create a New Project</b> option on the Start Page</li> </ul> <p>All of these options display the New Project dialog; select a directory and enter a file name for your project</p> <p>Once the project has been saved, the Select Model(s) dialog displays, which makes a selection of Model Packages available; select the Model Packages to include</p> <p>Enterprise Architect adds a model containing the selected Model Packages to the Project Browser</p>	<a href="#">Model Wizard</a> <sup>[520]</sup>
<b>Default EABase.EAP Installation directories</b>	<p>The default installation directories, depending on which version you have installed, are:</p> <ul style="list-style-type: none"> <li>• Registered version: C:\Program Files\Sparx Systems\EA</li> <li>• Trial version: C:\Program Files\Sparx Systems\EA Trial</li> <li>• Lite version: C:\Program Files\Sparx Systems\EA Lite</li> </ul> <p>Having copied the base project as a template for your own project, you can rename it</p>	<a href="#">Copy a Base Project</a> <sup>[147]</sup> <a href="#">Rename a Project</a> <sup>[420]</sup>
<b>Configure Project</b>	<p>Having created your project, you can set a range of project parameters to define defaults, tailor the project to particular coding languages, and ensure consistent development and use of the project</p>	<a href="#">The Settings Menu</a> <sup>[98]</sup> <a href="#">Defaults and User Settings</a> <sup>[119]</sup>
<b>Create Custom Templates</b>	<p>You can customize any Enterprise Architect project as a template project with company standards, tutorials, frameworks and any other common piece of modeling already in-built; with careful planning you can save yourself many hours of work at project start-up</p>	<a href="#">Incorporate Model Templates</a> <sup>[108]</sup>
<b>Copy Existing Project</b>	<p>A Base project contains templates and reference data to enable you to develop your own project quickly</p> <p>You can also copy an operational .EAP project file to enable</p>	<a href="#">Copy Existing Projects</a> <sup>[148]</sup>

Topic	Detail	See also
	separate development by team members, or to create an evaluation or distribution version of the project	

**Notes:**

- You can also add Model Packages to a project using the **New Model From Pattern** icon in the Project Browser toolbar

**3.2.1 Copy a Base Project**

You can copy an existing project as a new project. When using an existing project as the template for a new one, it is important to use this method, rather than simply copying the file using Windows Explorer. This process resets all the unique identifiers for packages and elements, so that your new project is truly unique - otherwise it is simply an exact copy of the source project.

**Access:** [Start Page: Copy a Base Project](#)

**Use to:**

- Create a project already largely set up, from a template project containing company standards, tutorials, frameworks and any other common piece of modeling
- Ensure all unique ID's ( GUIDS ) in a model are reset when starting a new model from an existing master

**How to:**

Step	Action	See also
1	On the Enterprise Architect Start Page, click on the <b>Copy a Base Project</b> option The Create New Enterprise Architect Project dialog displays	<a href="#">Start Page</a> <sup>[70]</sup>
2	In the <b>Model Project</b> field, select the project that is the base template The field defaults to EABase.eap, the default base project provided in the Enterprise Architect installer, but you can click on the <b>Browse</b> button and locate any other custom project file to use	<a href="#">Incorporate Model Templates</a> <sup>[1089]</sup>
3	In the <b>New Project</b> field, click on the <b>Browse</b> button and select the file path for saving your project If this is to be a shared project, store the file on a shared network resource such as a Network Server or Workgroup Server	
4	To replace all GUIDs from the source model with fresh GUIDs in the new model, select the <b>Reset New Project GUIDs</b> checkbox However, if the new project is based on one that is already under version control, we recommended that you deselect this checkbox to prevent duplication of packages when the <i>Get Latest</i> facility is used	<a href="#">Package Version Control Menu</a> <sup>[279]</sup>
5	Click on the <b>Create Project</b> button to create your project	

### 3.2.2 Copy Existing Project

You can copy an operational .EAP project file to a new file location under a new name.

**Access:** **File | Save Project Copy**

**Use to:**

- Provide separate copies for individual team members
- Create an evaluation or distribution version of the project

**How to:**

To create a copy of a project, follow the steps below:

Step	Action	See also
1	Select the <b>Save Project Copy</b> menu option The Save Enterprise Architect Project Copy dialog displays	
2	In the <b>Target Project</b> field, type the new project filename You can either type in the file path as well, or click on the <b>Browse</b> button and browse for the required file path	
3	If this copy is to be used for a different project, select the <b>Reset New Project GUIDs</b> checkbox This ensures that all components of the new project have different IDs to their counterparts in the source project	
4	Click on the <b>Save As</b> button to save the new project	

### 3.3 Server Based Repositories

If you purchase the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions, you can upsize the .eap templates (such as EABase.eap) or any existing .eap project to a DBMS data repository.

A DBMS repository enables you to support larger models with more concurrently connected users.

Topic	Detail	See also
<b>Supported DBMSs</b>	<ul style="list-style-type: none"> <li>• SQL Server 2000, 2005 or 2008</li> <li>• MySQL 4 or 5</li> <li>• PostgreSQL 7, 8 or 9</li> <li>• Adaptive Server Anywhere 8 or 9, or SQL Anywhere 10, 11 or 12</li> <li>• Access 2007</li> <li>• Progress OpenEdge</li> <li>• MSDE or</li> <li>• Oracle 9i, 10g or 11g</li> </ul>	
<b>Upsize Project to DBMS Repository</b>	<p>To upsize the Enterprise Architect models (either existing or template) to use your selected DBMS:</p> <ol style="list-style-type: none"> <li>1. Install the DBMS software; how you do this is explained in your DBMS documentation and beyond the scope of the Enterprise Architect documentation</li> <li>2. Create a repository and run a script supplied by Sparx Systems to create the required tables</li> <li>3. Set up an ODBC driver to enable connection to the repository(not all DBMSs require this)</li> <li>4. Open Enterprise Architect and perform a Project Integrity Check on the project .eap file (existing or template); this ensures the data is clean before uploading</li> <li>5. In Enterprise Architect, open the Project Transfer dialog, connect to the .EAP file and the repository, and transfer the project data from the .EAP file to the DBMS repository</li> </ol> <p>You cannot move a model from a source .EAP file of a version earlier than 3.5.0.</p>	<p><a href="#">Create a Repository</a><sup>[149]</sup></p> <p><a href="#">Sparx Systems Scripts</a></p> <p><a href="#">Set Up an ODBC Driver</a><sup>[155]</sup></p> <p><a href="#">Check Project Data Integrity</a><sup>[416]</sup></p> <p><a href="#">Connect to a Data Repository</a><sup>[162]</sup></p> <p><a href="#">Perform a Project Data Transfer</a><sup>[345]</sup></p>

#### 3.3.1 Create a Repository

A repository hosted in a DBMS system requires some initial setup and configuration, and the actual steps required differ depending on the DBMS chosen. In general you must setup your database management system, configure a new database and then populate that database using the scripts provided by Sparx Systems. As a final step, you populate the new repository using a project transfer of the base model.

For more information and the steps involved for specific systems, follow the links below:

Topic	Link
MySQL	<a href="#">Create a MySQL Data Repository</a> <sup>[150]</sup>
Access	<a href="#">Create An Access Data Repository</a> <sup>[150]</sup>
SQL Server	<a href="#">Create a SQL Server Data Repository</a> <sup>[151]</sup>
Oracle	<a href="#">Create an Oracle Data Repository</a> <sup>[152]</sup>
PostgreSQL	<a href="#">Create a PostgreSQL Data Repository</a> <sup>[152]</sup>
Adaptive Server Anywhere	<a href="#">Create an Adaptive Server Anywhere Data Repository</a> <sup>[153]</sup>
MSDE Server	<a href="#">Create an MSDE Server Data Repository</a> <sup>[153]</sup>
Progress OpenEdge	<a href="#">Create a Progress OpenEdge Data Repository</a> <sup>[154]</sup>

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)

### 3.3.1.1 Access 2007 Repository

The process of creating an Access 2007 repository is very simple. Using Access 2007, open the .EAP file and allow Access to convert it to a .ACCDB file. This forms the Access 2007 repository.

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- If you do not have Access 2007, you can download the Access Database Engine from the [Microsoft downloads site](#)
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

### 3.3.1.2 MySQL Repository

Creating a MySQL database is beyond the scope of this User Guide - refer to your MySQL documentation for assistance.

Having created your MySQL database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect.

You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**Third Party Tools:**

If you are unfamiliar with MySQL and DBMS systems in general, you might want to consider a suitable front end tool. MySQL Administrator is one such tool, providing a convenient graphical user interface to enable the creation of databases, execution of scripts, backups and restores.

You might, therefore:

1. Run MySQL Administrator and create a new database
2. Run MySQL Query Browser, and open and execute the MySQL repository script

After creating a MySQL data repository in Enterprise Architect, you must set up the MySQL ODBC drivers.

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)
- [MySQL Workbench \(including MySQL Administrator\) download site](#)
- [MySQL ODBC Driver](#)<sup>[155]</sup>

### 3.3.1.3 SQL Server Repository

Before creating a SQL Server data repository, you must have SQL Server and MDAC 2.6 or higher installed, and access permission to create a new database. Creating a SQL Server database is beyond the scope of this User Guide - refer to your SQL Server documentation for assistance.

Having created your SQL Server database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**How to:**

If you are unfamiliar with SQL Server and DBMS systems in general, you might want to consider a suitable front end tool, such as SQL Enterprise Manager. The following example shows how to create the repository in SQL Enterprise Manager.

Step	Action
1	In SQL Enterprise Manager, locate the server on which to create your new Enterprise Architect model; for example: DBSERVER02\SQLEXPRESS
2	Right-click and choose the <b>New Database</b> context menu option
3	Enter a suitable name for the database. Set any file options as required Ensure that the database collation is set to the alphabet you use, such as Latin or Cyrillic, and case-insensitive
4	Click on the database to select it, then select the <b>New Query</b> menu option
5	In the Query window, use the Open File dialog to locate the supplied Enterprise Architect SQL Server Model script file
6	Click on the <b>Open</b> button. In the drop-down menu, check that you have selected the correct database to run the script in
7	Click on the <b>Execute</b> button; SQL Server executes the script, which creates the base model for an Enterprise Architect project

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)

### 3.3.1.4 Oracle Data Repository

Before creating an Oracle data repository, you must have the appropriate version of Oracle (9i, 10g or 11g) and MDAC 2.6 or higher installed, and access permission to create a new database. Creating an Oracle database is beyond the scope of this User Guide - refer to your Oracle documentation for assistance.

Having created your Oracle database, use the SQL script provided by Sparx Systems to create the required table definitions and indexes for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**Third Party Tools:**

If you are unfamiliar with Oracle and DBMS systems in general, you might want to consider a suitable front end tool. You could connect to the database and execute the scripts with a program such as Oracle SQL\*Plus or SQL Plus Worksheet.

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)

### 3.3.1.5 PostgreSQL Repository

Creating a PostgreSQL database is beyond the scope of this User Guide - refer to your PostgreSQL documentation for assistance.

Having created your PostgreSQL database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**Third Party Tools:**

If you are unfamiliar with PostgreSQL and DBMS systems in general, you might want to consider a suitable front end tool. One such tool is *pgAdminIII*. It provides a convenient graphical user interface to enable creation of databases, execution of scripts and restores.

After creating a PostgreSQL data repository in Enterprise Architect, you must set up the PostgreSQL and PostgreSQL ODBC drivers.

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)
- [pgAdminIII Download Site](#)
- [Set up a PostgreSQL ODBC Driver](#)<sup>[156]</sup>

### 3.3.1.6 Adaptive Server Anywhere Repository

Creating an ASA database is beyond the scope of this User Guide - refer to your Sybase Adaptive Server Anywhere documentation for assistance.

Having created your ASA database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**Third Party Tools:**

If you are unfamiliar with ASA and DBMS systems in general, you might want to consider a suitable front end tool. Sybase Central is one such tool, that can be installed along with the DBMS. It provides a convenient graphical user interface to enable creation of databases, execution of scripts and restores.

After creating an ASA data repository in Enterprise Architect, you must set up the ASA ODBC driver.

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)
- [Setup an Adaptive Server Anywhere ODBC Driver](#)<sup>[159]</sup>

### 3.3.1.7 MSDE Server Repository

Before creating an MSDE data repository, you must have MSDE Server and MDAC 2.6 or higher installed. Creating an MSDE Server database is beyond the scope of this User Guide - refer to your MSDE Server documentation for assistance.

Having created your MSDE Server database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)

- Corporate edition Resources page (Trial users)

**How to:**

- Create the MSDE Server repository in the same way as a SQL Server repository

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)
- [Create an SQL Server Data Repository](#)<sup>[15]</sup>

### 3.3.1.8 Progress OpenEdge Repository

Before creating a Progress OpenEdge data repository, you must have OpenEdge 10.0B03, 10.1B01 or later, and MDAC 2.6 or higher installed, and access permission to create a new database. Creating an OpenEdge database is beyond the scope of this User Guide - refer to your OpenEdge documentation for assistance.

Having created your OpenEdge database, use the SQL script provided by Sparx Systems to create the required table definitions for Enterprise Architect. You can obtain the scripts from the Sparx Systems website, on the:

- Registered Corporate edition Resources page (Registered users)
- Corporate edition Resources page (Trial users)

**How to:**

Step	Action
1	Run proenv from the OpenEdge menu: <b>Start   Programs   OpenEdge   proenv</b>
2	Create the database: <code>prodb &lt;database_name&gt; empty.</code>
3	Start the database server: <code>proserve &lt;database_name&gt; -S &lt;port_number&gt;</code>
4	Open Data Administration to add a user: <code>prowin32 -db &lt;database_name&gt; -S &lt;port_number&gt; -p _admin -rx</code>
5	Select <b>Admin   Security   Edit User List</b> .
6	Close Data Administration.
7	Open the SQL Explorer Tool, connect as <i>sysprogress</i>
8	Add a user: <code>create user 'user', 'password'; commit;</code>
9	Grant privileges: <code>grant dba, resource to &lt;user&gt;; commit;</code>

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- Ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic

**Learn More:**

- [Registered User's Scripts page](#)
- [Trial User's Scripts Page](#)

**3.3.2 Set Up an ODBC Driver for a Connection to a Repository**

Setting up an ODBC driver is only necessary for certain database management systems, which require specific set-up in order to operate as a repository.

Other database management systems connect through OLE DB and do not require a driver. However, you can connect to an Oracle repository using either OLE DB or an ODBC driver; if you intend to connect through the ODBC driver, you must first set it up.

For more information and the steps involved for specific systems, follow the links below:

Topic	Link
MySQL	<a href="#">Set up a MySQL ODBC Driver</a> <sup>[155]</sup>
PostgreSQL	<a href="#">Set up a PostgreSQL ODBC Driver</a> <sup>[156]</sup>
Adaptive Server Anywhere	<a href="#">Set up an Adaptive Server Anywhere ODBC Driver</a> <sup>[159]</sup>
Progress OpenEdge	<a href="#">Set up a Progress OpenEdge ODBC Driver</a> <sup>[160]</sup>
Oracle	<a href="#">Set up an Oracle ODBC Driver</a> <sup>[161]</sup>

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C:\Windows\SysWOW64\odbcad32.exe

**3.3.2.1 MySQL ODBC Driver**

This topic explains how to set up a MySQL ODBC driver.

**Prerequisites:**

You must first have installed:

- Microsoft MDAC components
- MySQL DBMS and repository
- MySQL ODBC driver software version 5.1.5 (version 3.51.14 creates problems in incorporating tests in elements)

**Use to:**

- Set up the MySQL ODBC driver so that you can connect to your MySQL repository in Enterprise Architect

**How to:**

Step	Action
1	Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option The ODBC Data Source Administrator window displays
2	Click on the <b>Add</b> button The Create New Data Source dialog displays, enabling you to add a new DSN
3	Select <b>MySQL ODBC 5.1 Driver</b> from the list
4	Click on the <b>Finish</b> button The MySQL Connector/ODBC dialog displays
5	Enter the following configuration details: <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• A description (optional)</li> <li>• The host address of the DBMS server</li> <li>• User name and password</li> <li>• The database name on the selected server</li> </ul>
6	To set the advanced options, click on the <b>Details&gt;&gt;</b> button
7	Select the following checkboxes (where provided): <ul style="list-style-type: none"> <li>• <b>Return matched rows instead of affected rows</b> (Connection or Cursors/Results tab)</li> <li>• <b>Allow big result sets</b> (Connection tab)</li> </ul>
8	Click on the <b>Test Connection</b> button to confirm that the details are correct
9	<ul style="list-style-type: none"> <li>• If the test succeeds, click on the <b>OK</b> button to complete the configuration</li> <li>• If the test does not succeed, review your settings</li> </ul>

Your MySQL connection is now available to use in Enterprise Architect.

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C: `Windows\SysWOW64\odbcad32.exe`

**Learn More:**

- [Create MySQL Repository](#) <sup>[150]</sup>
- [Connect To MySQL Data Repository](#) <sup>[163]</sup>

### 3.3.2.2 PostgreSQL ODBC Driver

This topic explains how to set up a PostgreSQL ODBC driver.

**Prerequisites:**

You must first have installed:

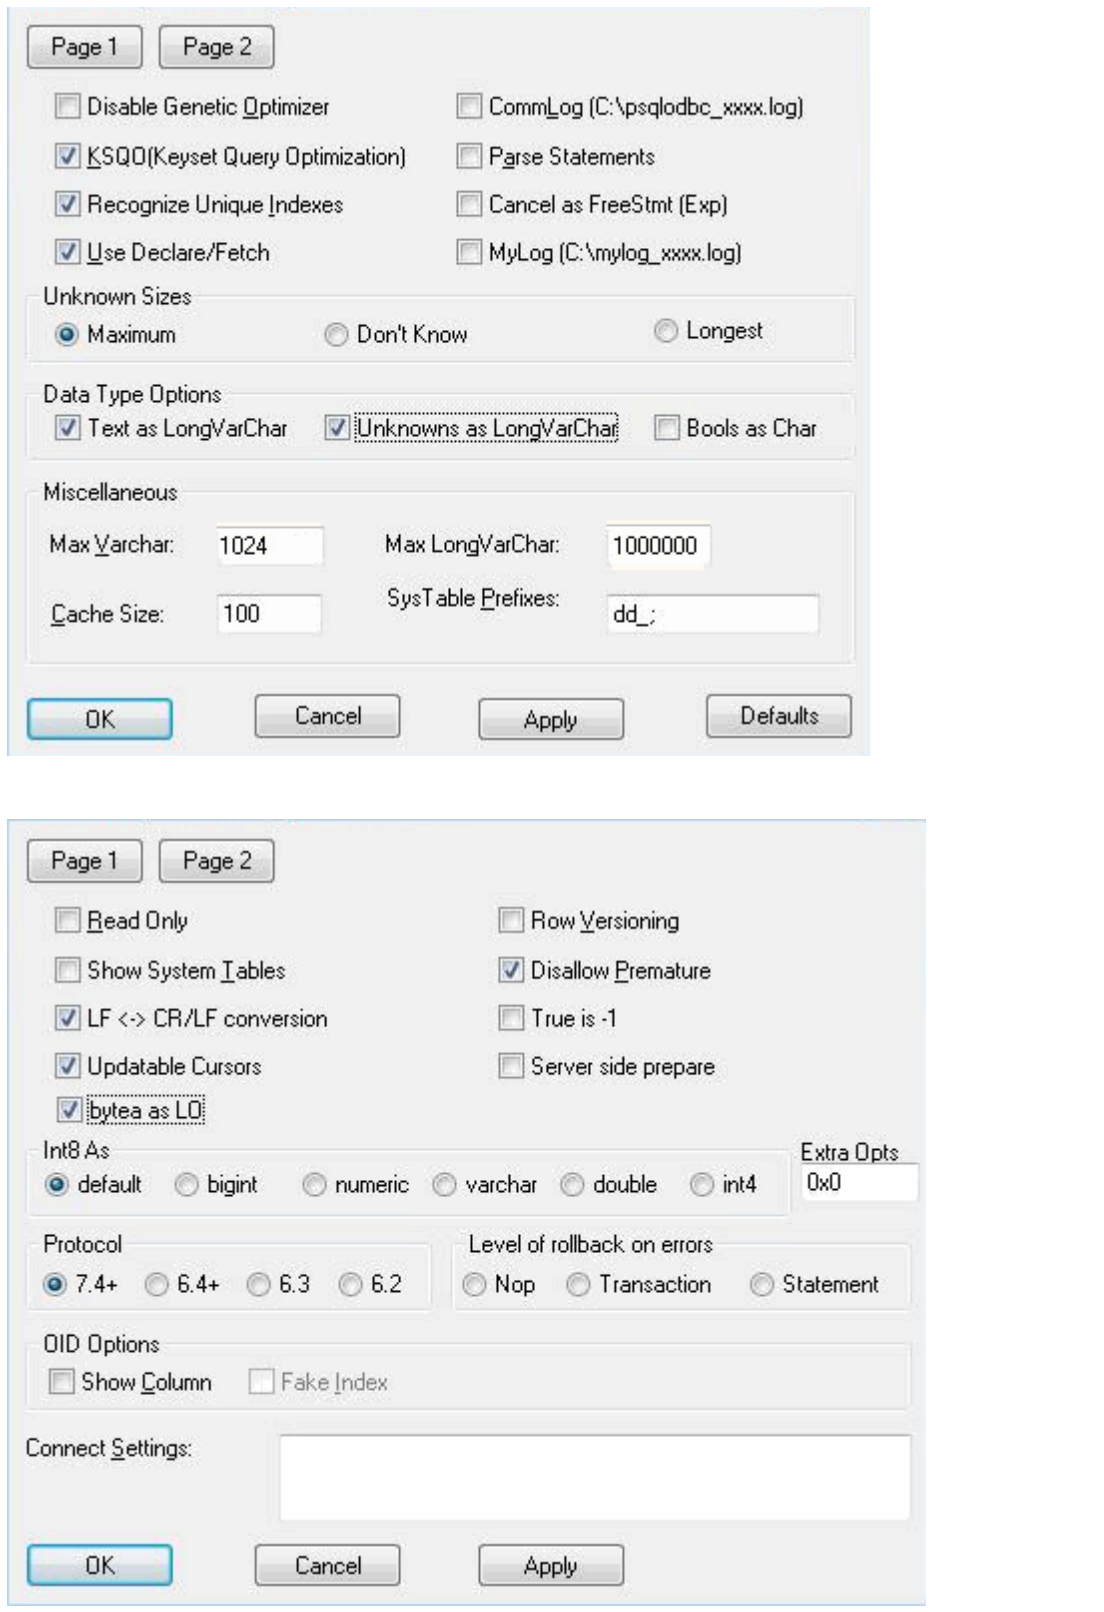

- Microsoft MDAC components
- PostgreSQL DBMS and repository
- PostgreSQL ODBC driver software version 7.03.01.00 or above (note that versions 8.3.4 and 8.4.1 of the PostgreSQL ODBC Driver are not supported)

**Use to:**

- Set up the PostgreSQL ODBC driver so that you can connect to your PostgreSQL repository in Enterprise Architect

**How to:**

Step	Action
1	Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option The ODBC Data Source Administrator window displays
2	Click on the <b>Add</b> button The Create New Data Source dialog displays, enabling you to add a new DSN
3	Select <b>PostgreSQL UNICODE</b> from the list
4	Click on the <b>Finish</b> button The Postgre SQL Connector/ODBC dialog displays
5	Enter the following configuration details: <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• The actual name of the database</li> <li>• The host address of the DBMS server</li> <li>• User name</li> <li>• A description (optional)</li> <li>• The password</li> </ul>
6	To set the advanced options, click on the <b>Datasource</b> button and set the options on Page 1 and Page 2 as shown below:

Step	Action
	
7	<p>If you are using PostgreSQL version 8+, on Page 2 select:</p> <ul style="list-style-type: none"> <li>The <b>Disallow Premature</b> checkbox</li> </ul>

Step	Action
	<ul style="list-style-type: none"> <li>In the Protocol panel, the <b>7.4+</b> radio button</li> </ul>
<b>8</b>	Click on the <b>OK</b> button to complete the configuration

Your PostgreSQL connection is now available to use in Enterprise Architect.

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C: *Windows\SysWOW64\odbcad32.exe*

**Learn More:**

- [Create a PostgreSQL Repository](#)<sup>[152]</sup>
- [Connect To a PostgreSQL Data Repository](#)<sup>[168]</sup>

### 3.3.2.3 ASA ODBC Driver

This topic explains how to set up an Adaptive Server Anywhere (ASA) ODBC driver.

**Prerequisites:**

You must first have installed:

- Microsoft MDAC components
- Adaptive Server Anywhere - SQL Anywhere Studio 8 or higher, and created a repository
- ASA ODBC driver software (installed with the ASA DBMS)

**Use to:**

- Set up the ASA ODBC driver so that you can connect to your ASA repository in Enterprise Architect

**How to:**

Step	Action
<b>1</b>	Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option The ODBC Data Source Administrator window displays
<b>2</b>	Click on the <b>Add</b> button The Create New Data Source dialog displays, enabling you to add a new DSN
<b>3</b>	Select <b>Adaptive Server Anywhere</b> or <b>SQL Anywhere</b> from the list
<b>4</b>	Click on the <b>Finish</b> button The ASA Connector/ODBC dialog displays
<b>5</b>	Enter the following configuration details: <ul style="list-style-type: none"> <li>A data source name for the connection, on the ODBC tab</li> <li>User name and password on the Login tab (dba, sql are the defaults when ASA is installed)</li> <li>The server name and the path to the database, on the Database tab</li> </ul>

Step	Action
	<ul style="list-style-type: none"> <li>The network protocol on the Network tab (if the database is on a network location)</li> </ul>
6	Return to the ODBC tab and test the connection
7	Click on the <b>OK</b> button to complete the configuration

Your ASA connection is now available to use in Enterprise Architect.

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C: `Windows\SysWOW64\odbcad32.exe`

**Learn More:**

- [Create an Adaptive Server Anywhere Repository](#)<sup>[153]</sup>
- [Connect To an ASA Data Repository](#)<sup>[170]</sup>

### 3.3.2.4 Progress OpenEdge ODBC Driver

This topic explains how to set up a Progress OpenEdge ODBC driver.

**Prerequisites:**

You must first have installed:

- Microsoft MDAC components
- OpenEdge DBMS and repository
- DataDirect ODBC driver for OpenEdge software (version 4.20 minimum)

**Use to:**

- Set up the Progress OpenEdge ODBC driver so that you can connect to your OpenEdge repository in Enterprise Architect

**How to:**

Step	Action
1	Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option The ODBC Data Source Administrator window displays
2	Click on the <b>Add</b> button The Create New Data Source dialog displays, enabling you to add a new DSN
3	Select <b>DataDirect/OpenEdge SQL Driver</b> from the list
4	Click on the <b>Finish</b> button The DSN Configuration dialog displays
5	Enter the following configuration details: <ul style="list-style-type: none"> <li>A data source name for the connection</li> </ul>

Step	Action
	<ul style="list-style-type: none"> <li>• A description (optional)</li> <li>• The host name and port number of the DBMS server</li> <li>• The database name on the selected server</li> <li>• The User ID</li> </ul>
6	Click on the <b>Test Connect</b> button to confirm that the details are correct
7	<ul style="list-style-type: none"> <li>• If the test succeeds, click on the <b>OK</b> button to complete the configuration</li> <li>• If the test does not succeed, review your settings</li> </ul>

Your OpenEdge connection is now available to use in Enterprise Architect.

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C: `Windows\SysWOW64\odbcad32.exe`

**Learn More:**

- [Create a PostgreSQL Repository](#)<sup>[152]</sup>
- [Connect To a PostgreSQL Data Repository](#)<sup>[168]</sup>

### 3.3.2.5 Oracle ODBC Driver

This topic explains how to set up an Oracle ODBC driver.

**Prerequisites:**

You must first have installed:

- Microsoft MDAC components
- Oracle DBMS and repository

**Use to:**

- Set up the Oracle ODBC driver so that you can connect to your Oracle repository in Enterprise Architect, in preference to using an OLE DB connection

**How to:**

Step	Action
1	Select the Windows™ <b>Control Panel   Administrative Tools   Data Sources (ODBC)</b> option The ODBC Data Source Administrator window displays
2	Click on the <b>Add</b> button The Create New Data Source dialog displays, enabling you to add a new DSN
3	Select <b>Oracle in OraDB11g_home1</b> from the list (or similar, depending on the ODBC installation)
4	Click on the <b>Finish</b> button The Oracle ODBC Driver Configuration dialog displays

Step	Action
5	Enter the following configuration details: <ul style="list-style-type: none"> <li>• A data source name for the connection</li> <li>• A description (optional)</li> <li>• The TNS Service Name (click on the drop down arrow and select from the list)</li> <li>• User ID</li> </ul>
6	Click on the <b>Test Connection</b> button and enter the Oracle user password to confirm that the details are correct
7	<ul style="list-style-type: none"> <li>• If the test succeeds, click on the <b>OK</b> button to complete the configuration</li> <li>• If the test does not succeed, review your settings</li> </ul>

Your Oracle connection is now available to use in Enterprise Architect.

**Notes:**

- Enterprise Architect requires 32-bit ODBC drivers to connect to a repository through ODBC; to set up the ODBC configuration on 64-bit clients, run the 32-bit ODBC Data Source Administrator from C: `Windows\SysWOW64\odbcad32.exe`

**Learn More:**

- [Create an Oracle Server Repository](#)<sup>[152]</sup>
- [Connect to an Oracle Data Repository \(ODBC\)](#)<sup>[165]</sup>

### 3.3.3 Connect to a Data Repository

This topic describes how to connect to a data repository to:

- Access an Enterprise Architect model in the repository
- Reverse engineer a database schema into a model using the ODBC driver provided by the DBMS vendor

To connect to a repository, you must have the usual SELECT, UPDATE, INSERT and DELETE permissions.

For more information and the steps involved for specific systems, follow the links below:

SQL Server	<a href="#">Connect To a SQL Server Data Repository</a> <sup>[164]</sup>
Oracle	<a href="#">Connect To an Oracle Data Repository</a> <sup>[165]</sup>
PostgreSQL	<a href="#">Connect To a PostgreSQL Data Repository</a> <sup>[166]</sup>
Adaptive Server Anywhere	<a href="#">Connect To an Adaptive Server Anywhere Data Repository</a> <sup>[170]</sup>
MSDE Server	<a href="#">Connect To an MSDE Server data Repository</a> <sup>[171]</sup>
Progress OpenEdge	<a href="#">Connect To a Progress OpenEdge Data Repository</a> <sup>[171]</sup>

**Learn More:**

- [Import Database Schema Using ODBC](#)<sup>[138]</sup>

### 3.3.3.1 MySQL Data Repository

This topic explains how to connect to a MySQL data repository in Enterprise Architect.

**Access:** **File | Open Project ( Ctrl+O )**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create a MySQL Repository
- Set up a MySQL ODBC driver

**How to:**

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
2	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list
4	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field From the list, select the ODBC driver you have set up to connect to your MySQL repository
6	If required, type in a <b>User</b> name and <b>Password</b>
7	If required, type in an initial catalog
8	Click on the <b>Test Connection</b> button to confirm that the details are correct
9	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays
10	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
11	If required, select the <b>Encrypt Connection String</b> checkbox This encrypts and hides the connection details of the database from the users that the connection string is given to
12	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
13	If required, select the <b>Use WAN Optimization</b> checkbox

Step	Action
	To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time  If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 17
14	In the <b>Server</b> field, type the network name or address of the optimizer server
15	In the <b>Port</b> field, type the port on which the server is running on the remote machine
16	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
17	Click on the <b>OK</b> button to complete the configuration

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Create a MySQL Repository](#)<sup>[150]</sup>
- [Set up a MySQL ODBC driver](#)<sup>[155]</sup>
- [The WAN Optimizer](#)<sup>[184]</sup>
- [Open a Project](#)<sup>[139]</sup>

**3.3.3.2 SQL Server Data Repository**

This topic explains how to connect to a SQL Server data repository in Enterprise Architect.

**Access:** **File | Open Project (Ctrl+O)**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create a SQL Server Repository

**How to:**

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
2	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
3	Select <b>Microsoft OLE DB Provider for SQL Server</b> from the list
4	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays

Step	Action
5	Type in the server details, including Server Name, User Name and Password.
6	Click on the <b>Select the database on the server</b> option and on the drop-down arrow. From the list, select the model to connect to.
7	Click on the <b>Test Connection</b> button to confirm that the details are correct
8	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays
9	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
10	If required, select the <b>Encrypt Connection String</b> checkbox This encrypts and hides the connection details of the database from the users that the connection string is given to
11	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
12	If required, select the <b>Use WAN Optimization</b> checkbox To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time If you select this checkbox, complete the next two fields (see your administrator for the correct values); otherwise go to step 15
13	In the <b>Server</b> field, type the network name or address of the optimizer server
14	In the <b>Port</b> field, type the port on which the server is running on the remote machine
15	Click on the <b>OK</b> button to complete the configuration

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Create a SQL Server Repository](#)<sup>[15]</sup>
- [The WAN Optimizer](#)<sup>[18]</sup>

**3.3.3.3 Oracle Data Repository (ODBC)**

This topic explains how to connect to an Oracle 9i, 10g or 11g data repository in Enterprise Architect using an Oracle ODBC driver.

You can also connect to the Oracle repository using OLE DB.

**Access:** **File | Open Project (Ctrl+O)**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create an Oracle Repository
- Set up an Oracle ODBC driver

**How to:**

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
2	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list
4	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays
5	In the <b>Data source</b> field, click on the drop-down arrow and select the data source name
6	Type in the <b>User</b> name and <b>Password</b>
7	Click on the <b>Test Connection</b> button to confirm that the details are correct
8	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; Oracle prompts you for the password
9	Type in the password The Connection Name and Type dialog displays
10	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
11	If required, select the <b>Encrypt Connection String</b> checkbox This encrypts and hides the connection details of the database from the users that the connection string is given to
12	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
13	If required, select the <b>Use WAN Optimization</b> checkbox To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time If you select this checkbox, complete the next two fields (see your administrator for the correct values); otherwise go to step 16
14	In the <b>Server</b> field, type the network name or address of the optimizer server
15	In the <b>Port</b> field, type the port on which the server is running on the remote machine

Step	Action
16	Click on the <b>OK</b> button to complete the configuration

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Create an Oracle Data Repository](#)<sup>[152]</sup>
- [Set up an Oracle ODBC Driver](#)<sup>[167]</sup>

- [Open a Project](#)<sup>[139]</sup>

**3.3.3.4 Oracle Data Repository (OLE DB)**

This topic explains how to connect to an Oracle 9i, 10g or 11g data repository in Enterprise Architect using OLE DB.

You can also connect to the Oracle repository using an Oracle ODBC driver.

**Access:** **File | Open Project (Ctrl+O)**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create an Oracle Repository

**How to:**

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
2	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
3	Select <b>Oracle Provider for OLE DB</b> from the list Do not select <b>Microsoft OLE DB Provider for Oracle</b> ; Enterprise Architect might not work as expected
4	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays
5	In the <b>Data source</b> field, click on the drop-down arrow and select the data source name (the service name of the Oracle database)

Step	Action
6	Type in the <b>User</b> name and <b>Password</b>
7	Click on the <b>Test Connection</b> button to confirm that the details are correct
8	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; the Connection Name and Type dialog displays
9	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
10	If required, select the <b>Encrypt Connection String</b> checkbox  This encrypts and hides the connection details of the database from the users that the connection string is given to
11	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded  With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
12	If required, select the <b>Use WAN Optimization</b> checkbox  To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time  If you select this checkbox, complete the next two fields (see your administrator for the correct values); otherwise go to step 15
13	In the <b>Server</b> field, type the network name or address of the optimizer server
14	In the <b>Port</b> field, type the port on which the server is running on the remote machine
15	Click on the <b>OK</b> button to complete the configuration

**Notes:**

### 3.3.3.6 ASA Data Repository

This topic explains how to connect to an Adaptive Server Anywhere data repository in Enterprise Architect.

**Access:** **File | Open Project (Ctrl+O)**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create an ASA Data Repository
- Set up an ASA ODBC driver

**How to:**

Step	Action
1	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
2	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
3	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list
4	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays
5	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field From the list, select the ODBC driver you have set up to connect to your ASA repository
6	Click on the <b>Test Connection</b> button to confirm that the details are correct
7	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; the Connection Name & Type dialog displays
8	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
9	If required, select the <b>Encrypt Connection String</b> checkbox This encrypts and hides the connection details of the database from the users that the connection string is given to
10	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded;

Step	Action
	instead, only the parts that are necessary to display the visible portion of the tree are loaded With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
11	If required, select the <b>Use WAN Optimization</b> checkbox To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 15
12	In the <b>Server</b> field, type the network name or address of the optimizer server
13	In the <b>Port</b> field, type the port on which the server is running on the remote machine
14	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
15	Click on the <b>OK</b> button to complete the configuration

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Create an Adaptive Server Anywhere Repository](#)<sup>[153]</sup>
- [Set up an ASA ODBC Driver](#)<sup>[159]</sup>
- [The WAN Optimizer](#)<sup>[184]</sup>
- [Open a Project](#)<sup>[139]</sup>

**3.3.3.7 MSDE Server Data Repository**

To connect to an MSDE Server Data Repository, follow the steps in [Connect to an SQL Server Repository](#)<sup>[164]</sup>.

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**3.3.3.8 Progress OpenEdge Repository**

This topic explains how to connect to a Progress OpenEdge data repository in Enterprise Architect.

**Access:** **File | Open Project (Ctrl+O)**

**Use to:**

- Connect to the data repository so that you can open a project held in the repository

**Prerequisites:**

- Create a Progress OpenEdge Repository
- Set up a Progress OpenEdge ODBC driver

**How to:**

<b>Step</b>	<b>Action</b>
<b>1</b>	In the Open Project dialog, select the <b>Connect to Server</b> checkbox
<b>2</b>	Click on the ( ... ) (Browse) button The Data Link Properties dialog displays
<b>3</b>	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list
<b>4</b>	Click on the <b>Next&gt;&gt;</b> button The Connection tab displays
<b>5</b>	Click on the <b>Use data source name</b> radio button and on the drop-down arrow in its field From the list, select the ODBC driver you have set up to connect to your Progress OpenEdge repository
<b>6</b>	Enter the <b>User Name</b> and <b>Password</b>
<b>7</b>	Enter the <b>Initial catalog</b>
<b>8</b>	Click on the All tab and double-click on <b>Extended Properties</b>
<b>9</b>	Click on the Connection tab again
<b>10</b>	In the <b>Property Value</b> field, edit the value to: <b>DefaultSchema=PUB</b> Click on the <b>Test Connection</b> button to confirm that the details are correct
<b>11</b>	If the test does not succeed, revise your settings If the test succeeds, click on the <b>OK</b> button; the Logon to Progress dialog displays
<b>12</b>	Check the details to ensure that they are correct Click on the <b>OK</b> button; the Connection Name and Type dialog displays
<b>13</b>	Give the connection a suitable name so that you can recognize it in the Recent Projects panel on the Open Project dialog
<b>14</b>	If required, select the <b>Encrypt Connection String</b> checkbox This encrypts and hides the connection details of the database from the users that the connection string is given to
<b>15</b>	If required, select the <b>Lazy Load</b> checkbox to not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded With this setting, the model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model
<b>16</b>	If required, select the <b>Use WAN Optimization</b> checkbox To improve performance over a Wide Area Network, remote database calls can be routed through a WAN Optimizer that compresses the data returned from the repository, reducing transfer time If you select this checkbox, complete the next three fields (see your administrator for the correct values); otherwise go to step 20
<b>17</b>	In the <b>Server</b> field, type the network name or address of the optimizer server
<b>18</b>	In the <b>Port</b> field, type the port on which the server is running on the remote machine

Step	Action
19	In the <b>DSN</b> field, type the data source name of the database as it appears on the remote machine.
20	Click on the <b>OK</b> button to complete the configuration

**Notes:**

- This feature is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Create a Progress OpenEdge Repository](#)<sup>[154]</sup>
- [Set up a Progress OpenEdge ODBC Driver](#)<sup>[160]</sup>
- [The WAN Optimizer](#)<sup>[184]</sup>

### 3.3.4 Upsizing

This topic explains how you upsize your .EAP project or template to one of a range of DBMS repositories.

For more information and the steps involved for specific systems, follow the links below:

Topic	Link
MySQL	<a href="#">Upsize to MySQL</a> <sup>[173]</sup>
Access	<a href="#">Upsize to Access 2007</a> <sup>[175]</sup>
SQL Server	<a href="#">Upsize to SQL Server</a> <sup>[177]</sup>
Oracle	<a href="#">Upsize to Oracle 9i, 10g or 11g</a> <sup>[178]</sup>
PostgreSQL	<a href="#">Upsize to PostgreSQL</a> <sup>[180]</sup>
Adaptive Server Anywhere	<a href="#">Upsize to Sybase ASA</a> <sup>[181]</sup>
MSDE Server	<a href="#">Upsize to MSDE</a> <sup>[183]</sup>
Progress OpenEdge	<a href="#">Upsize to Progress OpenEdge</a> <sup>[183]</sup>

**Notes:**

- You cannot move a model from a source .EAP file of a version earlier than 3.5.0
- Before proceeding, ensure MDAC 2.6 or higher is installed on your system

#### 3.3.4.1 Upsize to MySQL

This topic explains how to upsize your .EAP project or template for use with MySQL.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Install MySQL components
- Stage 3: Select table type
- Stage 4: Create an empty database repository
- Stage 5: Set up the ODBC Driver

- Stage 6: Transfer the data

#### Perform Project Integrity Check:

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[410]</sup>

#### Install MySQL Components:

Step	Action	See also
1	Install MySQL version 4.0.3 or higher	<a href="#">Create a MySQL Repository</a> <sup>[150]</sup>
2	Install MySQL ODBC 3.51 or higher	

#### Select Table Type:

If MyISAM table types are used (default), transactional support is disabled. To enable transactions you must set up MySQL to use InnoDB tables and create the database tables as InnoDB type.

Sparx provide scripts to create both InnoDB- and MyISAM-based repository tables.

Step	Action	See also
1	Set up the <i>MySQL .ini</i> file as required	
2	If you are using <i>InnoDB</i> tables run the <i>MySQL_InnoDB_EASchema.sql</i> script  If you are using <i>MyISAM</i> tables run the <i>MySQL_MyISAM_EASchema.sql</i> script.	<a href="#">Sparx Systems website</a>

#### Create Database Repository:

Step	Action	See also
1	Create an empty database repository	<a href="#">Create a New MySQL Repository</a> <sup>[150]</sup>

#### Set Up the ODBC Driver:

Step	Action	See also
1	Create a suitable ODBC Data Source to point to your new database Select the following checkboxes: <ul style="list-style-type: none"> <li>• <b>Return matched rows instead of affected rows</b></li> <li>• <b>Allow big result sets</b></li> </ul>	<a href="#">Set up a MySQL ODBC Driver</a> <sup>[155]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to MySQL	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list Click on the <b>Next</b> button	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database Click on the <b>OK</b> button	<a href="#">Connect to a MySQL Data Repository</a> <sup>[163]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to MySQL and can now open it from Enterprise Architect.

#### **3.3.4.2 Upsize to Access 2007**

This topic explains how to upsize your .EAP project or template for use with Access 2007.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Transfer the data

**Perform Project Integrity Check:**

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

**Create Database Repository:**

Step	Action	See also
1	Create an empty database repository	<a href="#">Create an Access 2007 Repository</a> <sup>[156]</sup>

**Transfer the Project Data:**

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to Access 2007	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft Office 12.0 Access Database Engine OLE DB Provider</b> from the list Click on the <b>Next</b> button	
7	On the Data Source Details page of the Connection dialog, type in the full path to the Access 2007 .ACCDB file Click on the <b>OK</b> button to return to the Project Transfer dialog	
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to Access 2007 and can now open it from Enterprise Architect.

### 3.3.4.3 Upsize to SQL Server

This topic explains how to upsize your .EAP project or template for use with SQL Server.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Transfer the data

#### Perform Project Integrity Check:

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

#### Create Database Repository:

Step	Action	See also
1	Install SQL Server	
2	Create the empty database	<a href="#">Create an SQL Server Repository</a> <sup>[157]</sup>
3	Using a tool such as the SQL Query Analyser, load the <i>SQLServer_EASchema.sql</i> file	<a href="#">Sparx Systems Website</a>
4	Make sure the new database is the currently active database	
5	Run the script to create all required data structures	<a href="#">Create an SQL Server Repository</a> <sup>[157]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	

Step	Action	See also
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to SQL Server	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft OLE DB Provider for SQL Server</b> from the list Click on the <b>Next</b> button	
7	On the Data Source Details page of the Connection dialog, type in the server name, database name and security details as required Click on the <b>OK</b> button	<a href="#">Connect to SQL Server Data Repository</a> <sup>[164]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to SQL Server and can now open it from Enterprise Architect.

**Notes:**

- When transferring a project you must have **db\_ddladmin** permission in order to execute the **SET IDENTITY\_INSERT ( table ) {ON | OFF}** command

### 3.3.4.4 Upsize to Oracle 9i, 10g or 11g

This topic explains how to upsize your .EAP project or template for use with Oracle 9i, 10g or 11g.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Transfer the data

**Perform Project Integrity Check:**

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

**Create Database Repository:**

Step	Action	See also
1	Install Oracle	
2	Create the empty database	<a href="#">Create an Oracle Data Repository</a> <sup>[152]</sup>
3	Using a tool such as the SQL*Plus or SQL Plus Worksheet, load the <i>Oracle_EASchema.sql</i> file	<a href="#">Sparx Systems Website</a>
4	Make sure the new database is the currently active database	
5	Run the script to create all required data structures	<a href="#">Create an Oracle Data Repository</a> <sup>[152]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to Oracle	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Oracle Provider for OLE DB</b> from the list Click on the <b>Next</b> button	
7	On the Connection page of the Datalink Properties dialog, enter the Oracle service name in the <b>Data Source</b> field, and the user name and password as required. Click on the <b>OK</b> button	<a href="#">Connect to an Oracle Data Repository</a> <sup>[165]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to Oracle and can now open it from Enterprise Architect.

#### Notes:

- When transferring a project to Oracle you must have permission to execute the **CREATE SEQUENCE**

command

### 3.3.4.5 Upsize to PostgreSQL

This topic explains how to upsize your .EAP project or template for use with PostgreSQL.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Install PostgreSQL Driver
- Stage 4: Transfer the data

#### Perform Project Integrity Check:

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

#### Create Database Repository:

Step	Action	See also
1	Install PostgreSQL, version 7.3.2 or higher	
2	Create the empty database	<a href="#">Create a PostgreSQL Repository</a> <sup>[152]</sup>
3	From the PSQL command line, or using a tool such as the PostgreSQL command line, pgAdminIII or EMS PostgreSQL Manager, load the <i>PostgreSQL_EASchema.sql</i> file	<a href="#">Sparx Systems Website</a>
4	Run the script to create all required data structures	<a href="#">Create a PostgreSQL Repository</a> <sup>[152]</sup>

#### Set Up the ODBC Driver:

Step	Action	See also
1	Install psqLODBC, version 7.03.01.00 or higher (but do not use version 8.4.1)	
2	Create a suitable ODBC Data Source to point to your new database	<a href="#">Set up a PostgreSQL ODBC Driver</a> <sup>[156]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to SQL Server	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list Click on the <b>Next</b> button	
7	On the <b>Use Data Source Name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database Click on the <b>OK</b> button	<a href="#">Connect to a PostgreSQL Data Repository</a> <sup>[168]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to PostgreSQL and can now open it from Enterprise Architect.

**Notes:**

- During the transfer, if an error message displays reporting '*...nonstandard use of \ in a string literal...*', set the server variable in the *postgresql.conf* file to: *escape\_string\_warning = off*

### 3.3.4.6 Upsize to Sybase ASA

This topic explains how to upsize your .EAP project or template for use with Sybase Adaptive Server Anywhere.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Transfer the data

**Perform Project Integrity Check:**

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

#### Create Database Repository:

Step	Action	See also
1	Install Adaptive Server Anywhere - SQL Anywhere Studio 8 or higher This also installs the ASA ODBC driver	
2	Using Sybase Central, create a new database for the Enterprise Architect repository	<a href="#">Create an Adaptive Server Anywhere Repository</a> <sup>[153]</sup>
3	Open Interactive SQL and load the <i>ASA_EASchema.sql</i> file	<a href="#">Sparx Systems Website</a>
4	Run the script to create all required data structures	<a href="#">Create an Adaptive Server Anywhere Repository</a> <sup>[153]</sup>
5	Create a suitable ODBC Data Source to point to your new database	<a href="#">Set up an Adaptive Server Anywhere ODBC Driver</a> <sup>[159]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to ASA	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list Click on the <b>Next</b> button	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database	<a href="#">Connect to an Adaptive Server Anywhere Data Repository</a> <sup>[170]</sup>

Step	Action	See also
	Click on the <b>OK</b> button	
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to Adaptive Server Anywhere and can now open it from Enterprise Architect.

### 3.3.4.7 Upsize to MSDE

To upsize your model to MSDE, follow the steps in [Upsize to SQL Server](#)<sup>[177]</sup>.

### 3.3.4.8 Upsize to Progress OpenEdge

This topic explains how to upsize your .EAP project or template for use with Progress OpenEdge.

The process has the following stages:

- Stage 1: Perform project integrity check
- Stage 2: Create an empty database repository
- Stage 3: Transfer the data

#### Perform Project Integrity Check:

Step	Action	See also
1	Open the base project or template .eap file	
2	Select and run <b>Tools   Data Management   Project Integrity Check</b> This ensures your project data is 'clean' before uploading	<a href="#">Project Integrity Check</a> <sup>[416]</sup>

#### Create Database Repository:

Step	Action	See also
1	Install OpenEdge, version 10.0B3 or higher	
2	Create an empty OpenEdge database for the new repository	<a href="#">Create a Progress OpenEdge Repository</a> <sup>[154]</sup>
3	Download the <i>OpenEdge_EASchema.sql</i> file from the Sparx Systems Registered Users Resources page	<a href="#">Sparx Systems Website</a>
4	Make sure the new database is selected as the current database	
5	Run the script to create all required data structures	<a href="#">Create a Progress OpenEdge Repository</a> <sup>[154]</sup>
6	Install OpenEdge ODBC Driver, 10.0B or higher	<a href="#">Set Up a Progress OpenEdge</a>

Step	Action	See also
	Create a suitable ODBC Data Source to point to your new database	<a href="#">ODBC Driver</a> <sup>[160]</sup>

#### Transfer the Project Data:

Step	Action	See also
1	Open Enterprise Architect Click on the <b>Cancel</b> button on the Open Project screen to open with no project loaded	
2	Select the <b>Tools   Data Management   Project Transfer</b> menu option The Project Transfer dialog displays	
3	In the Transfer Type panel, select <b>.EAP to DBMS</b>	
4	In the <b>Source Project</b> field, type the name of the .EAP file to upsize to Progress OpenEdge	
5	At the right of the <b>Target Project</b> field, click on the ( ... ) (Browse) button The Datalink Properties dialog displays	
6	Select <b>Microsoft OLE DB Provider for ODBC Drivers</b> from the list Click on the <b>Next</b> button	
7	In the <b>Use Data source name</b> field, click on the drop-down arrow and select the ODBC Data Source you configured to point to your new database Click on the <b>OK</b> button	<a href="#">Connect to a Progress OpenEdge Data Repository</a> <sup>[171]</sup>
8	If required, select the <b>Logfile</b> checkbox and type a path and filename for the data transfer log file	
9	Click on the <b>Transfer</b> button to begin the data transfer process	

When the process is complete, you have upsized your model to Progress OpenEdge and can now open it from Enterprise Architect.

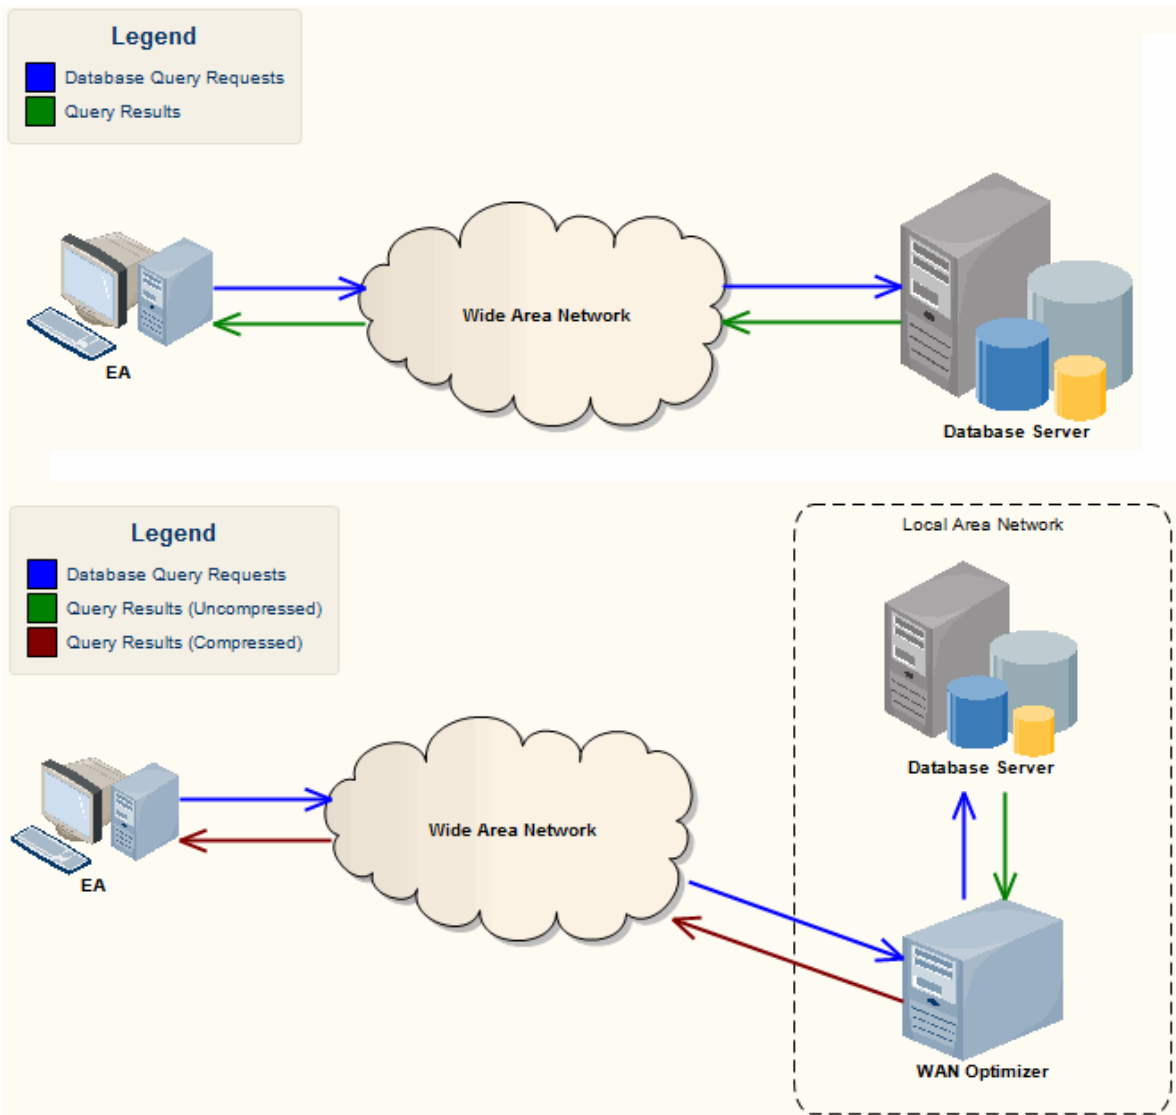

### 3.3.5 The WAN Optimizer

The Sparx *Wide Area Network (WAN) Optimizer* is a lightweight server installed on a Local Area Network (LAN) connection to a Database Management System (DBMS) that hosts an Enterprise Architect repository. You can configure the server to listen for client connections on a particular port; it acts as a local proxy to execute queries and return the results in a compressed format to the client.

The WAN Optimizer significantly improves Enterprise Architect's performance in a WAN by reducing the amount of data transmitted and, in turn, the number of network calls made.

In the following diagram, transmission between Enterprise Architect and a DBMS is depicted first without and then with the WAN Optimizer.

You can download the WAN Optimizer installer from the Downloads page of the Registered Users section of the Sparx Systems website. The Wan Optimizer Service installer package provides two installable features for the target machine:

- WAN Optimizer Service - the installer also helps register and start the service on the target machine, and add it to the Windows Startup folder
- WAN Optimizer Admin Client - to enable an administrator to administer and configure the service from a remote client.

The Optimizer has its own *Sparx WAN Optimizer User Guide*. See that User Guide for more information on:

- WAN Optimizer Components
- Installing and Starting the WAN Optimizer Service
- Configuring the Service
- Troubleshooting

## 3.4 Team Development

Enterprise Architect enables you to develop a project across a team of people, so that each person can access the latest data without the risk of damaging or losing that data.

### Topics:

Topic	Detail	See also
<b>Making project data available in a distributed environment</b>	Enterprise Architect offers a diverse set of functionality designed specifically for sharing projects in team-based and distributed development environments; for example: network deployment of model repositories, replication and XML Import/Export	<a href="#">Project Sharing</a> <sup>[186]</sup>
<b>Applying security to the model</b>	Enterprise Architect Security is a means of improving collaborative design and development by preventing concurrent editing, and limiting the possibility of inadvertent model changes by users not designated as model authors	<a href="#">Configure User Security</a> <sup>[195]</sup>
<b>Using an internal discussion forum</b>	The Enterprise Architect Project Team Review facility is a discussion forum within your development team community to discuss the development and progress of a project	<a href="#">Team Review Tools</a> <sup>[217]</sup>
<b>Building company policy and project development guidelines into the project</b>	Enterprise Architect enables you to create workflow scripts that provide a robust approach to applying company policy and strengthening project development guidelines, by validating against the policy and procedures within the model itself	<a href="#">Workflow Scripts</a> <sup>[232]</sup>
<b>Standardizing and re-using project data</b>	You can import and export Reference data (including Glossary and Issue information) from .XML files of another iteration of the same model, or of a different model	<a href="#">Sharing Reference Data</a> <sup>[237]</sup>

### 3.4.1 Project Sharing

Enterprise Architect offers a diverse set of functionality designed specifically for sharing projects in team-based and distributed development environments, through network deployment of model repositories, replication and XML Import/Export.

### Topics:

Topic	Detail	See also
<b>Network Deployment</b>	Network deployment is possible under two different schemas: <ul style="list-style-type: none"> <li>• .EAP based repositories or</li> <li>• DBMS server based repositories</li> </ul>	<a href="#">Share a Project</a> <sup>[187]</sup>

Topic	Detail	See also
	<p>DBMS server based repositories offer better:</p> <ul style="list-style-type: none"> <li>• response times than .EAP files on networks, due to the inherent structure of the DBMS</li> <li>• solutions when networking problems are encountered, as they have the ability to backtrack transactions caused by external breakdowns</li> </ul>	
<b>Replication</b>	<p>Replication enables data interchange between .EAP based repositories and is suitable for where many different users work independently in parallel development</p> <p>Modelers merge their changes into a Design Master only as required; it is recommended that a backup is carried out prior to replication</p> <p>Replication cannot be performed on repositories stored on a DBMS server</p>	<a href="#">Replication</a> <sup>[189]</sup>
<b>XMI Import and Export</b>	<p>XMI Import/Export can be used to export and share discrete packages between developers; XMI enables the export of packages into XML files which can then be imported into any model</p> <p>Package control can be used to set up packages for version control and to enable batch export of packages using XMI; Version Control enables a repository to be maintained by a third-party source code control application that is used to control access and record revisions</p>	<a href="#">XMI Import/Export</a> <sup>[320]</sup> <a href="#">Version Control</a> <sup>[243]</sup> <a href="#">Controlled Packages</a> <sup>[328]</sup>

**Notes:**

- DBMS Repository support is available with the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

**Learn More:**

- [Deployment of Enterprise Architect white paper](#)

**3.4.1.1 Share Enterprise Architect Projects**

The most efficient way of using Enterprise Architect to manage a team development is to *share* a project amongst a team of designers, developers and analysts.

**Guide:**

Topic	Detail	See also
<b>By Sharing a project</b>	<ul style="list-style-type: none"> <li>• Many people can work on the model at the same time and contribute their particular skill</li> <li>• Team members can always see what the latest changes are, keeping the team informed and up to date with the project status</li> </ul>	<a href="#">Refresh View of Shared Project</a> <sup>[188]</sup>
<b>You can share a project in three</b>	<ul style="list-style-type: none"> <li>• Place the project in a shared network directory</li> </ul>	<a href="#">Share Projects on Network Drive</a> <sup>[189]</sup>

Topic	Detail	See also
ways	<ul style="list-style-type: none"> <li>Use replication</li> <li>Use a shared DBMS-based repository</li> </ul>	<a href="#">Replication</a> <sup>[189]</sup> <a href="#">Server Based Repositories</a> <sup>[149]</sup>

**Notes:**

- Project Sharing and Replication are enabled in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- DBMS repositories are supported in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

**3.4.1.1 Refresh View of Shared Project**

When a user of a shared model checks out a package and makes changes, other users can see those changes by refreshing their view of the package or the changed diagram within the package, in a number of ways.

Refresh	Detail	See also
Project	<ul style="list-style-type: none"> <li>Right-click on the package name in the Project Browser and select the <b>Contents   Reload Current Package</b> context menu option</li> <li>Select the <b>File   Reload Current Project</b> menu option</li> <li>Select the <b>Reload Project</b> icon in the Project toolbar</li> <li>Press ( <b>Ctrl+Shift+F11</b> )</li> <li>Close the project and reopen it</li> </ul>	<a href="#">Contents Submenu</a> <sup>[450]</sup> <a href="#">File</a> <sup>[74]</sup> <a href="#">Project Toolbar</a> <sup>[109]</sup>
Diagram	<ul style="list-style-type: none"> <li>Select the <b>Window   Reload Current View</b> menu option</li> <li>Right-click on the opened diagram tab in the diagram view, and select the <b>Reload &lt;diagram name&gt;</b> context menu option</li> </ul>	<a href="#">Window Menu</a> <sup>[100]</sup> <a href="#">Diagram Tabs</a> <sup>[545]</sup>

**3.4.1.2 Share Projects on Network Drive**

The easiest way to share a project amongst a work group of developers and analysts is to place the project file on a shared network drive, to which people connect from their workstations.

Individual developers and analysts can then open and work on the project concurrently.

Network Issues	See also
<p>Enterprise Architect accepts a number of concurrent connections without issue; however:</p> <ul style="list-style-type: none"> <li>There can be occasional 'lock-outs' when one user tries to access or update something another user is in the process of modifying</li> <li>Changes to the Project Browser (and other project views) are not automatically updated; to compensate for this, users must occasionally reload their project to see changes made by other users</li> <li>If two or more people work on the same diagram concurrently, unexpected results can occur; it is best to allow only one analyst to work on a diagram at a time</li> </ul>	<a href="#">Refresh Model View</a> <sup>[188]</sup>

Network Issues	See also
<ul style="list-style-type: none"> <li>(.EAP files only) If a user's machine crashes, the network suffers an outage or a machine is turned off unexpectedly, the project file might require repair to compensate for the sudden inconsistency; a repair facility is provided (<b>Tools   Data Management   Manage .EAP File   Repair .EAP File</b>) to carry out this task</li> </ul>	<a href="#">Repair a Project</a> <sup>[42]</sup>

### 3.4.1.3 Distributed Development

Enterprise Architect supports distributed development using two different techniques.

Topic	Detail	See also
<b>Replication</b>	Enables geographically separated analysts to update and modify parts of the model in replicas, then merge these back together at a central location	<a href="#">Replication</a> <sup>[189]</sup>
<b>XMI Import/Export</b>	<p>Use XMI-based import/export to export discrete packages to XML to share among the development team; this has several benefits over replication:</p> <ul style="list-style-type: none"> <li>You can assemble a model from only the parts necessary to get your job done</li> <li>You can assemble a full model if required</li> <li>You can assemble a model from different package versions for different purposes (such as customer visible, internal release only)</li> <li>You can roll-back parts of a model as required</li> <li>There is less chance of 'collisions' between developers if each works on a discrete package</li> <li>The process is controllable using a version control system, or through package control</li> </ul> <p>XML based import/export is UML1.3 / XMI1.1 compliant; you can also write XML based tools to manipulate and extract information from XML files to enhance the development process</p> <p>XMI-based Import/Export is accessed through <b>Project   Model Import/Export</b></p>	<a href="#">Import/Export</a> <sup>[320]</sup>  <a href="#">Version Control</a> <sup>[243]</sup> <a href="#">Controlled Packages</a> <sup>[328]</sup>  <a href="#">XMI Import Export Options</a> <sup>[81]</sup>

### 3.4.1.4 Replication

Apart from sharing Enterprise Architect projects in real time over a network, you can also share projects using replication.

Guide:

Topic	Detail	See also
<b>Replication</b>	Replication is a powerful means of sharing projects between isolated or mobile users; it enables different users to work independently of one another, and to merge their	

Topic	Detail	See also
	<p>changes at a later time</p> <p>In Replication:</p> <ul style="list-style-type: none"> <li>• A project is converted to a design master, then replicas are made of the master</li> <li>• Users take the replicas away, modify the project, then bring their replicas back to be synchronized with the master file</li> </ul>	
<b>Use Replication</b>	<p>To use replication, follow the steps below</p> <ol style="list-style-type: none"> <li>1. Convert the base project to a design master</li> <li>2. Create replicas from the design master</li> <li>3. Take the replica away and work on it as required, then bring it back for synchronization with the design master</li> <li>4. Synchronize the replicas, during which all changes to both the master and the replica are propagated in both directions, so they both finally contain the same information</li> </ol>	<a href="#">Design Master</a> <sup>[191]</sup> <a href="#">Create Replicas</a> <sup>[191]</sup> <a href="#">Synchronize Replicas</a> <sup>[192]</sup>
<b>Enterprise Architect Merge Rules</b>	<p>Enterprise Architect follows these rules in merging:</p> <ul style="list-style-type: none"> <li>• Additions are cumulative; that is, two replicas each creating three new Classes result in six new Classes after merging</li> <li>• Deletions prevail over modifications; if one replica changes a Class name and other deletes the Class, merging replicas results in both files losing the Class</li> </ul> <p>Conflicting modifications appear in the Resolve Replication Conflicts dialog</p>	<a href="#">Resolve Conflicts</a> <sup>[193]</sup>
<b>Upgrades and Replicas</b>	<p>When you upgrade your version of Enterprise Architect, you must not open a replica until you have opened the design master and then synchronized the replicas with the master; you cannot directly upgrade a replica</p>	<a href="#">Upgrade Replicas</a> <sup>[194]</sup>
<b>Avoid Change Collisions</b>	<p>If two or more people make changes to the same element, Enterprise Architect arbitrarily overwrites one person's change with the other's; to avoid this, different users should work on different packages</p> <p>However, since Enterprise Architect does not enforce this rule, it is possible for users' work to conflict; to minimize difficulties, please note the following guidelines:</p> <ul style="list-style-type: none"> <li>• If users are likely to have worked in the same area of the model, they should both witness the synchronization and confirm that they are happy with the net result</li> <li>• If small pieces of information have been lost, they should be typed into one of the merged models after synchronization</li> <li>• If a large piece of information has been lost (for example, an overwritten large Class note) use the Resolve Replication Conflicts dialog</li> </ul>	<a href="#">Resolve Conflicts</a> <sup>[194]</sup>
<b>Disable or</b>	<p>If you have converted a project to a design master but now</p>	<a href="#">Remove Replication</a> <sup>[193]</sup>

Topic	Detail	See also
<b>Remove Replication Features</b>	want to disable the replication features, you can remove Replication; ensure that you back up all your files first	

#### 3.4.1.4.1 Design Masters

A design master is the first converted Enterprise Architect project that supports replication.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Make Design Master](#)

##### Use to:

- Create the master project from which you create replicas that can be modified independently of the master project and re-merged later

##### How to:

To create a design master, follow the steps below:

Step	Action
1	Take a back-up of the required Enterprise Architect project
2	Select the project in the Project Browser
3	Select the <b>Make Design Master</b> menu option and follow the on-screen instructions

##### Learn More:

- [Create Replicas](#) <sup>[19]</sup>

#### 3.4.1.4.2 Create Replicas

A replica is one of several copies of the design master of an Enterprise Architect project.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Create New Replica](#)

##### Use to:

- Create a copy of the master project for you or another user to modify independently and re-merge later

##### How to:

To create a replica, follow the steps below:

Step	Action
1	First create a design master, then select the <b>Create New Replica</b> menu option and follow the on-screen instructions
2	Edit the replica over time and, when required, return the file for merging with the design master

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Replicas** permission to create a replica

**Learn More:**

- [Design Masters](#) <sup>[194]</sup>
- [Manage Replicas User Permissions](#) <sup>[206]</sup>

**3.4.1.4.3 Synchronize Replicas**

Synchronizing replicas combines the changes made to each file.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Synchronize Replicas](#)

**Use to:**

- Merge the changes made to each replica with the design master, so that a new set of replicas with all changes can be generated and distributed
- Combine the changes made to two replicas, should it be necessary for two team members to combine their work

**How to:**

To synchronize replicas, follow the steps below:

Step	Action
1	Open the design master project file (or the first required replica)
2	Select the Synchronize Replicas menu option
3	Locate and select the (second) required replica to merge the open project and the replica

**Notes:**

- Information is copied both ways, including deletes, updates and inserts; both projects end up containing identical information
- If this process generates 'conflicting changes' errors, you should review and, if necessary, resolve these conflicts
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Replicas** permission to create a replica

**Learn More:**

- [Resolve Conflicts](#) <sup>[194]</sup>
- [Manage Replicas User Permissions](#) <sup>[206]</sup>

### 3.4.1.4.4 Remove Replication

Replication makes many changes to the database structure of your model, so the model file becomes considerably larger with additional information; you might, therefore, decide not to use the replication feature any more.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Remove Replication](#)

**Use to:**

- Remove replication from your model

**How to:**

To remove replication from your model, follow the steps below:

Step	Action
1	Ensure that you have open a temporary repository (not the one having replication removed) - the menu option is not available if no repository is open
2	Select the <b>Remove Replication</b> menu option The Remove Replication Wizard displays
3	Enter the full path and file name of the project to have replication removed Click on the <b>Next</b> button
4	Enter the full path and file name of the base Enterprise Architect model (with no replication) to act as template Click on the <b>Next</b> button
5	Enter the full path and required file name for the output file Click on the <b>Next</b> button
6	Select whether to have a log file created and, if so, enter a file name for the log file
7	Click on the <b>Run</b> button to begin removing replication Enterprise Architect creates a new project containing all the model information Your model has now had replication removed, and should be considerably smaller

**Notes:**

- You cannot remove replication from a model with Auditing enabled - if you want to remove replication:
  - Disable Auditing
  - If prompted to do so, allow Enterprise Architect to roll back the database version
  - Remove replication

**Learn More:**

- [Auditing](#)<sup>[300]</sup>
- [Auditing Settings](#)<sup>[302]</sup>

### 3.4.1.4.5 Upgrade Replicas

A new release of Enterprise Architect might contain changes to the underlying project structure, such as more tables or changed queries. If you use Replication, you must take care with your upgrade.

#### Guide:

Topic	Detail	See also
<b>Open Design Master Project first</b>	After installing the new version of Enterprise Architect, it is very important that you open the <i>design master</i> before opening any of the replicas with the updated version	<a href="#">Design Masters</a> <sup>[191]</sup>
<b>Changes to the database design</b>	Changes to the database design in a replicated project can ONLY be done to the design master; trying to update a replica at best does nothing, and at worst causes the update of the master to fail	
<b>Propagate Changes</b>	Design changes are propagated through to the replicas the next time the replicas are synchronized with the master	<a href="#">Synchronize Replicas</a> <sup>[192]</sup>
<b>Alternatively</b>	One other strategy is to remove replication from a copy of the replica set, upgrade that project and convert it into a new design master from which new replicas are created	<a href="#">Remove Replication</a> <sup>[193]</sup>

### 3.4.1.4.6 Resolve Conflicts

If two or more people each work on the same model object in their respective replicas between synchronizations, the replication engine has problems in resolving which change is the master.

#### Guide:

Topic	Detail	See also
<b>Avoid the problem</b>	Ensure that each team member always works in a separate area of the model within their replica	
<b>Check for conflicts</b>	After synchronizing replicas, open the Resolve Conflicts dialog (see below this table) and check if there were any conflicts	
<b>Response to conflicts</b>	<p>When a project record has been modified in different ways by different users, the replication engine selects one of the conflicting values based on rules within the JET replication manager</p> <p>However, the replication engine stores the discarded changes and flags the conflict on the Resolve Conflicts dialog so that you can choose to roll in the discarded change instead</p> <p>Normally it is not necessary or desirable to examine conflicts, since they represent relatively inconsequential pieces of information that can very easily be modified through the normal Enterprise Architect interface; for example, by moving a diagram element</p> <p>The only case in which the Resolve Conflicts dialog should be used is where a substantial piece of information has been overridden by a user, and you want to retrieve it</p>	

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Resolve Replication Conflicts](#)

**Use to:**

- Select which of two conflicting changes you should save to the Design Master and/or replicas, where a substantial piece of information has been overridden by a user and you want to retrieve it

**How to:**

To resolve conflicts in changes to the same model object in two separate replicas, follow the steps below:

Step	Action
1	Synchronize a replica with the Design Master, and display the Resolve Conflicts dialog
2	In the Table with Conflicts list, click on the entry that is likely to contain the lost information
3	Click on each entry in the Conflicting Records list  When the lost information appears in the Conflict Details list, click on the <b>Overwrite with Conflict</b> button.
4	In the Conflicting Records list, you can also copy each Row ID to the clipboard by right-clicking on the row and selecting the <b>Copy to Clipboard</b> menu option

### 3.4.2 Configure User Security

User security in Enterprise Architect can be used to limit the access to update functions within the model.

**Topics:**

Topic	Detail	See also
<b>User Security</b>	<p>Security in Enterprise Architect is a means of improving collaborative design and development by preventing concurrent editing and limiting the possibility of inadvertent model changes by users not designated as model authors</p> <p>User security is not enabled by default in Enterprise Architect; the Administrator must enable it first</p> <p>Where user security is enabled a password is required to log in to the model</p> <p>Elements can be locked per user or per group</p>	<a href="#">Enable Security</a> <sup>[197]</sup>
<b>Security Policies</b>	<p>Enterprise Architect User Security offers two policies:</p> <ul style="list-style-type: none"> <li>• Standard security mode - all elements are initially unlocked and, as necessary, a user can set a user or group lock on any element or set of elements in order to make changes and protect those changes</li> <li>• Rigorous security mode - an Enterprise Architect model is read-only and nothing in the model can be edited until explicitly checked out with a user lock</li> </ul>	<a href="#">Security Policy</a> <sup>[198]</sup>
<b>Security Operations For Administrators</b>	A number of security tasks can only be performed by users with Administrative rights to the model	<a href="#">Set Security Policy</a> <sup>[198]</sup>

Topic	Detail	See also
		<a href="#">Enable Security</a> <sup>[197]</sup> <a href="#">Maintain Users</a> <sup>[199]</sup> <a href="#">Import User IDs From Active Directory</a> <sup>[200]</sup> <a href="#">Change User Passwords</a> <sup>[210]</sup> <a href="#">Assign User To Groups</a> <sup>[202]</sup> <a href="#">View All User Permissions</a> <sup>[203]</sup> <a href="#">Maintain Groups</a> <sup>[204]</sup> <a href="#">View and Manage Locks</a> <sup>[208]</sup> <a href="#">Password Encryption</a> <sup>[209]</sup> <a href="#">Create Workflow Scripts</a> <sup>[232]</sup>
<b>Security Operations For Users</b>	Other Security tasks can be performed by users who do not have Administrative rights	<a href="#">Lock Model Elements</a> <sup>[211]</sup> <a href="#">Lock Packages</a> <sup>[213]</sup> <a href="#">Apply a User Lock</a> <sup>[214]</sup> <a href="#">Identify Who Has Locked An Object</a> <sup>[216]</sup> <a href="#">Locked Element Indicators</a> <sup>[215]</sup> <a href="#">Manage Your Own Locks</a> <sup>[216]</sup> <a href="#">Change Your Own Password</a> <sup>[210]</sup>
<b>Security Scripts</b>	<p>With workflow administration permissions, you can also develop workflow scripts using the Scripting window</p> <p>Workflow scripts validate and control user input.</p>	<a href="#">List of Available Permissions</a> <sup>[206]</sup> <a href="#">Workflow Scripts</a> <sup>[232]</sup> <a href="#">Scripting</a> <sup>[1832]</sup> <a href="#">Workflow Script Functions</a> <sup>[233]</sup>

**Notes:**

- User security can be enabled in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- For a number of operations in Enterprise Architect, if security is enabled a user must have the appropriate user or group access permission to perform the operation; however, if security is not enabled, the user does not have to have these access permissions

### 3.4.2.1 Enable Security

User security is not enabled by default in Enterprise Architect, the Administrator must enable it using an Authorization key obtained from the Sparx Systems website.

**Access:** [Project](#) | [Security](#) | [Enable Security](#)

**Use to:**

- Enable User Security on a project
- Disable User Security, in exactly the same way

**How to:**

Step	Action	See also
1	Obtain the Authorization Key from the Sparx Systems website on: <ul style="list-style-type: none"> <li>• the Team Modeling Resources section (Trial User) or</li> <li>• the Registered Users section (Registered User; you must also have your Registered Users login and password)</li> </ul>	<a href="#">Team Modeling Resources web pages</a> <a href="#">Registered Users web pages</a>
2	In Enterprise Architect, select the <b>Enable Security</b> menu option The Enter authorization dialog displays	
3	In the <b>Enter authorization key</b> field, type the authorization key from the Sparx Systems website	
4	If required, select the <b>Automatically apply Exclusive Edit Locks to diagrams</b> checkbox  This option is ignored in <i>Require User Lock</i> security mode.  In standard ( <i>User/Group Locking</i> ) mode, this option blocks multiple users from simultaneously attempting to modify the same diagram (see <i>Notes</i> below)	<a href="#">Security Policy</a> <sup>[198]</sup>
5	Click on the <b>OK</b> button  Security is enabled, and an <b>Admin</b> user and user group are created with all access rights and a password of <b>password</b>	<a href="#">List of Available Permissions</a> <sup>[206]</sup>
6	Select the <b>Project   Security   Login as Another User</b> menu option, and log in as <b>Admin</b> with the initial password of <b>password</b>  If required, you can change the Admin password	<a href="#">Change Password</a> <sup>[210]</sup>
7	Set up users and permissions as required.	<a href="#">Maintain Users</a> <sup>[199]</sup> <a href="#">Assign User To Groups</a> <sup>[202]</sup> <a href="#">Set Up Single Permissions</a> <sup>[202]</sup> <a href="#">Maintain Groups</a> <sup>[204]</sup> <a href="#">Set Group Permissions</a> <sup>[205]</sup>

**Notes:**

- Once security has been enabled, you must have the **Security - Enable/Disable** access right to turn it off - the initial administrator automatically has this access right; the system prompts you to log off the project and log on again, but this is not strictly necessary
- If you re-enable security, be aware that any changes you have made to the **Admin** user (password and reduced access rights) are reset to password and full access
- The **Automatically apply Exclusive Edit Locks to diagrams** option is not displayed when disabling security, therefore to toggle the setting whilst security is enabled you must disable security and re-enable it; security settings (users, groups and permissions) and locks on elements, are NOT affected by this action
- If the **Automatically apply Exclusive Edit Locks to diagrams** option is selected, as a user modifies a diagram Enterprise Architect automatically applies a User Lock to the diagram, preventing any other user from modifying it  
It is creating difference between the database and buffer versions of the diagram that triggers the temporary lock, and elimination of difference that releases the lock; therefore, Enterprise Architect releases the lock when:
  - The user saves the changes to the diagram, with the **Save** icon or keyboard keys
  - The user undoes the last remaining action in the **Undo** list
  - The user saves or discards changes via the system prompt when they close the diagram
 If the diagram already has a User Lock or Group Lock that does not exclude the current user, this lock is set aside and saved when the temporary User Lock is applied. When the temporary User Lock is released, the pre-existing lock is restored

### 3.4.2.2 Security Policy

There are two possible security policies in Enterprise Architect.

#### Guide:

Topic	Detail	See also
<b>User/Group Locking mode</b>	<p>All elements and diagrams are considered unlocked and anyone can edit any part of the project</p> <p>However, when you edit a diagram, package or element, you lock the element or set of elements at either the user level or group level</p> <p>This mode is good for cooperative work groups where there is a solid understanding of who is working on which part of the model, and locking is used mainly to prevent further changes or to limit who has access to a part of the model</p>	
<b>Require User Lock to edit mode</b>	<p>More rigorous: the Enterprise Architect model is read-only, and everything is locked so that nobody can edit anything unless they explicitly check out the object with a user lock</p> <p>A single 'check out' function operates on a diagram to check out the diagram and all contained elements in one go</p> <p>There are also functions on the context (right-click) menus of packages, diagrams and elements in the Project Browser to apply a user lock when this mode is in use</p> <p>You would use this mode when there is a strict requirement to ensure only one person can edit a resource at one time; this is suitable for much larger projects where there might be less communication between users</p>	

#### Notes:

- Toggle between the security modes using **Project | Security | Require User Lock to Edit** - deselected

for **User/Group Locking** mode, selected for **Require User Lock to edit** mode

- When you add new elements in **User/Group Locking** mode (elements editable by default), no user lock is created automatically for the newly created element
- When you add new elements in **Require User Lock to Edit** mode (elements locked by default), a user lock is created on the new element to enable instant editing

### 3.4.2.3 Maintain Users

If you enable security you have access to the Security Users dialog, which you can use to set up more users for your model.

**Access:** [Project](#) | [Security](#) | [Manage Users](#)

**Use to:**

- Define the user IDs and initial passwords for the users that are to have access to the model

**How to:**

To set up a user for your model, follow the steps below:

Step	Action	See also
1	Select the <b>Manage Users</b> menu option  The Security Users dialog displays, which you can use to set up new users by providing their name and other details  You can also: <ul style="list-style-type: none"> <li>• Import User IDs from a Windows Active Directory</li> <li>• Assign User IDs to User Groups</li> <li>• Set up single permissions for a user</li> <li>• View all permissions for the currently selected user</li> </ul>	<a href="#">Import User IDs from a Windows Active Directory</a> <sup>[200]</sup>  <a href="#">Assign User IDs to Groups</a> <sup>[202]</sup>  <a href="#">Single Permissions</a> <sup>[202]</sup>  <a href="#">View All</a> <sup>[203]</sup>
2	To identify a new user on this dialog, click on the <b>New</b> button and type in the user's login ID, first name and last name  If required, also provide the user's department name	
3	To set the user's password, click on the <b>Change Password</b> button  The Change Password dialog displays	
4	In the <b>New password</b> field, type the user's password  This must be 12 characters or less in length	
5	In the <b>Retype new</b> field, type the user's password again, for confirmation	
6	Click on the <b>OK</b> button  A <i>Password Changed</i> message displays	
7	Click on the <b>OK</b> button	
8	When you have entered the details for the user, click on the <b>Save</b> button	
9	Click on either the: <ul style="list-style-type: none"> <li>• <b>New</b> button to add another user, or</li> <li>• <b>Close</b> button to exit the Security Users dialog</li> </ul>	

**Notes:**

- You must have **Security - Manage Users** permission to maintain users, and **Change Password** permission to change the password of the current user; the initial **Admin** administrator automatically has these permissions
- You can transport the user definitions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options
- If you select the **Accept Windows Authentication** checkbox, when a user opens the model Enterprise Architect checks the user's database for their Windows ID and, if it matches, automatically logs the user in without prompting for a password
- The **Accept Windows Authentication** checkbox enables the **Import** button, which you can select to import user IDs from a Windows Active Directory
- As a security measure, the **Accept Windows Authentication** checkbox is automatically deselected if the project .eap file is moved to a different location; once the file has been relocated, you can select the checkbox again to apply Windows authentication from the new database

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

**3.4.2.4 Import User IDs From Active Directory**

You can import the Enterprise Architect security user IDs from Windows Active Directory.

When you import the user IDs, you should create an appropriate user group and assign the user IDs to that group; you can then assign appropriate permissions to the group.

**Access:** **Project | Security | Manage Users**

**Use to:**

- Import Windows user IDs as Enterprise Architect security user IDs for use with Windows Authentication

**How to:**

To import user IDs from Windows Active Directory, follow the steps below:

Step	Action	See also
1	On the Security Users dialog select the <b>Accept Windows Authentication</b> checkbox and click on the <b>Import</b> button The Import Users dialog displays	
2	Click on the down arrow in the <b>Security Group</b> field and select the appropriate security group for the imported user IDs	
3	Click on the <b>Add</b> button The Select Users screen displays	
4	Click on the <b>Object Types</b> button The Object Types dialog displays	

Step	Action	See also
5	Select the checkbox for the type of object to import from the Active Directory Click on the <b>OK</b> button to return to the Select Users dialog	
6	Click on the <b>Locations</b> button The Locations dialog displays	
7	Browse for and select the checkbox for the location to import from within the Active Directory Click on the <b>OK</b> button to return to the Select Users dialog	
8	In the <b>Enter the object names to select</b> field, either: <ul style="list-style-type: none"> <li>• type in the user IDs individually (click on the <b>examples</b> link to see examples of the correct formats) or</li> <li>• click on the <b>Advance</b> button to search for IDs; the Select Users dialog redisplay with a Common Queries tab</li> </ul>	
9	In the <b>Name</b> and <b>Description</b> fields, type any characters or text that helps identify the IDs you are searching for	
10	In the <b>Starts with</b> field, click on the drop-down arrow and select the appropriate qualifier	
11	If required, select the <b>Disabled accounts</b> or <b>Non-expiring password</b> checkboxes, and/or select a value in the <b>Days since last logon</b> field, to further filter the IDs to search for	
12	Click on the <b>Find Now</b> button to initiate the search, and to display a list of IDs in the bottom panel of the dialog  You can vary the types of information shown here by clicking on the <b>Columns</b> button and selecting the column headings to display	
13	When you have identified the IDs to import, click on a required ID (or press <b>(Ctrl)</b> or <b>(Shift)</b> while you click to select several) and click on the <b>OK</b> button  The Select Users dialog redisplay, with the selected ID or IDs listed in the <b>Enter the object names to select</b> field	
14	Click on the <b>OK</b> button to redisplay the Import Users dialog with the selected users' names listed in the Users panel	
15	Click on the <b>Import</b> button to add the user IDs to the Security Users dialog	
16	Click on a user ID to populate the dialog fields with the user ID details, to set group membership and to set single permissions as required.	<a href="#">Group Membership</a> <sup>[202]</sup> <a href="#">Set Single Permissions</a> <sup>[202]</sup>

**Notes:**

- Enterprise Architect generates random passwords for Windows user IDs; however, if required you can assign a new password to an imported user ID

**Learn More:**

- [Maintain Groups](#) <sup>[204]</sup>
- [Change Password](#) <sup>[210]</sup>

### 3.4.2.5 Assign User To Groups

A user might belong to one or more work groups, each of which would have permissions to perform work in specific areas of Enterprise Architect.

**Access:** [Project](#) | [Security](#) | [Manage Users: Group Membership button](#)

**Use to:**

- Assign a user's ID to one or more work groups

**How to:**

To assign a user to user groups follow the steps below:

Step	Action	See also
1	On the Security Users dialog click on the <b>Group Membership</b> button The User Groups dialog displays	
2	Select the checkbox against each group this user belongs to	
3	Click on the <b>OK</b> button to assign the user to the selected groups	

**Notes:**

- To assign users to groups, you must have **Security - Manage Users** permission; the initial Admin administrator automatically has this permission.
- User groups must already exist in order to assign users to them

**Learn More:**

- [List of Available Permissions](#)<sup>[206]</sup>
- [Maintain Groups](#)<sup>[204]</sup>

### 3.4.2.6 Set Up Single Permissions

A user commonly belongs to one or more work groups that give that user group permissions to work in areas of Enterprise Architect. You can also assign additional, specific user permissions to that user ID.

**Access:** [Project](#) | [Security](#) | [Manage Users: Single Permissions button](#)

**Use to:**

- Define the specific permissions an individual user has to perform work in Enterprise Architect

**How to:**

To set up single permissions for a user follow the steps below:

Step	Action	See also
1	On the Security Users dialog, click on the <b>Single Permissions</b> button	

Step	Action	See also
	The User Permissions dialog displays	
2	Select the checkbox against each specific permission to assign to this user Click on the: <ul style="list-style-type: none"> <li>• Select All button to select all permissions for the user, or</li> <li>• <b>Deselect All</b> button to clear all selected permissions</li> </ul>	
3	Click on the <b>OK</b> button to assign the selected permissions to the user	

**Notes:**

- You must have **Security - Manage Users** permission to assign permissions to users; the initial Admin administrator automatically has this permission
- A user's total permissions are those granted by Group Membership plus those granted by specific permission assignment
- You can transport the user permissions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

### 3.4.2.7 View All User Permissions

This topic explains how to list all the permissions a user has.

**Access:** **Project | Security | Manage Users**

**Use to:**

- Display a list of the permissions a specific user has, derived from their individual profile and from their membership of security groups

**How to:**

Step	Action	See also
1	Select the <b>Manage Users</b> menu option The Security Users dialog displays	
2	Select the required user Click on the <b>View All</b> button A dialog displays, listing all of the user's permissions	

### 3.4.2.8 Maintain Groups

This topic explains how to create a security group. Security groups make it easy to configure sets of permissions and apply them to a number of users in one action.

**Access:** [Project | Security | Manage Groups](#)

**Use to:**

- Create a security group prior to:
  - Assigning permissions to the group
  - Assigning users to the group

**How to:**

To set up a security group, follow the steps below:

Step	Action	See also
1	Select the <b>Manage Groups</b> menu option The Security Groups dialog displays	
2	In the <b>Group Name</b> and <b>Description</b> fields, type the security group name and a description of the group	
3	Click on the <b>Save</b> button	
4	The group name can be selected as the recipient of an internal email; when an email is sent to the group, all members of the group receive that email in their Personal Information window  However, the group name can act as either: <ul style="list-style-type: none"> <li>• A mail list, in which case each group member receives their own copy of the message, or</li> <li>• A mailbox, in which case the email is a single entity - the group members do not receive separate instances of it; therefore, if one group member responds to or deletes the email, the other group members see that action as if they had performed it themselves</li> </ul> To make the group name act as a mailbox, select the <b>Shared Mail</b> checkbox against the group name in the Groups panel  To use the group name as a mail list, leave the checkbox unselected	<a href="#">Internal Mail</a> <sup>[380]</sup>

**Notes:**

- You must have **Security - Manage Users** permission to manage user groups; the initial Admin administrator automatically has this permission
- You do not define groups as group logins with passwords; if you intend to use a group login, you can define a single-user login and password that all group members use (that is, Enterprise Architect allows multiple logins under one user ID)
- Emails already sent to a group as a mail list and those sent to a group as a mailbox cannot be interchanged; if you change the status of the **Shared Mail** checkbox, the only way to change the distribution of past emails is to forward them to the group name again

**Learn More:**

- [Maintain Users](#) <sup>[199]</sup>
- [Set Group Permissions](#) <sup>[205]</sup>
- [Assign User To Groups](#) <sup>[202]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

### 3.4.2.9 Set Group Permissions

This topic explains how to assign permissions to a security group.

**Access:** **Project | Security | Manage Groups: Set Group Permissions button**

**Use to:**

- Assign permissions to a previously-created user group, to work in various areas of Enterprise Architect

**How to:**

To assign permissions to a security group, follow the steps below:

Step	Action	See also
1	Select the <b>Manage Groups</b> menu option The Security Groups dialog displays	
2	Click on the <b>Set Group Permissions</b> button The Group Permissions dialog displays	
3	Select the checkbox against each required permission Click on the: <ul style="list-style-type: none"> <li>• <b>Select All</b> button to select all permissions</li> <li>• <b>Deselect All</b> button to clear all selected permissions</li> </ul>	
4	Click on the <b>OK</b> button to assign the permissions All of the users assigned to this group share in this set of permissions	

**Notes:**

- You can transport the group permissions between models as Reference Data, using the **Project | Model Import/Export | Export Reference Data** and **Import Reference Data** options
- You must have **Security - Manage Users** permission to assign permissions to user groups; the initial **Admin** administrator automatically has this permission

**Learn More:**

- [Maintain Groups](#) <sup>[204]</sup>
- [Assign User To Groups](#) <sup>[202]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

### 3.4.2.10 List of Available Permissions

In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled, users can only perform certain tasks if they have the appropriate permissions for those tasks.

Some permissions take precedence over others. For example, if a user has **Use Version Control** permission, they can modify model elements on import even if they do not have **Update Element** permission.

#### Reference:

Permission	Enables the user to	See also
<b>Administer Database</b>	Compact and repair a project database	<a href="#">Compact a Project</a> [420] <a href="#">Repair a Project</a> [421]
<b>Admin Workflow</b>	Develop and manage workflow scripts	<a href="#">Workflow scripts</a> [232]
<b>Audit Settings</b>	Change the audit settings in the Audit Settings dialog	<a href="#">Audit Settings</a> [302]
<b>Audit View</b>	Enable auditing and display data in the Audit View and Audit History tab	<a href="#">Audit View Controls</a> [306] <a href="#">Audit History Tab</a> [308]
<b>Baselines - Manage</b>	Create, delete, import and export Baselines	<a href="#">Package Baselines</a> [310]
<b>Baselines - Restore</b>	Merge data into the project model from a Baseline or XML file	<a href="#">Package Baselines</a> [310]
<b>Change Password</b>	Change your own password or (Administrator) another user's password	<a href="#">Change Password</a> [210]
<b>Check Data Integrity</b>	Check and repair project data integrity	<a href="#">Check Project Data Integrity</a> [416]
<b>Configure Datatypes</b>	Add, modify and delete datatypes	<a href="#">Data Types</a> [779]
<b>Configure Images</b>	Configure alternative element images	<a href="#">Using The Image Manager</a> [595]
<b>Configure Packages</b>	Configure controlled packages and package properties	<a href="#">Configure Packages</a> [331]
<b>Configure Resources</b>	Create and manage Resources window items: RTF templates, patterns, profiles and favorites	<a href="#">Resources</a> [791]
<b>Configure Stereotypes</b>	Add, modify and delete Stereotypes	<a href="#">Stereotype Settings</a> [775]
<b>Configure Version Control</b>	Set up version control options for the current model	<a href="#">Version Control Settings Dialog</a> [271]
<b>Export XMI</b>	Export a model to XMI	<a href="#">Export to XMI</a> [321]
<b>Generate Documents</b>	Generate RTF and HTML documents from model packages	<a href="#">RTF Documents</a> [1738] <a href="#">HTML Reports</a> [1817]

Permission	Enables the user to	See also
<b>Generate Source Code and DDL</b>	Generate source code and DDL from a model element, and synchronize code against model elements if it already exists	<a href="#">Generate Source Code</a> <sup>[149]</sup> <a href="#">Generate DDL for a Table</a> <sup>[1385]</sup> <a href="#">Synchronize Model and Code</a> <sup>[1515]</sup>
<b>Import XML</b>	Import a model from XML	<a href="#">Import from XML</a> <sup>[324]</sup>
<b>Lock Objects</b>	Lock an element or package	<a href="#">Lock Model Elements</a> <sup>[211]</sup> <a href="#">Lock Packages</a> <sup>[213]</sup>
<b>Manage Diagrams</b>	Create new diagrams, copy and delete existing diagrams, and save a diagram as a UML Pattern	<a href="#">Create a Pattern</a> <sup>[1024]</sup> <a href="#">Add New Diagrams</a> <sup>[570]</sup> <a href="#">Copy a Diagram</a> <sup>[585]</sup> <a href="#">Delete Diagram</a> <sup>[582]</sup>
<b>Manage Glossary</b>	Create, edit and delete glossary items in the Project Glossary	<a href="#">Project Glossary</a> <sup>[364]</sup>
<b>Manage Issues</b>	Update and delete model Issues	<a href="#">Project issues</a> <sup>[360]</sup>
<b>Manage Project Calendar</b>	Add, update and delete Project Calendar events; those without this permission can view calendar items	<a href="#">Calendar</a> <sup>[394]</sup>
<b>Manage Project Information</b>	Update and manage project resources, metrics and risks	<a href="#">Project Resources</a> <sup>[350]</sup>
<b>Manage Reference Data - Update</b>	Update and delete reference items	<a href="#">Reference Data</a> <sup>[774]</sup>
<b>Manage Replicas</b>	Create and synchronize replicas	<a href="#">Create Replicas</a> <sup>[191]</sup> <a href="#">Synchronize Replicas</a> <sup>[192]</sup>
<b>Manage Tests</b>	Update and delete Test records	<a href="#">The Testing Workspace</a> <sup>[1707]</sup>
<b>Reverse Engineer from DDL and Source Code</b>	Reverse engineer from source code or ODBC, and synchronize model elements against code	<a href="#">Import Source Code</a> <sup>[1517]</sup>
<b>Security - Enable/Disable</b>	Disable user security in Enterprise Architect	<a href="#">Enable Security</a> <sup>[197]</sup>
<b>Security - Manage Locks</b>	View and delete element locks	<a href="#">View and Manage Locks</a> <sup>[208]</sup>
<b>Security - Manage Users</b>	Maintain users, groups and assigned permissions	<a href="#">Maintain Users</a> <sup>[199]</sup> <a href="#">Assign User to Groups</a> <sup>[202]</sup> <a href="#">Set Up Single Permissions</a> <sup>[202]</sup>

Permission	Enables the user to	See also
Spell Check	Spell check package and set spell check language	<a href="#">Using the Spell Checker</a> <sup>[378]</sup>
Transfer Data	Transfer model between different repositories	<a href="#">Perform a Project Data Transfer</a> <sup>[345]</sup>
Transform Package	Perform transformations of packages and elements	<a href="#">Model Transformations</a> <sup>[1307]</sup>
Update Diagrams	Update diagram appearance, properties and layout, including the Page Setup dialog	<a href="#">Diagram Properties</a> <sup>[571]</sup> <a href="#">Set Diagram Page Size</a> <sup>[602]</sup>
Update Element	Save model changes (including delete) for elements, packages, and relationships	<a href="#">Element Tasks</a> <sup>[627]</sup> <a href="#">Packages</a> <sup>[535]</sup> <a href="#">Connector Tasks</a> <sup>[742]</sup>
Use Version Control	Check files in and out using version control	<a href="#">Check In and Check Out Packages</a> <sup>[276]</sup>

### 3.4.2.11 View and Manage Locks

Enterprise Architect provides a function to view and manage active locks on elements.

**Access:** [Project](#) | [Security](#) | [Manage Locks](#)

**Use to:**

- Periodically examine and, if necessary, delete locks placed on elements by users

**How to:**

To view locks and, if necessary, delete them, follow the steps below:

Step	Action	See also
1	Select the <b>Manage Locks</b> menu option The Active Locks dialog displays	
2	In the View Locks For panel, click on the radio button for the type of lock to view <ul style="list-style-type: none"> <li>All</li> <li>Groups Only</li> <li>Users Only</li> </ul> Locks of the selected type are listed in the Active Locks panel	
3	To remove a lock, click on it and click on the <b>Unlock Selected</b> button	
4	When finished, click on the <b>Close</b> button to close the dialog	

**Notes:**

- You must have **Security - Manage Locks** permission to view and delete user locks; the initial **Admin** administrator automatically has this permission
- If you want to display the resulting information in a more readable layout, you can resize the dialog and its columns
- If an element is locked then connectors attached to it are also locked, so to unlock the connector you must unlock the element; however, under certain circumstances you can add new connectors to a locked element

**Learn More:**

- [List of Available Permissions](#)<sup>[206]</sup>
- [Add Connectors to Locked Elements](#)<sup>[212]</sup>

**3.4.2.12 Password Encryption**

This topic is retained to support regression to releases of Enterprise Architect prior to version 7.1; for password encryption for all repositories at and beyond release 7.1, you create model shortcuts. Enterprise Architect Security Administrators of projects on SQL Server or Oracle repositories can encrypt the password used to set up the connection between Enterprise Architect and the repository. The Enterprise Architect user does not have the real password, thereby preventing them from accessing the repository using other tools such as Query Analyzer or SQLPlus.

**Access:** **Project | Security | Encrypt Password**

**Use to:**

- Encrypt the password used to set up the connection between Enterprise Architect and a SQL Server or Oracle repository

**How to:**

To encrypt a repository password, follow the steps below:

Step	Action	See also
1	Select the <b>Encrypt Password</b> menu option A simple dialog displays	
2	In the <b>Password</b> field, enter the password to access the repository The <b>Encrypted</b> field displays the modified password to be used by users	
3	Instruct users to connect Enterprise Architect to the repository using the encrypted password prefixed with \$\$	<ul style="list-style-type: none"> <li>• <a href="#">Connect to Oracle Data Repository</a><sup>[163]</sup></li> <li>• <a href="#">Connect to SQL Server Data Repository</a><sup>[164]</sup></li> </ul>

**Notes:**

- Do not use the **Test Connection** button as it can cause an error with encrypted passwords
- For SQL Server repositories, you must enter the **Initial Catalog** details from the All tab of the Data Link Properties dialog

Learn More:

- [Model Shortcuts](#)<sup>[14]</sup>

**3.4.2.13 Change Password**

This topic explains how to change a password when security is set.

**Access:** **Project | Security | Change Password** (User)  
**Project | Security | Manage Users** (Administrator)

Use to:

- Change your own password (User)
- Set or change any user's password (Administrator)

How to:

To change your own user password, follow the steps below:

Step	Action	See also
1	Select the <b>Change Password</b> menu option The Change Password dialog displays	
2	In the <b>Enter old password</b> field, type your current password	
3	In the <b>New password</b> field, type your new password This must be 12 characters or less in length	
4	In the <b>Retype new</b> field, type your new password again, for confirmation	
5	Click on the <b>OK</b> button The <i>Password Changed</i> message displays	
6	Click on the <b>OK</b> button to clear the message Your new password is effective next time you log in	

To set or change any user's password as Administrator, follow the steps below

Step	Action	See also
1	Select the <b>Manage Users</b> menu option The Security Users dialog displays	
2	In the Users: panel, click on the user's name The user's details display in the dialog fields	
3	Click on the <b>Change Password</b> button The Change Password dialog displays	

Step	Action	See also
4	In the <b>New password</b> field, type the user's password This must be 12 characters or less in length You do not have to enter the user's current password	
5	In the <b>Retype new</b> field, type the user's password again, for confirmation	
6	Click on the OK button The <i>Password Changed</i> message displays	
7	Click on the <b>OK</b> button	

**Notes:**

- A user must have **Change Password** permission to change a password; the initial Admin administrator automatically has this permission

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>

**3.4.2.14 Lock Model Elements**

This topic explains how to set a lock on a model object in **User/Group Locking** mode.

In **Require User Lock to edit** mode, the *Apply a User* lock process applies.

**Access:**

Select:

- **Project Browser | Package context menu | Lock**
- **Project Browser | Diagram context menu | Lock**
- **Project Browser | Element context menu | Lock**
- **Diagram background context menu | Lock** or
- **Diagram Element context menu | Lock**

**Use to:**

- Set an editing lock on a modeling object so that:
  - Nobody can edit the object
  - Only you can edit the object, or
  - Only a member of your user group can edit the object
- Clear any editing lock on the object

**How to:**

To set a lock on an object in **User/Group Locking** mode, follow the steps below:

Step	Action	See also
1	Select the <b>Lock</b> option on the appropriate context menu	

Step	Action	See also
	The Element Lock dialog displays	
2	Select the radio button for the required option: <ul style="list-style-type: none"> <li>• <b>No lock</b> - do not lock this object; clear any existing lock</li> <li>• <b>Full lock</b> - lock this object so that no-one can edit it</li> <li>• <b>User lock</b> - lock this object so that only the locking user can make further edits</li> <li>• <b>Group lock</b> - lock this element so that any member of the specified group can edit the object, but others are excluded</li> </ul>	
3	If you have selected the <b>Group lock</b> option, in the <b>GroupID</b> field click on the drop-down arrow and select the group that can edit the object	
4	Click on the <b>OK</b> button	

**Notes:**

- You must have **Lock Objects** permission to lock an element
- If the item already has a lock, only the corresponding lock option and the **No lock** option are shown; you have to release the lock in order to set a different type of lock
- If a diagram is locked and you select an object on it, the object border displays in red, indicating that you cannot change the object

**Learn More:**

- [List of Available Permissions](#)<sup>[206]</sup>
- [Security Policy](#)<sup>[198]</sup>
- [Apply a User Lock](#)<sup>[214]</sup>

**3.4.2.15 Add Connectors To Locked Elements**

When working in a diagram containing locked elements, you can add connectors depending on the lock status of the source and target elements.

**Reference:**

Element Status	Add Connectors	See also
Source unlocked, target unlocked	Yes, any kind of connector can be added	
Source unlocked, target locked	Yes, except for Composition connectors	
Source locked, target unlocked	No, except for Composition connectors	
Source locked, target locked	No, prohibited for all connectors	

**Notes:**

- Generally, a connector can be added if its source is unlocked - you are modifying what the source can see
- The exception is Composition connectors, where the target (the parent) must be unlocked - you are modifying the parent by adding children
- Connectors with locked source or target elements are also locked; to unlock the connector, you must

unlock the source and/or target element

**Learn More:**

- [View and Manage Locks](#)<sup>[208]</sup>

### 3.4.2.16 Lock Packages

This topic explains how to lock the complete contents of a package (and optionally all contents of its child packages) in **User/Group locking** mode, in one operation.

**Access:** **Project Browser | Package context menu | Lock Package**

**Use to:**

- Automatically set or clear locks on elements and diagrams within a package in **User/Group locking** mode, as if the locks had been set or cleared individually

**How to:**

To lock a package, follow the steps below:

Step	Action	See also
1	Deselect the <b>Project   Security   Require User Lock to Edit</b> menu option	<a href="#">Security Policy</a> <sup>[198]</sup>
2	In the Project Browser, right-click on the package to lock The context menu displays	
3	Select the <b>Lock Package</b> menu option The Lock/Unlock Package(s) dialog displays	
4	In the Lock Type panel, select the appropriate radio button for the lock to apply, as for an individual object lock	<a href="#">Lock Model Elements</a> <sup>[211]</sup>
5	As required, select the checkboxes to lock: <ul style="list-style-type: none"> <li>• Elements and/or diagrams</li> <li>• The contents of child packages (that is, lock the whole branch)</li> </ul>	
6	Click on the <b>OK</b> button to apply the lock.	

**Notes:**

- If security is enabled you must have **Lock Objects** permission to lock a package

**Learn More:**

- [List of Available Permissions](#)<sup>[206]</sup>

### 3.4.2.17 Apply a User Lock

In the **Require User Lock to Edit** security mode, where a User Lock is required before any edit can occur, you can set or release the lock in either a diagram or the **Project Browser**.

#### Access:

Select:

- **Project Browser | Package context menu | Apply/Release User Lock**
- **Project Browser | Diagram context menu | Apply/Release User Lock**
- **Project Browser | Element context menu | Apply/Release User Lock**
- **Diagram background context menu | Apply/Release User Lock** or
- **Diagram Element context menu | Apply/Release User Lock**

#### Use to:

- Set an editing lock on a modeling object so that only you can edit the object
- Clear the editing lock on the object

#### How to:

To set or clear a user lock in **Require User Lock to Edit** security mode, follow the steps below:

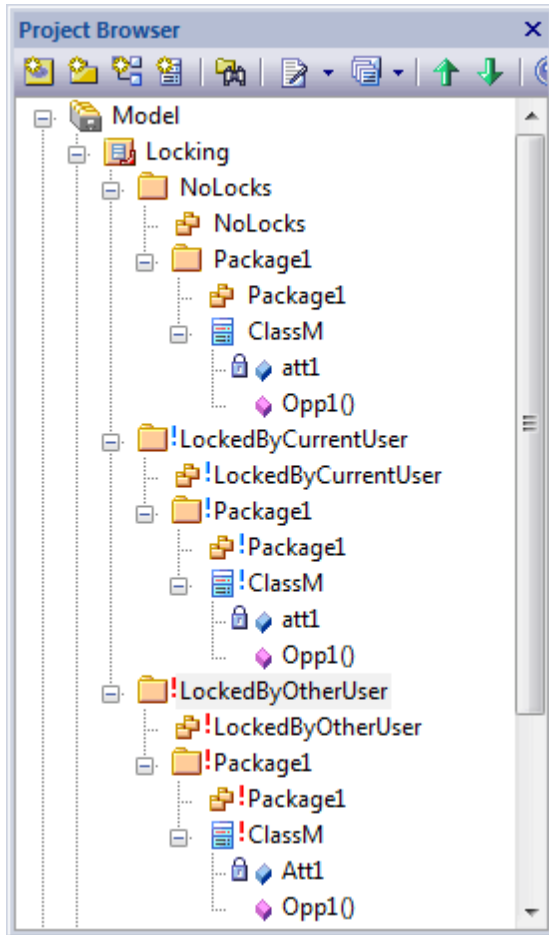

Step	Action	See also
1	Right-click on the required object in the Project Browser or diagram, and select the <b>Apply/Release User Lock</b> option	
2	Select the appropriate radio button to apply a user lock to, or release a user lock on, the selected object  Enterprise Architect adjusts the lock for the element, or for the diagram and any elements contained in the diagram.	
3	For a package, if required, select to also lock all child packages  If any elements in the package tree are locked by other users, a list of elements that couldn't be locked displays	

#### Learn More:

- [Security Policy](#)<sup>[198]</sup>

### 3.4.2.18 Locked Element Indicators

When an item is locked through User Security, the lock is indicated in the Project Browser by a marker against the item, as shown below:

**Guide:**

The meanings of the markers depend on the security mode:

Security Mode	Marker	Meaning	See also
Require User Lock to Edit	No marker	There is no lock, the item is <b>not</b> editable, but any user can now apply a user lock to edit the item	<a href="#">Security Policy</a> [198]
	Blue exclamation mark	The current user has applied a user lock and can edit the item; no other user can edit the item	<a href="#">Apply a User Lock</a> [214]
	Red exclamation mark	Another user has applied a user lock, and the current user cannot edit the item You can find out which user has locked the item	<a href="#">Identify Who Has Locked An Object</a> [216]

Security Mode	Marker	Meaning	See also
User/Group Lock	No marker	There is no lock, the item is editable, but any user can now apply a user or group lock	<a href="#">Security Policy</a> [198] <a href="#">Lock Model Elements</a> [211]
	Blue exclamation mark	The item has a lock set by the current user or a group having the current user as a member, and the user can edit the item	
	Red exclamation mark	The item has a lock set by another user, or a group of which the current user is <b>not</b> a member; the current user cannot edit the item  You can find out which user has locked the item	<a href="#">Identify Who Has Locked An Object</a> [216]

**Notes:**

- If a diagram is locked and you select an object on it, the object border displays in red; this indicates that you cannot change the object

**3.4.2.19 Identify Who Has Locked An Object**

If you find that a diagram, package or element is locked, you can find out which group or user currently holds the lock on that item.

**Access:**

- **Project Browser | Package context menu | Lock**
- **Project Browser | Diagram context menu | Lock**
- **Project Browser | Element context menu | Lock**

**Use to:**

- Determine which user or user group has locked the package, diagram or element in which you are interested

**How to:**

To identify the lock holder, follow the steps below:

Step	Action	See also
1	In the Project Browser, right-click on the diagram, package or element that is locked by another user or user group, and select the <b>Lock</b> option  A message box displays showing which group or user currently holds the lock on that item	

**3.4.2.20 Manage Your Own Locks**

You can view and delete your own user-level locks in Enterprise Architect. This is especially useful when working in *Require user locks to edit* security mode.

**Access:** **Project | Security | My Locks**

**Use to:**

- Review the locks you have set and, where necessary, clear them

**How to:**

To manage your locks, follow the steps below:

Step	Action	See also
1	Select the <b>My Locks</b> menu option The My Locks dialog displays, showing all the locks you have set	<a href="#">Lock Model Elements</a> <sup>[211]</sup> <a href="#">Apply a User Lock</a> <sup>[214]</sup> <a href="#">Lock Packages</a> <sup>[213]</sup>
2	If you intend to clear locks, either: <ul style="list-style-type: none"> <li>• Select a lock you intend to clear</li> <li>• Press <b>(Ctrl)</b> or <b>(Shift)</b> as you select a number of locks or a range of locks respectively, to clear</li> <li>• Click on <b>Select All</b> to select all of your locks, or</li> <li>• Click on <b>Select None</b> to clear your selection, if you have made an error</li> </ul>	
3	If you have selected locks to clear, click on the <b>Unlock Selected</b> button The objects that were locked are now unlocked	

**Learn More:**

- [Security Policy](#) <sup>[198]</sup>

### 3.4.3 Team Review Tools

The Enterprise Architect Project *Team Review* can be used by the team members to discuss the development and progress of a project.

**Access:** [View | Team Review](#) (Ctrl+Alt+U)

**Topics:**

Topic	Detail	See also
<b>Team Review Facility</b>	The Team Review is discussion forum within your development team community  A point of discussion and the responses to that point are created as <i>Posts</i>  Posts are held in <i>Topic</i> groups, which are in turn organized into <i>Categories</i> ; your organization decides on the grouping and organization of Posts	<a href="#">Add a new Category</a> <sup>[221]</sup> <a href="#">Add a New Topic</a> <sup>[222]</sup> <a href="#">Add a New Post</a> <sup>[223]</sup>

Topic	Detail	See also
	You can create text to explain Categories and Topics, and you can create and respond to Posts and replies	
<b>Displays</b>	<ul style="list-style-type: none"> <li>The <i>Team Review window</i>, used to create new Categories and Topics and to delete messages, using a context menu</li> </ul> <p>Each item in the hierarchy displays a mouse-over tooltip, showing the item title, the author's name and the date and time the item was created</p> <ul style="list-style-type: none"> <li>The <i>Team Review tab</i>, in the main work area, used to view, print, create, edit, and reply to review Posts</li> </ul> <p>This tab has a status bar that shows the item author's name, the date and time the item was created, and the date and time the item was last modified</p> <ul style="list-style-type: none"> <li>The <i>linked objects panel</i>, located at the bottom of the Team Review tab, used to associate model elements, diagrams, external files and other postings with a review posting</li> </ul>	<a href="#">The Team Review Context menu</a> <sup>[219]</sup> <a href="#">Reply to a Post</a> <sup>[220]</sup> <a href="#">Add Object Links</a> <sup>[228]</sup>
<b>Features</b>	<ul style="list-style-type: none"> <li>Display or edit the text on the Team Review tab by clicking on the item name in the Team Review window</li> <li>Using the <b>Search</b> icon in the Team Review toolbar, search for text strings in the item titles to locate posts on a specific topic</li> <li>Add resources to a Category, Topic or Post; resources such as diagram images and XML files of packages, are held in a <i>Resources</i> folder under the selected Team Review item</li> <li>Change the loading behavior of the forum</li> <li>Access team reviews from other projects, including those on servers</li> </ul>	<a href="#">Edit an Item</a> <sup>[227]</sup> <a href="#">Search Team Review</a> <sup>[230]</sup> <a href="#">Team Review Resources</a> <sup>[229]</sup> <a href="#">Team Review Options</a> <sup>[230]</sup> <a href="#">Team Review Connections</a> <sup>[231]</sup>
<b>Icons</b>	<p>The icons beside the review items have the following meanings:</p> <ul style="list-style-type: none"> <li> Post read</li> <li> Post unread</li> <li> Reply read</li> <li> Reply unread</li> <li> Category (name in bold indicates category is unread)</li> <li> Topic read</li> <li> Topic unread</li> <li> <i>Resources</i> folder for a Category, Topic or Post</li> <li> Diagram or clipboard image within <i>Resources</i> folder</li> <li> XML File of package, within <i>Resources</i> folder.</li> </ul>	

### 3.4.3.1 Context Menu

The **Team Review** context menu enables you to access a wide range of functions, depending on the object that you right-click on.

Action	Usage	Shortcut	See also
<b>New Category</b> <b>New Topic</b> <b>New Post</b>	Add a new Category, new Topic or new Post to the Team Review  Alternatively, for a Topic or Post, click on the <b>New</b> icon in the window toolbar		<a href="#">Add a New Category</a> <sup>[221]</sup> <a href="#">Add a New Topic</a> <sup>[222]</sup> <a href="#">Add a New Post</a> <sup>[223]</sup>
<b>New Category From Template</b> <b>New Topic from Template</b> <b>New Post from Template</b>	Add a new Category, new Topic or new Post, based on a defined template		<a href="#">Add a New Category</a> <sup>[221]</sup> <a href="#">Add a New Topic</a> <sup>[222]</sup> <a href="#">Add a New Post</a> <sup>[223]</sup>
<b>Post Reply</b>	Create a reply <sup>[225]</sup> to the selected Post  Alternatively, click on the <b>New</b> icon in the window toolbar		<a href="#">Reply to a Post</a> <sup>[225]</sup>
<b>Rename</b>	Edit the name, in situ, of the currently-selected item	<b>F2</b>	
<b>Copy Path to Clipboard</b>	Copy the path of the currently-selected item to the clipboard  You can then paste the path into a document or file to add the discussion to any text concerning the item	<b>Ctrl+C</b>	
<b>Show Contents</b>	Display the description or text of the selected item in the Team Review window, if the Team Review tab is not yet open		
<b>Share Resource</b>	(If anything other than a Resources folder is selected)  Add a package from the current model, or an image of the currently-displayed diagram, or an image from the clipboard, to the <i>Resources</i> folder under the selected Category, Topic or Post  If the <i>Resources</i> folder does not exist, this option creates it		<a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Add Package From Current Model</b>	(If a Resources folder is selected)  Export a package as an XML file from the current model as a resource of the selected Category, Topic or Post  You browse for and select the required package using the Select <item> dialog		<a href="#">Team Review Resources</a> <sup>[229]</sup> <a href="#">Select &lt;item&gt; Dialog</a> <sup>[692]</sup>
<b>Import to Current Model</b>	(If a package XML file resource is selected)  Import the resource package to the current model  You browse for and select the required target		<a href="#">Select &lt;item&gt; Dialog</a> <sup>[692]</sup>

Action	Usage	Shortcut	See also
	<p>package using the Select &lt;item&gt; dialog; the resource is imported as a child of that package</p> <p>This is a useful option for transferring relevant packages from the Team Review of one model into another model</p>		
<b>Add Image of Active Diagram</b>	<p>(If a Resources folder is selected)</p> <p>Add an image of the currently-displayed diagram as a resource of the selected Category, Topic or Post</p> <p>You are prompted to provide a reference name for this image</p>		<a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Add Active Profiler Report</b>	<p>(If a Resources folder is selected)</p> <p>Add an active Profiler Report as a resource of the selected Category, Topic or Post</p> <p>You are prompted to browse for and select the appropriate active report</p>		<a href="#">Team Review Resources</a> <sup>[229]</sup> <a href="#">Save Report in Team Review</a> <sup>[1673]</sup>
<b>Image From Clipboard</b>	<p>(If a Resources folder is selected)</p> <p>Add an image held on the clipboard as a resource of the selected Category, Topic or Post</p>		<a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>View Image</b>	<p>(If a diagram image resource is selected)</p> <p>Open the View Image window, containing an image of the selected diagram</p> <p>Alternatively, double-click on the image name</p>		<a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Copy Image To Clipboard</b>	<p>(If an image resource is selected)</p> <p>Copy the image or diagram image to the clipboard</p>		<a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Refresh Category 'xyz'</b> <b>Refresh Topic 'xyz'</b> <b>Refresh Post 'xyz'</b>	<p>Refresh the currently-open Category, Topic or Post, getting new replies, Posts and Topics that other users might have created</p> <p>However, if you open another Category, Topic or Post the Team Review always displays the latest information from the database</p> <p>Alternatively, click on the <b>Refresh</b> icon in the window toolbar</p>		
<b>Reload Current Connection</b>	<p>Reload the entire <b>Team Review</b> connection, getting new Categories, Posts and Topics</p>		
<b>Review Status</b>	<p>Assign or clear a status marker against the selected Category, Topic or Post; you can mark the item as:</p> <ul style="list-style-type: none"> <li>• <b>Awaiting Approval</b></li> <li>• <b>Approved</b></li> <li>• <b>Rejected</b></li> </ul> <p>Or clear the marker (<b>None</b>)</p>		

Action	Usage	Shortcut	See also
<b>Mark</b>	See the <b>Mark</b> submenu, below		
<b>Connections...</b>	<p>Access other Team Reviews from other Enterprise Architect models or models located on servers</p> <p>Alternatively, click on the drop-down arrow in the <b>Connection Options</b> field in the window toolbar, and select one of the listed models</p> <p>The <b>&lt;Configure Connections&gt;</b> option enables you to add and connect to additional Team Reviews</p>		<a href="#">Team Review Connections</a> <sup>[237]</sup>
<b>Options...</b>	Change the loading behavior of the Team Review		<a href="#">Team Review Options</a> <sup>[230]</sup>
<b>Delete Category &lt;xyz&gt;</b> <b>Delete Topic &lt;xyz&gt;</b> <b>Delete Post &lt;xyz&gt;</b> <b>Delete Resource &lt;xyz&gt;</b>	Delete this Category, Topic, Post or reply and all sub-topics and sub-posts, or delete the resource attached to the item		<a href="#">Edit an Item</a> <sup>[227]</sup>

Action	Usage	Shortcut	See also
<b>All items as Read</b>	Mark the entire contents of the <b>Team Review</b> as read <sup>[1009]</sup>		<a href="#">Team Review Tools</a> <sup>[217]</sup>
<b>All items as Unread</b>	Mark the entire contents of the <b>Team Review</b> as unread <sup>[413]</sup>		<a href="#">Team Review Tools</a> <sup>[217]</sup>
<b>Branch as Read</b>	Mark this item and all its contents as read		
<b>Branch as Unread</b>	Mark this item and all its contents as unread		
<b>'xyz' as Unread</b>	Mark only this item as unread		

### 3.4.3.2 Add a New Category

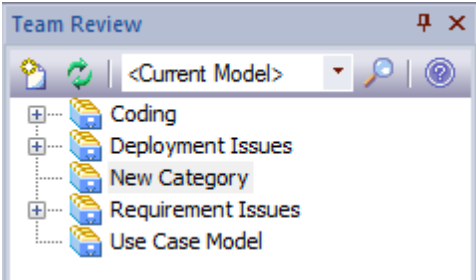

This topic explains how to add new Categories to the Team Review.

**Access:** **View | Team Review (Ctrl+Alt+U)**

Use to:

- Create a new Category in which to store related Topics and Posts

How to:

Step	Action	See also
1	<p>Right-click on a blank area in the Team Review window and select the <b>New Category</b> context menu option</p> <p>A new Category icon displays in the hierarchy</p> 	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Category</i> text with the name of the Category, and clicking off the name</p> <p>The Category description editor displays in the Team Review tab; type the appropriate Category description, if required</p>	
3	Add new Topics and/or resources to the Category	<a href="#">Add a New Topic</a> <sup>[221]</sup> <a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Alternatively</b>		
1	<p>Right-click on a blank area in the Team Review window and select the <b>New Category from template</b> context menu option</p> <p>A new Category icon displays in the hierarchy</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Category</i> text with the name of the Category, and clicking off the name</p> <p>The Create New Category dialog displays</p>	
3	<p>Click on the <b>Copy template</b> drop-down arrow and select a predefined template for the Category description</p> <p>Click on the <b>OK</b> button</p>	
4	The Category description editor displays in the Team Review tab; type the appropriate Category description, if required	
5	Add new Topics and/or resources to the Category	<a href="#">Add a New Topic</a> <sup>[221]</sup> <a href="#">Team Review Resources</a> <sup>[229]</sup>

### 3.4.3.3 Add a New Topic

This topic explains how to add new Topics to a Category in the Team Review.

**Access:** [View | Team Review](#) (Ctrl+Alt+U)

**Use to:**

- Create a new Topic in which to store related Posts and their responses

**How to:**

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>Right-click on the required Category name in the Team Review window and select the <b>New Topic</b> context menu option</li> <li>Click on the Category name and click on the <b>New</b> icon in the Team Review toolbar, or</li> <li>Click on the Category name and press ( <b>Ctrl+N</b> )</li> </ul> <p>A new <b>Topic</b> icon displays under the Category name</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Topic</i> text with the name of the Topic, and clicking off the name</p> <p>The Topic description editor displays in the Team Review tab; type the appropriate Topic description, if required</p>	
3	Add new Posts and/or resources to the Topic	<a href="#">Add a New Post</a> <sup>[223]</sup> <a href="#">Team Review Resources</a> <sup>[229]</sup>
<b>Alternatively</b>		
1	<p>Right-click on the required Category name in the Team Review window and select the <b>New Topic from template</b> context menu option</p> <p>A new Topic icon displays under the Category Name</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Topic</i> text with the name of the Topic, and clicking off the name</p> <p>The Create New Topic dialog displays</p>	
3	<p>Click on the <b>Copy template</b> drop-down arrow and select a predefined template for the Topic description</p> <p>Click on the <b>OK</b> button</p>	
4	The Topic description editor displays in the Team Review tab; type the appropriate Topic description, if required	
5	Add new Posts and/or resources to the Topic	<a href="#">Add a New Post</a> <sup>[223]</sup> <a href="#">Team Review Resources</a> <sup>[229]</sup>

**3.4.3.4 Add a New Post**

This topic explains how to create a new Post on a Topic in the **Team Review**.

**Access:** **View | Team Review** ( **Ctrl+Alt+U** )

**Use to:**

- Create a blank Post
- Create a Post based on a predefined template

- Create a Post from a file link

#### How to - Create a blank message:

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>• Right-click on the appropriate Topic name in the Team Review window and select the <b>New Post</b> context menu option</li> <li>• Click on the Topic name and on the <b>New</b> icon in the Team Review toolbar, or</li> <li>• Click on the Topic name and press ( <b>Ctrl+N</b> )</li> </ul> <p>A new Post icon displays underneath the Topic name</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Post</i> text with the name of the Post, and clicking off the name</p> <p>The Post text editor displays in the Team Review tab</p>	
3	Type the text of the Post as required	<a href="#">Edit an Item</a> <sup>[227]</sup>

#### How to - Create a Post based on a predefined template:

Step	Action	See also
1	<p>Right-click on the appropriate Topic name in the Team Review window and select the <b>New Post from template</b> context menu option</p> <p>A new Post icon displays in the hierarchy</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	<p>Overtyping the <i>New Post</i> text with the name of the Post, and clicking off the name</p> <p>The Create New Post dialog displays</p>	
3	Click on the drop-down arrow in the <b>Copy template</b> field, and select a predefined template for the Post contents	
4	<p>Click on the <b>OK</b> button</p> <p>The template structure is displayed in the Team Review tab</p>	
5	Enter the text of the Post as required	<a href="#">Edit an Item</a> <sup>[227]</sup>

#### How to - Create a Post based on a link to an external file:

Step	Action	See also
1	Open a file browser (such as Windows Explorer) and locate the file	
2	<p>Click on the file name and drag it onto the appropriate Topic name in the Team Review window</p> <p>A new Post icon is created underneath the selected Topic, and the body of the Post is shown in the Team Review tab</p>	

Step	Action	See also
	A link to the source file is created at the start of the message	
3	Click twice on the <i>New Post</i> text in the Team Review window, and overtype the text with the name of the Post	
4	In the Team Review tab, create and edit text around the file link, and add further links if required	<a href="#">Edit an Item</a> <sup>[227]</sup>

**When you have created the Post:**

Topic	Detail	See also
You can create links from the Post	To elements and diagrams from the: <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Model Search</li> <li>• Model Views window</li> <li>• Package Browser</li> </ul>	<a href="#">Add Object Links</a> <sup>[228]</sup> <a href="#">The Project Browser</a> <sup>[443]</sup> <a href="#">Model Search</a> <sup>[477]</sup> <a href="#">Model Views</a> <sup>[466]</sup> <a href="#">Package Browser</a> <sup>[455]</sup>
	To related Team Review: <ul style="list-style-type: none"> <li>• Categories</li> <li>• Topics</li> <li>• Posts</li> </ul>	<a href="#">Add Object Links</a> <sup>[228]</sup>
	To external files, either in the text of the Post or in the Linked Objects panel	<a href="#">Add Object Links</a> <sup>[228]</sup>
Add resources to the Post		<a href="#">Team Review Resources</a> <sup>[229]</sup>
Other users can reply to it		<a href="#">Reply to a Post</a> <sup>[228]</sup>

**3.4.3.5 Reply to a Post**

This topic explains how to reply to a Post in the **Team Review**.

**Access:** [View | Team Review](#) (Ctrl+Alt+U)

**Use to:**

- Create a response to a Post
- Create a response to an existing response to a Post

**How To:**

Step	Action	See also
1	<p>Either:</p> <ul style="list-style-type: none"> <li>• Right-click on the required Post (or response) in the Team Review window and select the <b>Post Reply</b> context menu option</li> <li>• Click on the Post name and on the <b>New</b> icon in the Team Review toolbar, or</li> <li>• Click on the Post name and press ( <b>Ctrl+N</b> )</li> </ul> <p>A <i>Re:&lt;Postname&gt;</i> entry displays underneath the Post you are replying to, and the cursor becomes active in the Team Review tab to enable you to create and edit your response</p>	<a href="#">Context Menu</a> <sup>[219]</sup>
2	Type in, format and save the contents of the reply	<a href="#">Edit an Item</a> <sup>[227]</sup>
<b>Alternatively</b>		
1	Open a file browser (such as Windows Explorer) and locate the file	
2	<p>Click on the file name and drag it into the Team Review window, over the Post to which you are replying</p> <p>A <i>Re:&lt;Postname&gt;</i> entry displays underneath the Post, and the cursor becomes active in the Team Review tab to enable you to edit your response</p> <p>A link to the source file is created at the start of the message</p>	
3	Type in, format and save the contents of the reply	<a href="#">Edit an Item</a> <sup>[227]</sup>

**When you have created the Post:**

Topic	Detail	See also
You can create links from the Post	To elements and diagrams from the: <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Model Search</li> <li>• Model Views window</li> <li>• Package Browser</li> </ul>	<a href="#">Add Object Links</a> <sup>[228]</sup> <a href="#">The Project Browser</a> <sup>[443]</sup> <a href="#">Model Search</a> <sup>[477]</sup> <a href="#">Model Views</a> <sup>[466]</sup> <a href="#">Package Browser</a> <sup>[458]</sup>
	To related Team Review: <ul style="list-style-type: none"> <li>• Categories</li> <li>• Topics</li> <li>• Posts</li> </ul>	<a href="#">Add Object Links</a> <sup>[228]</sup>
	To external files, either in the text of the Post or in the Linked Objects panel	<a href="#">Add Object Links</a> <sup>[228]</sup>
Add resources to the Post		<a href="#">Team Review Resources</a> <sup>[229]</sup>
Other users can reply to it		<a href="#">Reply to a Post</a> <sup>[225]</sup>

### 3.4.3.6 Edit an Item

This topic explains how to edit or delete a Category, Topic, Post or reply.

**How to:**

Topic	Detail	See also
<b>Select an item to edit</b>	Click on the item name in the Team Review window The item text displays in the Team Review tab to enable you to edit the text	
<b>Change the name of the item</b>	Click on the item name in the Team Review window and press <b>(F2)</b> Overtyping the current name	
<b>Delete an item</b>	Either: <ul style="list-style-type: none"> <li>Right-click on the item in the Team Review window and select the <b>Delete &lt;item&gt; &lt;name&gt;</b> context menu option, or</li> <li>Click on the item and press <b>(Delete)</b></li> </ul> A confirmation dialog displays; click on the <b>Yes</b> button to remove the item and any dependent items from the Team Review	<a href="#">Context Menu</a> <sup>[219]</sup>
<b>Edit the text</b>	Access the Team Review Editor standard functions by right-clicking on the text, to display a hierarchy of context menus  When you have completed your editing, select <b>Right-click   File   Save</b> and then click on another item in the Team Review window to exit the message  The text is saved in the Team Review item  To redisplay the text in the Team Review tab, click on the item name once	<ul style="list-style-type: none"> <li><a href="#">Scroll Through Text</a> <sup>[1756]</sup></li> <li><a href="#">File and Print Options</a> <sup>[1757]</sup></li> <li><a href="#">Cut and Paste Options</a> <sup>[1758]</sup></li> <li><a href="#">Image and Object Imports</a> <sup>[1761]</sup></li> <li><a href="#">Character Formatting</a> <sup>[1762]</sup></li> <li><a href="#">Paragraph Formatting</a> <sup>[1763]</sup></li> <li><a href="#">Tab Support</a> <sup>[1766]</sup></li> <li><a href="#">Page Breaks and Repagination</a> <sup>[1766]</sup></li> <li><a href="#">Insert Headers and Footers</a> <sup>[1767]</sup></li> <li><a href="#">Insert Bookmarks</a> <sup>[1767]</sup></li> <li><a href="#">Table Commands</a> <sup>[1769]</sup></li> <li><a href="#">Sections and Columns</a> <sup>[1772]</sup></li> <li><a href="#">Stylesheets and Table of Contents</a> <sup>[1772]</sup></li> </ul>

Topic	Detail	See also
		<ul style="list-style-type: none"> <li>• <a href="#">Text/Picture Frame and Drawing Objects</a> <sup>[1776]</sup></li> <li>• <a href="#">Search/Replace Commands</a> <sup>[1777]</sup></li> <li>• <a href="#">Hyperlink From Linked Document</a> <sup>[734]</sup></li> <li>• <a href="#">Create Elements From Linked Documents</a> <sup>[734]</sup></li> </ul>

### 3.4.3.7 Add Object Links

In the **Team Review** tab you can create hyperlinks to elements and diagrams that are associated with a Post.

#### Use to:

- Rapidly navigate to the objects in the Project Browser
- Access the element properties
- Open a diagram directly from the Team Review
- Create links to:
  - Other Categories, Topics and Posts in the Team Review window
  - External files from a file browser

#### How to:

Topic	Detail	See also
Associate an element, diagram or Team Review item with a message	Drag the object into the Linked Elements panel at the bottom of the Team Review tab, from the: <ul style="list-style-type: none"> <li>• Project Browser</li> <li>• Package Browser</li> <li>• Model Views window</li> <li>• Model Search dialog or</li> <li>• Team Review window</li> </ul>	<a href="#">The Project Browser</a> <sup>[443]</sup> <a href="#">Model Search</a> <sup>[477]</sup> <a href="#">Model Views</a> <sup>[466]</sup> <a href="#">Package Browser</a> <sup>[458]</sup>
Associate an external file with the message	Click on and drag the file name from any browser into either: <ul style="list-style-type: none"> <li>• the linked elements panel or</li> <li>• the text of the message itself</li> </ul> The filename becomes a link to the file; click on it to display the contents of the file  The external file name also becomes a link to the file within the message when you drag the filename onto a Topic to create a Post	<a href="#">Add a New Post</a> <sup>[223]</sup>

To access the navigation options of each object in the Linked Elements panel (outlined below) right-click on

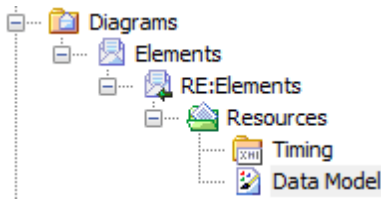

the object to display the navigation context menu.

Action	Usage	Shortcut	See also
Open	Open the diagram or external file		
Properties	Display the element properties for the selected element		
Find in all Diagrams	Open the diagram in which the element is used, or display a list of several diagrams in which the element has been used		
Delete Link	Delete the association between the message and the object		

### 3.4.3.8 Team Review Resources

You can add resources to a Category, Topic or Post within the **Team Review** window.

**Topics:**

Topic	Detail	See also
Resources	<ul style="list-style-type: none"> <li>• XML files of packages within the current project</li> <li>• Active Profiler reports</li> <li>• Images of currently-active diagrams</li> </ul>	<a href="#">Save and Load Reports</a> <sup>[1673]</sup> <a href="#">XML Import and Export</a> <sup>[320]</sup>
Location	<p>Resources are created in a <i>Resources</i> folder underneath the selected Category, Topic or Post, as illustrated below:</p> 	
Management	<p>All Team Review resource management tasks are performed using options on the <b>Team Review</b> context menu</p> <p>You create the <i>Resources</i> folder by creating a resource underneath the selected Category, Topic or Post</p> <p>Similarly, you delete the <i>Resources</i> folder by deleting the last resource within it</p> <p>Having added a resource, you can:</p> <ul style="list-style-type: none"> <li>• Reimport the package XML files to the model or</li> <li>• Display the diagram images</li> </ul>	<a href="#">Context Menu</a> <sup>[219]</sup>

### 3.4.3.9 Search Team Review

The Team Review provides the facility to search the *titles* of all Team Review items.

#### Use to:

- Locate items referring to a specific subject

#### How to:

To search the Team Review, follow the steps below:

Step	Action	See also
1	In the Team Review window toolbar, click on the <b>Search</b> icon The search panel displays underneath the toolbar	
2	In the blank field, type the text string to search for	
3	If required, select the <b>Match Case</b> checkbox to locate text with the same case as the search string	
4	If required, select the <b>Match Whole Word</b> checkbox to locate only complete words that match the search string	
5	Click on the <b>Find</b> button The search locates the first instance of the search string in the title of a Category, Topic, Post or reply item, and displays the contents of that item in the Team Review tab	
6	To locate further instances of the text string, click on the <b>Find</b> button again	
7	To close the search panel, click on the <b>Search</b> icon in the toolbar again	

### 3.4.3.10 Team Review Options

You can change the loading behavior of the Team Review, using the Team Review Server Options dialog.

**Access:** [Right-click Team Review window | Options](#)

Action	Usage	Shortcut	See also
<b>Mark All Unread</b>	Resets all posts you have read to 'unread' (bolds all items in the Team Review)		
<b>Load item data when required</b>	The fastest loading option; Team Review data is only loaded on demand - for example, when you read a post		
<b>Preload all data</b>	Caches the entire contents of the Team Review on load; this takes longer to load but, once completed, navigating the Team Review is faster		

### 3.4.3.11 Team Review Connections

The **Connections** option enables you to access other Team Reviews from other Enterprise Architect models, including models located on servers.

**Access:** Through the Team Review Toolbar  
From the Team Review context menu options

**How to:**

To switch to another Team Review, follow the steps below:

Step	Action	See also
1	<p>In the Team Review toolbar, click on the drop-down arrow in the <b>Connection Options</b> field and select the appropriate model name from the list, to connect to the Team Review for that model</p> <p>If the required model is not listed, click on the <b>&lt;Configure Connections&gt;</b> option; the Team Review Server Connections dialog displays</p> <p>Go to <b>Step 3</b></p>	
2	<p><i>Alternatively:</i></p> <p>Right-click anywhere in the Team Review window and select the <b>Connections</b> context menu option; The Team Review Server Connections dialog displays</p> <p>In the list in the Connections panel, select the check box against the appropriate model name to connect to the Team Review for that model, and click on the <b>Open</b> button</p> <p>The connection now switches to the Team Review in the selected model</p> <p>If the required model is not listed, go to <b>Step 3</b></p>	
3	<p>Select the appropriate <b>Connection Type</b> radio button and click on the <b>New</b> button</p> <ul style="list-style-type: none"> <li>• For a .eap file, a browser dialog displays through which you can search for and select the appropriate model</li> <li>• For a model in a DBMS data repository, the Microsoft Data Link dialogs display, which enable you to locate and connect to the repository</li> </ul>	
4	<p>When you have selected and opened or connected to the required Enterprise Architect model, and returned to the Team Review Server Connections dialog, the model name displays in the <b>Connection Name</b> field and in the Connections panel</p>	
5	<p>Select the check box against the model name and click on the <b>Open</b> button to connect to the Team Review for that model</p> <p>The Team Review now shows the discussion in the selected model</p>	

For further details of the fields and buttons on the Team Review Server Connections dialog, refer to the table below.

Action	Usage	Shortcut	See also
<b>Connection Name</b>	Verify the name of the selected model		
<b>Connection Type</b>	Specify the type of Enterprise Architect model: a local .eap file (as above) or a model on a remote server		<a href="#">Connect to a Data Repository</a> <sup>[162]</sup>
<b>Target Model</b>	Verify the path to the selected model		
<b>New</b>	Create a new Team Review connection		
<b>Delete</b>	Delete the currently selected connection from the Connections list		
<b>Connections</b>	List all Team Review connections created; click on the checkbox against the required connection		
<b>Open</b>	Switch the Team Review to the one selected in the Connections list		

### 3.4.4 Workflow Scripts

Enterprise Architect enables you to create workflow scripts that provide a robust approach to applying company policy and strengthening project development guidelines, by validating against the policy and procedures within the model itself.

Topic	Detail	See also
<b>Project Governance</b>	<p>Good corporate governance relies on well written and transparent project development guidelines and company policy</p> <p>A project might be compromised if the appropriate policies and procedures are poorly understood and not followed correctly - effective governance can be hampered by human error and the costs of recovering from the inadequate compliance of developers</p>	
<b>Policies, Procedures and Development</b>	<p>Company policy and procedures can be integrated with the development process to manage work flows, determine access rights, extend role based security permissions and respond to property change events</p> <p>This approach reduces compliance costs, enhances collaborative development and gives you confidence that projects are being developed correctly the first time around</p> <p>Development teams can adhere to best practice guidelines that govern model validation, change management, access controls and general development principles</p>	
<b>Scripts</b>	<p>Project administrators can write scripts to manage the way users interact with a model, such as managing security, staff compliance and model access, and monitoring changes made by users</p> <p>Administrators can also use workflow scripts to control a user's capacity to change a model element, taking into account factors such as access rights, group membership and even the value of a proposed change</p>	<a href="#">Workflow Script Functions</a> <sup>[233]</sup>

Topic	Detail	See also
<b>Script Implementation</b>	<p>When a model is launched, the Workflow Engine is initialized with the current user and group memberships; this information determines who can access and modify parts of a given model</p> <p>When a selected event occurs, the script engine is initialized with values including the author's name and access rights, and the element name and version details</p> <p>The workflow script implements rules governing change management, access control and model validation; if a user attempts to make changes in violation of company policy, the script denies the update</p> <p>The user is notified why the validation failed and the activity is logged</p> <p>These reminders help to reinforce company policy, reduce human error and provide management with valuable project feedback</p>	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Admin Workflow** permission to develop and manage workflow scripts

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>

**3.4.4.1 Workflow Script Functions**

Workflow scripts are executed by the Enterprise Architect workflow engine, to manage user input. You write the scripts in the Scripting window, in VBScript, under the Workflow group type.

**Topics:**

**3.4.4.1.1 Functions - Validate and Control User Input**

These are functions that Enterprise Architect calls to validate and control user input. For each function a set of objects is filled.

Function	Action	Return Value
<b>AllowPhaseUpdate(OldValue, NewValue)</b>	Validate a change a user has made to a phase	<ul style="list-style-type: none"> <li>• <b>True</b> to allow this user to make this change</li> <li>• <b>False</b> to disallow the change and revert to the previous value</li> </ul>
<b>AllowStatusUpdate(OldValue, NewValue)</b>	Validate a change a user has made to a status	
<b>AllowTagUpdate(TagName, OldValue, NewValue)</b>	Validate a change a user has made to a Tagged Value	
<b>AllowVersionUpdate(OldValue, NewValue)</b>	Validate a change a user has made to a version	
<b>CanEditPhase()</b>	Enable or disable the control for editing a phase	<ul style="list-style-type: none"> <li>• <b>True</b> to allow this user to make changes by enabling the control</li> <li>• <b>False</b> to completely disable edit of this property by disabling the control</li> </ul>
<b>CanEditStatus()</b>	Enable or disable the control for editing a status	
<b>CanEditTag(TagName)</b>	Enable or disable the control for editing a Tagged Value	
<b>CanEditVersion()</b>	Enable or disable the control for editing a version	
<b>PreAllowPhaseUpdate(OldValue, NewValue)</b>	Determine what information is required to validate this change	Semi-colon separated list of additional data required in order to validate this change  <i>Supported Data Type:</i>  <b>Tests</b> - fill the Tests array in the WorkflowContext object
<b>PreAllowStatusUpdate(OldValue, NewValue)</b>		
<b>PreAllowTagUpdate(TagName, OldValue, NewValue)</b>		
<b>PreAllowVersionUpdate(OldValue, NewValue)</b>		

**Learn More:**

- [Filled Workflow Data Structures](#) <sup>[235]</sup>

**3.4.4.1.2 Functions - Create a Search With User Tasks**

These are functions that Enterprise Architect calls to create a search with user tasks.

Function	Action	Return Value
<b>GetWorkflowTasks</b>	Describe the searches that this user must run	Ignored

**3.4.4.1.3 Filled Workflow Data Structures**

These workflow data structures are objects that Enterprise Architect fills.

Workflow Data Structure	Description	Calls	See Also
<b>WorkflowUser</b>	<p>This object provides information about the user currently logged in to the model</p> <p>It is filled by Enterprise Architect before any function is called by Enterprise Architect; it has the following properties:</p> <ul style="list-style-type: none"> <li>• <b>Username</b> - the username for login to the system (if using Windows Authentication, this matches the Windows username)</li> <li>• <b>Firstname</b> - as found in the Security Users dialog</li> <li>• <b>Surname</b> - as found in the Security Users dialog</li> <li>• <b>Fullname</b> - the combination &lt;Firstname &gt; &lt;Surname&gt; (the form Enterprise Architect uses for <b>Author</b> fields and similar)</li> </ul>	<p>This object calls the <b>IsMemberOf (GroupName)</b> function (see below)</p>	<p><a href="#">Maintain Users</a> <sup>[199]</sup></p>
<b>WorkflowContext</b>	<p>This object provides information about the object currently in context</p> <p>It is filled by Enterprise Architect before any searches except <b>GetWorkflowTasks</b> are run; it has the following properties:</p> <ul style="list-style-type: none"> <li>• <b>MetaType</b> - the type of the current object, either an Enterprise Architect core type or a profile-specified metatype</li> <li>• <b>Name</b> - as found in the object Properties dialog</li> <li>• <b>Status</b> - as found in the object Properties dialog</li> <li>• <b>Phase</b> - as found in the object Properties dialog</li> <li>• <b>Version</b> - as found in the object Properties dialog</li> </ul>	<p>This object calls the <b>TagValue (TagName)</b> function (see below)</p>	<p><a href="#">Functions - Create a Search With User Tasks</a> <sup>[235]</sup></p> <p><a href="#">The Testing Workspace</a> <sup>[1707]</sup></p>

Workflow Data Structure	Description	Calls	See Also
	<ul style="list-style-type: none"> <li>• <b>Stereotypes</b> - an array of strings for the stereotypes applied to this object</li> <li>• <b>Tags</b> - an array of Tagged Values, providing: <ul style="list-style-type: none"> <li>• <b>Name</b> - the Tagged Value name</li> <li>• <b>Value</b> - the Tagged Value value</li> </ul> </li> <li>• <b>Tests</b> - an array of tests; only filled during an <i>Allow*</i> call after the <i>PreAllow*</i> call has specified that tests are required</li> </ul> <p>Provides the following details, as found in the Testing window:</p> <ul style="list-style-type: none"> <li>• <b>Name</b></li> <li>• <b>Status</b></li> <li>• <b>RunBy</b></li> <li>• <b>CheckedBy</b></li> <li>• <b>TestClass</b></li> <li>• <b>TestType</b></li> </ul>		

Function	Action	Return Value
<b>IsMemberOf (GroupName)</b>	Check group membership of the current user	<b>True</b> if the current user is a member of the group with the specified name
<b>TagValue (TagName)</b>	Get the value from a named tag	Returns the value of the first Tagged Value with that name, or an empty string if no Tagged Value with that name exists

#### 3.4.4.1.4 Workflow Data Structures You Fill

These two workflow data structures are objects that you can fill.

Workflow Data Structure	Description
<b>WorkflowStatus</b>	<p>Use this data structure to provide information on the status of the object</p> <ul style="list-style-type: none"> <li>• <b>LogEntry</b> - set to <b>True</b> or <b>False</b> to indicate whether or not a log item should be recorded</li> <li>• <b>Reason</b> - indicate what reason should be recorded in the log</li> <li>• <b>Action</b> - indicate how to display the log message; valid values are: <b>MessageBox</b>, <b>StatusBar</b>, <b>Output</b> (default)</li> </ul>
<b>WorkflowSearches</b>	<p>Use this data structure to provide an array of searches</p> <p>Use <b>Redim WorkflowSearches(x)</b> to specify the number of searches being provided</p> <p>Each search has the following attributes:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> - the name of this search</li> <li>• <b>Group</b> - the name of the group that this search should appear under in the <b>Search</b> combo box</li> <li>• <b>ID</b> - the GUID for this search</li> <li>• <b>Tasks</b> - the array of tasks that this search looks for; an entry describes how to</li> </ul>

Workflow Data Structure	Description
	<p>find all objects required to meet a particular task:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> - the name of the task, as displayed in the Search view; workflow searches are grouped by this field by default</li> <li>• <b>Conditions</b> - an array of conditions, all of which must be matched for an object to be included in this task; a condition is a comparison of a single field to a value: <ul style="list-style-type: none"> <li>• <b>Column</b> - the name of the field</li> <li>• <b>Operator</b> - operator types, either = (provide matching values only) or &lt;&gt; (provide non-matching values only)</li> <li>• <b>Value</b> - if this contains a comma, the string is treated as a comma separated list of values to compare against; otherwise the string is a single value to compare against</li> </ul> </li> </ul>

#### 3.4.4.1.5 Functions You Call

These are functions that Enterprise Architect provides for you to call.

Function	Action	Return Value	See also
<b>NewSearch(name, group, guid, taskcount)</b>	Create a new search object to be included in <b>WorkflowSearches</b> Initializes each member	The created search	<a href="#">Workflow Data Structures You Fill</a> <sup>[236]</sup>
<b>NewTask(name, conditioncount)</b>	Create a new task object to be included in a search Initializes each member	The created task	
<b>NewCondition(column, operator, value)</b>	Create a new condition object to be included in a task Initializes each member	The created condition	
<b>SetLastError(message, outputMethod)</b>	Log and/or report the provided message to the user	The message	

### 3.4.5 Sharing Reference Data

You can conveniently update your models with reference data (including Glossary and Issue information) by exporting the data to and importing the data from .XML files.

You import data into the model automatically or manually from a reference data .XML file, exported from another model or an iteration of the current model.

**Use to:** (For example)

- Copy glossaries from one model to another
- Add additional stereotype profiles by merging new stereotypes into the model
- Update reference data from files supplied by Sparx Systems as a maintenance release
- Copy resources, clients and so on from one model to another

**Learn More:**

- [Reference Data](#) <sup>[774]</sup>

- [Import Reference Data](#)<sup>[240]</sup>
- [Export Reference Data](#)<sup>[238]</sup>

### 3.4.5.1 Export Reference Data

This topic explains how to export reference and project data to a custom XML file. This includes table information, filter information, rows and columns.

**Access:** [Project](#) | [Model Import/Export](#) | [Export Reference Data](#)

#### Use to:

- Capture reference data of one or more specific data types in an XML file, to review or transfer into another project or tool  
The exported data includes all instances of the data type in the project; for example, all defined cardinality values, or all RTF Style Templates

#### How to:

Step	Action	See also
1	Select the <b>Export Reference Data</b> menu option The Data Exporter dialog displays	
2	From the <b>Name</b> list, select the data type tables to export You can select one or more tables to be exported to a single XML file, by pressing <b>(Ctrl)</b> or <b>(Shift)</b> as you click on the data type table names	<a href="#">Code Templates</a> <sup>[149]</sup> <a href="#">Automation Scripts</a> <sup>[1832]</sup> (JavaScript, JScript and VBScript) <a href="#">Cardinality Types</a> <sup>[778]</sup> <a href="#">Constraint Status Types</a> <sup>[787]</sup> <a href="#">CSV</a> <sup>[340]</sup> Specifications <a href="#">Defined Metric Types</a> <sup>[356]</sup> <a href="#">Defined Problem Types</a> <sup>[789]</sup> <a href="#">Diagram Matrix Profiles</a> <sup>[594]</sup> (Model Profiles) <a href="#">Estimation - Environment Complexity Factor Values</a> <sup>[404]</sup> <a href="#">Estimation - Technical Complexity Factor Values</a> <sup>[403]</sup> <a href="#">General Constraint Types</a> <sup>[786]</sup> <a href="#">General Effort Types</a> <sup>[355]</sup> <a href="#">Import Component Types</a> <sup>[1527]</sup> <a href="#">Linked Document Templates</a> <sup>[736]</sup> <a href="#">Macro List</a> <sup>[1534]</sup> (Preprocessor macros) <a href="#">Maintenance Types</a> <sup>[789]</sup> (Problem Types plus Test Types)

Step	Action	See also
		<p><a href="#">Model Authors</a> <sup>[780]</sup></p> <p>Model Data Types - <a href="#">Code</a> <sup>[779]</sup> and <a href="#">DDL</a> <sup>[1359]</sup></p> <p><a href="#">Model Images</a> <sup>[595]</sup></p> <p><a href="#">Project Clients</a> <sup>[784]</sup></p> <p><a href="#">Project Glossary</a> <sup>[364]</sup></p> <p><a href="#">Project Issues</a> <sup>[360]</sup></p> <p><a href="#">Project Resources</a> <sup>[783]</sup></p> <p><a href="#">Project Roles</a> <sup>[782]</sup></p> <p><a href="#">Project Tasks</a> <sup>[358]</sup></p> <p><a href="#">Property Types</a> <sup>[1117]</sup> (Tagged Value Types)</p> <p><a href="#">Requirement Types</a> <sup>[787]</sup></p> <p><a href="#">Risk Types</a> <sup>[357]</sup></p> <p><a href="#">Scenario Types</a> <sup>[788]</sup></p> <p><a href="#">Security - Group Permission</a> <sup>[205]</sup></p> <p><a href="#">Security - Groups</a> <sup>[204]</sup></p> <p><a href="#">Security User Groups</a> <sup>[202]</sup></p> <p><a href="#">Security - User Permissions</a> <sup>[202]</sup></p> <p><a href="#">Security - Users</a> <sup>[199]</sup></p> <p>Standard Complexity Types (<a href="#">a Predefined Reference Data Tagged Value Type</a> <sup>[1114]</sup>)</p> <p><a href="#">Status Colors</a> <sup>[785]</sup> (colors defined for status types)</p> <p><a href="#">Status Types</a> <sup>[785]</sup></p> <p><a href="#">Status Types - Application</a> <sup>[785]</sup> (elements to which status can be applied)</p> <p><a href="#">Stereotypes</a> <sup>[1047]</sup> (as listed on the Stereotypes page of the UML Types dialog)</p> <p>Templates - HTML Style (the <a href="#">web templates</a> <sup>[1819]</sup> listed in the Resources window)</p> <p>Templates - HTML Style Detail (the content of the HTML report templates)</p> <p>Templates - RTF Document (the <a href="#">Extended RTF Style templates</a> <sup>[1755]</sup> in the Resources window)</p> <p>Templates - RTF Style (<a href="#">the Legacy RTF Style templates</a> <sup>[1806]</sup> in the</p>

Step	Action	See also
		Resources window) Templates - RTF Style Detail (the content of the Legacy RTF Style templates) Templates - RTF Tag and Language Options (RTF <a href="#">word substitution</a> templates) <a href="#">Test Types</a> <a href="#">Transform Templates</a>
3	Click on the <b>Export</b> button	
4	When prompted to do so, enter a valid file name with a .XML extension	
5	Click on the <b>Save</b> and <b>OK</b> buttons  This exports the data to the file; you can use any text or XML viewer to examine the file	

**Notes:**

- If there are no instances of a selected data type in the project, the export does not generate any output for that data type in the XML file
- Entries for code language templates and/or transformation templates are included in the **Name** list only if templates for a particular language or transformation exist in the model
- Currently, Standard Complexity Types cannot be directly edited and are therefore effectively standard for all models; they can be listed using the Predefined Reference Data Tagged Value type *ComplexityTypes*

**3.4.5.2 Import Reference Data**

You can import reference data into a model in Enterprise Architect from a reference data .xml file that was exported from another model or from an iteration of the current model, either:

- Manually, as required, whenever you know there is new or changed data to apply, or
- Automatically whenever the model is reloaded into Enterprise Architect (if the file has changed since the previous import)

When you import data into Enterprise Architect, the system merges the incoming data with the existing data. If a record already exists it is updated to the new values. If the record does not exist, Enterprise Architect adds a new record. Enterprise Architect never deletes records.

The automatic import checks if the source file has changed since the last import; if the file has not changed, the import does not proceed. If the file has changed, the changed data is imported; however, you can configure Enterprise Architect to display a prompt for you to allow or cancel the import.

**Access:** **Project | Model Import/Export | Import Reference Data > Import File tab**  
**Project | Model Import/Export | Import Reference Data > Shared File tab**

**How to:**

To import reference data *manually*, follow the steps below:

Step	Action	See also
1	Select the <b>Import Reference Data</b> menu option The Import Reference Data dialog displays	
2	Click on the Import File tab and on the <b>Select File</b> button, then select the filename to import data from  This must be an XML file produced by the Enterprise Architect Data Exporter	<a href="#">Export Reference Data</a> <sup>[238]</sup>
3	If you have entered the name of a valid file, a list of available tables to import displays in the Select Datasets to Import panel	<a href="#">Export Reference Data</a> <sup>[238]</sup>
4	Click on one or more of the tables to import Press <b>(Ctrl)</b> or <b>(Shift)</b> to click on multiple tables	
5	Click on the <b>Import</b> button to start the process  A message displays when the import is complete; generally the process is quite fast.	

To import reference data automatically, follow the steps below:

Step	Action	See also
1	Select the <b>Import Reference Data</b> menu option The Import Reference Data dialog displays	
2	Click on the Shared File tab	
3	If you are changing an existing configuration to import from a different XML file, click on the <b>Clear</b> button to clear the dialog fields	
4	Click on the <b>Select File</b> button and browse for the filename to import data from  This must be an XML file produced by the Enterprise Architect Data Exporter	<a href="#">Export Reference Data</a> <sup>[238]</sup>
5	If you have entered the name of a valid file, a list of tables to import displays in the Datasets in File panel	<a href="#">Export Reference Data</a> <sup>[238]</sup>
6	If you prefer to control whether or not the automatic import takes place, select the <b>Always prompt before import</b> checkbox	
7	Click on the <b>Import</b> button to import the reference data now, and to enable the automatic check and import for subsequent reloads	

### 3.5 Change Management

This section describes the tools and facilities for controlling and monitoring changes to the data in a project.

#### Topics:

Topic	Detail	See also
<b>Version Control of Packages</b>	<p>Enterprise Architect Model Version Control enables you to:</p> <ul style="list-style-type: none"> <li>• Coordinate sharing of packages between users, with either read-only access or update access, ensuring that work on different areas of the model is coordinated and synchronous rather than conflicting</li> <li>• Save and retrieve a history of changes to packages</li> </ul> <p>To use version control in Enterprise Architect, you require a third-party source-code control application such as:</p> <ul style="list-style-type: none"> <li>• Subversion</li> <li>• CVS</li> <li>• MS Team Foundation Server (TFS), or</li> <li>• Any other version control product that complies with the Microsoft Common Source Code Control standard</li> </ul>	<a href="#">Version Control</a> [243]
<b>Tracking Changes</b>	<p>Enterprise Architect provides two separate but complementary facilities for tracking changes to data across the project:</p> <ul style="list-style-type: none"> <li>• Auditing of model changes</li> <li>• Baselining and differencing to capture and roll back changes</li> </ul>	<a href="#">Tracking Changes</a> [299]
<b>Project Data Transfer</b>	<p>Enterprise Architect enables you to transfer project data between project data repositories either for:</p> <ul style="list-style-type: none"> <li>• sections of the project (XML and CSV) or</li> <li>• the whole project, row by row, table by table (in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect)</li> </ul>	<a href="#">Model Transfer</a> [320]

### 3.5.1 Version Control

Enterprise Architect supports version control of your projects, by allowing you to place your model packages under version control. You can place any individual packages, view nodes or model root nodes under version control.

To use version control in Enterprise Architect, a third-party source-code control application is required that controls access to and stores revisions of the controlled packages.

#### Guide:

Topic	Detail	See Also
<b>Introduction</b>	Version Control provides numerous key facilities: <ul style="list-style-type: none"> <li>• Saving a history of changes to Enterprise Architect packages</li> <li>• The ability to retrieve previous revisions of packages</li> <li>• Propagating model updates between team members</li> <li>• Coordinating sharing of packages between team members</li> </ul>	<a href="#">Introduction</a> <sup>[244]</sup>
<b>Product Setup</b>	To use version control in Enterprise Architect, a third-party source-code control application is required that controls access to and stores revisions of the controlled packages	<a href="#">Setting Up a Version Control Environment</a> <sup>[253]</sup>
<b>Configuring Enterprise Architect</b>	Once the version control software has been installed and configured, to use your installed version control product you must first define a Version Control Configuration within Enterprise Architect	<a href="#">Version Control Setup</a> <sup>[269]</sup>
<b>Using Version Control</b>	Version control activities include such things as; <ul style="list-style-type: none"> <li>• Controlling packages</li> <li>• Checking out packages for editing</li> <li>• Checking in modifications to packages</li> <li>• Retrieving previous revisions of controlled packages</li> </ul>	<a href="#">Using Version Control</a> <sup>[276]</sup>

#### Notes:

- Sparx Systems strongly urge you not to manipulate version controlled package files outside of Enterprise Architect; it is possible to leave the package files in a state that Enterprise Architect cannot recognize
- Database replication should not be combined with version controlled packages
- If the packages under version control contain any alternative images and those images are subject to frequent change, you can set the **Export alternate images** option on the Options dialog to export the images to the version control repository when you check in the packages; if the images are not subject to frequent change, do not select this option and instead use **Export / Import Reference Data** to manage alternative images

### 3.5.1.1 Introduction

Enterprise Architect's version control integration provides numerous key facilities;

- Saving a history of changes to your model's packages
- The ability to retrieve previous revisions of packages
- Propagating model updates between team members
- Coordinating sharing of packages between team members

This section discusses some factors you should consider when setting up and using version control in your model development.

#### Topics:

Topic	Detail	See also
<b>Version Control Usage</b>	<p>There are two main ways in which Enterprise Architect's projects can be deployed;</p> <ul style="list-style-type: none"> <li>• Centralized Shared Model</li> <li>• Distributed Private Models</li> </ul> <p>Version control is employed in the same way for both scenarios, however, when using Private Model deployment it serves the additional role of propagating model updates throughout the team.</p> <p>Version Control can also be used to share standard packages between different projects.</p>	<a href="#">Version Control Usage</a> [245]
<b>Version Control Basics</b>	Enterprise Architect must enforce serialized editing of version controlled packages, using the lock-modify-unlock mode of operation.	<a href="#">Version Control Basics</a> [247]
<b>Applying Version Control to Models</b>	Using version control in Enterprise Architect consists of placing individual model packages under version control, rather than version controlling the project as a whole.	<a href="#">Version Control Of Model Data</a> [246]
<b>Version Control and Project Reference Data</b>	To ensure that changes in reference data are shared between users in a version-controlled project that is deployed as multiple private models, you should periodically export the reference data from the model where the changes were made, and import it into the other models maintained by the team.	<a href="#">Version Control and Reference Data</a> [247]
<b>Team Deployment</b>		<a href="#">Version Control &amp; Team Deployment</a> [248]
<b>Project Browser Indicators</b>	Packages under version control are identified in the Project Browser by icons that indicate the current status of the package.	<a href="#">Project Browser Indicators</a> [250]
<b>Offline Version Control</b>	<p>You can prevent Enterprise Architect from attempting to make any version control connections by choosing to <b>Work Offline</b> before loading a model.</p> <p>If Enterprise Architect is unable to connect a Version Control Configuration for any reason, it displays warning messages to notify you and provides 'offline' version control functionality for all packages associated with the failed connection.</p>	

Topic	Detail	See also
<b>System Requirements and Configuration</b>	<p>To use version control in Enterprise Architect, a third-party source-code control application is required that controls access to and stores revisions of the controlled packages.</p> <p>Typically there are:</p> <ul style="list-style-type: none"> <li>• A server component that manages a version control repository, and</li> <li>• Client components on the workstations, that manage local working copies of controlled files.</li> </ul> <p>Enterprise Architect uses the client component to communicate with the server. A version control client must be installed on every machine where you run Enterprise Architect and want to access your version control system.</p>	<a href="#">System Requirements and Configuration</a> <sup>[25]</sup>

### 3.5.1.1.1 Version Control Usage

There are four basic ways in which the version control facility might be used:

Field	Usage	See also
<b>Single Shared model</b>	<p>Users share an Enterprise Architect model, stored in a central .EAP file or DBMS repository. This configuration enables you to view changes to other users' packages without explicitly having to check them out, but by simply refreshing your view of the model.</p> <p>Version control is used to;</p> <ul style="list-style-type: none"> <li>• Archive successive versions of your work to date</li> <li>• Maintain package revision history</li> <li>• Provide an "undo" facility to recover from unwanted changes or accidental deletions</li> <li>• Regulate access to packages</li> </ul>	
<b>Multiple Private models</b>	<p>An Enterprise Architect model is created by a single user who configures it for version control. The model file is then distributed to other users, with each user storing their own private copy of the model.</p> <p>Version control is used to;</p> <ul style="list-style-type: none"> <li>• Propagate changes to the model, throughout the team</li> <li>• Archive successive versions of your work to date</li> <li>• Maintain package revision history</li> <li>• Provide an 'undo' facility to recover from unwanted changes or accidental deletions</li> <li>• Regulate access to packages</li> </ul>	
<b>Shared packages</b>	<p>Individual users create separate Enterprise Architect models but share one or more packages.</p> <ul style="list-style-type: none"> <li>• Users share packages through version control</li> </ul>	
<b>Standard packages</b>	<p>A company might have a standard set of packages which are broadly shared (on a read-only basis).</p> <ul style="list-style-type: none"> <li>• Individual users retrieve packages with the <b>Get Package</b> menu option</li> </ul>	

**Learn More:**

- [Version Control Best Practices for Enterprise Architect](#)

**3.5.1.1.2 Version Control of Model Data**

Using version control in Enterprise Architect consists of placing individual model packages under version control, rather than version controlling the project as a whole.

**Guide:**

Topic	Detail	See also
<b>Version Controlling your Project files</b>	<p>All Enterprise Architect models are stored in databases - even the .EAP file is an MS Jet database</p> <p>In simple terms, the project file is a single entity of binary data</p> <p>It is not practical to apply version control to the database as a whole; being binary data, it would require the use of the lock-modify-unlock model of version control, which would mean that only a single user at a time could work on any given (version controlled) model</p> <p>Therefore, avoid placing your .EAP files under version control, as this can create problems for you</p> <ul style="list-style-type: none"> <li>• Most version control systems mark their controlled files as read only, unless they are specifically checked-out to you</li> <li>• The .EAP file is an MS Jet database, and Enterprise Architect must be able to open this file for read/write access when you load your model (Enterprise Architect displays an error message and fails to load the model if it is read-only)</li> </ul>	<a href="#">Version Control Basics</a> <sup>[247]</sup>
<b>Version Controlling Packages in your model</b>	<p>To overcome the limitations described above, Enterprise Architect exports discrete units of the model - the packages - as XML package files, and it is these XML files, not the .EAP file, that are placed under version control</p> <p>The XML file format used by Enterprise Architect dictates that they too be treated as binary files (therefore it is not possible to merge the XML files either); however, by splitting the model into much smaller parts, this approach enables many users to work on separate parts of the model simultaneously</p>	
<b>Nested version controlled packages</b>	<p>Nested version controlled packages result in much smaller XML files being exported for parent packages, as the parent packages' XML files do not contain any content for the version controlled child packages</p> <p>Version Control of nested packages, together with a model structure having small individual packages, also provides greater scope for multiple users to work concurrently, as individual users are locking much smaller parts of the model</p>	

**3.5.1.1.3 Version Control and Reference data**

To ensure that changes in reference data are shared between users in a version-controlled project that is deployed as multiple private models, you should periodically export the reference data from the model where the changes were made, and import it into the other models maintained by the team.

Guide:

Topic	Detail	See also
<b>Reference Data</b>	Reference data is data that is used across a model or project; it is not package-specific.	<a href="#">Reference data</a> <sup>[774]</sup>
<b>Version Control in Enterprise Architect</b>	Version control in Enterprise Architect operates at package level, and therefore does not capture changes in reference data.  Where version control is used in a multiple private model set up, changes in reference data are not brought into the model when packages are updated from version control.	
<b>Sharing Reference Data</b>	In a Shared Model environment, all users are accessing the same Project Reference data. However, in a Multiple Private Model environment, to ensure that changes in reference data are shared between users in a version-controlled project, you should periodically export the reference data from the model where the changes were made, and import it into the other models maintained by the team.	<a href="#">Sharing Reference Data</a> <sup>[237]</sup>
<b>Version control of Reference Data</b>	Reference data is exported and imported as an XML file, which contains whatever types of reference data you want to transfer.  To place your project reference data under version control, you should export the data as an XML file and apply version control to the file using your version control software, external to Enterprise Architect	<a href="#">Export Reference Data</a> <sup>[238]</sup>

**3.5.1.1.4 Version Control Basics**

Enterprise Architect implements version control of your model, by exporting package data from the project database to XML package files. It is these package files that are then placed under version control. The XML file format cannot be merged in the same way that ordinary text files can be merged.

The information below, illustrates why Enterprise Architect must enforce serialized editing of version controlled packages.

Guide:

Topic	Detail	See also
<b>The Lock-Modify-Unlock Solution</b>	Many version control systems use a lock-modify-unlock model to address the problem of different authors in a shared source overwriting each other's work.  In this model, the version control repository allows only one person to change a file at a time, and access is managed using locks. Harry must lock a file before he can begin making changes to it. If Harry has locked a file, Sally cannot also lock it, and therefore cannot make any changes to that file. All she can do is read the file, and wait for Harry to finish his changes and release the lock. After Harry unlocks the file, Sally can take her turn in	

Topic	Detail	See also
	locking and editing the file.	
<b>The Copy-Modify-Merge Solution</b>	<p>Subversion, CVS and a number of other version control systems use a copy-modify-merge model as an alternative to locking.</p> <p>In this model, each user's client contacts the project repository and creates a personal working copy- a local reflection of the repository's files and directories. Users then work simultaneously and independently, modifying their private copies. In due course, the private copies are merged together into a new, final version. The version control system often assists with the merging, but ultimately a person is responsible for making it happen correctly.</p>	
<b>When Locking is Necessary</b>	<p>While the lock-modify-unlock model is generally considered a hindrance to collaboration, there are still times when locking is necessary.</p> <p>The copy-modify-merge model is based on the assumption that files are contextually merge-able: that is, the files in the repository are line-based text files (such as program source code). But for files with binary formats, such as artwork or sound, it is often impossible to merge conflicting changes. In these situations, it really is necessary for users to take strict turns in changing the file. Without serialized access, somebody ends up wasting time on changes that are ultimately discarded.</p>	

### 3.5.1.1.5 Applying Version Control in a Team Environment

The following information provides an overview of the steps involved in setting up a version control environment and applying version control to an Enterprise Architect project to be accessed by a number of users.

#### Use to:

- Setup a version control environment
- Apply version control to an Enterprise Architect project

#### How to:

Step	Action	See also
1	Install your version control product.	
2	Create a version control repository.	
3	Create a version control project to be used with your Enterprise Architect project	
4	<p>Check-out a working copy of the version control project (a module, project or folder within the version control system) into a local folder.</p> <p>(You must do this for every team member that is accessing the version controlled packages, whether you are using a single shared model or each team member stores his own private copy of the model.)</p>	<a href="#">Create a Local Workspace - SVN</a> <sup>[257]</sup> <a href="#">Create a Local Workspace - CVS</a> <sup>[263]</sup>
5	Within Enterprise Architect, define a version control configuration to provide access to	<a href="#">Version</a>

	<p>the working copy files.</p> <p>Throughout a team, the name of the version control configuration must be the same across all machines. That is, all version control access to a given Enterprise Architect package must be through version control configurations with the same name, across all models and all users.</p> <p>The easiest way to perform this step, (throughout the team), is to have one user set up version control on the model and then share that model with the rest of the team.</p> <ul style="list-style-type: none"> <li>• In Shared Model deployment, all users connect to a single instance of the model database, so the model is shared automatically.</li> <li>• In Private Model deployment, it is easiest to distribute copies of the original model (after version control has been set up) to all other members of the team.</li> </ul> <p>Whenever you open a model (Private or Shared) that uses a version control configuration that is not yet defined on your workstation, Enterprise Architect prompts you to complete the definition for that configuration. This typically means specifying the local working copy directory and maybe choosing the version control project associated with this Enterprise Architect project.</p> <p>Once this has been done, the version controlled packages that already exist in the model are ready for use.</p>	<a href="#">Control Setup</a> <small> 269</small>
6	Configure packages within the Enterprise Architect model for version control. That is, apply version control to individual packages.	<a href="#">Configure Package for Version Control</a> <small> 283</small>
7	Check-out and check-in packages as required.	<a href="#">Check Out</a> <small> 287</small> <a href="#">Check In</a> <small> 286</small>

**Notes:**

- It is possible to use multiple version control configurations within the same model, so different packages can still use different version control configurations within the same model, as long as any given package is always accessed via the same version control configuration

**Learn More:**

Team deployment and the use of version control is discussed in two Sparx Systems white papers, available on the Sparx Systems web site:

- [http://www.sparxsystems.com/WhitePapers/Version\\_Control.pdf](http://www.sparxsystems.com/WhitePapers/Version_Control.pdf)
- [http://www.sparxsystems.com/downloads/whitepapers/EA\\_Deployment.pdf](http://www.sparxsystems.com/downloads/whitepapers/EA_Deployment.pdf)

**3.5.1.1.6 Version Control Nested Packages**

In releases of Enterprise Architect later than version 4.5, when you save a package to the version control system only stub information is exported for any nested packages. This ensures that information in a nested package is not inadvertently over-written by a top level package.

**Guide:**

Topic	Detail	See also
Checking Out	When checking out a package, Enterprise Architect does not modify or delete nested packages; only the top level package is	

Topic	Detail	See also
	<p>modified.</p> <p>As a consequence of this behavior, if you check out or get a version controlled package with nested packages not already in your model, you see stubs in the model for the nested packages only.</p>	
<b>Get All Latest</b>	If you select the <b>Get All Latest</b> option from the version control menu, Enterprise Architect populates any new stubs from the version control system.	<a href="#">Get All Latest</a> <sup>[279]</sup>
<b>Importing Models</b>	<p>You can populate a large and complex model, by 'getting' only the root packages, then using <b>Get All Latest</b> to recursively iterate through the attached and nested packages.</p> <p>This is a powerful and efficient means of managing your project and simplifies handling very large models, even in a distributed environment.</p> <p>The command <b>Import a Model Branch</b>, combines the steps described above into a single operation.</p>	<a href="#">Get Package</a> <sup>[290]</sup> <a href="#">Import Controlled Model Branch</a> <sup>[292]</sup>

**Notes:**

- It is recommended you do not mix versions of Enterprise Architect later than version 4.5 with earlier versions when sharing a version controlled model. If this is necessary it is best to go to the Version Control Settings dialog and deselect the Save nested version controlled packages to stubs only checkbox, setting Enterprise Architect to the pre-version 4.5 behavior (for the current model only)

**3.5.1.1.7 Project Browser Indicators**

Packages under version control are identified in the Project Browser by icons that indicate the current status of the package.

**Reference:**

Icon	Indicates that	See Also
	This package is version controlled and not checked out to you. You cannot edit the package (unless you check out the package).	
	This package is version controlled and checked out to you. You can edit the package.	
	This package is version controlled, but you checked it out whilst not connected to the version control server. You can edit the package but there could be version conflicts when you check the package in again.	<a href="#">Offline Version Control</a> <sup>[251]</sup>
	This package is controlled and is represented by an XMI file on disk, but it is not under version control. You can edit this package.	<a href="#">Controlled Packages</a> <sup>[328]</sup>

**Learn More:**

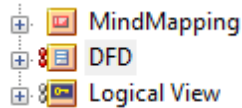

- [Using Version Control](#)<sup>[276]</sup>

### 3.5.1.1.8 Offline Version Control

When loading a model that uses version control, Enterprise Architect normally initializes a connection to the version control system for each Version Control Configuration defined in the model.

If Enterprise Architect is unable to connect a Version Control Configuration for any reason, it displays warning messages to notify you and provides 'offline' version control functionality for all packages associated with the failed connection.

#### Guide:

Topic	Detail	See also
<b>Choose to Work Offline</b>	<p>You can prevent Enterprise Architect from attempting to make any version control connections by selecting the <b>Project   Version Control   Work Offline</b> menu option before loading a model.</p> <p>This is useful if you know that Enterprise Architect cannot connect to your version control system. For example, if you are working on a laptop computer that is disconnected from your network and you have an Enterprise Architect model that uses a large number of Version Control Configurations, choosing to work offline before you load the model enables you to avoid all the error messages that Enterprise Architect would normally display as each version control connection attempt fails.</p> <p>You can switch between working offline and working online at any time, either before or after a model is loaded. Toggle the <b>Project   Version Control   Work Offline</b> menu option. Enterprise Architect disconnects or reconnects version control (depending on connection availability) according to your selection.</p>	
<b>Use Version Control Whilst Disconnected From Your Version Control Server</b>	<p>Enterprise Architect 'remembers' the status of a model's version controlled packages. Packages that were checked out to you prior to disconnecting from the server are still shown as checked out to you, even though you are no longer connected to the server. You can still edit these packages as you normally would.</p> <p>Packages that were not checked out to you prior to disconnecting from the server are shown as version controlled and locked. You cannot edit these packages until you check them out.</p>	
<b>Offline Check Out</b>	<p>In releases of Enterprise Architect from release 6.0 onwards, you can 'check-out' and edit a version controlled package even when your machine is disconnected from the version control server. In the example below, the colored 'figure 8' icon for DFD indicates that you have checked it out whilst offline (the gray 'figure 8' icon shown against Logical View indicates that you have checked out a version-controlled package online).</p> 	<a href="#">Project Browser Indicators</a> <sup>[250]</sup>

Topic	Detail	See also
	<p>You should be aware that the version control system - and therefore other users - have no way of knowing that you have 'checked-out' a package whilst offline. It is not possible to merge changes to an XML file that result from two users editing the same package at the same time. If an offline checkout leads to two people editing the same package at the same time, when the changes are brought back online the first-saved set of changes is lost.</p>	
<p><b>Checking In a Package That Was Checked Out Offline</b></p>	<p>Once you reconnect your machine to the version control server, if the package you checked out offline is not currently checked out by another user, you can check in that package. However, before Enterprise Architect checks in such a package, it compares the local working copy of the package file with the latest revision in the repository. (These package files remain unchanged in your work area until Enterprise Architect exports the package again before checking in.) If the repository version remains unchanged from when you last updated your local copy, Enterprise Architect exports and checks in your package without further prompting.</p> <p>On the other hand, if the repository now contains a file that has changed since you last updated your local copy, checking in your package overwrites whatever those changes might be. Enterprise Architect displays a message warning you of the pending data loss and giving you the opportunity to abort the check in. At this point, you must decide whether to discard your own changes, using the <b>Undo Check Out</b> command, or continue with your check in and overwrite the changes that have been committed to the repository since you last updated your local copy from the repository.</p> <p>You can use the <b>File Properties</b> command to determine who checked in the last changes to this package. This might help you to discover what changes have been uploaded and decide whose changes take precedence.</p>	
<p><b>Update Before You Disconnect</b></p>	<p>Whenever you are connected to the version control server, you are always working with the latest version of a package. This is because you cannot modify a package until you check it out from version control, and checking it out loads the latest revision from the repository into your model.</p> <p>These rules do not apply when you are disconnected from the version control server. You are working on whatever versions you have on your machine, dating back to the last time you updated your local copy of each version controlled package. So, if you are planning to work on a model whilst disconnected from version control, it is a very good idea to make sure that you have the latest versions of all packages before you disconnect. The <b>Get All Latest</b> option makes this a simple task.</p>	<p><a href="#">Get All Latest</a> <sup>[279]</sup></p>

### 3.5.1.1.9 Version Control Branching

Currently, Enterprise Architect does not support Version Control Branching.

Work-arounds to achieve similar results might be possible for certain version-control products; contact Sparx Support for advice:

### 3.5.1.2 Version Control Product Setup

Enterprise Architect relies on third-party version control products to control and maintain the different revisions of your project packages.

Once your version control product is installed and a suitable environment has been created, Enterprise Architect can then utilize that environment to control your project's packages.

#### Guide:

Topic	Detail	See also
<b>Version Control System Components</b>	<p>Typically, version control products consist of:</p> <ul style="list-style-type: none"> <li>• a server component</li> <li>• a client component</li> </ul> <p>Enterprise Architect integrates with version control <b>client</b> components.</p> <p>It provides integration for Subversion, CVS and MS Team Foundation Server command line clients, as well as integration for products having API clients that comply with the MS SCCI specification.</p>	
<b>Version Control Server</b>	<p>The server component maintains the controlled files in their many revisions in a central repository.</p> <p>The server component is usually located on a server machine, that is accessible by all team members who are using version control.</p>	
<b>Server Configuration</b>	<p>Steps involved in configuring a version control server usually include;</p> <ul style="list-style-type: none"> <li>• Installing the software</li> <li>• Creating a repository</li> <li>• Creating version control projects (or modules or folders for use with specific projects)</li> <li>• Configuring user IDs and passwords</li> </ul> <p>The details of configuring any particular version control server are beyond the scope of this document.</p> <p>Please consult the appropriate documentation.</p>	
<b>Version Control Client</b>	<p>The client component deals with the working copies of the controlled files, submitting or retrieving files to and from the server as required.</p> <p>A version control client must be installed on every machine where you run Enterprise Architect and want to access your version control system.</p>	
<b>Client Configuration</b>	<p>Steps involved in configuring a version control client usually include;</p> <ul style="list-style-type: none"> <li>• Installing the software</li> <li>• Creating a new directory for use as a local working copy</li> </ul>	<p><a href="#">Create a Subversion Environment</a><sup>[253]</sup></p> <p><a href="#">Create a CVS</a></p>

### 3.5.1.2.2 Create a Subversion Environment

Before Subversion can be used as a version control provider for Enterprise Architect, the appropriate software must be installed and configured by a Subversion administrator.

The following topics describe some basic tasks that must be completed and some tools for performing these tasks, in order to create an operational Subversion environment.

#### Topics:

Topic	Detail	See Also
<b>Install server components</b>	<p>Executable files for Subversion can be obtained from the Apache Software Foundation</p> <p>Subversion server components are available to run on a</p>	<p><a href="#">Apache Subversion Official Subversion Documentation</a></p>

Topic	Detail	See Also
	<p>wide range of different hardware and operating systems; Enterprise Architect is not affected by your choice of server components</p> <p>VisualSVN is a package that can greatly simplify the installation, configuration and management of your Subversion server</p>	
<b>Create a repository</b>	Please consult the official Subversion documentation	<a href="#">Official Subversion Documentation</a>
<b>Create Subversion users</b>	Please consult the official Subversion documentation	<a href="#">Official Subversion Documentation</a>
<b>Create a new repository sub-tree</b>	<p>It is good practice to create folders in your PC's file system for organizing your files and documents; similarly, it is good practice to create a new repository sub-tree in Subversion for each new Enterprise Architect model</p> <p>TortoiseSVN can greatly simplify the process of creating new repository sub-trees</p>	<a href="#">Create a Repository Sub-tree</a> <sup>[257]</sup>
<b>Install client components</b>	Executable files for Subversion can be obtained from the Apache Software Foundation	<a href="#">Apache Subversion</a>
<b>Create a working copy folder</b>	<p>To create a local working copy, you must perform an initial check-out of a folder from the Subversion repository; this downloads a copy of the folder and its contents, to create your local working copy</p> <p>TortoiseSVN can greatly simplify the initial check out of a working copy folder</p>	<a href="#">Create a Local Working Copy</a> <sup>[257]</sup>
<b>Subversion under Wine/CrossOver</b>	The set up and use of Subversion with Enterprise Architect under Wine is almost identical to when running natively under Windows, apart from some minor differences when installing the Subversion client and performing the initial check out of the working copy folder	<a href="#">Subversion under Wine</a> <sup>[259]</sup>
<b>TortoiseSVN</b>	TortoiseSVN is a Windows shell extension; Enterprise Architect can <b>not</b> use TortoiseSVN as its client, it must use the Subversion command line client	<a href="#">TortoiseSVN</a> <sup>[261]</sup>

**Notes:**

- Enterprise Architect relies on exclusive file locking when applying version control to its packages; file locking was not introduced into Subversion until version 1.2, therefore Enterprise Architect does not work with Subversion releases earlier than Subversion 1.2
- Sparx Systems recommend that each new Enterprise Architect model being added to version control with Subversion should have a separate repository sub-tree created for it, and users should create a new local working copy from the sub-tree to be used with that model

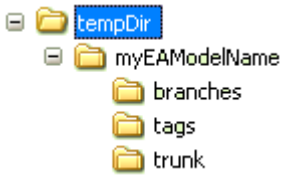

**3.5.1.2.2.1 Create a new Repository Sub-tree**

In the same way that it is good practice to create folders in your PC's file system for organizing your files and documents, it is good practice to create a new repository sub-tree in Subversion for each new Enterprise Architect model.

**Use to:**

- Create a new sub-tree in the Subversion repository

**How to:**

Step	Action	See also
1	<p>Use Windows Explorer to create a temporary directory structure on your PC file system, that can be imported into the Subversion repository to create a new repository sub-tree. The resulting sub-tree can then be used to control the package files for your Enterprise Architect model.</p> <p>The directory structure should look like this:</p> 	
2	<p>Open a Windows command prompt, navigate to "tempDir" and issue the Subversion command <b>import</b>.</p> <p>For example;</p> <pre>C:\Documents and Settings\user&gt; cd \tempDir C:\tempDir&gt; svn import . https://host.example.com:8443/repos/</pre>	<p><a href="#">Subversion repository administration basics</a></p>
3	<p>Delete the temporary directory structure. That is, delete "tempDir" and all its contents.</p>	

**Notes:**

- After the import is finished, the original tree is not converted into a Subversion working copy; you should delete the temporary structure and check out a fresh working copy of the tree
- The process described above can also be performed using TortoiseSVN's Repository Browser, which provides commands that allow you to simply create new folders directly in the repository

**3.5.1.2.2.2 Create a Local Working Copy**

In order to make use of Subversion to provide version control of your model's packages, you must prepare a functional SVN working copy folder that can be accessed through an Enterprise Architect version control configuration.

**Use to:**

- Create a Subversion working copy folder, suitable for use with Enterprise Architect

**How to:**

Step	Action	See also
1	Choose a suitable directory on your system, in which to create your Subversion Working Copy	
2	<p>Open a command prompt window and (if necessary create and then) navigate to a suitable directory to use as your Subversion working copy directory</p> <p>For example:</p> <pre data-bbox="355 544 906 622">C:\&gt; mkdir mySVNWorkSpace C:\&gt; mkdir mySVNWorkSpace/myEAModelName C:\&gt; cd mySVNWorkSpace/myEAModelName</pre>	
3	<p>Issue the command to perform the initial check out from the Subversion repository, specifying the repository folder and local working copy folder, as well as your user name and password</p> <p>(By specifying your Subversion username and password, you ensure that they are correctly cached by Subversion and available for use by Enterprise Architect)</p> <p>For example;</p> <pre data-bbox="355 891 1161 1003">C:\&gt; svn checkout "https://myserver:8443/svn/repos_folder "C:\mySVNWorkSpace/myEAModelName " --username myUserName --password myPassword</pre> <p>If you specify the HTTPS protocol when performing the initial Subversion check out, a prompt displays to accept a security certificate; in this instance, press <b>(P)</b> to permanently accept the certificate</p> <p>The nominated local folder is configured as a Subversion working copy folder</p> <p>Any files already existing in the repository folder are downloaded to the working copy folder as working copy files</p>	
4	You should now verify that your Subversion environment functions correctly	<a href="#">Verify the SVN Workspace</a> <small>258</small>

**Notes:**

- It is important that Subversion caches your username and password, so that it never has to prompt for user input; a check-out operation might not request authentication, and if it does not you should perform an action that does request authentication, such as adding and committing a dummy test file
- The process described above can also be performed using TortoiseSVN's Checkout command (which provides options to browse) when specifying both your repository folder and your local folder; when prompted for authentication details by TortoiseSVN, make sure you place a check against the **Save Authentication Data** option

**3.5.1.2.2.3 Verify the SVN Workspace**

After creating the Subversion local working copy to hold the working copies of your Enterprise Architect package files, you should verify that it functions correctly.

You should be able to add files to Subversion, lock the files and commit changes to those files.

**Use To:**

- Verify correct operation of a newly created Subversion working copy folder, before attempting to use it with Enterprise Architect.

**How To:**

Step	Action	See also
1	Use Windows to open a command prompt window.	
2	Change directory to the one you specified as the working copy, in the Subversion checkout command when preparing the SVN workspace.  For example; <pre>C:\&gt; cd mySVNWorkSpace</pre>	
3	Create a test file, such as Test.txt, containing the text "Subversion Test".  For example; <pre>C:\&gt; echo Subversion Test &gt; Test.txt</pre>	
4	Execute the following Subversion commands: <ul style="list-style-type: none"> <li>• <code>svn add Test.txt</code></li> <li>• <code>svn commit -m"Commit comment" Test.txt</code></li> <li>• <code>svn update Test.txt</code></li> <li>• <code>svn lock Test.txt</code></li> <li>• Use your preferred editor to modify the file and save the changes</li> <li>• <code>svn commit -m"Second commit comment" Test.txt</code></li> </ul> <p>The commands should execute without any errors and without prompting the user for any extra input.</p>	

**Notes:**

- Your environment must be set up such that you can perform these operations without ever being prompted for user ID or password; for further information, please see the *Caching Client Credentials* topic in the official Subversion documentation

**3.5.1.2.2.4 Subversion Under WINE-Crossover**

The set up and use of Subversion with Enterprise Architect under Wine is almost identical to when running natively under Windows.

When running Enterprise Architect under Wine or CrossOver, you still use a Windows-based Subversion command line client.

There are some differences in the way you go about preparing your Subversion working environment, specifically in the way you install your Subversion client and how you check out a working copy folder from the Subversion repository.

**Guide:**

Topic	Detail	See also
<b>System Requirements</b>	Sparx Systems has tested and succeeded in using Enterprise Architect with Subversion under Wine 1.2, on Mac OS 10.4 & 10.6.2, as well as Ubuntu 10.04.  When using Wine 1.2 on the Ubuntu 9.10 platform, Sparx	

Topic	Detail	See also
	Systems was unable to successfully use the <b>https:</b> protocol to communicate with the SVN server, however we could use the <b>svn:</b> and <b>file:</b> protocols.	
<b>Installing a Subversion Client</b>	Wine is able to install applications from either a Windows .EXE file, or a .MSI installer file. You should place the installer for your Windows Subversion client in a convenient location on the native file system. Then, open a Wine console window from within Enterprise Architect and run the installer from within the Wine console. This ensures that your Subversion installation accesses the same C: drive and folders that Enterprise Architect is accessing.	<a href="#">Preparing a Subversion Environment Under Wine.</a> <sup>[260]</sup>

Wine is able to install Subversion from either a Windows *.EXE* file, or a *.MSI* file. By performing your Subversion installation and initial check out from within a Wine console window that is opened from within Enterprise Architect, you can ensure that you have access to the same C: drive and folders that Enterprise Architect is accessing.

#### Use to:

- Set up Subversion for use with Enterprise Architect, running under Wine

#### How to:

Step	Action	See also
1	Start Enterprise Architect You do not have to load a project at this stage	
2	Select <b>Tools   Customize &gt; Tools : New</b> The Customize dialog displays, at the Tools page, and a new, blank entry is created	<a href="#">Custom Tools</a> <sup>[12]</sup>
3	Define the new menu item entry, as follows: <ul style="list-style-type: none"> <li>• In the newly-opened <b>Menu contents</b> field, type the name <b>Wine Console</b></li> <li>• In the <b>Command</b> field, type <b>wineconsole</b></li> <li>• In the <b>Arguments</b> field, type <b>cmd</b></li> <li>• The <b>Initial directory</b> field should be left blank</li> </ul>	
4	Click on the <b>Close</b> button The Customize dialog closes	
5	Select <b>Tools   Wine Console</b> A Wine console window opens	
6	Type <b>C:</b> and press ( <b>Enter</b> ) The Wine console switches to the C: drive	
7	Issue the command to install your Subversion client For example; <pre>C:\&gt;/Installers/Subversion-client-1.6.12-1.win32.exe</pre>	

	<p>To install from a .msi file, use Wine's <b>msiexec</b> utility</p> <p>For example;</p> <pre>C:\&gt;msiexec "Slik-Subversion-1.6.9-win32.msi" /i</pre> <p>Installation of the Subversion command line client begins</p>	
8	<p>Create a folder to serve as the working copy folder to be used by Enterprise Architect</p> <p>For example:</p> <pre>C:\&gt;mkdir C:\VC_workspaces\SVN_workcopy</pre>	
9	<p>Issue the command to perform the initial check out from the Subversion repository, specifying the repository folder, the working copy folder, and the username and password</p> <p>(By specifying your Subversion username and password, you ensure that they are correctly cached by Subversion and available for use by Enterprise Architect)</p> <p>For example;</p> <pre>C:\&gt;svn checkout "https://myServer:8443/svn/repo_folder" "C:\VC_workspaces\SVN_workcopy" "--username myUserName" "--password myPassword"</pre> <p>If the HTTPS protocol is specified when performing the initial Subversion check out, you are prompted to accept a security certificate; in this instance, press ( <b>P</b> ) to permanently accept the certificate</p> <p>The nominated local folder is configured as a Subversion working copy folder</p> <p>Any files already existing in the repository folder are downloaded to the working copy folder as working copy files</p>	
10	<p>Type <b>Exit</b> and press ( <b>Enter</b> )</p> <p>The Wine console window closes</p> <p>You are now ready to load a project in Enterprise Architect and apply version control to it, following the normal Windows-based procedures</p>	<p><a href="#">Version Control Setup</a> <sup>[269]</sup></p> <p><a href="#">Use Version Control</a> <sup>[276]</sup></p>

**Notes:**

- You should copy the installer for your Windows Subversion client to a convenient location on the native file system, so that you can easily refer to it from within the Wine console window in step 7 above

**3.5.1.2.2.5 TortoiseSVN**

TortoiseSVN is a Windows shell extension for Subversion. TortoiseSVN provides icon overlays in Windows Explorer that are useful as a tool for observing the status of your Subversion controlled files.

It also enables you to create your repository sub-trees and check out local working copies from within Windows Explorer using simple menu commands.

TortoiseSVN can be downloaded from <http://tortoisesvn.net/downloads.html>.

**Notes:**

- Enterprise Architect must use the Subversion command line client. It **can not use** TortoiseSVN to communicate with the Subversion server

### 3.5.1.2.3 Create a CVS Environment

Before CVS can be used as a version control provider for Enterprise Architect, the appropriate software must be installed and configured by a CVS administrator.

The following topics describe some basic tasks that must be completed and some tools for performing these tasks, in order to create an operational CVS environment.

#### Topics:

Topic	Detail	See Also
Install server components	<p>Executable files for CVS can be obtained from the Free Software Foundation, or from March Hare Software.</p> <p>CVS server components are available to run on a wide range of different hardware and operating systems. Enterprise Architect is not affected by you choice of server components</p>	<a href="#">FSF CVS</a> <a href="#">March Hare CVS</a> <a href="#">CVS Documentation</a>
Create a repository	Please consult the CVS documentation.	<a href="#">CVS Repository Administration</a>
Create CVS users	Please consult the CVS documentation.	<a href="#">CVS Documentation</a>
Create a new repository module	<p>It is good practice to create folders in your PC's file system for organizing your files and documents. Similarly, it is good practice to create a new repository module in CVS for each new Enterprise Architect model.</p> <p>A repository module represents a project, or set of related files in the repository.</p> <p>TortoiseCVS can greatly simplify the process of creating new repository modules.</p>	<a href="#">CVS Starting a New Project</a>
Install client components	<p>Executable files for CVS can be obtained from the Free Software Foundation, or from March Hare Software.</p> <p>Enterprise Architect is a Windows based application - it requires a Windows based CVS command line client for integration.</p>	<a href="#">FSF CVS</a> <a href="#">March Hare CVS</a>
Create a working copy folder	<p>To create a local working copy, you must perform an initial check-out of a module from the CVS repository. This downloads a copy of the module, to create your local working copy.</p> <p>TortoiseCVS can greatly simplify the initial check out of a working copy folder.</p>	<a href="#">Create a CVS Local Workspace</a> <sup>[263]</sup>
CVS under Wine/ CrossOver	The set up and use of CVS with Enterprise Architect under Wine is almost identical to when running natively under Windows, apart from some minor differences when installing the CVS client and performing the initial check out of the working copy folder.	
TortoiseCVS	TortoiseCVS is a Windows shell extension. Enterprise Architect can <b>not</b> use TortoiseCVS as its client, it must use the CVS command line client.	<a href="#">TortoiseCVS</a> <sup>[265]</sup>

**Notes:**

- If you do not already use CVS for version control, you should consider using Subversion instead. Subversion's client-server protocols provide a broader range of possibilities for connecting to remote servers, with easier set up of secure connections
- Sparx Systems recommend that each new Enterprise Architect model being added to version control with CVS should have a separate repository module created for it, and users should create a new local working copy from the module to be used with that model

**3.5.1.2.3.1 Prepare a CVS Local Workspace**

In order to make use of CVS to provide version control of your model's packages, you must prepare a functional CVS working copy folder, that can be accessed through an Enterprise Architect version control configuration.

**Use to:**

- Prepare a CVS environment, suitable for use with Enterprise Architect

**How to:**

Step	Action	See also
1	Ask your system administrator to install CVS and create a remote repository with a module that you can use to control your Enterprise Architect package files.  Your administrator must create a username and password for you before you can make a connection.	
2	Open a command prompt window and (if necessary create and then) navigate to a suitable directory to use as your CVS working copy directory.  For example: <pre>C:\&gt; mkdir myCVSWorkSpace C:\&gt; cd myCVSWorkSpace</pre>	
3	Log in to the remote CVS repository.  For example; <pre>C:\myCVSWorkSpace&gt; cvs -d:pserver:myUserID@ServerName:/reposPath</pre> Replace <i>myUserID</i> with your CVS username, replace <i>ServerName</i> with the name of your CVS server and replace <i>reposPath</i> with the path to the repository on the server.  A prompt for a password displays.	
4	Enter your password.  You are logged in to the CVS server.	
5	Perform the initial check out of the CVS repository module, into the local working copy directory.  For example; <pre>C:\myCVSWorkSpace&gt; cvs -d:pserver:myUserID@ServerName:/reposPath</pre> (Replace <i>moduleName</i> with the name of the repository module that you want to check out.)  A subdirectory is created in your current working directory, that has the same name	

	as the module being checked out. Any files already existing in the repository module are downloaded to the working copy folder as working copy files.	
6	You should now verify that your CVS environment functions correctly.	<a href="#">Verify the CVS Workspace</a> 264

**Notes:**

- Much of the process described above can also be performed (more simply) using the TortoiseCVS command "Make New Module"

**3.5.1.2.3.2 Verify the CVS Workspace**

After creating the CVS local working copy to hold the working copies of your Enterprise Architect package files, you should verify that it functions correctly.

You should be able to add files to CVS, and then commit changes to those files. You should also be able to register as an editor of the file as well as retrieve the list of currently registered editors.

**Use To:**

- Verify correct operation of a newly created CVS working copy folder, before attempting to use it with Enterprise Architect

**How To:**

Step	Action	See also
1	Use Windows to open a command prompt window.	
2	Change directory to the one you specified as the working copy, in the cvs checkout command when preparing the CVS workspace.  For example; <code>C:\&gt; cd myCVSWorkSpace</code>	
3	Create a test file, such as Test.txt, containing the text "CVS Test".  For example; <code>C:\&gt; echo CVS Test &gt; Test.txt</code>	
4	Execute the following CVS commands: <ul style="list-style-type: none"> <li>• <code>cvs add Test.txt</code></li> <li>• <code>cvs commit -m"Commit comment" Test.txt</code></li> <li>• <code>cvs update Test.txt</code></li> <li>• <code>cvs edit Test.txt</code></li> <li>• <code>cvs editors Test.txt</code></li> </ul> <p>The commands should execute without any errors and without prompting the user for any extra input.</p> <p>The editors command should produce output that resembles the following;</p> <pre>Test1.txt myUserID Tue Aug 9 10:08:43 2009 GMT myComputer C</pre>	
5	Take note of the userID that follows the filename.  Enterprise Architect must find and use this user ID when you create your version	<a href="#">CVS Settings</a> 274

	control configuration.	
--	------------------------	--

**Notes:**

- Your environment must be set up such that you can perform these operations without ever being prompted for input, such as user ID or password

**3.5.1.2.3.3 TortoiseCVS**

TortoiseCVS is a Windows shell extension for CVS. TortoiseCVS provides icon overlays in Windows Explorer that are useful as a tool for observing the status of your CVS controlled files.

It also enables you to create your repository modules and check out local working copies from within Windows Explorer using simple menu commands.

TortoiseCVS can be downloaded from: <http://www.tortoisecvs.org>

**Notes:**

- Enterprise Architect cannot use TortoiseCVS to communicate with the CVS server; it must use the CVS command line client

**3.5.1.2.4 Create a TFS Environment**

Before Enterprise Architect can be used with TFS, the appropriate software must be installed by a TFS administrator. Ask your system administrator to obtain and install the TFS server and client applications.

The following topics describe some basic tasks that must be completed in order to create a TFS environment that can be used by Enterprise Architect

**Topics:**

Topic	Detail	See Also
Obtain and install TFS	Enterprise Architect uses the TFS command line client to integrate TFS version control.  It is assumed that the TFS command line client is installed as part of your Visual Studio installation.	
Choose a TFS project	It is good practice to create folders in your PC's file system for organizing your files and documents. Similarly, it is good practice to create a new TFS project, or least a new Source Control Folder within a project, for each new Enterprise Architect project.  If you have a single Enterprise Architect project, that contains many different models, (for example, a DBMS hosted project with multiple model root nodes), you might choose to create a new TFS project for each separate model.  Please consult your TFS documentation.	
Create a TFS workspace	The TFS workspace is used to map a local working folder on your PC, to a Source Control Folder within a TFS project.  A single TFS workspace can map many different local folders - each one to a separate Source Control Folder.  You can gain performance benefits for some of Enterprise Architect's	<a href="#">TFS Workspaces</a> [266]

Topic	Detail	See Also
	version control operations if you keep your version controlled package files in a folder that is separate from other artefacts, such as source code files. This can be achieved either by creating a separate work space to use just for your package files, or by creating and mapping a separate folder for package files within an existing workspace.	
Configure exclusive check-outs.	The XML file format used for version control of Enterprise Architect's packages can not be merged like ordinary text files. Therefore, Enterprise Architect must enforce serialized editing of its version controlled packages. As a consequence, it is important that TFS is configured to use 'exclusive checkouts' for XML files.	<a href="#">TFS Exclusive Check Outs</a> [267]

**Notes:**

- TFS can also be used with an SCC client. The MS TFS-SCC client is available for download from Microsoft's web site
- Visual Studio Integration (MDG Integration for Visual Studio 2005 or 2008) enhances TFS support by providing access to, for example, work items and bugs within both Enterprise Architect and the MDG Integration product

**Learn More:**

- [System Requirements](#) [254]

**3.5.1.2.4.1 TFS Workspaces**

The TFS workspace is used to map a local working folder on your PC, to a Source Control Folder within a TFS project.

**Use To:**

- Associate a local folder on your PC, with a Source Control Folder in the TFS repository

**How To:**

Step	Action	See also
1	It is assumed a Team Project already exists, that you can use to control your Enterprise Architect package files.  The following actions are carried out within MS Visual Studio.	
2	Connect to your TFS server. From the main menu, choose <b>View   Team Explorer</b> .	
3	From the main menu, choose <b>View   Other Windows   Source Control Explorer</b> .	
4	From the main menu, choose <b>Tools   Connect to Team Foundation Server</b> . A prompt displays for you to log in to the Team Foundation Server; another prompt then displays to choose an available Team Foundation Server.	
5	Choose an appropriate server and click <b>OK</b> .  The selected Team Foundation Server is displayed in the Team Explorer	

	pane. The server's project hierarchy is displayed in the Source Control Explorer's Folders pane.	
6	From the main menu, choose <b>File   New   Team Project</b> . The New Team Project wizard opens.	
7	Enter an appropriate name and description for the new Team Project. Choose the option to create an empty source control folder.	
8	Create a new Workspace.	
9	Create a new workspace. In the Source Control Explorer, click on the drop-down arrow in the <b>Workspace</b> field, then choose <b>Workspaces</b> The Manage Workspaces dialog is displayed.	
10	Click on the <b>Add...</b> button. The Add Workspace dialog is displayed.	
11	Enter an appropriate name for the new workspace and enter a comment if required.	
12	Click in the <b>Source Control Folder</b> column, then click the <b>Browse</b> button, to select a Source Control Folder. Select the new folder that was created in step 7.	
13	Click the <b>Browse</b> button in the <b>Local Folder</b> column and create a new local folder. This is the working copy folder into which Enterprise Architect exports the package files.	
14	Click <b>OK</b> . The new workspace is created and saved. The Add Workspace dialog closes.	
15	Click <b>OK</b> . The Manage Workspaces dialog closes.	

**Notes:**

- The local folder referenced in step 13, is the Working Copy Path that should be specified when defining an Enterprise Architect Version Control Configuration to use this TFS workspace

**Learn More:**

- [TFS Settings](#) 

**3.5.1.2.4.2 TFS Exclusive Check Outs**

The XMI file format used for version control of Enterprise Architect's packages can not be merged like ordinary text files. Therefore, Enterprise Architect must enforce serialized editing of its version controlled packages. As a consequence, it is important that TFS is configured to use 'exclusive checkouts' for XML files. Otherwise, TFS can return file statuses that make it look like the package file is not checked-out by another user when indeed it is.

**Use To:**

- Configure TFS to enforce exclusive check outs for XML files

**How To:**

Step	Action	See also
1	Using Visual Studio, from the main menu select <b>View   Team Explorer</b> .	
2	In the Team Explorer pane, right-click on the TFS Server name that is controlling the EA package files, then from the context menu select <b>Team Foundation Server Settings   Source Control File Types</b> .	
3	Select the entry for XML files (or create an entry if necessary) then click on <b>Edit</b> .	
4	Clear the check-mark from the option <b>Enable file merging and multiple check out</b> .	

**3.5.1.2.5 Create an SCC Environment**

Before Enterprise Architect can be used with an SCC version control product, the appropriate software must be installed and configured by an administrator.

The following topics describe some basic tasks that must be completed in order to create an SCC based version control environment that can be used by Enterprise Architect

**Topics:**

Topic	Detail	See Also
<b>Install and configure your chosen version control product.</b>	<p>A version control server component is typically installed on a dedicated server machine. All Enterprise Architect users who require access to version control must be able to connect to the server machine.</p> <p>After installing the version control software, the administrator should also create version control user IDs for all users who require access to version control.</p> <p>Please consult the documentation for your particular version control product.</p>	<a href="#">List of SCC compatible version control providers</a> <sup>[254]</sup>
<b>Create a new SCC project</b>	<p>It is good practice to create folders in your PC's file system for organizing your files and documents.</p> <p>Similarly, it is good practice to create a new version control project, or least a new folder within a project, for each new Enterprise Architect project.</p> <p>If you have a single Enterprise Architect project, that contains many different models, (for example, a DBMS hosted project with multiple model root nodes), you might choose to create a new version control project for each separate model.</p> <p>Please consult the documentation for your particular version control product.</p>	
<b>Configure your SCC project</b>	The XML file format used for version control of Enterprise	

Topic	Detail	See Also
<b>to support exclusive check-outs for .XML files</b>	Architect's packages can not be merged like ordinary text files. Therefore, Enterprise Architect must enforce serialized editing of its version controlled packages. As a consequence, it is important that your version control system is configured to use 'exclusive checkouts' for XML files.	
<b>Create a local working copy folder</b>	<p>A working copy folder should be created on each users' machine, for Enterprise Architect to use when exporting and importing the version controlled package files.</p> <p>The working copy folder is the "sandbox" where you modify the controlled files. The working copy folder is usually associated with a folder that exists within the version control repository. Your version control product provides some means by which you associate a "working copy" folder with a repository folder.</p> <p>It is this folder that is specified as the Local Project Path, when defining your Version Control Configurations.</p> <p>Please consult the documentation for your particular version control product.</p>	<a href="#">Version Control Setup</a> <sup>[269]</sup>

**Notes:**

- When installing the client component software on users' PCs, ensure that the SCC client is also installed, as it might not be a part of the default installation

**3.5.1.3 Version Control Setup**

Once the version control software has been installed and configured, to use your installed version control product you must first define a Version Control Configuration within Enterprise Architect.

**Use to:**

- Define a new Version Control Configuration, that can then be used to control the packages in your project

**How to:**

Step	Action	See also
1	Start Enterprise Architect and load the model for which you are defining the Version Control Configuration.	
2	Open the <b>Version Control Settings</b> dialog; <b>Project   Version Control   Version Control Settings</b>	<a href="#">Version Control Settings dialog</a> <sup>[271]</sup>
3	Click on the <b>New</b> button.	
4	In the <b>Unique ID</b> field, type a suitable name.	
5	Select the <b>Type</b> of version control product you are connecting to, by clicking on the corresponding radio button.	

Step	Action	See also
6	At this point, the middle section of the dialog changes to display a collection of fields specific to the type of Version Control Configuration you are defining.  Enter details relating to the version control workspace that this configuration is to use.	
7	Click on the <b>Save</b> button. The new configuration is added to the <b>Defined Configurations</b> list.	
8	When you have finished defining your version control configurations, click on the <b>Close</b> button.	

**Notes:**

- Version Control Configuration details are stored in the user's Windows Registry settings, but each project stores a list of the configurations it uses, so that version control connections can be initialized as a project is being loaded
- You can define any number of Version Control Configurations for use in a single model, however any given package can be associated with only one configuration
- If you are using the Corporate or extended editions of Enterprise Architect with security enabled, you must also set up permissions to configure and use version control. See **List of Available Permissions** for more information

**Learn More:**

- [List of Available Permissions](#) 

**3.5.1.3.1 Re-use an Existing Configuration**

Once a version control configuration has been defined for use in one project, it is possible to re-use that configuration in other projects.

**Use To:**

- Provide access to an already existing version control environment (a working copy directory and its associated repository that is already in use)
- Provide access to version controlled packages that were created (and version controlled) in another project

**How To:**

Step	Action	See also
1	Choose one of; <ul style="list-style-type: none"> <li>• <b>Project   Version Control   Version Control Settings</b></li> <li>• <b>Right-click any package in the Project Browser   Package Control   Version Control Settings</b></li> </ul> The <b>Version Control Settings</b> dialog displays.	<a href="#">Version Control Settings dialog</a> 
2	Click on the <b>New</b> button.  The various fields on the dialog are cleared, ready for data entry.	
3	In the <b>Unique ID</b> field, click on the drop-down arrow and select one of the	

Step	Action	See also
	previously-defined version control configurations. The details of the selected configuration are displayed in the dialog.	
4	Click on the <b>Save</b> button. The configuration details are saved and ready for use in the current project.	

### 3.5.1.3.2 Version Control Settings Dialog

The Version Control Settings dialog enables you to define Version Control Configurations, that are used by Enterprise Architect to communicate with your version control system.

**Access:** **Project | Version Control | Version Control Settings**

**OR Right-click on any package node | Package Control | Version Control Settings**

#### Use To:

- Define new Version Control Configurations
- Update existing Version Control Configurations

#### Reference:

Field	Usage	See Also
<b>This mode is private</b>	Specify whether this model database is to be accessed by just a single user (Private Model) or by multiple concurrent users (Shared Model).  The default value is "unchecked" (Shared Model). If in doubt, use the default value.	
<b>Save nested version controlled packages to stubs only</b>	Specify whether the exported XMI file for a version controlled package, shall contain package stubs (place holders) or full content for nested version controlled child packages.  It is recommend to always export version controlled child packages as stubs only.	
<b>Report cross package reference deletions before check-in</b>	Choose whether or not Enterprise Architect should alert the user when cross package references are being removed from the exported XMI package file, when compared to the previous revision of that file.	<a href="#">Report Deletion of Cross Package References</a> <sup>[337]</sup>
<b>Unique ID</b>	A name that uniquely identifies the configuration.  Enter a name to identify a new configuration, or use the drop-down list to retrieve details of a configuration previously defined in a different project.	
<b>Type</b>	Specify the type of version control system associated with this configuration.  Once the type is selected, the middle section of the dialog changes to display a collection of fields relating to the type of Version Control Configuration you are defining. For a	<a href="#">SCC Settings</a> <sup>[272]</sup> <a href="#">CVS Settings</a> <sup>[274]</sup> <a href="#">SVN Settings</a> <sup>[274]</sup> <a href="#">TFS Settings</a> <sup>[275]</sup>

Field	Usage	See Also
	<p>description of those fields, see the links at right.</p> <p>Set the type to SCC for;</p> <ul style="list-style-type: none"> <li>• MS Visual Source Safe</li> <li>• Rational Clear Case</li> <li>• Perforce</li> <li>• AccuRev</li> <li>• other SCC compatible clients</li> </ul> <p>For CVS, Subversion or TFS, choose the type that matches the product you are using.</p>	
<b>New</b>	Create a new Version Control Configuration.	
<b>Save</b>	Save the details of a new or updated configuration.	
<b>Delete</b>	Remove the definitions of the currently selected configuration from this model.	
<b>Defined Configurations</b>	List of configurations that are in use in the current model.	
<b>In future, do not prompt for incomplete configurations</b>	Choose whether or not the user is prompted to complete the definition of configurations that are not fully specified.	
<b>Close</b>	Close this dialog.	
<b>Help</b>	Display this Help topic.	

**Notes:**

- When you first open an Enterprise Architect project that was created by another user and that uses version control, the Version Control Configuration(s) used by that project do not yet exist in your Windows registry settings. You must complete the definitions of those configurations before you can use version control in that project
- It is important that for any given version controlled package file, all access of that file from any model and by any user, is done using Version Control Configurations having the same UniqueID
- If Project Security is enabled, you must have **Configure Version Control** permission to set up version control options for the current model
- It is possible to use multiple version control configurations in the same Enterprise Architect model

**Learn More:**

- [Applying version control to a package.](#)<sup>[283]</sup>
- [Applying version control to a hierarchy of packages.](#)<sup>[291]</sup>
- [Configure Version Control](#)<sup>[206]</sup>

**3.5.1.3.2.1 SCC Settings**

When you specify the type of your Version Control Configuration as SCC, the middle section of the Version Control Settings dialog changes to allow you to enter details that are specific to SCC based configurations.

**Access:** **Version Control Settings dialog > Choose type: SCC**

**Use To:**

- Define the working copy folder to be used with an SCC based version control configuration

- Specify the details necessary to connect to the SCC version control system

**Reference:**

Field	Usage	See Also
<b>Local Project Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only, its value can only be set through use of the <b>Select Path</b> button.	
<b>Select Path</b>	Choose the Local Project Path, by opening a file browser dialog and navigating through the file system to the appropriate folder. <ul style="list-style-type: none"> <li>• After choosing the appropriate folder path, the Select SCC Provider dialog opens. This dialog displays a list of all SCC providers that are installed on the current PC. Choose the SCC provider to use and click on the <b>OK</b> button</li> <li>• At this point, the SCC client opens its own dialog to prompt you for information, such as the SCC Project to use</li> <li>• You might also be asked to log in the the version control system</li> <li>• At the conclusion of this process, all of the SCC details should be filled in. You can then save the definition by clicking <b>Save</b> on the Version Control Settings dialog</li> </ul>	<a href="#">System Requirements</a> <sup>[25]</sup> <a href="#">Version Control Settings dialog</a> <sup>[27]</sup>
<b>Current User</b>	Displays the user name used to log on to the version control system that is accessed through this configuration.  This field is read-only, the value it displays is retrieved from the SCC client.	
<b>SCC Provider</b>	Displays the name of the SCC provider.  This field is read-only, the value it displays is retrieved from the SCC client.	
<b>SCC Project</b>	Displays the name of the SCC Project that this configuration attaches to.  This field is read-only, the value it displays is retrieved from the SCC client.	

**Notes:**

- After choosing an SCC Provider and clicking OK in the Select SCC Provider dialog, the SCC client takes control to prompt the user for information. SCC products implement this functionality in quite varied ways, but typically you are prompted to log in to the version control system, then prompted to choose the SCC Project to use and possibly a (server) folder contained within that project

### 3.5.1.3.2.2 CVS Settings

When you specify the type of your Version Control Configuration as CVS, the middle section of the Version Control Settings dialog changes to allow you to enter details that are specific to CVS based configurations.

**Access:** Version Control Settings dialog > Choose type: CVS

**Use To:**

- Define the working copy folder to be used with a CVS based version control configuration
- Specify the path to the CVS command line client

**Reference:**

Field	Usage	See Also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button.	
<b>Select Path</b>	Choose the Working Copy Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Current User</b>	This field is read-only. Its value is retrieved by Enterprise Architect, from a file named "CVS\Root", located in the folder specified by Working Copy Path above.	
<b>CVS Exe Path</b>	Displays the full path of the CVS command line client executable file.  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button.	
<b>Select Path</b>	Specify the path to the CVS command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	

**Notes:**

- When connecting to a remote CVS repository, the **Current User** field should display the user name used to log into that repository. If this does not happen, it indicates that Enterprise Architect cannot extract the user name from the file "...WorkingCopyPath\CVS\Root" and the configuration does not work correctly

### 3.5.1.3.2.3 SVN Settings

When you specify the type of your Version Control Configuration as Subversion, the middle section of the Version Control Settings dialog changes to allow you to enter details that are specific to Subversion based configurations.

**Access:** Version Control Settings dialog > Choose type: Subversion

**Use To:**

- Define the working copy folder to be used with a Subversion based version control configuration

- Specify the path to the Subversion command line client

**Reference:**

Field	Usage	See Also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files.  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button.	
<b>Select Path</b>	Choose the Working Copy Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Subversion Exe Path</b>	Displays the full path of the Subversion command line client executable file.  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button.	
<b>Select Path</b>	Specify the path to the Subversion command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	

**3.5.1.3.2.4 TFS Settings**

When you specify the type of your Version Control Configuration as TFS, the middle section of the Version Control Settings dialog changes to allow you to enter details that are specific to TFS based configurations.

**Access:** **Version Control Settings dialog > Choose type: TFS**

**Use To:**

- Define the working copy folder to be used with a TFS based version control configuration
- Specify the user name and password to log in to the TFS server
- Specify the path to the TFS command line client

**Reference:**

Field	Usage	See Also
<b>Working Copy Path</b>	Displays the full path of the folder that contains the local (working) copies of the XML package files  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button	
<b>Select Path</b>	Choose the Working Copy Path, by opening a file browser dialog and navigating through the file system to the appropriate folder.	
<b>Server Name</b>	Displays the name of the TFS Server that is associated with the working copy folder specified in Working Copy Path above.  This field is read-only. Enterprise Architect retrieves the value it displays by querying the TFS client.	

Field	Usage	See Also
<b>Workspace Name</b>	Displays the name of the TFS Workspace that is associated with the working copy folder specified in Working Copy Path above.  This field is read-only. Enterprise Architect retrieves the value it displays by querying the TFS client.	
<b>User Name</b>	Specify the user name with which to log into the TFS Server.	
<b>Password</b>	Specify the password with which to log into the TFS Server.	
<b>TFS Exe Path</b>	Displays the full path of the TFS command line client executable file.  This field is read-only, its value can only be set through use of the associated <b>Select Path</b> button.	
<b>Select Path</b>	Specify the path to the TFS command line client, by opening a file browser dialog and navigating through the file system to locate the appropriate file.	

**Notes:**

- Users who automatically log in to TFS through means external to Enterprise Architect (for example, through MS Integrated Security) can leave the User Name and Password fields blank
- If the Password field is blank, Enterprise Architect retrieves the current user's Windows username and uses that value when determining whether a package file is checked out to them or to some other user
- TFS version control can also be accessed using the TFS MSSCCI client. To make use of the TFS MSSCCI client, please define an SCC based Version Control Configuration

**3.5.1.4 Use Version Control**

Once your version control product is installed and a suitable environment has been created, Enterprise Architect can then utilize that environment to control your project's packages.

The following topics describe use of the version control features of Enterprise Architect, accessed through the Package Version Control Menu.

**Guide:**

Topic	Detail	See also
<b>Version Control Settings</b>	Version Control Configurations are used by Enterprise Architect to communicate with your version control system.  You must define a Version Control Configuration in your project and then use that configuration to control the packages in your project.	<a href="#">Version Control Setup</a> <sup>[269]</sup>
<b>Configure a Package</b>	To put a package under version control, you must mark the package as a controlled package, specify the version control configuration to control it and associate an XML file with the package.	<a href="#">Configure Controlled Package</a> <sup>[283]</sup>
<b>Check In a Model</b>	The Check In a Model Branch command allows you to	<a href="#">Check In a Model</a>

Topic	Detail	See also
<b>Branch</b>	check-in all packages involved in a particular unit of work, as a single operation.	<a href="#">Branch</a> <sup>[285]</sup>
<b>Check Out a Model Branch</b>	The Check Out a Model Branch command allows you to check-out all packages within a selected model branch, as a single operation.	<a href="#">Check Out a Model Branch</a> <sup>[285]</sup>
<b>Check In a Package</b>	The Check In command allows you to check-in the package currently selected in the Project Browser.	<a href="#">Check In a Package</a> <sup>[286]</sup>
<b>Check Out a Package</b>	To work on a version controlled package you must have the package checked out.  The Check Out command allows you to check-out the package currently selected in the Project Browser.	<a href="#">Check Out a Package</a> <sup>[287]</sup>
<b>Undo Check Out of a Package</b>	The Undo Check Out command allows you to undo the check-out of a package, discarding any modifications that have been made by restoring the package content to the latest revision held in version control.	<a href="#">Undo Check Out of a Package</a> <sup>[288]</sup>
<b>Import a Package From Version Control</b>	You can retrieve packages from version control that have been created by other users, or by you in another model, and import them into your current model.	<a href="#">Include Other Users Packages</a> <sup>[290]</sup>
<b>Apply Version Control to a Model Branch</b>	Enterprise Architect enables you to apply version control to all packages within a selected model branch, in a single operation. In this context, a model branch is a package that is currently selected in the Project Browser, and all of the packages contained within it.	<a href="#">Apply Version Control to Branches</a> <sup>[291]</sup>
<b>Export a Version Controlled Model Branch</b>	The Export a Model Branch command exports version control information about the root package of a model branch, that is used to simplify the process of exporting and importing a hierarchy of packages from one model to another.	<a href="#">Export Controlled Model Branch</a> <sup>[291]</sup>
<b>Import a Model Branch From Version Control</b>	Model branch files can simplify the process of exporting and importing a hierarchy of packages from one model to another.  The Import a Model Branch command uses Enterprise Architect's Model Branch Files, of which there are few, to retrieve information about the root package file and import the model branch.	<a href="#">Import Controlled Model Branch</a> <sup>[292]</sup>
<b>View Package Revision History</b>	The File History command allows you to review the change history of version controlled packages.  It also enables you to check out a prior revision of the package for editing, effectively allowing you to roll-back to a prior revision of the package.	<a href="#">Review Package History</a> <sup>[295]</sup>
<b>Validate Package Configurations</b>	You can test the validity of the version control settings associated with each version controlled package within your current model.	<a href="#">Validate Package Configurations</a> <sup>[297]</sup>
<b>Resynchronize the Status of Version Controlled Packages</b>	Enterprise Architect enables you to re-synchronize the version control status of version controlled packages within your project with the status reported by your version control provider.	<a href="#">Resynchronize Package Status</a> <sup>[298]</sup>

**Notes:**

- Database replication should not be combined with version controlled packages
- If the packages under version control contain any alternative images and those images are subject to frequent change, you can set the **Export alternate images** option on the **Options** dialog to export the images to the version control repository when you check in the packages. If the images are not subject to frequent change, do not select this option and instead use **Export / Import Reference Data** to manage alternative images

**3.5.1.4.1 Project Version Control Menu**

Provides access to various project related version control functions

**Access:** **Project | Version Control**

**Use to:**

- Apply version control to a package
- Modify or check version control settings
- Validate settings for all version controlled packages
- Resynchronize the status of all version controlled packages, with their associated version control system.
- Allow working when not connected to version control

**Reference:**

Action	Usage	Shortcut	See also
<b>Configure Current Package</b>	Display the Package Control Options dialog, which enables you to specify whether this package (and its children) is version controlled, and which version control configuration applies.	<b>Ctrl + Alt + P</b>	<a href="#">Package Control Options</a> <sup>[283]</sup> dialog
<b>Version Control Settings</b>	Display the Version Control Settings dialog <sup>[271]</sup> .		<a href="#">Version Control Settings dialog</a> <sup>[271]</sup>
<b>Validate Package Configurations</b>	Test the validity <sup>[297]</sup> of the version control settings associated with each version controlled package within your current model.		<a href="#">Validate package configuration</a> <sup>[297]</sup>
<b>Re-Synch Statuses of All Packages</b>	Resynchronize the version control status of packages <sup>[298]</sup> as recorded in your Enterprise Architect project when they are out of synchronization with the version control status reported by your version control provider.  The function acts on all version controlled packages within the Enterprise Architect project, updating the values recorded in the project to match the values reported by the version control provider, without performing any XML import or export.		<a href="#">Resynchronize the version control status of packages</a> <sup>[298]</sup>
<b>Work Offline</b>	Work independently of the version control server.  By selecting Work Offline before loading your project, you can prevent Enterprise Architect from		<a href="#">Offline version control</a> <sup>[251]</sup>

Action	Usage	Shortcut	See also
	attempting to connect to a version control server that is unavailable, thereby avoiding the delays of waiting for the server to respond and any associated error messages.		

### 3.5.1.4.2 Package Version Control Menu

The Package Control menu, when invoked from a version controlled package, provides access to all of the version control operations that are performed on packages.

**Access:** Right-click on a version controlled package node | Package Control

**Use to:**

- Open the dialog for working with baselines
- Apply version control to a single package or a selected hierarchy of packages
- Check-in and check-out single packages or a selected hierarchy of packages
- Update packages to the latest revision from the version control repository
- Inspect the revision history or properties of the XML file associated with a package
- Revert a package to a previous revision
- Compare the current model content of a package, against the latest revision of the package in version control
- Import and export hierarchies of packages (model branches) to and from the model, through the version control system
- Synchronize the status of a package, with the version control system

**Reference:**

Action	Usage	Shortcut	See also
<b>Configure</b>	Display the Package Control Options dialog for the currently selected package  Use to apply or remove version control for a package (specify version control settings) or to specify a file for use in XML package control	<b>Ctrl + Alt + P</b>	<a href="#">Package Control Options Dialog</a> [283]
<b>Manage Baselines</b>	Create a Baseline of the current package, or compare the current package with a previous Baseline	<b>Ctrl + Alt + B</b>	<a href="#">Create a Baseline</a> [313]
<b>Check In Branch</b>	Check-in packages contained in the currently selected model branch  For the selected branch of the model, (that is, the selected package and all of its child packages) display the Select Packages to Check In dialog, listing all version controlled packages within that branch that are checked out to you; you can then select packages in the displayed list, to be submitted for check-in  You can also choose to keep the		<a href="#">Check In a Model Branch</a> [285]

**Learn More:**

- [Controlled Package Menu](#)<sup>[329]</sup>

**3.5.1.4.3 Configure Controlled Package**

To put a package under version control, you must mark the package as a controlled package, specify the version control configuration to control it and associate an XML file with the package. Enterprise Architect can then export and import the package data to and from the file as required and issue commands to the version control system as appropriate.

**Use to:**

- Apply version control to a single package

**How to:**

Step	Action	See also
1	<p>In the Project Browser, right-click on the package to be placed under version control and choose <b>Package Control   Configure...</b></p> <p>The Package Control Options dialog displays.</p>	
2	Click on the <b>Control Package</b> checkbox to insert a check mark, indicating that this package is to be controlled.	
3	<p>Click on the <b>Version Control</b> drop-down arrow and select the Version Control Configuration to be used to control this packages.</p> <p>The <b>XMI Filename</b> field then displays a default filename for the package export file,</p>	

Step	Action	See also
	based on the package name.	
4	<p>Optionally, modify the default <b>XMI Filename</b>.</p> <p>Choose either;</p> <ul style="list-style-type: none"> <li>• type a new name into the filename field</li> <li>• click on the browse button ( ... ) to open a file chooser dialog.</li> </ul> <p>The target file must be located within the working copy folder of the selected Version Control Configuration, or one of its sub-folders.</p>	
5	<p>Optionally, update the <b>Version ID</b> for this package.</p> <p>The <b>Version ID</b> field defaults to 1.0; if necessary, change this to the appropriate reference.</p>	
6	<p>Optionally, update the <b>Owner</b> field.</p> <p>The <b>Owner</b> field defaults to your user name; if necessary, type or select the name of the user who owns the package.</p>	
7	<p>Click on the <b>OK</b> button.</p> <p>The Add Package to Version Control dialog displays.</p>	
8	<p>Optionally, clear the <b>Keep checked out</b> checkbox.</p> <p>After applying version control, the package is either checked-out for editing, or checked-in and locked against editing, in accordance with this setting.</p>	
9	<p>Click on the <b>OK</b> button.</p> <p>The Add Comment dialog displays.</p>	
10	<p>Optionally, add any further comments to the default comment.</p> <p>Enterprise Architect provides a default comment that includes the current date &amp; time.</p>	
11	<p>Click on the <b>OK</b> button.</p> <p>The current package is exported to the nominated XMI file, which is then committed to version control. The package icon in the Project Browser is updated to reflect the package's version control status.</p>	<a href="#">Project Browser Indicators</a> <sup>[250]</sup>

**Notes:**

- If you are using the Corporate or extended editions of Enterprise Architect with security enabled, then this feature is only available to users who have been granted permission to configure and use version control

- [List of Available Permissions](#) <sup>[206]</sup>

### 3.5.1.4.4 Check In a Model Branch

The Check In a Model Branch command enables you to check-in all packages involved in a particular unit of work, as a single operation. You can even commit new revisions of the affected packages as you complete milestones, while still keeping the packages checked-out for further editing.

#### Use to:

- Check in a selection of packages from within the currently selected model branch

#### How to:

Step	Action	See also
1	Right-click on the package icon at the root of the model branch that is to be checked in and select <b>Package Control   Check In Branch</b> .  The Select Packages to Check-in dialog displays, listing all version controlled and checked-out packages within that model branch.	<a href="#">Check In Package</a> <sup>[286]</sup> <a href="#">Check Out Model Branch</a> <sup>[285]</sup>
2	Select the packages to be checked-in. (By default, the entire list is selected.)  Optionally; <ul style="list-style-type: none"> <li>• Click an individual package to select just that package</li> <li>• <b>Ctrl + click</b> to add or remove an individual package from the selection</li> <li>• <b>Shift + click</b> to select a range of packages</li> <li>• Click on <b>All</b> to select all listed packages</li> <li>• Click on <b>None</b> to clear the selection</li> </ul>	
3	Optionally, tick the checkbox <b>Keep packages checked-out after committing new revision</b> .  Use this option to commit into version control, a new revision of all selected packages, while keeping all packages checked out for further editing.	
4	Click on the <b>OK</b> button.  The Add Comment dialog displays. A default comment is provided that contains the current date and time.	
5	Optionally, modify the default check-in comment.  This comment is applied to all packages that are checked in.	
6	Click on the <b>OK</b> button.  The selected packages are exported and checked-in. The package icons are updated to reflect any change in version control status. If you opted to keep packages checked out, there is no change in status.	

### 3.5.1.4.5 Check Out a Model Branch

The Check Out a Model Branch command allows you to check-out all packages within a selected model branch, as a single operation.

#### Use to:

- Check out an entire sub-tree of model packages

**How to:**

Step	Action	See also
1	<p>Right-click on the package icon at the root of the model branch that is to be checked out and select <b>Package Control   Check Out Branch</b>.</p> <p>The selected package and all of its contained sub-packages are recursively checked out.</p> <p>Any packages that cannot be checked-out are listed in a message box, with a brief description of the problem. For example: <i>The package is already checked out by user 'Fred'</i>.</p>	<p><a href="#">Check Out Package</a> [287]</p> <p><a href="#">Check in Model Branch</a> [285]</p>
2	<p>When Project Security is enabled in <i>Lock to Edit</i> mode, Enterprise Architect prompts you to apply a User Lock throughout the selected model branch before proceeding.</p>	

**Notes:**

- Any packages that cannot be checked-out are listed in a message box, with a brief description of the problem. For example: The package is already checked out by user 'Fred'

### 3.5.1.4.6 Check In a Package

The Check In command allows you to check-in the package currently selected in the Project Browser.

**Use to:**

- Check in a single package

**How to:**

Step	Action	See also
1	<p>In the Project Browser, right-click on the package that is to be checked in and select <b>Package Control   Check In</b>.</p> <p>The package is exported and the Add Comment dialog displays. A default comment is provided that contains the current date and time.</p>	<p><a href="#">Check In Model Branch</a> [285]</p> <p><a href="#">Check Out Package</a> [287]</p>
2	<p>Optionally, modify the default check-in comment.</p>	
3	<p>Click <b>OK</b>.</p> <p>The package file is checked-in to version control and the package icon is updated to reflect the change in version control status.</p>	

### 3.5.1.4.7 Check Out a Package

To work on a version controlled package you must have the package checked out. When a package is checked out to a specific user, no other user can check out the package to make changes to it until it has been checked in again.

The Check Out command allows you to check-out the package currently selected in the Project Browser.

**Use to:**

- Check out a single package

**How to:**

Step	Action	See also
1	In the Project Browser, right-click on the package that is to be checked out and select <b>Package Control   Check Out</b> .  The local XMI file associated with the package is checked-out from version control.	<a href="#">Check Out Model Branch</a> <sup>[285]</sup> <a href="#">Check In Package</a> <sup>[286]</sup>
2	When working in a Private Model, if Enterprise Architect determines that the package content in the model is already up to date with the latest revision of the package file retrieved from version control, then the Import Package dialog displays. This dialog is not displayed for Shared Models.  The following options are offered; <ul style="list-style-type: none"> <li>• Force reload From XMI</li> <li>• Accept current package</li> </ul> Choose <b>Accept current package</b> to skip the process of re-importing the package from XMI.  The option <b>Refresh model view</b> allows you to specify whether or not to refresh the Project Browser and diagrams, by reloading the package content from the project database.  The Import Package dialog also has an option <b>Always use these settings</b> . When selected, if you subsequently check out a package that is found to be up to date, the same settings are applied again without displaying the dialog. <ul style="list-style-type: none"> <li>• To display the dialog if, for example, you want to change the settings, press a <b>Ctrl</b> key while you select the <b>Package Control   Check Out</b> menu option.</li> </ul>	
3	The package file is imported into your model.  The package icon is updated to reflect the change in the package's version control status.	

**Notes:**

- If you check out a version controlled package whilst offline, the package icon has a red figure 8 in front of it

**Learn More:**

- [Offline Version Control](#) <sup>[251]</sup>

### 3.5.1.4.8 Undo Check Out of a Package

The Undo Check Out command allows you to undo the check-out of a package, discarding any modifications that have been made by restoring the package content to the latest revision held in version control. The package returns to a Checked-in state and subsequently can be checked out by any user.

#### Use to:

- Undo the Check out of the selected package, restoring the package content to the latest revision held in version control

#### How to:

Step	Action	See also
1	In the Project Browser, right-click on the package and select <b>Package Control   Undo Check Out</b> . A confirmation dialog is displayed.	
2	Click <b>OK</b> . The latest revision of the package is retrieved from version control and re-imported into your model. The package icon is updated to reflect the change in the package's version control status.	

### 3.5.1.4.9 Update to the Latest Revision of Selected Package

When you are part of a team working in a Distributed Model environment, from time to time, you will want to update your model with the changes that other team members have committed into version control. The Get Latest command allows you to bring in updates made by other users, for the package currently selected in the Project Browser.

#### Use to:

- Update a single package to the latest revision retrieved from version control

#### How to:

Step	Action	See also
1	In the Project Browser, right-click on the package that is to be updated and select <b>Package Control   Get Latest</b> . The local XML file associated with the package is updated to the latest revision from version control. The XML file is imported into your model database, updating the package in your model.	<a href="#">Update All Packages</a> [289]
2	When working in a Private Model, if Enterprise Architect determines that the package content in the model is already up to date with the latest revision of the package file retrieved from version control, then the Import Package dialog displays. This dialog is not displayed for Shared Models. The following options are offered; <ul style="list-style-type: none"> <li>• Force reload From XML</li> </ul>	

	<ul style="list-style-type: none"> <li>Accept current package</li> </ul> <p>Choose <b>Accept current package</b> to skip the process of re-importing the package from XML.</p> <p>The option <b>Refresh model view</b> allows you to specify whether or not to refresh the Project Browser and diagrams, by reloading the package content from the project database.</p> <p>The Import Package dialog also has an option <b>Always use these settings</b>. When selected, if you subsequently check out a package that is found to be up to date, the same settings are applied again without displaying the dialog.</p> <ul style="list-style-type: none"> <li>To display the dialog if, for example, you want to change the settings, press a <b>Ctrl</b> key while you select the <b>Package Control   Get Package</b> menu option.</li> </ul> <p>The package file is imported into your model, in accordance with your selection.</p>	
--	---	--

**Notes:**

- The Get Latest command is disabled for any package that is checked-out (to anybody) in the currently loaded project.
- When using a Shared Model environment, where all users are connected to a single model database, you should reload the package from the database, rather than using the Get Latest command.

**3.5.1.4.10 Update to the Latest Revision of All Packages**

When you are part of a team working in a Distributed Model environment, from time to time, you will want to update your model with the changes that other team members have committed into version control. The command Get All Latest, allows you to bring in updates made by other users, for all of the version controlled packages in the currently loaded project.

**Use to:**

- Update all packages in your project, to the latest revision retrieved from version control

**How to:**

Step	Action	See also
1	<p>In the Project Browser, right-click on any package and select <b>Package Control   Get All Latest</b>.</p> <p>All of the local XML files for all of the version control configurations used in the project, are updated to the latest revision from version control.</p> <p>Enterprise Architect scans the packages in the model, to determine which ones are up to date and which are not, compared to the latest revisions of the associated package files.</p> <p>You are then prompted to choose one of the following import options for packages that are up to date;</p> <ul style="list-style-type: none"> <li>Import changed files only,</li> <li>Always import</li> <li>Prompt for each file.</li> </ul>	<p><a href="#">Update Selected Package</a> <sup>[288]</sup></p> <p>See the note below.</p>

2	<p>Click on the <b>OK</b> button.</p> <p>The version controlled packages in your project are updated as appropriate.</p>	
---	--	--

**Notes:**

- There is no need to re-import packages that are already up to date. Re-importing packages involves first deleting them from the project, before re-importing them from the XML file. This is quite time consuming as well as quite unnecessary. We strongly recommend using the default option "Import changed files only".
- The Get All Latest command will not update any package that is checked-out (to anybody) in the currently loaded project. Otherwise, any changes not yet committed to version control would be discarded.
- When using a Shared Model environment, where all users are connected to a single model database, there is no need to use the Get All Latest command. The information in the model database is always ahead of what is committed into version control. You should from time to time refresh your view of the model database, by reloading diagrams or reloading package content in the Project Browser.

**3.5.1.4.11 Include Other Users' Packages**

You can retrieve packages from version control that have been created by other users, or by you in another model, and import them into your current model.

Other users might be creating packages to use in your model. If you are not sharing a SQL database or .eap file, those packages do not automatically become part of your model. If the packages have been placed into version control, you can retrieve them and import them into your model as children of an existing package, using the **Get Package** command.

**Use to:**

- Retrieve and import packages from version control, into the current project

**How to:**

Step	Action	See also
1	In the Project Browser, right-click on the package to use as the <b>parent</b> of the incoming package	
2	Select the <b>Package Control   Get Package</b> context menu option. The Get Shared File dialog displays.	
3	Click on the drop-down arrow of the <b>Version Control Configuration</b> field, and select the version control configuration associated with the package to retrieve.  The file list is populated with the names of files available through that configuration, for retrieval and import into your model.	
4	Select the package file to import into your model and click on the <b>OK</b> button.  The selected package file is imported as a new child package, under the parent package selected in step 1.	

**Notes:**

- You must have access to the package files through the version control system and you must define a Version Control Configuration through which to access those files
- The version control configuration must use the same unique ID that was originally used to add the

- package to version control
- XML package files associated with packages that are already part of your project, are NOT included in the list of files available for import

### 3.5.1.4.12 Apply Version Control To Branches

Enterprise Architect enables you to apply version control to all packages within a selected *model branch*, in a single operation. In this context, a model branch is a package that is currently selected in the **Project Browser**, and all of the packages contained within it.

**Use to:**

- Apply version control to all packages within a selected model branch

**How to:**

Step	Action	See also
1	Right-click on the required package and select the <b>Add Branch to Version Control</b> context menu option.  The Apply VC to Branch dialog displays.	
2	Click on the drop-down arrow in the <b>Version Control Configuration</b> field and select the configuration to use.	
3	Optionally, tick the checkbox <b>Export as Model Branch</b> .  Once the version control operation is complete Enterprise Architect creates a Model Branch file (.EAB file) for this branch.	<a href="#">Export Model Branch</a> 291  <a href="#">Import Model Branch</a> 292
4	Click on the <b>OK</b> button.  Enterprise Architect creates a number of sub-folders within the version control working copy folder, then exports all of the packages within the selected model branch. Enterprise Architect generates filenames for the XML files, based on the package GUIDs.	

**Notes:**

- The Version Control Configuration to be used in this operation must be defined within the model before selecting this command
- When invoked on the model root node, this command applies version control to every package within the model

### 3.5.1.4.13 Export Controlled Model Branch

Model branch files can simplify the process of exporting and importing a package hierarchies from one model to another.

You might want to export a newly created model branch from your own private copy of a model so that, for example:

- Another user can import that branch into their own private copy of the same model
- It can be imported for inclusion as a common branch in a number of different models

Applying version control to an Enterprise Architect model can result in many XML files placed under version control. It could then be hard to locate and import the file corresponding to the root of a particular model branch. Enterprise Architect's Model Branch Files (.EAB files) overcome this problem by simplifying the

retrieval of model hierarchies for use in other models.

**Use to:**

- Create a Model Branch File to represent a package hierarchy that is stored in version control

**How to:**

Step	Action	See also
1	Select the version controlled package to export as a model branch.	
2	Right-click on the package and choose <b>Package Control   Export as Model Branch</b> . The Export as Model Branch dialog displays.	<a href="#">Import Model Branch</a> 292
3	In the <b>EAB Filename</b> field, type a name for your Model Branch File. Alternatively, click on ( ... ) and browse for the file location. Note that the package name is supplied as a default.	
4	Click <b>OK</b> . A branch file is created to represent the selected package. The branch file is committed to version control using the same Version Control Configuration that controls the package selected in step 1.	

**Notes:**

- You can specify any file name, including sub-folder names, as long as the file is contained in or below the working folder of your version control configuration
- The facility is only enabled for packages that are already under version control

### 3.5.1.4.14 Import Controlled Model Branch

Applying version control to an Enterprise Architect model can result in many XML files placed under version control. It could then be hard to locate and import the file corresponding to the root of a particular model branch. Enterprise Architect's Model Branch files overcome this problem by simplifying the retrieval of package hierarchies for use in other models.

The Import a Model Branch command uses Enterprise Architect's Model Branch Files, of which there are few, to retrieve information about the root package file and import the model branch. The Model Branch File records information such as the name and type of the version control configuration for the selected package, and the relative filename of the version controlled XML file associated with the package.

**Use to:**

- Retrieve a model branch created by another user in a private copy of a model, to import it into your own private copy of the same model
- Retrieve a model branch that is common in many models, for inclusion in a new model

**How to:**

Step	Action	See also
------	--------	----------

1	Ensure that you have an operational version control environment that can be accessed by Enterprise Architect <b>and</b> that you have downloaded all of the version controlled package files and the model branch file associated with the model branch to import, into a valid and accessible working copy folder.	<a href="#">Version Control Product Setup</a> <sup>[253]</sup>
2	Select the package into which the model branch is to be imported.	
3	Right-click on the package and choose <b>Package Control   Import a Model Branch</b> .  The Import VC Model Branch dialog displays.	
4	Choose one of either; <ul style="list-style-type: none"> <li>Use the lower portion of the Import VC Model Branch dialog to select a model branch file.</li> </ul> <p>(This is the simpler option if the associated version control configuration has already been saved in the current model. Continue with step 5.)</p> <ul style="list-style-type: none"> <li>Click on the <b>Find a Model Branch (.EAB) file</b> button.</li> </ul> <p>(This option is useful when you have not yet defined the version control configuration that is associated with the model branch to be imported.)</p> <p>If choosing this option, please refer to "Manually Locating Model Branch Files".</p>	<a href="#">Manually Locating Model Branch Files</a> <sup>[293]</sup>
5	Click the drop-down arrow in the <b>Select a Version Control Configuration</b> field and select the configuration  A list of EAB files controlled by that configuration is displayed.	
6	Select the Model Branch File from the <b>Select a Model Branch (.EAB) file</b> list.	
7	Click <b>OK</b> .  Enterprise Architect imports the root package specified in the Model Branch File and recursively imports and populates all the sub-packages contained in the root package.	

**Notes:**

- The **Import a Model Branch** command is only enabled for packages that you (the current user) are able to edit, as the imported model branch is inserted into the model under the selected package

**Learn More:**

- [Export a Model Branch](#) <sup>[291]</sup>

**3.5.1.4.14.1 Manually Locating Model Branch Files**

When importing a Model Branch File from version control, sometimes you do not yet have the associated version control configuration saved in the model that is receiving the import. In this situation, it is simpler to manually locate the Model Branch File and let Enterprise Architect derive the details of the configuration from the branch file you select.

**Use To:**

- Browse the file system to locate the Model Branch File (.EAB) to import.

- Let Enterprise Architect determine the details of the required version control configuration, based on information contained in the Model Branch File

**Access:** **Right Click on a package | Package Control | Import a Model Branch > Find a Model Branch (.EAB) file**

**How to:**

Step	Action	See also
1	Ensure that you have an operational version control environment that can be accessed by Enterprise Architect <b>and</b> that you have downloaded all of the version controlled package files and the model branch file associated with the model branch to import, into a valid and accessible working copy folder.	<a href="#">Version Control Product Setup</a> <sup>[253]</sup>
2	Choose the package in the Project Browser, into which the model branch is to be imported.	
3	Right-click on the package and choose <b>Package Control   Import a Model Branch</b> . The Import VC Model Branch dialog displays.	
4	Click on the button <b>Find a Model Branch (.EAB) file</b> . A file selection dialog is displayed.	<a href="#">Import Controlled Model Branch</a> <sup>[292]</sup>
5	Browse for and select the Model Branch File that represents the model branch to import.	
6	Click <b>Open</b> . If the version control configuration referenced by the file is fully defined within the current model, the import commences at this point. Otherwise, Enterprise Architect displays a dialog prompting you to complete the required configuration.	
7	Click <b>Yes</b> to proceed with completing the definition of the version control configuration. The Version Control Settings dialog is displayed.	<a href="#">Version Control Settings dialog</a> <sup>[271]</sup>
8	Complete the definition of the configuration. (Typically this involves simply specifying the working copy folder.)	
9	Click <b>Save</b> . The configuration details are saved. The import of the model branch proceeds.	

**Notes:**

- The Import a Model Branch command is only enabled for packages that you (the current user) are able to edit, as the imported model branch is inserted into the model under the selected package
- It is not necessary to have the relevant Version Control Configuration set up within Enterprise Architect before issuing this command - Enterprise Architect prompts you to complete specification of the configuration if necessary

**Learn More:**

- [Export a Model Branch](#)<sup>[29]</sup>

**3.5.1.4.15 Review Package History**

The File History command allows you to review the change history of version controlled packages.

It also enables you to check out a prior revision of the package for editing, effectively allowing you to roll-back to a prior revision of the package.

**Use to:**

- Review the change history of version controlled packages
- Revert to a previous revision of a version controlled package

**How to:**

Step	Action	See also
1	In the Project Browser, select the package for which to view change history.	
2	Right-click on the package and choose <b>Package Control   File History</b> .  For version control environments using Subversion, CVS or TFS command line clients, Enterprise Architect's File Version History dialog displays.  For version control environments using SCC based clients, your particular product opens its own File Version History dialog	<a href="#">Review Package History - SCC Client.</a> <sup>[29]</sup>
3	Click on a revision number In the <b>Revisions</b> field, to select that revision and view its log entry.	
4	Optionally, click on either; <ul style="list-style-type: none"> <li>• <b>Check Out</b></li> <li>• <b>Retrieve</b></li> </ul> If you click on <b>Check Out</b> , the selected revision of the package file is retrieved from version control and imported into your model as a package that is checked out for editing. You can subsequently check in this revision as a new HEAD revision - effectively allowing you to revert a package to a prior revision.  If you click on <b>Retrieve</b> , the selected revision of the package file is retrieved from version control and imported into your model, but the package remains flagged as checked-in, so it cannot be modified. Subsequently checking out the package updates the package to the latest revision before it is unlocked for editing.	

**Notes:**

- If the selected package was already checked out in the current model, the **Retrieve** and **Check Out** buttons are disabled
- If you check out a prior revision of a package, but do not want to commit it as a new revision, right-click on the package and select **Package Control | Undo Check Out**

### 3.5.1.4.15.1 Review Package History - SCC Client

The File History command allows you to review the change history of version controlled packages. It also enables you to check out a prior revision of the package for editing, effectively allowing you to roll-back to a prior revision of the package.

The process for reviewing the package history of packages configured for version control with an SCC client (which includes products such as Visual Source Safe, TFS-SCC, ClearCase, Perforce, AccuRev, MKS Source Integrity and Serena Dimensions) differs from that for Subversion, CVS or TFS command line clients.

#### Use to:

- Review the change history of version controlled packages
- Revert to a previous revision of a version controlled package

#### How to:

Step	Action	See also
1	In the Project Browser, select the package for which to view change history.	
2	Right-click on the package and choose <b>Package Control   File History</b> . The change history mechanism offered by the third party SCC provider displays.	
3	To import a prior revision of the package into your model, use the SCC History dialog to retrieve the revision, then close the dialog. The SCC client notifies Enterprise Architect that a different revision has been retrieved. Enterprise Architect then displays a prompt, asking whether to check-out the prior revision.	<a href="#">Example - Retrieve Prior Revision From SCC</a> <sup>[297]</sup>
4	Optionally, click on either; <ul style="list-style-type: none"> <li>• <b>Yes</b>, to check out the prior revision</li> <li>• <b>No</b>, to import the prior revision as read-only</li> </ul> <p>If you click on <b>Yes</b>, the selected revision of the package file is retrieved from version control and imported into your model as a package that is checked out for editing. You can subsequently check in this revision as a new HEAD revision - effectively allowing you to revert a package to a prior revision.</p> <p>If you click on <b>No</b>, the selected revision of the package file is retrieved from version control and imported into your model, but the package remains flagged as checked-in, so it cannot be modified. Subsequently checking out the package updates the package to the latest revision before it is unlocked for editing.</p>	

#### Notes:

- If the selected package was already checked out in the current model, Enterprise Architect does not proceed with retrieving a prior revision
- If you check out a prior revision of a package, but do not want to commit it as a new revision, right-click on the package and select **Package Control | Undo Check Out**

Depending on your version control product, retrieving the prior revision can involve a number of prompts regarding overwriting the current local copy.

The following example details retrieval of a prior revision from a TFS-SCC version control configuration.

**How to:**

Step	Action	See also
1	Display the TFS File History dialog.	<a href="#">Package History - SCC</a>
2	Click on the <b>Get</b> button. The TFS-SCC client displays the Resolve Conflicts dialog. This dialog offers an option to <b>Automerge All</b> XML package files. DO NOT select this option. It is important to prevent any merging of Enterprise Architect's XML package files!	
3	Click on the <b>Resolve</b> button. The TFS-SCC client displays the Resolve writable file conflict dialog.	
4	Select the <b>Overwrite local file/folder</b> option. The existing working copy of the package file is <b>overwritten</b> by the prior revision retrieved from version control.	
5	Click the <b>OK</b> button. The TFS-SCC client redisplay the Resolve writable file conflict dialog; it should now show no conflicts.	
6	Click on the <b>Close</b> button. The TFS-SCC client redisplay the file History dialog.	
7	Click on the <b>Close</b> button. Enterprise Architect displays a prompt, asking whether to check-out the prior revision.	
8	Click on the: <ul style="list-style-type: none"> <li>• <b>Yes</b> button to check-out the prior revision</li> <li>• <b>No</b> button to retrieve a read-only version of the package, that is NOT checked-out and is NOT editable.</li> </ul>	

**3.5.1.4.16 Validate Package Configurations**

You can test the validity of the version control settings associated with each version controlled package within your current model.

**Access:** [Project | Version Control | Validate Package Configurations](#)

**How To:**

Step	Action	See also
1	<p>From the main menu choose <b>Project   Version Control   Validate Package Configurations</b>.</p> <p>The validation process scans the model database and verifies that the version control configuration associated with each version controlled package is fully specified in the current model. It also queries the corresponding version control provider to find the status of the package file associated with each version controlled package.</p> <p>The results of the validation process are sent to the Enterprise Architect <b>Output</b> window.</p>	
2	Open the Version Control Settings dialog to complete the definition of any invalid or missing version control configurations.	<a href="#">Version Control Setup</a> [269]
3	Click on an error message in the Output window to highlight the corresponding package in the <b>Project Browser</b> .	
4	<p>Right-click a package node and choose <b>Package Control   Configure Package</b> to open the Package Control Options dialog.</p> <p>Correct any problems with the version control details for the package.</p> <p>Correct any problems with the package's associated XMI file.</p>	<a href="#">Configure Controlled Package</a> [283]

#### 3.5.1.4.17 Resynchronize the Status of Version Controlled Packages

Enterprise Architect enables you to re-synchronize the version control status of version controlled packages within your project with the status reported by your version control provider. This can be useful if you are creating copies of your Enterprise Architect project, where checking in a package from one copy of the model leaves the package in the second copy of the model with an out of date version control status.

For a given package, the re-synchronization process queries the corresponding version control provider to find the status of the package file associated with the version-controlled package. If necessary, the process then updates the package flags within the model database, to synchronize the package status recorded in the model with the value reported by the version control provider.

##### Use to:

- Update the version control status of packages in your model, to align it with the status reported by their associated Version Control Configuration

##### How to:

Step	Action	See also
1	<p>You can resynchronize either a single version controlled package or all version controlled packages within your project:</p> <p>Choose either;</p> <ul style="list-style-type: none"> <li>• Right-click the package in the Project Browser and select <b>Package Control   Re-synch Status With VC Provider</b></li> <li>• <b>Project   Version Control   Re-synch Statuses of All Packages</b></li> </ul> <p>The results of the re-synchronization process are sent to the Enterprise Architect Output window.</p>	

2	Double-click on any result message to select, in the Project Browser, the corresponding package.	
---	--	--

**Notes:**

- This process does not cause any package data to be either exported from your model to the associated package file, or imported from a package file into your model's package data
- If a package has been checked-out and modified with Enterprise Architect, but your version control provider reports the package file as checked-in, running this process marks the package within Enterprise Architect as being checked-in, without exporting and committing the pending changes. Subsequently checking-out the package imports the latest revision of the package file from version control, effectively discarding the uncommitted modifications from the model
- Similarly, if a package file is checked-out to you in your local working copy folder, but not in the Enterprise Architect model, running this process marks the package within the model as checked-out, but it does not import the associated package file from the version control system. Consequently, it is possible to check-in a package from Enterprise Architect that is potentially out of date, compared to the latest revision of the package file within the version control system

### 3.5.2 Tracking Changes

Enterprise Architect provides two separate but complementary facilities for tracking changes to data across the project.

**Topics:**

Topic	Detail	See also
<b>Auditing of model changes</b>	<p><i>Auditing</i> is a project-level feature, available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions, that enables you to record model changes in Enterprise Architect</p> <p>By enabling this feature, model administrators can view a range of information regarding changes, such as:</p> <ul style="list-style-type: none"> <li>• Who changed an element</li> <li>• How many elements they changed</li> <li>• When they changed the data</li> <li>• What the previous values were, and</li> <li>• What type of elements they changed</li> </ul>	<a href="#">Auditing</a> <sup>[300]</sup>
<b>Baselining and differencing to capture and roll back changes</b>	<p>The Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions provide a facility to '<i>baseline</i>' or snapshot a model branch in XML format at a particular point in time, and store it within the model in compressed format</p> <p>More than one baseline can be stored against a single Enterprise Architect package; using baselines, you can compare packages at the current and earlier stages of development, using the <i>Compare (Diff)</i> utility</p> <p>The Compare utility is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect; it enables you to compare the current model with:</p>	<p><a href="#">Package Baselines</a> <sup>[310]</sup></p> <p><a href="#">The Compare Utility (Diff)</a> <sup>[314]</sup></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• A Baseline</li> <li>• An exported Enterprise Architect XML file on disk</li> <li>• A version-controlled Enterprise Architect XML file on disk</li> </ul>	

### 3.5.2.1 Auditing

*Auditing* is a project-level feature that enables model administrators to record model changes in Enterprise Architect.

#### Guide:

Topic	Detail	See also
<b>Overview</b>	<p>By enabling Auditing, you can view information on changes such as:</p> <ul style="list-style-type: none"> <li>• Who changed an element</li> <li>• How many elements they changed</li> <li>• When they changed the data</li> <li>• What the previous values were, and</li> <li>• What type of elements they changed</li> </ul> <p>Auditing does <b>not</b> record changes to:</p> <ul style="list-style-type: none"> <li>• RTF Templates</li> <li>• Model Documents</li> <li>• Baselines</li> <li>• Profiles</li> </ul>	
<b>Quickstart</b>	You can quickly enable auditing and see it in action	<a href="#">Auditing Quickstart</a> <sup>[301]</sup>
<b>Settings</b>	Once auditing is enabled within a project, you have a variety of options available for customizing what is recorded by the audit	<a href="#">Audit Settings</a> <sup>[302]</sup>
<b>The Audit View</b>	<p>To view what has been recorded by the audit, use the Audit View, which provides an interface to everything recorded by auditing</p> <p>If security is enabled, you must have Audit View permission to display data in the Audit View</p>	<a href="#">Audit View</a> <sup>[304]</sup> <a href="#">List of Available Permissions</a> <sup>[206]</sup>
<b>Model Views</b>	<p>You can also obtain a snapshot of selected items in the model, using the <i>Model View</i> facility</p> <p>In the Corporate, Business and Software Engineering, Systems Engineering or Ultimate editions of Enterprise Architect, this facility enables you to automatically generate a snapshot at intervals and, if there are changes in the items collected by the defined search, to trigger a notification to you of such changes</p> <p>This enables you to monitor work flow and other events of</p>	<a href="#">Model View</a> <sup>[466]</sup> <a href="#">Monitor Events</a> <sup>[415]</sup>

Topic	Detail	See also
	concern to you	
<b>RTF Report</b>	You can generate an RTF report that includes the audit history information for the selected element or package, by choosing the <i>basic + audit</i> RTF template	<a href="#">RTF Dialog Options</a> <sup>[1742]</sup>
<b>Audit History</b>	Using Auditing, you can track changes to an element or connector over time  However, enabling Auditing also enables an Audit History tab in the System Output window, which summarizes all changes made to the selected element or connector	<a href="#">Audit History Tab</a> <sup>[308]</sup>
<b>Performance Issues</b>	By enabling auditing on a project, you increase the time taken for most actions  For most modeling tasks, this increase is insignificant, however, there are some instances where the difference is more substantial	<a href="#">Performance Issues</a> <sup>[309]</sup>

**Notes:**

- The Auditing facility is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- **Warning** - If your site runs separate editions of Enterprise Architect, when Auditing is turned on in a project any Desktop or Professional edition users are locked out of the project; to restore access, turn Auditing off in the project from the Corporate, Business and Software Engineering, Systems Engineering or Ultimate edition instance of Enterprise Architect

**3.5.2.1.1 Auditing Quickstart**

You can quickly enable auditing and see it in action.

**Access:** **Project | Audit View: Audit Settings button**

**How to:**

Step	Action	See also
1	Select the <b>Audit View</b> menu option to open the Audit View	<a href="#">The Audit View</a> <sup>[304]</sup>
2	Click on the <b>Audit Settings</b> button The Audit Settings dialog displays	<a href="#">Auditing Settings</a> <sup>[302]</sup>
3	Select the <b>Enable Auditing</b> checkbox	
4	Click on the <b>OK</b> button to close the Audit Settings dialog	
5	Close the Audit View dialog	
6	Change and save your project; for example: <ul style="list-style-type: none"> <li>• Add a new package</li> <li>• Add a new Class</li> <li>• Add a new connector</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Change the name of an element</li> <li>Delete an element</li> </ul>	
7	Open the Audit View again and click on the <b>Refresh</b> (or <b>Load</b> ) button to display a record of the changes you made	

### 3.5.2.1.2 Auditing Settings

The Audit Settings dialog enables you to change what is recorded by the Auditing facility.

**Access:** **Project | Audit View: Audit Settings**

**Use to:**

- Define the areas of processing in Enterprise Architect to audit
- Administer your audit records
- Indicate the kind of model objects for which changes are to be recorded
- Configure auditing to record changes to only certain types of elements

**Reference:**

Action	Usage	See also
<b>Enable Auditing</b>	Turn the Auditing facility on	
<b>Audit XMI Import</b>	Include XMI importing in the audit As version control uses XMI, this option must be selected to record changes from checking out packages	<a href="#">Version Control</a> <sup>[243]</sup>
<b>Audit XMI Export</b>	Include XMI exporting in the audit As version control uses XMI, this option must be selected to record changes from checking out packages	<a href="#">Version Control</a> <sup>[243]</sup>
<b>Audit Reverse Engineering</b>	Include reverse engineering in the audit	
<b>Use Database Timestamp</b>	Use the database server's timestamp instead of each user's local timestamp; this improves security Not available for .eap project files	
<b>Save Logs</b>	Save a copy of the logged audit items currently held in the project; these items remain in the project - use <b>Clear Logs</b> to remove them  Enterprise Architect prompts you to specify whether to save items covering a specific period of time <ul style="list-style-type: none"> <li>Click on the <b>No</b> button to save all log items currently held in the database</li> <li>Click on the <b>Yes</b> button to display the Time Filter dialog, on which you select a standard time period or define your own</li> </ul>	<a href="#">Audit View Controls</a> <sup>[306]</sup> <a href="#">Repository</a> <sup>[1870]</sup>

Action	Usage	See also
	This function can be accessed through the Automation Interface	
<b>Clear Logs</b>	<p>Permanently delete all log data from the current project; use the <b>Save Logs</b> button first, to save the audit records outside the project</p> <p>Enterprise Architect prompts you to specify whether to clear items covering a specific period of time</p> <ul style="list-style-type: none"> <li>• Click on the <b>No</b> button to clear all log items currently held in the database</li> <li>• Click on the <b>Yes</b> button to display the Time Filter dialog, on which you select a standard time period or define your own</li> </ul> <p>This function can be accessed through the Automation Interface</p>	<a href="#">Audit View Controls</a> <sup>[306]</sup> <a href="#">Repository</a> <sup>[1870]</sup>
<b>Load Logs</b>	<p>Load a previously saved set of logs back into the project; if the same record exists in both project and file, it is not reloaded</p> <p>This function can be accessed through the Automation Interface</p>	<a href="#">Repository</a> <sup>[1870]</sup>
<b>Core</b>	Record changes to elements (including attributes and operations), packages, connectors and some model-level information	
<b>Standard</b>	Record the same changes as the <b>Core</b> option, plus changes to diagrams	
<b>Extended</b>	Record the same changes as the Standard option, plus changes to security	
<b>Maintenance</b>	<p>Audit maintenance elements only; that is:</p> <ul style="list-style-type: none"> <li>• Package</li> <li>• Requirement</li> <li>• Feature</li> <li>• Use Case</li> <li>• Actor</li> <li>• Note</li> <li>• Issue</li> <li>• Change</li> </ul>	
<b>Core Structural</b>	<p>Audit maintenance elements plus some structural elements; that is:</p> <ul style="list-style-type: none"> <li>• Package</li> <li>• Class</li> <li>• Interface</li> <li>• Signal</li> <li>• Node</li> <li>• Component</li> <li>• Artifact</li> <li>• Part</li> <li>• Port</li> <li>• Device</li> </ul>	

Action	Usage	See also
All	Audit all elements	
Custom	<p>Audit element types that you specify</p> <p>The Customize button is made available; click on this button to display a list of element types, and select the checkbox against each element type to include in the audit (or click on the <b>Select All</b> button to select every element type)</p> <p>Click on the <b>OK</b> button to save the selection</p>	

**Notes:**

- As the number of records increases, the performance of the Audit View reduces; it is recommended that audit records that are not regularly required are saved to file, then cleared from the project, to help ensure high performance
- Connectors are audited when they are connected to an element that is included in the Audit Options
- If security is enabled, you must have **Audit View** permission to turn Auditing on, and **Audit Settings** permission to change Audit settings

**3.5.2.1.3 The Audit View**

The Audit View provides an interface to the information that has been recorded by auditing.

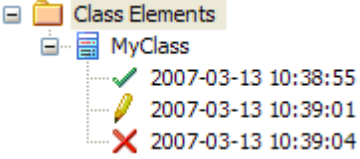

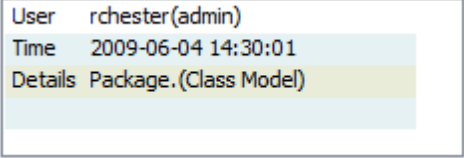

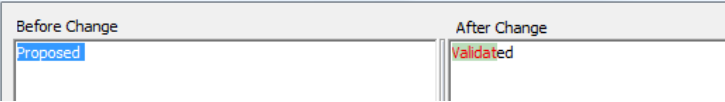

**Access:** **Project | Audit View**

**Guide:**

The Audit View is divided into three main areas:

Action	Usage	See also
View controls	The view controls provide a variety of settings for controlling auditing and the display of audit records	<a href="#">Audit View Controls</a> <sup>[306]</sup>
Audit tree	<p>The audit tree displays the log items that have been recorded by auditing</p> <p>What is displayed in the tree is affected by the view controls, such as:</p> <ul style="list-style-type: none"> <li>• Sorting</li> <li>• Filter (by time)</li> <li>• Mode</li> <li>• Auditing settings (what was actually recorded)</li> </ul> <p>If synchronizing with the Project Browser, it is also affected by the package, diagram or element you have selected</p>	<a href="#">Audit View Controls</a> <sup>[306]</sup> <a href="#">Auditing settings</a> <sup>[302]</sup> <a href="#">The Project Browser</a> <sup>[443]</sup>

Action	Usage	See also
	 <p>In the audit tree:</p> <ul style="list-style-type: none"> <li>• The green tick indicates a creation</li> <li>• The yellow pencil indicates an edit</li> <li>• The red cross indicates a deletion</li> </ul> <p>Right-clicking an element in the audit tree (such as <i>MyClass</i>) displays a context menu that enables you to locate the selected element in:</p> <ul style="list-style-type: none"> <li>• The Project Browser</li> <li>• Any diagrams in which it exists</li> </ul>	
<p><b>Record display</b></p>	<p>The record display is in two parts: the identity of the selected change, and the actual change made</p> <p>The data in the record display is determined by the view controls and mode and, if synchronizing with the Project Browser, by the package, diagram or element you have selected</p> <p><b>Identity:</b></p>  <p>The identity of a change consists of:</p> <ul style="list-style-type: none"> <li>• The Windows username of the user that made the change; if security is enabled, the name is of the format <i>WindowsUsername(SecurityUser)</i></li> <li>• When the change was made</li> <li>• The path of the change; for example: Class <i>Class1</i> - Attribute <i>Att1</i> - Attribute Constraint <i>Constraint</i></li> </ul> <p><b>Changes:</b></p> <p>Changes are displayed in a table format, showing the:</p> <ul style="list-style-type: none"> <li>• Property (or data item) name</li> <li>• Its original value before the change and</li> <li>• Its value after the change</li> </ul> <p>If you double-click on an item in the list of changes (or right-click and select the <b>Show Differences</b> context menu option) the Difference window displays:</p> 	<p><a href="#">Audit View Controls</a><sup>[308]</sup></p> <p><a href="#">The Project Browser</a><sup>[443]</sup></p>

Action	Usage	See also
	<p>This shows the specific changes that have been made, highlighting the edited, created, deleted or formatted characters</p> <p>Changes to the <i>format</i> of text in the element, made through the element Properties dialog, are not apparent in the initial table; they are visible in the Difference window, identified by HTML formatting tags</p>	

**Notes:**

- If security is enabled, you must have **Audit View** permission to display data in the Audit View

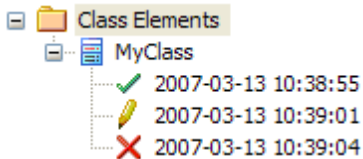

**Learn More:**

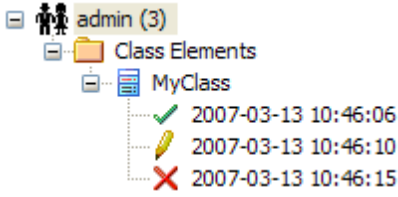

- [List of Permissions](#) <sup>[206]</sup>

**3.5.2.1.3.1 Audit View Controls**

The **Audit View** controls provide a variety of settings for controlling auditing and the display of audit records.

**Reference:**

Action	Usage	See also
<b>Load or Refresh</b>	Click to reload the Audit Tree, updated with any new audit results	
<b>Search</b>	<p>Click to search through log items for a particular area - you can search by Name, Type or GUID</p> <p>The items are loaded and filtered with the current Sort By, Time Filter and Mode settings</p> <p>If you refresh the Audit View, you must run the search again</p>	
<b>Audit Settings</b>	Click to open the Audit Settings dialog	<a href="#">Audit Settings</a> <sup>[302]</sup>
<b>Sort-by</b>	<p>Select the appropriate radio button for the required display setting:</p> <ul style="list-style-type: none"> <li>• <b>Type</b> - changes are grouped under element type (such as Class or Requirement), and then grouped under the changed element</li> </ul>  <ul style="list-style-type: none"> <li>• <b>User</b> - changes are grouped under user name, each with the number of changes for that user</li> </ul> <p>Under each user name, changes are grouped as for the Type sort</p>	

Action	Usage	See also
		
<b>Filter By Date/Time</b>	<p>Select to enable the <b>Filter Settings</b> button, to filter the audit results by time period</p> <p>Changes that occur <i>outside</i> the selected filter period are not shown in the Audit View</p>	
<b>Filter Settings</b>	<p>Click to display the Time Filter dialog, to set the filter time period:</p> <ul style="list-style-type: none"> <li>• <b>Today</b> - to display changes occurring today</li> <li>• <b>Previous Hour</b> - to display changes occurring in the last 60 minutes</li> <li>• <b>Previous 24 Hours</b> - to display changes occurring in the last 24 hours</li> <li>• <b>Previous Week</b> - to display changes occurring in the last 7 days</li> <li>• <b>Previous 30 Days</b> - to display changes occurring in the last 30 days</li> <li>• <b>Previous Year</b> - to display changes occurring in the last 365 days</li> <li>• <b>Custom</b> - to define your own time period, using the <b>From</b> and <b>To</b> fields</li> </ul> <p>The six pre-configured time periods automatically update when you click on the <b>Refresh</b> button; custom periods are static and do not automatically update</p> <p>If you have set a filter period, and you deselect the <b>Filter By Date/Time</b> checkbox, the period remains set; the custom time period, too, is retained so that you can re-use it or modify it later if required</p>	
<b>Status Text</b>	<p>Read to see which:</p> <ul style="list-style-type: none"> <li>• Mode has been selected and</li> <li>• Time filter is being applied to the data</li> </ul>	
<b>Mode</b>	<p>Click to display a menu of options to change the mode of the Audit View; select:</p> <ul style="list-style-type: none"> <li>• <b>Standard</b> - to automatically synchronize with the Project Browser; where changes have been made, the Audit View reflects your selection from the Project Browser - if you click on: <ul style="list-style-type: none"> <li>• An element, the Audit View displays the history for that element</li> <li>• A package, the Audit View displays the history for that package and its immediate children (but not the contents of nested packages)</li> </ul> </li> </ul>	<p><a href="#">The Audit View</a> <sup>304</sup></p>

Action	Usage	See also
	<ul style="list-style-type: none"> <li>A diagram, the Audit View displays the history for that diagram and its contents (which could be drawn from a wide area of the Project Browser)</li> <li><b>Advanced</b> - to load large sets of log items independent of the Project Browser; in this mode, a special Audit Settings group can be displayed in the Audit Tree, which records: <ul style="list-style-type: none"> <li>When Auditing has been enabled and disabled</li> <li>Who made the change</li> <li>The date and time of the change</li> <li>Changes to the Audit Settings</li> <li>When Audit Operations are executed</li> <li>Security changes (which can be browsed in the same way as other changes)</li> </ul> </li> <li><b>Deleted</b> - to display only deleted records, but otherwise data is shown as in <b>Advanced</b> mode; records can be sorted by element type or by user as required</li> <li><b>Raw</b> - to display all audit records in chronological order without sorting, enabling you to see a progression of changes; this can be especially useful in determining date-time inconsistencies</li> </ul> <p>Any search and filtering you define still apply, enabling you to view all of today's changes in order, or all changes for a particular element in order, or both</p> <p>Additional database information is displayed; this additional information might be insignificant or only in machine-readable format</p>	

#### 3.5.2.1.4 Audit History Tab

When Auditing is turned on, an Audit History tab is enabled in the System Output window.

**Access:** [View | System Output > Audit History tab](#)

**Guide:**

Topic	Detail	See also
<b>Prerequisite</b>	To see this tab, you must have the Audit View open The tab continues to display if you subsequently close the Audit View	<a href="#">The Audit View</a> <sup>[304]</sup>
<b>Information Shown</b>	The tab shows a history of changes to whichever element or connector you have selected in the: <ul style="list-style-type: none"> <li>current diagram</li> <li>Project Browser</li> <li>Audit View, or</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Package Browser</li> </ul> <p>As you select different elements or connectors, the Audit History tab automatically updates to reflect your current selection</p> <p>For each change made to the element or connector, the tab shows:</p> <ul style="list-style-type: none"> <li>• Who made the change</li> <li>• When the change was made</li> <li>• Where the change was made</li> <li>• The value of the characteristic before the change</li> <li>• The value of the characteristic after the change</li> </ul>	

**Notes:**

- If security is enabled, you must have **Audit View** permission to display data on the Audit History tab

**Learn More:**

- [System Output Window](#)<sup>[128]</sup>
- [List of Permissions](#)<sup>[206]</sup>

**3.5.2.1.5 Auditing Performance Issues**

Enabling auditing on a project increases the time taken for most actions.

For most modeling tasks, this increase is insignificant; however, there are some situations where the difference is more substantial.

Topic	Detail	See also
<b>Large Deletions</b>	<p>Deleting large packages or package structures, or large numbers of elements, takes significantly longer with auditing on</p> <p>You might disable auditing before performing such a deletion</p>	<a href="#">Auditing Settings</a> <sup>[302]</sup>
<b>XMI Imports</b>	<p>Importing XMI takes longer with auditing enabled</p> <p>A project-level option is provided for disabling auditing of XMI Imports</p>	<a href="#">Import From XMI</a> <sup>[324]</sup> <a href="#">Auditing Settings</a> <sup>[302]</sup>
<b>Reverse Engineering</b>	<p>Reverse engineering code takes longer with auditing enabled</p> <p>A project-level option is provided for disabling auditing of reverse engineering</p>	<a href="#">Import Source Code</a> <sup>[1517]</sup> <a href="#">Auditing Settings</a> <sup>[302]</sup>
<b>Replication</b>	<p>You cannot remove replication from a model with Auditing enabled</p> <p>If you have to remove replication, disable Auditing and - if prompted to do so - allow Enterprise Architect to roll back the database version; you can then remove replication</p>	<a href="#">Remove Replication</a> <sup>[193]</sup> <a href="#">Auditing Settings</a> <sup>[302]</sup>

### 3.5.2.1.6 Audit View Performance Issues

Most operations in the Audit View are affected by the volume of use of the database - both by other facilities and by auditing itself.

Some potential problems and their solutions are outlined below:

Topic	Detail	See also
<b>Navigating the Project Browser Within Auditing is Slow</b>	Try setting the time filter to a period in the immediate past, such as <b>Today</b> , <b>Previous 24 Hours</b> or <b>Previous Week</b> ; this time period updates each time you open or refresh the Audit View	<a href="#">Audit View Controls</a> <sup>[306]</sup> <a href="#">Auditing Settings</a> <sup>[302]</sup>
<b>The Audit View is Slow in Loading and Changing Modes</b>	Save log items outside the project with the <b>Save Logs</b> button; if you then clear the logs you have just saved, the load time of the Audit View is reduced  You can reload logs into the project at any time, using the <b>Load Logs</b> button	
<b>Navigating the Audit Tree is Slow</b>	Close the Audit History tab in the Output window	<a href="#">Audit History Tab</a> <sup>[308]</sup>

### 3.5.2.2 Package Baselines

Enterprise Architect includes tools to help you manage and review changes to your models over time. These tools apply the concepts of *Baselines*, *Differencing* and *Merges*.

You use Baselines, Differencing and Merges essentially to compare two snapshots of a specific part of your project, to capture the differences between them and either roll back or incorporate selected changes or all changes.

Topic	Detail	See also
<b>Baselines</b>	Enterprise Architect provides a facility to create a Baseline or 'snapshot' of the contents of a selected package and its child packages at a particular point in time; this enables you to later compare that branch of the model at that time with the current state of the branch  Baselines are stored in the same XML format as is used for version control, but are stored within the project in compressed format  You can also have parallel copies of parts of your model for team development, and create Baselines within each copy to merge changes into the project master	<a href="#">Baselines</a> <sup>[311]</sup>
<b>Differencing</b>	Differencing ( <i>Diff</i> , or <i>Compare</i> ) enables you to explore the differences between: <ul style="list-style-type: none"> <li>• The current state of a specific part of your project, and</li> <li>• Previous or parallel versions captured in a Baseline or an XML 1.1 file on disk</li> </ul> The section includes an example of such a comparison	<a href="#">The Compare Utility (Diff)</a> <sup>[314]</sup> <a href="#">Example Comparison</a> <sup>[316]</sup>
<b>Merges</b>	Once Differencing is complete, you can merge information from the Baseline into the current project; it is not possible to go the other way	<a href="#">Compare Utility Tab Options</a> <sup>[318]</sup>

Topic	Detail	See also
	<p>You can:</p> <ul style="list-style-type: none"> <li>• Merge information manually, change by change</li> <li>• Merge information automatically by electing to merge in all changes in one batch procedure</li> <li>• Revert completely to the original Baseline by importing the stored XMI directly</li> <li>• Merge information and elements from a Baseline in a different project, making it possible to keep multiple versions of a single model in synch</li> </ul> <p>The merge options are available through the toolbar, context menus and the keyboard on the Compare Utility tab, which shows the results of a comparison</p>	

**Notes:**

- Package Baseline facilities are available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- The Enterprise Architect Corporate, Business and Software Engineering, System Engineering and Ultimate editions provide another facility, Auditing, which you can switch on to perform continuous monitoring of changes across the project; you can dovetail your use of each facility to meet the range of your change management requirements
- If a package under version control forms part of a Baseline, and that package is checked in to the model, you cannot merge the original data from the Baseline into that package
- You can also obtain a snapshot of selected items in the model, using the Model Views facility; this facility enables you to automatically generate the snapshot at intervals and, if there are changes in the items collected by the defined search, to trigger a notification to you of such changes, which enables you to monitor work flow and other events of concern to you
- If security is enabled you must have **Baselines - Manage** permission to create, import and delete Baselines, and **Baselines - Restore** permission to merge data from a Baseline; security permissions are not required to select an existing Baseline and perform a comparison with the model

**Learn More:**

- [Auditing](#)<sup>[300]</sup>
- [List of Permissions](#)<sup>[206]</sup>
- [Model Views](#)<sup>[466]</sup>
- [Monitor Change Events](#)<sup>[415]</sup>

**3.5.2.2.1 Baselines**

Enterprise Architect provides a facility to 'Baseline' (snapshot) a model branch at a particular point in time for later comparison with the current package state.

Topic	Detail	See also
<b>Baselines</b>	<p>Baseline comparison is most useful for determining the changes made to the model during development compared to some Baseline saved at a crucial point - for example the completion of a phase or version iteration</p> <p>More than one Baseline can be stored against a single Enterprise Architect package</p>	<p><a href="#">The Compare Utility (Diff)</a><sup>[314]</sup></p>

Topic	Detail	See also
	<p>Baselines are particularly useful during requirements management to check for changes, additions and deletions that have occurred since the start of the current work phase; knowing how a model has changed is an important part of managing change and the overall development process</p> <p>Baselines are stored within the model in compressed XML format; you can save a Baseline to an external XML file for storage or archive, or for distributing to other users working on models derived from a master project</p> <p>Baselines are generally used in conjunction with the <i>Compare</i> utility</p>	
<b>Scenario</b>	<p>A typical scenario for using Baselines would be:</p> <ul style="list-style-type: none"> <li>• Create the base model branch to a sufficient point to create a Baseline (checkpoint); create and store the Baseline as Version 0.1a</li> <li>• As work continues on development, managers and developers can check the current model branch against the Baseline for important modifications, additions and deletions</li> </ul> <p>The Compare utility can be invoked from the Baseline dialog to check the current model branch against the stored version</p> <ul style="list-style-type: none"> <li>• As required, minor Baselines can be created to check recent progress; these 'temporary Baselines' are useful for managing change when a lot of work is being done and it is important to only see what has changed in, for example, the last 24 hours</li> <li>• At sign-off or the move to a new version/phase, a major Baseline can be created to capture the new state of the model</li> </ul> <p>Minor Baselines created earlier can be deleted if required to save space</p>	<p><a href="#">Manage Baselines</a><sup>[313]</sup></p> <p><a href="#">Create Baselines</a><sup>[314]</sup></p>
<b>Considerations</b>	<ul style="list-style-type: none"> <li>• Baselines are based on the GUID or unique ID of a particular package: <ul style="list-style-type: none"> <li>• Enterprise Architect checks for that ID as the root element within the XML document being used as a Baseline</li> <li>• When you export a package to XML, the package you export is the root element; likewise when you create a Baseline, the current package is the root package of the XML Baseline</li> <li>• When you save information in a version control system, the current version-controlled package is again the root package of the document</li> </ul> </li> <li>• It is not useful to create a Baseline by importing an XML package file created by version controlling a package that itself contains version-controlled child packages; that type of XML package file contains stubs for the child packages, not full information on the child packages and elements</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>If a package under version control forms part of a Baseline, and that package is checked in to the model, you cannot merge the original data from the Baseline into that package</li> <li>XML files must be in the same format used by the Baseline engine - currently the UML 1.3 XMI 1.1 format (plus Enterprise Architect extensions), which contains all the information necessary to reconstruct a UML model, even a UML 2.x model</li> </ul>	

**Notes:**

- The Baseline facility is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- The Compare utility is available in the *Professional* edition of Enterprise Architect, as well as in the Corporate and extended editions above

**3.5.2.2.1.1 Manage Baselines**

Enterprise Architect provides a range of facilities for working with and managing Baselines, through the Manage Baselines dialog.

**Access:** **Right-click model branch package | Package Control | Manage Baselines**

Field	Usage	See also
<b>Current Baselines For Package: &lt;Name&gt;</b>	Review the baselines for the current model branch, listed by version reference with the highest alphabetical/numerical value at the top  If an entry is longer than the display area, a horizontal scroll bar displays at the bottom of the panel; use this to scroll to the text that is not shown	<a href="#">Create Baselines</a> [314]
<b>Show Differences</b>	Run the Compare [314] utility on the selected Baseline and the current model branch, to display the differences [316] between the two	<a href="#">The Compare Utility</a> [314] <a href="#">Example Comparison</a> [316]
<b>Restore to Baseline</b>	Completely restore the model branch from the selected Baseline	
<b>New Baseline</b>	Create a new Baseline	<a href="#">Create Baselines</a> [314]
<b>Delete Selected</b>	Delete the selected Baseline	
<b>Load Other Baselines</b>	Display a drop-down menu that enables you to load Baselines from another model, in either a .EAP file or a DBMS file <ul style="list-style-type: none"> <li>For .EAP files, a browser displays; locate the required project file</li> <li>For DBMS files, the Windows Data Link Properties dialog displays; select the data provider and click on the <b>OK</b> button to display the Select Data Source dialog, from which you</li> </ul>	

Field	Usage	See also
	<p>select the required project</p> <p>In either case, the <i>Connected To:</i> message at the bottom of the Manage Baselines dialog changes to the name of the alternative model</p> <p>To return the dialog to the original project, select the third option on the drop down list: <b>Load From Selected Package</b></p>	
<b>Import File</b>	Import an XML 1.1 file from the file system as a new Baseline for this current model branch	
<b>Export File</b>	Export the selected Baseline to an XML file on disk	
<b>Compare Model to File</b>	Compare the selected model branch with an XML 1.1 file on disk; a browser displays, which you use to locate the file	
<b>Options</b>	Set filters <a href="#">316</a> to make the comparison more specific	<a href="#">Compare Options</a> <a href="#">316</a>

### 3.5.2.2.1.2 Create Baselines

**Access:** Right-click model branch package | Package Control | Manage Baselines: New Baseline button

The New Baseline dialog displays

Field	Usage	See also
<b>Name</b>	Display the package name of the currently selected model branch	<a href="#">Manage Baselines</a> <a href="#">313</a>
<b>Version</b>	<p>Type a unique version reference for this Baseline - this can consist of any alphanumeric characters</p> <p>The Manage Baselines dialog sorts the Baselines according to the value of this field</p>	
<b>Include Sub-packages</b>	<p>Include the entire sub-package hierarchy of this branch in the Baseline - defaults to selected</p> <p>If you deselect the checkbox, only the immediate contents (XMI stubs) of the package are included in the Baseline</p>	
<b>Note</b>	<p>Edit the default current time and date to any other value</p> <p>The field is a single-line entry, for display on the Manage Baselines dialog (a one-line-per-entry list)</p>	
<b>OK</b>	Click to create a new Baseline and return to the Manage Baselines dialog	

### 3.5.2.2.1.3 The Compare Utility (Diff)

Enterprise Architect has a comprehensive and powerful built in *Compare (diff)* utility, which enables you to:

- Explore what has changed within a model over time
- Explore how previous versions of a model branch differ from what is currently in the model
- Perform a full model comparison by exporting all of Model A to XML, then using **Compare Model to File** from within the current model (Model B)

Comparing and checking model development at various points in the process is an important aspect of managing change and development, monitoring what is being modified and ensuring the development and design process is on track.

**Access:**

- **Project Browser package context menu | Package Control | Manage Baselines: Show Differences** - use the Baseline dialog
- **Project Browser package context menu | Package Control | Compare with XMI File** (package not under version control)
- **Project Browser package context menu | Package Control | Compare with Controlled Version** (package under version control)

**Use to:**

- Compare a model branch in Enterprise Architect with a Baseline created using the Baseline functionality (Corporate, Business and Software Engineering, System Engineering and Ultimate editions)
- Compare a model branch in Enterprise Architect with a Baseline stored in a different model
- Compare a model branch in Enterprise Architect with an XML 1.1 file on disk created previously using the Enterprise Architect XML export facility (user selects file)
- Compare a model branch in Enterprise Architect with the current version-controlled XML 1.1 file on disk as created when using Version Control in Enterprise Architect (file automatically selected)

**Guide:**

Topic	Detail	See also
<b>Differencing With Baselines</b>	<p>As a Baseline is stored within a model and contains all the information, elements and connections for a package at a point in time, it can be used within Enterprise Architect to track changes to model elements over time</p> <p>The Differencing engine first builds a representation of the current package in memory, based on what is currently in the model</p> <p>It then compares this with the stored Baseline, highlighting changes, new elements, missing elements and elements that have been moved to other packages</p> <p>It is possible to filter the resultant output to display only one particular kind of change: for example, additions to the model.</p> <p>If a Baseline has been created to ignore child package content, a comparison between that Baseline and the model does not include any child package content in the model</p> <p>See the example model comparison</p>	<p><a href="#">Compare Options</a> <sup>[316]</sup></p> <p><a href="#">Create Baselines</a> <sup>[314]</sup></p> <p><a href="#">Example Comparison</a> <sup>[316]</sup></p>

**Notes:**

- This utility is available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- You cannot compare the current model with an XML 2.1 file; the utility can only compare with an XML 1.1 file

### 3.5.2.2.1.4 Compare Options

The Compare Options dialog enables you to refine the output of the Compare utility when it compares the current model with a Baseline.

To display the dialog, either:

- Click on the **Options** button on the Manage Baselines dialog
- Click on the **Compare Options** icon on the Compare Utility tab toolbar

Field	Usage	See also
<b>Always Expand to Differences</b>	<p>Always display the list of elements fully expanded to show changes</p> <p>If you deselect the checkbox, when the Compare Utility tab is first opened it lists the package contents to element level, and you expand each element as required to show the changed items</p> <p>For large branches of the model, it is better to leave the checkbox unselected</p>	
<b>Show Elements that are</b>	<p>List elements that:</p> <ul style="list-style-type: none"> <li>• Have been changed since the Baseline was created</li> <li>• Are in the Baseline only (that is, have been deleted from the model since the Baseline was created)</li> <li>• Are in the model only (that is, have been created since the Baseline was created)</li> <li>• Have not changed since the Baseline was created (you might generally leave this checkbox unselected)</li> </ul>	
<b>Suppress these Changes</b>	<p>Exclude:</p> <ul style="list-style-type: none"> <li>• Changes to diagrams</li> <li>• Changes to the <b>Date Modified</b> field for an item</li> <li>• Changes to the <b>Date Created</b> field for an item</li> <li>• Child items of a deleted item</li> <li>• Changes to advanced properties (defaults to selected)</li> </ul>	

If the Compare Utility tab shows the results of a Baseline comparison, when you click on the **OK** button the display refreshes to refine the information according to the options you have selected.

### 3.5.2.2.2 Example Comparison

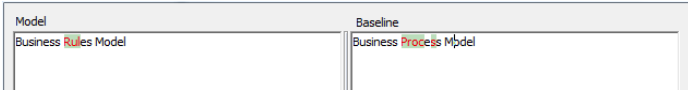

The diagram below shows the result of a comparison between a package (Business Process Model) in the current project and that package in a Baseline (version 0.1) captured at an earlier date.

The results of the comparison are displayed on the Compare Utility tab.

### 3.5.2.2.1 Compare Utility Tab Options

The Compare Utility tab enables you to perform operations on the reported information, using the toolbar, context menu, Merge dialog and certain keyboard keys.

- The toolbar is at the top of the left-hand panel; the icons operate either on the comparison as a whole or on the currently-selected item in the left hand panel of the Compare Utility tab
- Each item in the hierarchy has a context menu, which you display by right-clicking on the item; the options displayed depend on the level of the item in the hierarchy
- The Merge dialog enables you to specify which changes to roll back in the model from the baseline
- You can use a selection of keyboard keys to move up and down the hierarchy, or to roll back changes

#### Reference - Toolbar:

Action	Usage	Shortcut	See also
<b>Refresh</b>	Re-run the comparison to refresh the current display		
<b>Merge To Model</b>	Merge the values of the currently-selected item in the Baseline back into the model		
<b>Next Change</b>	Highlight the next changed item (skips <i>Moved</i> items)		
<b>Previous Change</b>	Highlight the previously-changed item		
<b>Expand All</b>	Fully expand the selected item		
<b>Collapse All</b>	Collapse the changed items in the selected item		
<b>Expand To Changed Items</b>	Expand the selected item to show changed items only (in the event that you have selected to also show <a href="#">[316]</a> unchanged items in the comparison)		<a href="#">Compare options</a> <a href="#">[316]</a>
<b>Find in Project Browser</b>	Highlight the item in the Project Browser		
<b>Log To XML</b>	Log the changes to an XML file A browser displays, on which you specify the file name and location

	<p>specification. When importing or exporting to XML 1.0, some loss of data occurs due to the limitations of XML 1.0</p> <p>With XML, model details can be exchanged between different UML tools and other tools that are capable of using XML</p> <p>Limited support for export to Rational Rose is provided using the Rose version of the XML 1.1 specification, as implemented by Unisys for Rational products.</p> <p>Packages can be exported from and imported into Enterprise Architect models, which greatly improves the flexibility and robustness of the models by enabling Analysts and Modelers to externalize model elements in XML for:</p> <ul style="list-style-type: none"> <li>• Version control</li> <li>• Distributed development</li> <li>• Post processing and</li> <li>• Transferring packages between models</li> </ul> <p>When performing Enterprise Architect-to-Enterprise Architect transfers, ensure that either XML version 1.1 or 2.1 is selected.</p> <p>When importing an XML file over an existing package, all information in the current package is deleted first, before importing from the XML file. Please make sure you do not have important changes that you do not want to lose before importing from XML.</p>	
<b>XMI Tasks</b>	<p>Tasks you might perform in importing and exporting XMI include:</p> <ul style="list-style-type: none"> <li>• Setting XML Options - XMI import, export and package control all rely on saving and loading XML files; you can set a number of options to streamline this process</li> <li>• Exporting a package to XMI in XMI 2.1 (and earlier)</li> <li>• Importing from XMI with support for XMI 2.1 (and earlier)</li> <li>• Setting up controlled packages</li> <li>• Manually controlling a package by linking it to an XMI file</li> <li>• Batch exporting controlled packages</li> <li>• Batch importing controlled packages</li> <li>• Factoring in the limitations of XMI</li> <li>• Applying a UML Data Type Definition (DTD)</li> </ul>	<p><a href="#">XML Specifications</a> <sup>[438]</sup></p> <p><a href="#">Export to XMI</a> <sup>[322]</sup></p> <p><a href="#">Publish Model Package</a> <sup>[323]</sup></p> <p><a href="#">Import from XMI</a> <sup>[324]</sup></p> <p><a href="#">Controlled Packages</a> <sup>[328]</sup></p> <p><a href="#">Manual Version Control with XMI</a> <sup>[336]</sup></p> <p><a href="#">Batch XMI Export</a> <sup>[334]</sup></p> <p><a href="#">Batch XMI Import</a> <sup>[335]</sup></p> <p><a href="#">Limitations of XMI</a> <sup>[327]</sup></p> <p><a href="#">The UML DTD</a> <sup>[328]</sup></p>

**Notes:**

- XML 2.1 exported by Enterprise Architect 7.0 (or later) might not be correctly imported into earlier versions of Enterprise Architect.
- When performing Enterprise Architect-to-Enterprise Architect transfers, ensure that either XML version 1.1 or 2.1 is selected.

**Learn More:**

- [XML/XMI Technology](#)

**3.5.3.1.1 Export to XMI**

The Export Package to XMI dialog is used to export a package to various XMI (XML-based) formats. This dialog, by default, allows exporting to either **XMI 1.1** or **XMI 2.1**. The exported XMI file contains all the information required for completely round-tripping the package within Enterprise Architect; that is, performing Enterprise Architect-to-Enterprise Architect transfers.

**Access:** Click on a package in Project Browser, then:

**Project | Model Import/Export | Export Package to XMI File**  
**Right-click | Import/Export | Export Package to XMI**

**Use to:**

- Move Enterprise Architect model elements between models, for distributed development, manual version control and other benefits

**Reference:**

Field/Option/Button	Usage	See also								
<b>Root Package</b>	Indicates the name of the selected package									
<b>Filename</b>	Specify the file path where the XMI file is to be generated

	Option/Button	Usage								
	<b>XMI 1.1</b>	Export the selected package to XMI 1.1								
	<b>XMI 2.1</b>	Export the selected package to XMI 2.1								
<b>Publish</b>	Opens the Publish Model Package dialog for exporting to other versions of XML									
<b>View XMI</b>	View the exported XMI file									
<b>Export</b>	Initiate XMI Export									
<b>Close</b>	Close this dialog									
<b>Help</b>	Display this Help topic									
<b>Progress</b>	Lists the progress of the XMI Export									

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Export XMI** permission to export to XMI
- Alternate Images used in the package being exported are not included in the exported XMI file unless the **Export Alternate Images** option is selected in the XML Specifications section of the Options dialog
- The Log file for the package being exported is not generated unless the **Write Log** option is selected in the XML Specifications section of the Options dialog

**Learn More:**

- [Limitations of XML](#)<sup>[327]</sup>
- [List of Available Permissions](#)<sup>[206]</sup>
- [Manual Version Control with XML](#)<sup>[336]</sup>
- [XML Specifications](#)<sup>[438]</sup>

**3.5.3.1.2 Publish Model Package**

The Publish Model Package facility is used to export a package to various XML formats, including XMI 1.1, XMI 2.1 and BPMN 2.0 XML.

**Access:** Click on a package in **Project Browser**, then:

**Project | Model Publisher**  
**Project | Model Import/Export | Export Package to XMI File: Publish**  
**Right-click | Import/Export | Export Package to XMI: Publish**

**Use to:**

- Move Enterprise Architect model elements between models, for distributed development, manual version control and other benefits
- Export BPMN 2.0 models to BPMN 2.0 XML
- Export Enterprise Architect model elements to Rational Rose and other tools that implement the:
  - UML 1.3 XMI 1.1 / XMI 1.0 standard
  - UML 1.4 XMI 1.2 standard, or
  - UML 2.1 XMI 2.1 standard

**Reference:**

Field/Option/ Button	Usage	See also	
<b>Root Package</b>	Indicates the name of the selected package		
<b>Filename</b>	Specify the file path where the XML file is to be generated		
<b>XML Type</b>	Select the XML/XMI version to export the package to		
<b>General Options</b>	<b>Field</b>	<b>Usage</b>	
	<b>Export Diagrams</b>	Export all the diagrams in the selected package	<a href="#">Image Manager</a> <sup>[595]</sup>
	<b>Export Alternate Images</b>	Export the alternate images used in the diagrams in the selected package	
	<b>Format XML Output</b>	Format the output into readable XML (this takes a few seconds at the end of the run)	
	<b>Write Log File</b>	Write a log of the export activity (recommended). The log file is saved to the directory into which the package is exported.	
	<b>Use DTD</b>	Use the XMI DTD when exporting to XMI 1.0. Setting this option validates the correctness of the XML.	

		checks that no syntactical errors have occurred	
	<b>Exclude EA Tagged Values</b>	Exclude Enterprise Architect-specific information	
	<b>Unisys/Rose Format</b>	Export in Unisys/Rose compatible XML format	
	<b>Generate Diagram Images</b>	Generate the exported diagrams in the specified format The generated diagrams are saved in a package directory into which the XML file is exported	
	Some of the above options might be unavailable, based on the selected <b>XML Type</b>		
<b>Stylesheet</b>	Select an XSL Stylesheet to post-process the XML content before saving to file ( <i>Optional</i> )  You can post-process the XML content before saving the package to file, using an XSLT to convert the output to HTML, XSL, code or other versions of XML; to do this, you must import the required style sheet into the project through the Resources window		<a href="#">Resource Window</a> <sup>[79]</sup>
<b>View XML</b>	View the exported XML file		
<b>Export</b>	Initiate XML Export		
<b>Close</b>	Close this dialog		
<b>Help</b>	Display this Help topic		
<b>Progress</b>	Lists the progress of the XML Export		

**Notes:**

- When exporting and importing with XML 1.0 with Enterprise Architect, some loss of data occurs due to the limitations of XML 1.0
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Export XML** permission to export to XML
- XML 2.1 exported by Enterprise Architect 7.0 (or later) might not be correctly imported into earlier versions of Enterprise Architect
- When you select to apply a Data Type Definition (DTD) during an XML 1.1 export, the UML\_EA.DTD file is written to the output directory into which the XML files are written (unless the UML\_EA.DTD file is already present in the directory); no error is generated if the UML\_EA.DTD file is not present in this directory during the XML export

**Learn More:**

- [Limitations of XML](#)<sup>[327]</sup>
- [List of Available Permissions](#)<sup>[206]</sup>
- [The Resources Window](#)<sup>[79]</sup>
- [Manual Version Control with XML](#)<sup>[336]</sup>
- [BPMN 2.0 XML](#)<sup>[1237]</sup>

**3.5.3.1.3 Import from XML**

You can import a package from an XML (XML-based) file in any of the following formats:

- UML 1.3 (XML 1.0)
- UML 1.3 (XML 1.1)

- UML 1.4 (XMI 1.2)
- UML 2.0 (XMI 2.1)
- UML 2.1 (XMI 2.1)
- MOF 1.3 (XMI 1.1)
- MOF 1.4 (XMI 1.2)

You can also import the \*.emx and \*.uml2 files generated by tools such as Rational Software Architect (RSA) and Rational Software Modeler (RSM).

**Access:** Click on target package in **Project Browser**, then:

**Project | Model Import/Export | Import Package From XMI File** or  
**Right-click | Import/Export | Import Package From XMI**

**Use to:**

- Move Enterprise Architect Model elements between models, for distributed development, manual version control and other benefits

**How to:**

To export a package to XML, follow the steps below:

Step	Action	See also
1	Select the target package and <b>Import Package From XMI</b> menu option The Import Package From XMI dialog displays	
2	In the <b>Filename</b> field, type the directory path and filename from which to import the XMI file	
3	Select the <b>Import diagrams</b> checkbox to import diagrams	
4	Select the <b>Strip GUIDs</b> checkbox to remove Universal Identifier information from the file on import  This enables the import of a package twice into the same model; the second import requires new GUIDs to avoid element collisions	
5	Select the <b>Write log file</b> checkbox to write a log of import activity (recommended)  The log file is saved in the directory from which the file is being imported, with the name <i>import.log</i>	
6	<b>Import using single transaction</b> defaults to selected  If the import encounters locking issues, or if you are importing a large XML file, deselect the checkbox to import the data items separately and identify problem items without blocking the whole import	
7	If you are importing from Rose XML 1.1, click on the <b>Treat Imported Datatypes</b> drop-down arrow and select the datatypes to add to the model	
8	Click on the <b>Import</b> button  Enterprise Architect indicates the progress of the import in the <b>Import Progress</b> field.	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Import XMI** permission to import packages from XMI
- When you import an XML file over an existing package, ALL information in the current package is deleted first; before you import the XML file, please make sure you do not have important changes that you do not want to lose
- If you are importing an XMI 1.1 file that was previously exported with a UML\_EA.DTD file, the UML\_EA.DTD file must be present in the directory into which the XML file is being written; an error occurs if the UML\_EA.DTD file is absent

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>
- [The Resources Window](#) <sup>[79]</sup>
- [Manual Version Control with XMI](#) <sup>[336]</sup>
- [The UML DTD](#) <sup>[328]</sup>
- [Import EMX/UML2 Files](#) <sup>[326]</sup>

**3.5.3.1.4 Import EMX/UML2 Files**

Rational Software Architect (RSA) enables you to add many UML models under a single root. These models can have cross references between them.

However, RSA cannot save the entire root as one file; it saves each UML model as a separate EMX file. This means that an EMX file with cross-references is not self-contained as it references elements in another EMX file.

In releases earlier than release 7.0, Enterprise Architect treats each EMX file as a separate model and hence does not allow for cross-references between them. From release 7.0, Enterprise Architect enables these cross-references.

You therefore have the options of:

- Importing a single EMX/UML2 file or
- Importing a group of related EMX/UML2 files together, thereby retaining the cross-references between the different files

**Access:** Click on target package in Project Browser, then:

**Project | Model Import/Export | Import Package From XMI File: Import EMX / UML2 Files button**

or

**Right-click | Import/Export | Import Package From XM File: Import EMX / UML2 Files button**

**Use to:**

- Import Enterprise Architect Model elements from EMX/UML2 files

**How to:**

To import single or multiple \*.emx/\*.uml2 files into Enterprise Architect, follow the steps below:

Step	Action	See also
1	Select the target package and <b>Import Package From XMI</b> menu option	

Step	Action	See also
	The Import Package From XML dialog displays	
2	Click on the <b>Import EMX / UML2 Files</b> button The Import Package from XML dialog redisplay, formatted for .EMX/UML2 file imports	
3	Click on the ( ... ) (Browse) button next to the <b>Directory</b> field The Select Import EMX / UML2 File(s) dialog displays, which enables you to select multiple files	
4	Select the file or files (use <b>(Ctrl) + click</b> or <b>(Shift) + click</b> to select several files) and click on the <b>Open</b> button The Import Package from XML dialog redisplay; the Selected File(s) panel lists the selected files	
5	Select the <b>Write Log File</b> checkbox to write a log of import activity (recommended) The log file is saved in the directory from which the file is being imported, with the name <i>import.log</i>	
6	Click on the <b>Import</b> button Enterprise Architect indicates the progress of the import in the <b>Import Progress</b> field.	

### 3.5.3.1.5 Limitations of XMI

Whilst XMI is a valuable means of specifying a UML model in a common format, it is relatively limited in the amount of additional information it can tolerate using the standard syntax.

#### Topics:

Topic	Detail	See also
<b>Notes on Enterprise Architect</b>	<p>A lot of information from an Enterprise Architect model must be converted to Tagged Values, which import into other modeling systems as additional information or are ignored completely</p> <p>Enterprise Architect can both generate and read:</p> <ul style="list-style-type: none"> <li>• XMI 1.0 and 1.1 using UML 1.3 format</li> <li>• XMI 1.2 using UML 1.4 format, and</li> <li>• XMI 2.1 using UML 2.0 and UML 2.1 format</li> </ul> <p>Round-tripping model elements using XMI in Enterprise Architect is possible using XMI 1.1 or XMI 2.1; XMI 1.1 uses the additional Tagged Values to store the UML 2.x information - this ensures no loss of data when round-tripping UML 2.x model elements using XMI 1.1</p> <p>Please note that Enterprise Architect exclusively uses XMI 1.1 for round-tripping models using Version Control</p>	
<b>Notes for Exporting to Rose and Other Tools</b>	There are discrepancies in the Unisys/Rose implementation with regard to spelling mistakes and slightly different syntax to the official XMI 1.1 specification, so problems might occur	

Topic	Detail	See also
	<p>The way packages are arranged in different models can impact successful import into other systems; experimentation is the only work around for this problem</p> <p>Some parts of the XML import/export process do not work as expected in products like Rational Rose; for example, Note Links are not supported, and State Operations import but do not appear in diagrams</p> <p>Rational Rose only supports import of a full project, not a single package.</p> <p>For best results, it is recommended that you keep the model elements to export to Rose simple and conforming as closely as possible to the UML 1.3 specification</p>	

### 3.5.3.1.6 The UML DTD

When you import or export Enterprise Architect packages to XML, the import or export process can be validated using a Data Type Definition (DTD).

#### Guide:

Topic	Detail	See also
<b>Notes on DTDs</b>	<p>The XML parser uses the DTD to validate the correctness of the model and to check that no syntactical errors have occurred</p> <p>It is always best to use a DTD when moving packages between Enterprise Architect models as it ensures correctness of the XML output, and prevents attempted imports of incorrect XML</p> <p>Several DTDs for XML/UML exist; the OMG defines a standard UML1.3 DTD for use in XML 1.1, and Enterprise Architect uses an extension of this with some additional element extensions for non-standard UML types, such as testing details</p> <p>Whenever you read an XML file, the XML parser looks in the current directory for the DTD - if specified - using the DOCTYPE element in the XML file</p> <p>If the parser cannot find the DTD, it records an error and aborts processing; you must ensure the UML_EA.DTD file is in the current XML output path (generated by default)</p>	

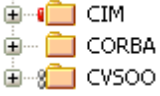

### 3.5.3.1.7 Controlled Packages

Controlled packages are a powerful means of 'externalizing' parts of an Enterprise Architect model.

#### Guide:

Topic	Detail	See also
<b>Using Controlled Packages</b>	<p>A controlled package is a package configured to save and load in XML format to a named file; the XML output is UML1.3 compliant XML, with Enterprise Architect extensions to support diagrams and</p>	<a href="#">Version Control</a> <sup>[243]</sup>

Topic	Detail	See also
	<p>additional model elements</p> <p>Package XML is standard XML-compliant output that can be loaded into any XML viewer, or used by any XML-based tool to perform manipulations and extracts, such as document or code generators</p> <p>Controlled packages appear in the Project Browser with a small colored rectangle to the left of the package icon, as shown below for the <i>CIM</i> package:</p>  <p>Using controlled packages you can support:</p> <ul style="list-style-type: none"> <li>• Widely distributed development by having team members submit packages in the form of XML for import into a central Enterprise Architect repository</li> <li>• Version control, by writing model elements in XML text files suitable for version control using standard version control software</li> </ul> <p>Using XML this way enables you to manually connect to third-party version control software outside the Enterprise Architect environment</p> <p>Enterprise Architect internally supports the configuration of version control through SCC and CVS</p> <ul style="list-style-type: none"> <li>• Import and export of model elements between different models</li> </ul> <p>For example, a Class library can be re-used in many models and kept up to date in target models using controlled packages, reloading packages as required when new versions of the Class model become available</p>	

**Notes:**

- If you are importing an XML 1.1 file that was previously exported with a UML\_EA.DTD (Data Type Definition) file, the UML\_EA.DTD file must be present in the directory into which the XML file is being written; an error occurs if the UML\_EA.DTD file is absent
- When you select to apply a DTD during an XML 1.1 export, the UML\_EA.DTD file is written to the output directory into which the XML files are written (unless the UML\_EA.DTD file is already present in the directory); no error is generated if the UML\_EA.DTD file is not present in this directory during the XML export

**3.5.3.1.7.1 Controlled Package Menu**

**Access:** **Project Browser > package | Package Control**

This menu is for a package that is not itself under version control (but that might contain child packages that are under version control).

Action	Usage	Shortcut	See also
<b>Configure</b>	Display the Package Control Options dialog,	<b>Ctrl + Alt +</b>	<a href="#">Configure</a>

Action	Usage	Shortcut	See also
(various settings for the package)	which enables you to specify whether this package (and its child packages) is controlled and which file it is controlled through	P	<a href="#">Packages</a> [331]
Manage Baselines	Create a Baseline of the current package, or compare the current package with a previous Baseline	Ctrl + Alt + B	<a href="#">Managing Baselines</a> [313]
Check In Branch	For the selected branch of the model, (that is, the selected package and all of its child packages) display the Select Packages to Check In dialog, listing all version controlled packages within that branch that are checked out to you  You can then select packages in the displayed list, to be submitted for check-in.		<a href="#">Check in a Model Branch</a> [285]
Check Out Branch	For the selected package, check out the package and recursively check out all of its contained sub-packages  Enterprise Architect retrieves the latest version of the packages from the central repository, overwriting the current packages  After check out, the packages are available for editing		<a href="#">Check Out a Model Branch</a> [285]
Save package to file	Save a controlled package to an XML file	Ctrl + Alt + S	<a href="#">Save a Package</a> [331]
Load package from file	Load a previously-saved XML file	Ctrl + Alt + L	<a href="#">Load a Package</a> [331]
View package XMI	Display the package XMI after the package has been exported to XMI	Ctrl + Alt + X	
Compare with XMI file	(Package not under version control) Compare the current package with a previously-saved XML file of the package		<a href="#">The Compare Utility (Diff)</a> [314]
Add Branch to Version Control	Apply version control to all packages within a selected model branch, in a single operation		<a href="#">Apply Version Control to Branches</a> [291]
Export as Model Branch	Export a newly created model branch from your own private copy of a model		<a href="#">Export Controlled Model Branch</a> [291]
Import a Model Branch	Retrieve a model branch and import it into either the source model or another model		<a href="#">Import Controlled Model Branch</a> [292]
Get package (for version control)	Enables you to gain access from packages in the version-controlled repository that is currently available in your model		<a href="#">Version Control</a> [243]
Get All Latest (for version control)	Retrieve the latest version of the package from the repository. Available only for packages that are checked in  The alternative option <b>Get Latest</b> - if displayed - is not intended for sharing .EAP files and should only be used when users have their own		<a href="#">Version Control</a> [243]

Action	Usage	Shortcut	See also
	individual databases		
<b>Re-synch Status With VC Provider</b>	(Version controlled package) Update the version control status value recorded for the selected package in the Enterprise Architect project to match the value reported by the version control provider, without performing an XML import or export		
<b>Version Control Settings</b>	Display the Version Control Settings dialog		<a href="#">Version Control Settings Dialog</a> <sup>[27]</sup>
<b>Update Package Status</b>	Provide a bulk update on the status of a package. This includes status options such as <b>Proposed</b> , <b>Validate</b> and <b>Mandatory</b>		<a href="#">Update Package Status</a> <sup>[413]</sup>

#### Learn More:

- For a package that is directly under version control, see [Package Version Control Menu](#)<sup>[279]</sup>

#### 3.5.3.1.7.2 Configure Packages

Before you can use a controlled package, you must configure it with options such as the filename to save to/load from, the type of export and the version number.

Once a package is configured and marked as controlled, it is displayed in the **Project Browser** with a small colored rectangle next to the package icon, indicating it is a controlled package; for example, the *RQ01: Formal Requirements* package below.

**Access:** **Project Browser | Package Context Menu | Package Control | Configure**

#### How to:

To configure a controlled package, follow the steps below:

Step	Action	See also
1	Select the package to control or configure, and the <b>Configure</b> context menu option The Package Control Options dialog displays	
2	Select the <b>Control Package</b> checkbox to indicate that this is a controlled package	
3	Click on the <b>Version Control</b> drop-down arrow and select the version control repositories; this connects the package to a specific version control configuration	
4	In the <b>XMI Filename</b> field, type or browse for the path and XML file for importing and	

Step	Action	See also
	<p>exporting XML files</p> <p>The field accepts <i>Local Path Substitution</i> strings; for example, use an XML local path definition where:</p> <pre>myLocal Path=" C:\ Documents and Settings\ John\ Desk top\ EA Model s"</pre> <p>Then %myLocal Pat h% Cl M. xml is equivalent to</p> <pre>C:\ Documents and Settings\ John\ Desk top\ EA Model s\ Cl M. xml</pre>	
5	<p>In the <b>UML/XMI Type</b> field, click on the drop-down arrow and select the type of XML generated; options include:</p> <ul style="list-style-type: none"> <li>• <b>Enterprise Architect XMI/UML 1.3</b></li> <li>• <b>Rational Rose/Unisys UML 1.3 and</b></li> <li>• <b>Generic XMI 1.0/UML 1.3</b></li> </ul> <p>Currently only Enterprise Architect UML 1.3 is supported for complete import/export round tripping of packages</p>	
6	<p>In the <b>Version ID</b> field, type the version ID number</p>	
7	<p>In the <b>Owner</b> field, type or select the name of the package owner</p>	
8	<p>If required, click on the <b>Use DTD</b> checkbox to use a Data Type Definition (DTD)</p>	
9	<p>If required, click on the <b>Log Import/Export</b> checkbox to log import and export activity to a log file</p>	
10	<p>If required, click on the <b>Batch Import</b> checkbox to mark the package as a Batch Import package</p>	
11	<p>If required, click on the <b>Batch Export</b> checkbox to mark the package as a Batch Export package</p>	
12	<p>If required, click on the <b>Include sub-package</b> checkbox to deselect it, to include only the immediate contents of the package in an XML export (XML stubs); this is available only for an XMI 1.1/UML 1.3 export</p> <p>If you leave the checkbox selected, the entire sub-package hierarchy of this branch is included in the export.</p>	
13	<p>Click on the <b>OK</b> button to set the Package Control options.</p>	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Packages** permission to configure controlled packages and package properties
- For batch import, the file date of the XML file is stored; you can bypass the batch import if there is no change; that is, the file date of the last import matches that of the current file

**Learn More:**

- [List of Available Permissions](#)<sup>206</sup>

### 3.5.3.1.7.3 Remove Package from Control

If required, you can remove the control from a package. Before removing the package control, you must check in the package if it is being used for version control.

**Access:** [Project Browser](#) | [Package Context Menu](#) | [Package Control](#) | [Configure](#) (Ctrl+Alt+P)

**How to:**

To remove control from a package, follow the steps below:

Step	Action	See also
1	Select the package and the <b>Configure</b> menu option The Package Control Options dialog displays	
2	Deselect the <b>Control Package</b> checkbox If the package is under version control, this sets the <b>Version Control</b> field to <b>(None)</b>	
3	Click on the <b>OK</b> button to remove package control Package control for the selected package has now been removed	

**Notes:**

- When disconnecting a package from version control, the association between the package and the exported XML file is removed from your model; however, the XML file itself is not removed from version control, nor is it deleted from your local version control working copy folder

This is because it is possible for another model to be using the version controlled package and still referencing the associated version controlled XML file

**Learn More:**

- [Check In a Package](#)<sup>[286]</sup>

### 3.5.3.1.7.4 Save a Package

Once you have correctly configured a package, you can save the controlled package to the designated XML file.

**Access:** [Project Browser](#) | [Package Context Menu](#) | [Package Control](#) | [Save Package to File](#)

**How to:**

To save a controlled package to file, follow the steps below:

Step	Action	See also
1	Select the package and the <b>Save package to File</b> menu option The export process executes automatically according to your configured preferences, overwriting any existing file	

**Notes:**

- If you are using a version control package in conjunction with the exported package files, you must check out the XML file first to enable Enterprise Architect to overwrite the existing version

**Learn More:**

- [Configure Packages](#)<sup>[331]</sup>

**3.5.3.1.7.5 Load a Package**

If a package has been marked for control it is displayed in the Project Browser with a red rectangle to the left of the package icon. If you have previously saved the controlled package, you can reload it.

**Access:** [Project Browser](#) | [Package Context Menu](#) | [Package Control](#) | [Load package from file](#)

**How to:**

To load a controlled package from an XML file, follow the steps below:

Step	Action	See also
1	Select the package and the <b>Load package from file</b> menu option If you have configured the package control details, Enterprise Architect prompts you to confirm the import.	
2	Click on the <b>Yes</b> button to confirm the import The current package is deleted and the saved package is imported	

**Notes:**

- Importing deletes the current package entirely from the model, and the action cannot be undone; you must be careful not to lose any current changes or information

**Learn More:**

- [Configure Packages](#)<sup>[331]</sup>

**3.5.3.1.7.6 Batch XMI Export**

You can export a group of controlled packages to XMI in one step.

**Access:** [Project](#) | [Model Import/Export](#) | [Batch XMI Export](#)

**How to:**

To export a group of controlled packages to XMI, follow the steps below:

Step	Action	See also
1	Select the <b>Batch XMI Export</b> menu option The Batch XMI Export dialog displays	
2	Select the checkbox against each package to include in this export run Select the <b>Select All</b> checkbox to select all packages in the list	
3	Select the <b>Restore Cross References Without Prompting</b> checkbox to automatically restore any missing cross package references without displaying a prompt	<a href="#">Report Deletion of Cross-Package References</a> <sup>[337]</sup>
3	To save this configuration as the default, click on the <b>Save Settings</b> button	
4	Click on the <b>Run Export</b> button Enterprise Architect cycles through each checked package and exports it using the options specified in the Package Control Options dialog As long as a valid filename exists, Enterprise Architect exports the package to XMI and proceeds to the next package	<a href="#">Configure Packages</a> <sup>[337]</sup>

**Notes:**

- The **Restore Cross References Without Prompting** checkbox is enabled only if the option **Report Cross Package Reference Deletions (XMI 1.1)** is set on the XML Specifications page of the Options dialog
- The option is applicable only to XMI 1.1 controlled packages

**Learn More:**

- [XML Specifications](#) <sup>[438]</sup>

**3.5.3.1.7.7 Batch XMI Import**

You can import a group of controlled packages from XMI into Enterprise Architect in one step.

As Enterprise Architect processes each package, it updates the **Status** column against each package name on the Batch XMI Import dialog.

- If the import is successful, Enterprise Architect updates the package status to **Imported**
- If the import is unsuccessful, Enterprise Architect updates the package status to **Not Imported**

Common reasons for an import to fail include:

- The package not being correctly configured
- The last import file date matches the import date of the file currently on disk

**Access:** **Project | Model Import/Export | Batch XMI Import**

**How to:**

To import a group of controlled packages from XMI, follow the steps below:

Step	Action	See also
1	Select the <b>Batch XMI Import</b> menu option The Batch XMI Import dialog displays	
2	Select the checkbox against each package to include in the import Select the <b>Select All</b> checkbox to select all packages in the list	
3	To save this configuration as the default, click on the <b>Save Settings</b> button	
4	Click on the <b>Run Import</b> button Enterprise Architect cycles through each checked package and imports it	<a href="#">Configure Packages</a> <sup>[331]</sup>

**Notes:**

- To avoid re-importing the same module multiple times, select the **Check file date before import** checkbox; Enterprise Architect then does not import a file if the last import file date matches that of the one currently on disk

**3.5.3.1.7.8 Manual Version Control with XMI**

You can use XMI to support version control by writing model elements in XML text files suitable for use with standard version control software.

Using XMI in this manner enables you to manually connect to third-party version control software outside the Enterprise Architect environment.

Enterprise Architect internally supports the configuration of version control through SCC and CVS configurations.

**How to:**

Before using XMI for version control, follow the steps below:

Step	Action	See also
1	Select suitable packages in the Project Browser, to be marked as controlled packages	
2	Configure these with filenames that are visible to a version control system of your choice	<a href="#">Configure Packages</a> <sup>[331]</sup>
3	Save the controlled packages to establish a model base and check these into the version control system	<a href="#">Save a Package</a> <sup>[333]</sup>

To apply version control, follow the steps below:

Step	Action	See also
1	Continue working on a package until versioning is required	

Step	Action	See also
2	Check out the package XMI file from the version control system	
3	Save the relevant package using the controlled package support	
4	Check the package back into the version control system	

To recover an earlier version, follow the steps below:

Step	Action	See also
1	Save the current version first This is important, because the package is completely deleted during the import process If necessary, manually update the version control system	
2	Get the required package version from the version control system	
3	Select the package to reload	
4	Select the <b>Package Control   Load package from file</b> menu option to import the previous version Enterprise Architect deletes the controlled package and restores the previous version	<a href="#">Load a Package</a> 334

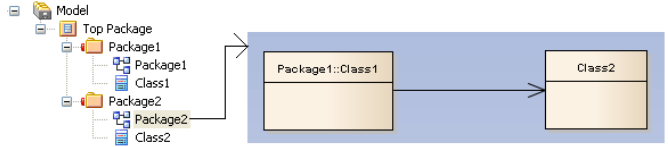

**Learn More:**

- [Version Control](#) 243

**3.5.3.1.7.9 Report Deletion of Cross Package References**

When saving an XMI 1.1 controlled package, if the **Report Cross Package Reference Deletions (XMI 1.1)** option is set in the Options dialog, Enterprise Architect compares the package being exported with the latest XMI 1.1 revision of the package.

**Topics:**

Topic	Detail	See also
Scenario	<p><i>Master.eap</i> contains two controlled packages - <i>Package1</i> and <i>Package2</i></p>  <pre> classDiagram     class Package1 {         Class1     }     class Package2 {         Class2     }     Package1 --&gt; Package2     </pre>	

Topic	Detail	See also
	<p>You now import just the controlled package, <i>Package2</i>, into a new .eap file, <i>New.eap</i></p> <p>Since <i>New.eap</i> does not contain <i>Package1</i> (and hence its element <i>Class1</i>), Enterprise Architect cannot show <i>Class1</i> and the Association connector on the diagram <i>Package2</i></p> <p>When the package <i>Package2</i> is exported to XML from <i>New.eap</i>, the XML file does not contain the information that the diagram <i>Package2</i> used to contain the element <i>Class1</i> and the Association connector</p> <p>If you import this XML file into <i>Master.eap</i>, Enterprise Architect removes the element <i>Class1</i> and the Association connector from the diagram <i>Package2</i></p>	
<b>Identify Cross-Package References</b>	<p>In order to retain such cross-package references in XML 1.1, you can set the <b>Report Cross Package Reference Deletions (XML 1.1)</b> option so that when you save a controlled package, Enterprise Architect compares the latest XML 1.1 revision of the package with the package being exported</p> <p>Any items that are missing from the package are listed on the <b>Missing Cross References</b> dialog</p>	<a href="#">XML Specifications</a> [438]
<b>Actions</b>	<p>To merge missing items, as identified in the <b>Missing Cross References</b> dialog, into the XML file that is being saved:</p> <ul style="list-style-type: none"> <li>• Select the checkbox against each item type</li> <li>• Click on the <b>OK</b> button</li> </ul> <p>If you do not select any items, they are omitted from the saved XML file</p> <p>To abort or cancel this XML Export (or Check-in, or Put Latest) operation</p> <ul style="list-style-type: none"> <li>• Click on the <b>Cancel</b> button</li> </ul> <p>To review the details of an entry:</p> <ul style="list-style-type: none"> <li>• Double-click on the type</li> </ul> <p>The details of each item are shown on the Missing &lt;item type&gt; dialog</p> <p>You can copy a value from any of the columns in this dialog to the clipboard:</p> <ul style="list-style-type: none"> <li>• Click on the column value to highlight it; the selected value is shown in the bottom left corner of the dialog</li> <li>• Copy that value to the clipboard ( <b>Ctrl+C</b> )</li> </ul>	

### 3.5.3.2 CSV Import and Export

Enterprise Architect enables you to import and export information about Enterprise Architect elements to and from CSV text files.

**Topics:**

Topic	Detail	See also
<b>Specifications</b>	To import and export element data from Enterprise Architect using CSV files, you must first set up one or more file specifications  You do this because the specification defines what types of value from the spreadsheet are to be imported, and how the information is translated between the spreadsheet and Enterprise Architect	<a href="#">CSV Specifications</a> <sup>[340]</sup>
<b>Import From CSV</b>	Once you have defined a CSV import specification, you can read in major element characteristics from a CSV text file	<a href="#">CSV Import</a> <sup>[341]</sup>
<b>Export To CSV</b>	Once you have defined a CSV export specification it is possible to write out major element characteristics to a CSV text file	<a href="#">CSV Export</a> <sup>[342]</sup>

#### 3.5.3.2.1 Compare Projects

It is often useful to compare the size and row counts of two projects; for example, after:

- a database crash
- importing from XML, or
- deleting model elements

Enterprise Architect examines the number of rows in each database and produces a report indicating the total records in each and the difference in record count between the two. No examination is made of the data in the table.

Comparing projects this way is a convenient 'sanity check' after restoring a backup or doing a project data transfer. If discrepancies are found, you must investigate further manually.

**Access:** [Tools | Data Management | Project Compare](#)

**Use to:**

- Compare a .EAP file to another .EAP file
- Compare a .EAP file to a DBMS-based repository
- Compare two DBMS repositories

**How to:**

Step	Action	See also
1	Select the <b>Project Compare</b> menu option The Project Compare dialog displays	

Step	Action	See also
2	Select the required comparison: <ul style="list-style-type: none"> <li>• .EAP to .EAP</li> <li>• DBMS to .EAP</li> <li>• .EAP to DBMS</li> <li>• DBMS to DBMS</li> </ul>	
3	In the <b>Source Project</b> and <b>Target Project</b> fields, type the name or connection string for the Source and Target projects	
4	Click on the <b>Compare Projects</b> button The results of the comparison display in the panel at the bottom of the dialog	
5	If required, click on the <b>Print List</b> button to print the results	

### 3.5.3.2.2 CSV Specifications

To import and export element data to and from Enterprise Architect using CSV files, you must first set up one or more file specifications.

A file specification defines the:

- Fields from the spreadsheet in the order they are imported or exported
- Filename (optional) and
- Delimiter between columns

Once you have defined one or more specifications, one can be selected in the CSV Import/Export dialog as the current specification to apply during an import or export action.

CSV Import/Exports only imports and exports *elements* (within packages) and their properties; items such as Class attributes cannot be imported or exported through this mechanism.

XML import/export provides a solution to this limitation, as does use of the Automation Interface (Object Model).

**Access:** [Project | Model Import/Export | CSV Import/Export Specifications](#)

#### How to:

To define a specification:

- Select the **CSV Import/Export Specifications** menu option
- The CSV Import/Export Specification dialog displays; complete the fields as required, as indicated in the following table:

Field	Usage	See also
<b>Specification Name</b>	Select the unique name for this specification	
<b>Delimiter</b>	Specify the character delimiter to use between record fields  If a field contains an instance of the delimiter, the field is exported wrapped in " (quotation marks) and all instances	

Field	Usage	See also
	of " in the field are doubled (that is, " becomes """)	
<b>Notes</b>	Record a brief description of the specification	
<b>Default Filename</b>	Select the default filename	
<b>Default Direction</b>	Set the default action - <b>Import</b> or <b>Export</b>  A specification can be used in either direction, but this enables you to set the default type	
<b>Default Types</b>	Limit the element types being exported, by entering a comma-separated list: for example: <i>class,requirement,component,node,object</i> . <ul style="list-style-type: none"> <li>• If you specify element types, ONLY elements of those types are exported or imported; therefore, in order to enable the <b>Preserve Hierarchy</b> option to operate (if selected) you must include <b>Package</b> as an element type, otherwise there are no packages in which to preserve the hierarchy</li> <li>• If you do not specify any default element types, all elements including Packages are exported or imported and the hierarchy can be preserved</li> </ul>	
<b>Preserve Hierarchy</b>	Include fields generated by Enterprise Architect to embed/reconstruct the package hierarchy	<a href="#">Using Preserve Hierarchy</a> <sup>[342]</sup>
<b>Available Fields</b>	Select from a list of possible record fields, not yet allocated	
<b>File Specification</b>	List the record fields (in the order they are plotted across the spreadsheet) already assigned	
<b>Add Field</b>	Move all selected fields in the top list to the bottom list	
<b>Remove Field</b>	Move all selected fields in the bottom list back to the available list	
<b>New</b>	Create a new specification	
<b>Save</b>	Save changes to the currently selected specification	
<b>Save As</b>	Save the current specification with a new name	
<b>Delete</b>	Delete the current specification	
<b>Close</b>	Close this dialog	

**Notes:**

- In **Available Fields** and **File Specification**, the record fields **Created Date** and **Modified Date** are not set when imported from CSV

**Learn More:**

- [XML Import and Export](#)<sup>[320]</sup>
- [Enterprise Architect Object Model](#)<sup>[1837]</sup>

### 3.5.3.2.2.1 Using Preserve Hierarchy

The **Preserve Hierarchy** option on the CSV Import/Export Specification dialog includes fields generated by Enterprise Architect to embed/reconstruct the package hierarchy in a CSV import or export.

When selected, the **Preserve Hierarchy** option inserts two fields into the CSV specification that are:

- automatically populated by Enterprise Architect on export and
- used to reconstruct the exported package's hierarchy upon import.

Field	Usage	See also
<b>CSV_KEY</b>	A unique identifier for the current element This key is unique per export; subsequent exports produce different keys for the same set of elements	
<b>CSV_PARENT_KEY</b>	The corresponding CSV_KEY of the current element's parent If the field is left blank or references a non-existent CSV_KEY, the element is added to the top level of the package	

It is highly recommended that you do not change these fields if they have been automatically generated by Enterprise Architect's CSV exporter.

If you intend to import hierarchical information from a spreadsheet that was **not** populated by exporting data from Enterprise Architect, you must add these two fields to your spreadsheet as the last two columns, and populate the columns yourself.

For example:

NAME	TYPE	NOTES	PRIORITY	STATUS	CSV_KEY	CSV_PARENT_KEY
Requirement Package	Package	Notes Package1			Package1	
REQ1	Requirement	Notes on REQ1	High	Approved	REQ1	Package1
REQ2	Requirement	Notes on REQ2	High	Approved	REQ2	Package1
REQ2.1	Requirement	Notes on REQ2.1	High	Approved	REQ2.1	REQ2
REQ2.2	Requirement	Notes on REQ2.2	Med	Approved	REQ2.2	REQ2
REQ2.3	Requirement	Notes on REQ2.3	High	Approved	REQ2.3	REQ2
REQ3	Requirement	Notes on REQ3	High	Approved	REQ3	Package1
REQ3.1	Requirement	Notes on REQ3.1	High	Approved	REQ3.1	REQ3
REQ3.2	Requirement	Notes on REQ3.2	High	Approved	REQ3.2	REQ3
REQ4	Requirement	Notes on REQ4	High	Approved	REQ4	Package1
REQ4.1	Requirement	Notes on REQ4.1	High	Approved	REQ4.1	REQ4
REQ4.2	Requirement	Notes on REQ4.2	High	Approved	REQ4.2	REQ4
REQ4.3	Requirement	Notes on REQ4.3	High	Approved	REQ4.3	REQ4

### 3.5.3.2.3 CSV Export

Enterprise Architect enables you to export information about elements to a CSV text file, using a CSV export specification.

If you intend to *re-import* the exported information into Enterprise Architect at some point, it is recommended that you include the **GUID** field in the CSV export specification. This ensures that Enterprise Architect can identify and update existing elements, rather than creating duplicates.

**Access:** [Project Browser](#) | [Package Context Menu](#) | [Import/Export](#) | [CSV Import/Export](#)

#### **How to:**

To export data in CSV format, follow the steps below

1. In the Project Browser, right-click on the package containing the elements to export and select the **CSV Import/Export** menu option
2. The CSV Import/Export dialog displays; complete the fields as required, as indicated in the following table:

Field	Usage	See also
<b>Package</b>	Confirm the name of the current selected package	
<b>Specification</b>	Specify the name of the export specification <sup>[322]</sup> to use	<a href="#">CSV Specifications</a> <sup>[340]</sup>
<b>Edit/New</b>	Edit the export specification or create a new one	
<b>File</b>	Specify the filename to export to	
<b>Types</b>	List the element types to export: leave blank for all, or enter a comma-separated list of types  If you specify element types, ONLY elements of those types are exported; therefore, to enable the <b>Preserve Hierarchy</b> option in the specification to operate (if selected) you must include <i>Package</i> as an element type, otherwise no Packages are exported in which to preserve the hierarchy  If you do not specify any element types, all elements including Packages are exported and the hierarchy can be preserved	
<b>Action</b>	Select the <b>Export</b> radio button to export to file	
<b>Print Results</b>	Print out the result list	
<b>View File</b>	View the resultant CSV file with the default Windows application for CSV files	
<b>Run</b>	Perform the export	
<b>Close</b>	Exit this dialog	

#### **Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have both **Export XMI** and **Import XMI** permissions to use the **CSV Import/Export** option

#### **Learn More:**

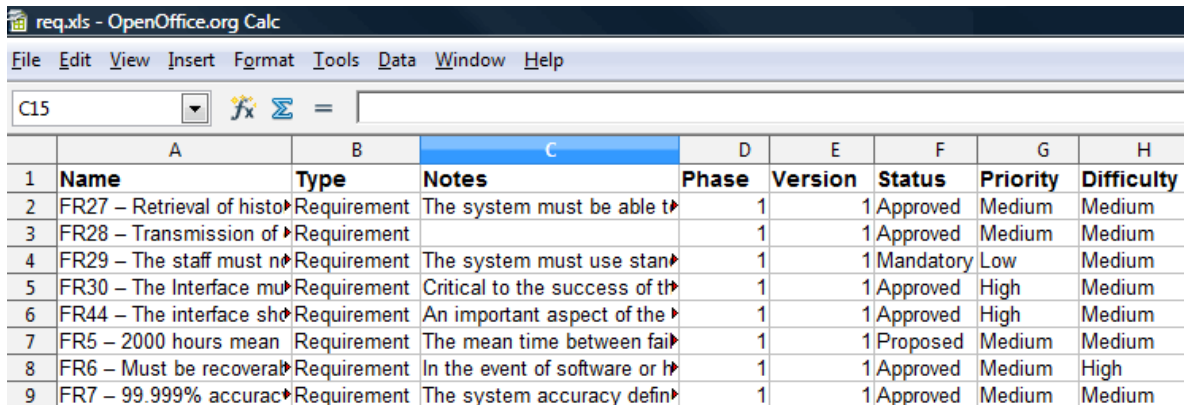

- [List of Available Permissions](#)<sup>[206]</sup>

### 3.5.3.2.4 CSV Import

Enterprise Architect enables you to import information about elements from a CSV text file, using a CSV export specification.

You import the CSV file into a selected package; if this package or any element within the package has a lock on it, you cannot import the CSV file into it. The **Import** option on the dialog is grayed out.

The format and content of the source data file should resemble the following:

The screenshot shows a spreadsheet window titled 'req.xls - OpenOffice.org Calc'. The spreadsheet contains a table with 9 rows and 9 columns. The columns are labeled A through H. The rows contain requirement data.

	A	B	C	D	E	F	G	H

**Access:** Project Browser | Package Context Menu | Import/Export | CSV Import/Export

#### How to:

To import data in CSV format, follow the steps below:

1. In the Project Browser, right-click on the package to import into and select the **CSV Import/Export** context menu option
2. The CSV Import/Export dialog displays; set the required options; as outlined below:

Field	Usage	See also
<b>Package</b>	Confirm the name of the current selected package	
<b>Specification</b>	Specify the name of the import specification <input type="text" value="1717"/> to use	<a href="#">Import specification</a> <input type="text" value="340"/>
<b>Edit/New</b>	Edit the import specification or create a new one	
<b>File</b>	Specify the spreadsheet filename to import from	
<b>Types</b>	Not used for import	
<b>Action</b>	Select the <b>Import</b> radio button to import from the file (grayed-out if the package or a child item in the package is locked)	
<b>Print Results</b>	Print out the result list	
<b>View File</b>	View the source CSV file with the default Windows application for CSV files	
<b>Run</b>	Perform the import	

Field	Usage	See also
Close	Exit this dialog	

**Notes:**

- When importing, Enterprise Architect checks the specification to see if there is a GUID field included; if there is, Enterprise Architect attempts to locate the element identified by the GUID and, if successful, updates the current element rather than creating a new one
- If no GUID field is defined, or Enterprise Architect cannot locate the identified element, a new element is created and placed in the current package; during import, **Type** is a mandatory field in the source file and must match one or more of the legal Enterprise Architect element types: for example: Requirement, or Class
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have both **Export XMI** and **Import XMI** permissions to use the **CSV Import/Export** option

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>
- [Enterprise Architect element types](#) <sup>[189]</sup>

### 3.5.3.3 Perform a Project Data Transfer

The Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect support a range of data repositories.

At some point, it might become necessary to move a complete model from one repository to another, row by row, table by table.

**Access:** [Tools | Data Management | Project Transfer](#)

**Use to:**

- Upload an existing .EAP file to a SQL Server or MySQL repository
- Download a repository in MySQL or SQL Server to a .EAP file
- Move a repository from SQL Server to MySQL or from one server to another
- Move all records from a .EAP file with replication to a model with none (Remove Replication)
- Copy all records from a .EAP file to another (recommended after serious network crash or repeated database corruption)
- Copy all records from a JET 3.5 to JET 4 (Access 2000 or XP) repository - or back the other way

**How to:**

To perform a project data transfer, follow the steps below:

Step	Action	See also
1	Take a backup of the target project to ensure that you can recover any important information it contains	
2	Select the <b>Project Transfer</b> menu option The Project Transfer dialog displays	

Step	Action	See also
3	Click on the option for the required transfer type: <ul style="list-style-type: none"> <li>• .EAP to .EAP</li> <li>• DBMS to .EAP</li> <li>• .EAP to DBMS</li> <li>• DBMS to DBMS</li> </ul>	
4	In the <b>Source Project</b> and Target Project fields, type or select the name or connection string for the Source and Target projects	
5	If you want to capture the transfer in a log file, select the <b>Logfile</b> checkbox and browse for the appropriate log file location	
6	Click on the <b>Transfer</b> button	
7	It is good practice to do a Project Compare after this process to verify that all records are written	<a href="#">Compare Projects</a> <sup>[339]</sup>

**Notes:**

- All records in the target repository are overwritten
- You cannot move a model from a source .EAP file of a version earlier than 3.5.0
- You must transfer data into a repository (where scripts have been run to set up tables), not just a database; if necessary, follow the steps below:
  - Install the DBMS software and create a database; ensure that the collation is set to the alphabet you use, such as Latin or Cyrillic
  - Run a script supplied by Sparx Systems to create the required tables
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Transfer Data** permission to transfer project data between repositories

**Learn More:**

- [Sparx Systems Scripts webpage](#)
- [Create a Repository](#) <sup>[149]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

**3.5.3.3.1 Copy Packages Between Projects**

Using the XML import/export capabilities of Enterprise Architect, you can copy and move packages between Enterprise Architect projects.

This gives you a high level of flexibility in building a project from re-usable parts and from elements produced in widely-dispersed geographic regions.

**Access:** [Project Browser](#) | [Package Context Menu](#) | [Import/Export](#) | [Export package to XMI file](#)  
[Project Browser](#) | [Package Context Menu](#) | [Import/Export](#) | [Import package from XMI file](#)

**Use to:**

- Copy individual child packages within or between models
- Duplicate larger structures, such as complete models or projects

**How to:**

To copy a package from one Enterprise Architect project to another, follow the steps below:

Step	Action	See also
1	Open the Enterprise Architect project to copy <i>from</i>	
2	In the Project Browser, right-click on the package to copy and select the <b>Export package to XMI file</b> option The Export Package to XMI dialog displays	
3	Select the appropriate options and filename	<a href="#">Export to XMI</a> <sup>[322]</sup>
4	Click on the <b>Export</b> button to begin the export process	
5	When the export is complete, open the Enterprise Architect project to copy <i>into</i>	
6	In the Project Browser, navigate to the location to import the package into	
7	Right-click and select the <b>Import package from XMI file</b> option The Import Package from XMI dialog displays	
8	Select the appropriate options and filename	<a href="#">Import from XMI</a> <sup>[324]</sup>
9	Click on the <b>Import</b> button The package is copied from the source project to the destination project.	

**Notes:**

- If the package you are importing already exists in the target project (that is, it has been imported previously), you must either import *over* the existing package or select the **Strip GUIDs** option

In the latter case, Enterprise Architect creates a copy of the original package

**Learn More:**

- [Copy a Package](#)<sup>[537]</sup>
- [Copy Elements Between Packages](#)<sup>[636]</sup>

## 3.6 Project Management

Enterprise Architect provides strong support for:

- Project Management, in estimating project size, measuring risk and effort, and assigning resources to elements
- Change control and maintenance

### Topics:

Topic	Detail	See also
<b>Metrics and Estimation</b>	<p>Project estimation is working out how much time and effort is required to build and deploy a solution</p> <p>Enterprise Architect provides the Use Case metrics facility as a means of:</p> <ul style="list-style-type: none"> <li>• Measuring the complexity of a system</li> <li>• Getting an indication of the effort required to implement the model</li> <li>• Getting an indication of the project timescale</li> </ul> <p>You base these estimates on carefully-calibrated metrics</p>	<a href="#">Use Case Estimation</a> <a href="#">402</a>
<b>Resource Management</b>	<p>Resources are the people who work on a project</p> <p>You can assign roles to resources and allocate tasks on specific model elements, which enables tracking of effort and estimation of time to complete</p>	<a href="#">Project Resources</a> <a href="#">350</a>
<b>Project Maintenance</b>	<p>During a project you monitor and manage the development and progress of individual model elements</p> <p>You can record problems, changes, issues and tasks that affect these individual elements as they arise, and document the solution and associated details</p> <p>Similarly, Enterprise Architect helps you to manage changes and issues that apply to the whole system</p>	<a href="#">Maintenance</a> <a href="#">1725</a> <a href="#">Changes and Defects</a> <a href="#">1731</a>
<b>Project Tasks and Issues</b>	<p>In the course of a project, there are various non-technical tasks that are vital to the successful management and completion of the project, such as meetings</p> <p>Enterprise Architect helps you to record and monitor these, and to manage non-technical project issues as they arise</p>	<a href="#">Project Tasks</a> <a href="#">358</a> <a href="#">Project Issues</a> <a href="#">360</a> <a href="#">Project Task Allocation</a> <a href="#">368</a>

### Learn More:

- [The Project Management Window](#)  
[349](#)
- [Personal Information](#)  
[379](#)
- [The Project Information Window](#)  
[358](#)

- [Project Glossary](#)<sup>[364]</sup>
- [Update Package Status](#)<sup>[413]</sup>
- [Manage Bookmarks](#)<sup>[414]</sup>
- [Monitor Change Events](#)<sup>[415]</sup>

### 3.6.1 The Project Management Window

The Project Management window enables you to input the following quantities associated with an element contained in the model:

- Resources - the people who work on a project, who can be assigned roles and allocated tasks
- Effort - effort expended in work on the element
- Risks - risk associated with the element
- Metrics - metrics measured for an element

Each of these four quantities has a separate tab in the window.

**Access:** [View](#) | [More Element Tools](#) | [Project Management](#)

**Reference:**

Action	Usage	See also
<b>New</b>	Create new item	<a href="#">Resource Allocation</a> <sup>[351]</sup> <a href="#">Effort Management</a> <sup>[352]</sup> <a href="#">Risk Management</a> <sup>[353]</sup> <a href="#">Metrics</a> <sup>[354]</sup>
<b>Save</b>	Save changes to an item	
<b>Save As New</b>	Duplicate an existing entry You must change an item's Role for this to become enabled	
<b>Delete</b>	Delete an item from the list	
<b>Sort</b>	Sort the items in the list into alphabetical order	
<b>Print</b>	Print item data from the list	
<b>Browse Element</b>	Display the Element Browser window for the selected element, to list and select the project management items for the element	<a href="#">The Element Browser</a> <sup>[689]</sup>
<b>Show/Hide Properties</b>	Swap between detailed and summary window styles	
<b>Help</b>	Show help contents for this window.	

**Notes:**

- Click on an element in the Project Browser to display project management information for that element in the Project Management window
- The window has two formats:
  - *List* mode - provides a detailed list showing several columns of information
  - *Item* mode - a summary list plus an editor to add or edit information for a single selected item
- Toggle between these modes using the **Show/Hide Properties** button in the window toolbar; each tab toggles between Item mode and List mode independently
- An asterisk on a tab name indicates that the tab contains saved information; if there is no information for a category of item, or the information has not yet been saved, its tab has no asterisk
- Right-click on the list to view the context menu, which enables you to add and delete list items

### 3.6.2 Project Resources

Resources are the people who work on a project. They can be assigned roles and allocated tasks, which enables tracking of effort and estimation of time to complete.

Resources are added, modified and deleted using the Project Management window.

**Access:** [View](#) | [More Element Tools](#) | [Project Management](#) (Ctrl+Shift+7)

**Use to:**

Usage	See also
Allocate a resource to an element	<a href="#">Resource Allocation</a> <sup>[351]</sup>
Record additional project management information for an element	<a href="#">Effort Management</a> <sup>[352]</sup> <a href="#">Risk Management</a> <sup>[353]</sup> <a href="#">Metrics</a> <sup>[354]</sup>
Obtain a report of resource allocation details	<a href="#">Resource Report</a> <sup>[372]</sup>
Configure Project Management data and populate the drop-down lists used on the Project Management dialog tabs	<a href="#">Roles</a> <sup>[782]</sup> <a href="#">Clients</a> <sup>[784]</sup> <a href="#">Effort Types</a> <sup>[355]</sup> <a href="#">Metric Types</a> <sup>[356]</sup> <a href="#">Risk Types</a> <sup>[357]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Project Information** permission to update and manage project resources, effort, metrics and risks

**Learn More:**

- [The Project Management Window](#) <sup>[349]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

### 3.6.2.1 Resource Allocation

In Enterprise Architect, the Project Manager can connect a named resource in a named role to a given model element.

To select the element to which to allocate resources, click on the required element in the Project Browser.

**Access:** **View | More Element Tools | Project Management > Resource Allocation: New (Ctrl+Shift+7)**

**Use to:**

- Track how far development of required components and Classes has progressed

**How to:**

To enter resource allocation details for an element, follow the steps below:

Step	Action	See also
1	Select the element in the Project Browser	
2	Select the <b>Project Management</b> menu option The Project Management window displays, showing the Resource Allocation tab	<a href="#">The Project Management Window</a> [349]
3	Click on the <b>New</b> icon on the Project Management window toolbar	
4	On the Resource Allocation tab enter the: <ul style="list-style-type: none"> <li>• Name of the resource (click on the drop-down arrow and select, or type the name in)</li> <li>• Role of the resource (click on the drop-down arrow and select, or type the name in)</li> <li>• Start and end date for the availability of the resource</li> <li>• Time allocated to the resource</li> <li>• Percentage of the task the resource has completed</li> <li>• Expected time allocated to the resource</li> <li>• Actual time expended by the resource</li> <li>• Description of the work being done by the resource (this text is also displayed in the Notes window; it cannot be edited in that window)</li> <li>• Notes on the activity history of the work done by the resource (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Notes</a> [77]
5	Click on the <b>Save</b> icon in the Project Management window toolbar	

**Notes:**

- To edit existing Resource Allocation items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in *List* mode
  - Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; resource allocation item icons have an **R** in the bottom right corner

**Learn More:**

- [The Element Browser](#)<sup>[689]</sup>

### 3.6.2.2 Effort Management

In Enterprise Architect, the Project Manager can allocate effort (as time) to work on a given model element.

To select the element to which to allocate effort, click on the required element in the Project Browser.

**Access:** **View | More Element Tools | Project Management > Effort: New (Ctrl+Shift+7)**

#### Use to:

- Enter the effort allocated to an element

#### How to:

To enter effort allocation details for an element, follow the steps below:

Step	Action	See also
1	Select the element in the Project Browser	
2	Select the <b>Project Management</b> menu option The Project Management window displays, showing the Resource Allocation tab	
3	Click on the Effort tab	
4	Click on the <b>New</b> icon on the Project Management window toolbar	
5	On the Effort tab enter the: <ul style="list-style-type: none"> <li>• Name of the effort (a short description)</li> <li>• Type of the effort (type the name or click on the drop-down arrow and select; the selection list is drawn from the global Effort Type list, but any new efforts you type in the Type field are not added to the list)</li> <li>• Time the effort is expected to expend</li> <li>• Notes on effort (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Effort Types</a> <sup>[355]</sup> <a href="#">Notes</a> <sup>[77]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar	

#### Notes:

- To edit existing Effort items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in List mode, or
  - Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; effort item icons have an **E** in the bottom right corner
- Although Enterprise Architect does not currently provide detailed reports on effort within a model, you can use the Automation Interface or similar tools to create your own custom reports based on effort information you enter

#### Learn More:

- [The Element Browser](#)<sup>[689]</sup>

- [Enterprise Architect Object Model](#)<sup>[1837]</sup>

### 3.6.2.3 Risk Management

In Enterprise Architect, the Project Manager can allocate the possible weighting of defined risks to work on a given model element.

To select the element to which to allocate risk weightings, click on the required element in the Project Browser.

**Access:** [View](#) | [More Element Tools](#) | [Project Management](#) > [Risks: New](#) (Ctrl+Shift+7)

**Use to:**

- Enter the details of risks that might impact work on an element

**How to:**

To enter risk details for an element, follow the steps below:

Step	Action	See also
1	Select the element in the Project Browser	
2	Select the <b>Project Management</b> menu option The Project Management window displays, showing the Resource Allocation tab	
3	Click on the Risks tab	
4	Click on the <b>New</b> icon on the Project Management window toolbar	
5	On the Risks tab enter the: <ul style="list-style-type: none"> <li>• Name of the risk (a short description)</li> <li>• Type of the risk (Mandatory: type the name or click on the drop-down arrow and select; the selection list is drawn from the global Risk Type list, but any new risks you type in the Type field are not added to the list)</li> <li>• Weighting allocated to the risk</li> <li>• Notes on the risk (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Risk Types</a> <sup>[357]</sup> <a href="#">Notes</a> <sup>[777]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar	

**Notes:**

- The risks described here are not the same as those represented by Risk elements; the risks described above are properties of a single element, whilst the Risk element represents something that can impact a range of other elements
- If you select a global risk type from the **Type** drop-down list and the associated **Weight** field is empty, the default Weight value is allocated to the **Weight** field on the Risks tab
- To edit existing Risk items for this element, click on the required item in the:
  - List panel to the left of the window, in *Item* mode
  - List, in List mode
  - Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; risk item icons have an **Ri** in the bottom right corner

- Although Enterprise Architect does not currently provide detailed reports on risks within a model, you can use the Automation Interface or similar tools to create your own custom reports based on risk information you enter

**Learn More:**

- [The Element Browser](#)<sup>[689]</sup>
- [Enterprise Architect Object Model](#)<sup>[1837]</sup>
- [Risk Elements](#)<sup>[1307]</sup>

### 3.6.2.4 Metrics

In Enterprise Architect, the Project Manager can allocate the possible weighting of defined metrics to work on a given model element.

To select the element to which to allocate metric weightings, click on the required element in the Project Browser.

**Access:** [View | More Element Tools | Project Management > Metrics: New \(Ctrl+Shift+7\)](#)

**Use to:**

- Enter the details of metrics that you might apply to work on an element

**How to:**

To enter metric details for an element, follow the steps below:

Step	Action	See also
1	Select the element in the Project Browser	
2	Select the <b>Project Management</b> menu option The Project Management window displays, showing the Resource Allocation tab	
3	Click on the Metrics tab	
4	Click on the <b>New</b> icon on the Project Management window toolbar	
5	On the Metrics tab enter the: <ul style="list-style-type: none"> <li>• Name of the metric (a short description)</li> <li>• Type of the metric (Mandatory: type the name or click on the drop-down arrow and select; the selection list is drawn from the global Metric Type list, but any new metrics you type in the Type field are not added to the list)</li> <li>• Weighting allocated to the metric</li> <li>• Notes on the metric (this text is also displayed in the Notes window; it cannot be edited in that window)</li> </ul>	<a href="#">Metric Types</a> <sup>[356]</sup> <a href="#">Notes</a> <sup>[771]</sup>
6	Click on the <b>Save</b> icon in the Project Management window toolbar	

**Notes:**

- If you select a global metric type from the **Type** drop-down list and the associated **Weight** field is empty, the default Weight value is allocated to the **Weight** field on the Metrics tab
- To edit existing Metric items for this element, click on the required item in the:

- List panel to the left of the window, in *Item* mode
- List, in List mode
- Project Management folder in the Element Browser window - if this window is not displayed, click on the **Browse Element** icon in the Project Management window toolbar; metric item icons have an **M** in the bottom right corner
- Although Enterprise Architect does not currently provide detailed reports on metrics within a model, you can use the Automation Interface or similar tools to create your own custom reports based on metric information you enter

**Learn More:**

- [The Element Browser](#)<sup>689</sup>
- [Enterprise Architect Object Model](#)<sup>1837</sup>

### 3.6.2.5 Effort Types

Enterprise Architect enables you to add an effort *type* to the global list of effort types that can be added to any element in the model.

The global list of effort types displays in the **Type** field drop-down list on the Effort tab of the Project Management window.

**Access:** [Settings](#) | [Project Types](#) | [Project Indicators](#) > [Effort: New](#)

**Use to:**

- Specify the effort types used when assigning effort to an element

**How to:**

To add a new effort type to the global list, follow the steps below:

Step	Action	See also
1	Select the Project Indicators menu option The Project Indicators dialog displays	
2	Click on the Effort tab.	
3	Click on the <b>New</b> button (To edit an existing effort type, click on the effort type name in the <b>Defined Effort Types</b> list)	
4	Complete the fields as follows: <ul style="list-style-type: none"> <li>• In the <b>Effort</b> field type the name of the effort type</li> <li>• In the <b>Description</b> field type a short description of the effort type</li> <li>• In the <b>Weight</b> field type the default weighting to apply to the effort type</li> <li>• In the <b>Note</b> field, type any additional information on the effort type</li> </ul>	
5	Click on the <b>Save</b> button.	

**Notes:**

- Although Enterprise Architect does not currently provide detailed reports on effort within a model, you can use the Automation Interface or similar tools to create your own custom reports based on effort information you enter
- You can transport effort types between models, using Export Reference Data and Import Reference Data

**Learn More:**

- [The Project Management Window](#)<sup>[349]</sup>
- [Enterprise Architect Object Model](#)<sup>[1837]</sup>
- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 3.6.2.6 Metric Types

Enterprise Architect enables you to add a metric *type* to the global list of metric types that can be added to any element in the model.

The global list of metric types displays in the **Type** field drop-down list on the Metrics tab of the Project Management window.

**Access:** [Settings](#) | [Project Types](#) | [Project Indicators](#) > [Metric: New](#)

**Use to:**

- Specify the metric types used when assigning metrics to an element

**How to:**

To add a new metric type to the global list, follow the steps below:

Step	Action	See also
1	Select the Project Indicators menu option The Project Indicators dialog displays	
2	Click on the Metric tab.	
3	Click on the <b>New</b> button (To edit an existing metric type, click on the metric type name in the <b>Defined Metrics</b> list)	
4	Complete the fields as follows: <ul style="list-style-type: none"> <li>• In the <b>Metric Type</b> field type the name of the metric type</li> <li>• In the <b>Description</b> field type a short description of the metric type</li> <li>• In the <b>Weight</b> field type the default weighting to apply to the metric type</li> <li>• In the <b>Note</b> field, type any additional information on the metric type</li> </ul>	
5	Click on the <b>Save</b> button.	

**Notes:**

- Although Enterprise Architect does not currently provide detailed reports on metrics within a model, you

can use the Automation Interface or similar tools to create your own custom reports based on metric information you enter

- You can transport metric types between models, using Export Reference Data and Import Reference Data

**Learn More:**

- [The Project Management Window](#)<sup>[349]</sup>
- [Enterprise Architect Object Model](#)<sup>[1837]</sup>
- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 3.6.2.7 Risk Types

Enterprise Architect enables you to add a risk *type* to the global list of risk types that can be added to any element in the model.

The global list of risk types displays in the **Type** field drop-down list on the Risks tab of the Project Management window.

**Access:** [Settings | Project Types | Project Indicators > Risk: New](#)

**Use to:**

- Specify the risk types used when defining risks to an element

**How to:**

To add a new risk type to the global list, follow the steps below:

Step	Action	See also
1	Select the Project Indicators menu option The Project Indicators dialog displays	
2	Click on the Risk tab.	
3	Click on the <b>New</b> button (To edit an existing risk type, click on the risk type name in the <b>Defined Risks</b> list)	
4	Complete the fields as follows: <ul style="list-style-type: none"> <li>• In the <b>Risk Type</b> field type the name of the risk type</li> <li>• In the <b>Description</b> field type a short description of the risk type</li> <li>• In the <b>Weight</b> field type the default weighting to apply to the risk type</li> <li>• In the <b>Note</b> field, type any additional information on the risk type</li> </ul>	
5	Click on the <b>Save</b> button	

**Notes:**

- Although Enterprise Architect does not currently provide detailed reports on risks within a model, you can use the Automation Interface or similar tools to create your own custom reports based on risk

information you enter

- You can transport risk types between models, using Export Reference Data and Import Reference Data

#### Learn More:

- [The Project Management Window](#)<sup>[349]</sup>
- [Enterprise Architect Object Model](#)<sup>[1837]</sup>
- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 3.6.3 The Project Information Window

The Project Information window documents tasks and issues that relate directly to the current project, and enables you to view and develop the project glossary of terms.

**Access:** [View](#) | [More Project Tools](#) | [Project Information](#) ( Alt+2 )

#### Use to:

Usage	See also
Review major project tasks that require attention; you can filter tasks based on their current status	<a href="#">Project Tasks</a> <sup>[358]</sup>
Review events, occurrences and situations that impact on project development and delivery	<a href="#">Project Issues</a> <sup>[360]</sup>
Review the technical and business terms already defined for a model You can add to the list, delete or change items, and filter the list to exclude by type	<a href="#">Project Glossary</a> <sup>[364]</sup>

You can add or work on an item in the Project Information window by *right-clicking* (context menu) or *double-clicking* on the blank or completed item line.

#### Notes:

- Right-clicking in the Project Information window displays a context menu that has options for filtering tasks/issues by status, and glossary by term; you can also rearrange the sort-order by clicking in the title bar of the column that the items are to be indexed on

#### 3.6.3.1 Project Tasks

The *Project Tasks List* is a convenient 'To Do' list of major project work items that are not recorded elsewhere, and can be used to track events such as requests or corrections. It is a tab of the Project Information window.

#### Notes:

- Right-click on the list to view the context menu, and select to add, modify or delete tasks, or to set a status filter
- To set the sort order, click the title-bar of the column on which to index the tasks
- To print out the currently displayed items, select the **Print List** context menu option
- You can transport task definitions between models using Export Reference Data and Import Reference Data

**Learn More:**

- [Add, Modify and Delete Tasks](#) <sup>[359]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

**3.6.3.1.1 Add, Modify and Delete Tasks**

This topic explains how to maintain project tasks.

**Access:** **View | More Project Tools | Project Information > Project Tasks**  
**View | Project Calendar > Project Tasks mode**  
**View | Personal Information > Project Tasks**

**Use to:**

- Add project tasks
- Edit project tasks
- Delete project tasks

**How to:**

To maintain tasks, follow the steps below:

Step	Action	See also
1	If creating a new task: <ul style="list-style-type: none"> <li>• Double-click in a blank area of the Project Tasks tab, or on a cell of the Project Calendar</li> </ul> If editing an existing item: <ul style="list-style-type: none"> <li>• Double click on the item on the Project Tasks tab or Project Calendar</li> </ul> The Task Detail dialog displays	<a href="#">The Project Information Window</a> <sup>[358]</sup> <a href="#">Project Calendar</a> <sup>[392]</sup>
2	Enter or update the following details of the task, selecting a value from the field's drop-down list where appropriate: <ul style="list-style-type: none"> <li>• The task name</li> <li>• Auto counters - if you have configured these, click on the <b>Auto</b> button</li> <li>• The task type</li> <li>• The task owner</li> <li>• The expected start and end date for the task (select the check boxes to activate the dates)</li> <li>• The current status of the task</li> <li>• The person this task has been assigned to</li> <li>• The task priority: high, medium or low</li> <li>• The expected total time for the task and the actual time expended</li> <li>• The percentage complete</li> <li>• The phase associated with this task</li> <li>• A description of the task</li> <li>• Any progress history appropriate to the task</li> </ul>	<a href="#">Use Auto Naming and Auto Counters</a> <sup>[630]</sup>
3	Click on the <b>Apply</b> button	

Step	Action	See also
4	To create another entry, click on the <b>New</b> button, or to close, click on the <b>OK</b> button	
5	To delete a task: <ul style="list-style-type: none"> <li>• Right-click on the task and select the <b>Delete</b> context menu option</li> <li>• Click on the <b>Yes</b> button on the confirmation prompt</li> </ul>	

### 3.6.3.2 Project Issues

Any identified issues can be recorded against the current project, on either the:

- Project Issues tab of the Project Information window, or
- Project Issues dialog

For each Issue, you record the description, date, owner and status.

**Access:** **View | More Project Tools | Project Information > Project Issues tab ( Alt+2 )**  
**Project | Documentation | Issues**

Usage	See also
Add, edit and delete Issues	<a href="#">Add, Delete and Modify Issues</a> <sup>[360]</sup>
Generate and view a rich text format report of your issue list	<a href="#">Report From Project Issues Dialog</a> <sup>[362]</sup> <a href="#">Report From Project Issues Tab</a> <sup>[362]</sup> <a href="#">Report Output Sample</a> <sup>[363]</sup>

#### Notes:

- You can transport these issue definitions between models, using Export Reference Data and Import Reference Data
- To print out the currently displayed items, select the **Print List** context menu option
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Issues** permission to update and delete Issues records

#### Learn More:

- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

#### 3.6.3.2.1 Add, Delete and Modify Issues

This topic explains how to maintain project issue records using either the:

- Issue Detail dialog from the Project Issues tab of the Project Information window, or
- Project Issues dialog

These two dialogs have very similar fields.

**Access:** [View](#) | [More Project Tools](#) | [Project Information](#) > [Project Issues tab](#) ( Alt+2 )  
[Project](#) | [Documentation](#) | [Issues](#)

**Use to:**

- Add project issues
- Edit project issues
- Delete project issues

**How to:**

To maintain issues, follow the steps below:

Step	Action	See also
1	<p>If creating a new issue:</p> <ul style="list-style-type: none"> <li>• On the Project Issues tab, double-click in a blank area to display the Issue Detail dialog</li> <li>• On the Project Issues dialog, click on the <b>New</b> button</li> </ul> <p>If editing an existing item:</p> <ul style="list-style-type: none"> <li>• On the Project Issues tab, double click on the item</li> <li>• On the Project Issues dialog, click on the item in the <b>Project Issues &amp; Discussion</b> list</li> </ul>	<a href="#">The Project Information Window</a> <sup>[358]</sup>
2	<p>Enter or update the following issue details, selecting a value from the field's drop-down list where appropriate:</p> <ul style="list-style-type: none"> <li>• The issue name</li> <li>• Auto counters - if you have configured these, click on the <b>Auto</b> button</li> <li>• The issue priority</li> <li>• The date the issue was raised</li> <li>• The issue status</li> <li>• The issue owner</li> <li>• A description of the issue</li> <li>• The name of the person who resolved the issue</li> <li>• The date on which the issue was resolved (select the check box to activate the date)</li> <li>• Any comments on the resolution</li> </ul>	<a href="#">Use Auto Naming and Auto Counters</a> <sup>[630]</sup>
3	Click on the <b>Apply</b> or <b>Save</b> button	
4	If the issue is closed (and all the <b>Resolution</b> fields are completed), click on the <b>Close Issue</b> button	
5	To create another entry, click on the <b>New</b> button, or to close, click on the <b>OK</b> or <b>Close</b> (Project Issues dialog) button.	
6	<p>To delete an issue:</p> <ul style="list-style-type: none"> <li>• On the Project Issues tab, right-click on the entry and select the <b>Delete</b> context menu option, then click on the <b>Yes</b> button on the confirmation prompt</li> <li>• On the Project Issues dialog, click on the item in the <b>Project Issues &amp; Discussion</b> list, ensure that the <b>Resolution</b> fields are complete, then click on the <b>Delete</b> button</li> </ul>	

**Notes:**

- You cannot delete a Closed issue through the Project Issues dialog
- You can filter the list of issues by status, to include or exclude:
  - On the Project Issues dialog, closed issues, using the **Show Closed Issues** checkbox
  - On the Project Issues tab, all issues or just Open, Closed or Under Review issues, using the **Set Term Filter** context menu option

**3.6.3.2.2 Report From Project Issues Dialog**

This topic explains how to generate an RTF report on your project issue records using the Project Issues dialog.

**Access:** [Project | Documentation | Issues](#)

**Use to:**

- Generate and view an RTF report on project issues

**How to:**

To generate your project issues report, follow the steps below:

Step	Action	See also
1	On the Project Issues dialog, click on the <b>Report</b> button The Save As dialog displays	
2	Browse for and select the appropriate file location In the <b>File name</b> field, type the file name for the report	
3	Click on the <b>Save</b> button A status message displays when the report has been generated	
4	Click on the <b>OK</b> button and then on the <b>View RTF</b> button The report displays in your default viewer	<a href="#">Report Output Sample</a> [363]

**3.6.3.2.3 Report From Project Issues Tab**

This topic explains how to generate an RTF report on your project issue records using the Project Issues tab of the Project Information window.

**Access:** [View | More Project Tools | Project Information > Project Issues tab \( Alt+2 \)](#)

**Use to:**

- Generate and view an RTF report on project issues

**How to:**

To generate your project issues report, follow the steps below:

Step	Action	See also
1	Right-click on the Project Issues tab; select the <b>Create RTF Report</b> context menu option The Save As dialog displays	
2	Browse for and select the appropriate file location In the <b>File name</b> field, type the file name for the report	
3	Click on the <b>Save</b> button A status message displays when the report has been generated	
4	Click on the <b>OK</b> button and then on the <b>View RTF</b> button The report displays in your default viewer	<a href="#">Report Output Sample</a> 363

#### 3.6.3.2.4 Report Output Sample

The following illustration is an example of the output from an *Issues* report.

### List of Project Issues: 24-Jul-2010 9:47:00 AM

Issue	Date/Owner	Description	Resolution
Test servers will be delayed	24/07/2010 Eloise Norman	The test server builds have been delayed because the particular (unusual) memory requirements to match the customer's site are not available on shore. They are being sourced from Singapore but it will delay the builds and delivery of the machines.	Closed: 24/07/2010 Geoffrey Sparks  The machines will be built and delivered using standard memory and the proprietary memory will be added later. All performance tests will be delayed until the memory is available.
Public Holidays	24/07/2010 Joanna Stoat	The schedule includes staff working on public holidays. A number of staff have indicated that contrary to what they stated earlier they are not available.	Open: 24/07/2010
Compiler Version disparity	24/07/2010 Eloise Norman	A number of the developers have downloaded different versions of a number of the compilers. This has lead to unpredictable builds impacting on testing.	Under Review: 24/07/2010

### 3.6.3.3 Project Glossary

The Project Glossary enables you to set up a list of defined terms for your project.

**Access:** [View | More Project Tools | Project Information > Project Glossary](#) ( Alt+2 )  
[Project | Documentation | Glossary](#)

Usage	See also
Add, delete and modify the project glossary entries through either the: <ul style="list-style-type: none"> <li>• Project Glossary tab on the Project Information window, or</li> <li>• Glossary dialog</li> </ul>	<a href="#">Project Glossary Tab</a> <sup>[364]</sup> <a href="#">The Glossary Dialog</a> <sup>[365]</sup>
Separate glossary items by category; for example, Business terms and Technical terms	<a href="#">Project Glossary Tab</a> <sup>[364]</sup> <a href="#">The Glossary Dialog</a> <sup>[365]</sup>
Save the glossary in Rich Text format for inclusion as part of a larger project document	<a href="#">Generate a Report</a> <sup>[366]</sup>
Create glossary terms and definitions from text in the Notes window, or from any <b>Notes</b> or <b>Description</b> fields that have the Notes toolbar	<a href="#">Notes</a> <sup>[771]</sup>
Insert existing glossary terms into any other <b>Notes</b> fields	<a href="#">Notes</a> <sup>[771]</sup>

#### Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions
- You might include a Glossary Report in your project requirements or functional specifications documents
- You can transport glossary definitions between models, using Export Reference Data and Import Reference Data

#### Learn More:

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

#### 3.6.3.3.1 Project Glossary Tab

The Project Glossary tab in the Project Information window shows displays the glossary terms already defined for your model.

**Access:** [View | More Project Tools | Project Information > Project Glossary tab](#) ( Alt+2 )

#### Use to:

- Add glossary terms
- Modify glossary terms
- Change a definition type for all terms of that type
- Filter the display show terms of a specific type only
- Print the displayed list of terms
- Delete glossary terms

**How to:**

Right-click on an entry on the Glossary tab, and select the appropriate context menu option for the operation you intend to perform (as listed above); if you select the:

- **Add New** or **Modify Selected** options, the Glossary Detail dialog displays; complete the fields as indicated in the following table:

Field	Usage	See also
<b>Term</b>	Type the term to include in the glossary	
<b>Type</b>	(Mandatory) Select the required type  If you require a different glossary type, click on the ( ... ) (browse) button and specify the name of the new type  This field applies the type <i>only</i> to the selected term; you can rename a type for <i>all</i> terms of that type, using the context menu as described below	
<b>Meaning</b>	(Mandatory) Type the definition or description of the term  If necessary, format the text of this description using the Notes toolbar at the top of the field	<a href="#">Notes</a>
<b>New</b>	Clear the dialog fields so that you can define a new Glossary term	
<b>Apply</b>	Save the new or updated glossary entry	
<b>Delete</b>	Delete the entry  A prompt displays to confirm the deletion; click on the <b>Yes</b> button to remove the term from the glossary	

- **Rename type** option, the Rename Glossary Type dialog displays on which you enter the alternative type name (either one of the existing types or a new type); when you click on **OK**, *all* entries of the original type are changed to the new type
- **Set term filter** option, the Term Type Filter dialog displays on which you enter the type of glossary term to list; when you click on **OK**, only items of that type are shown on the Project Glossary tab
- **Remove term filter** option, the Project Glossary tab refreshes to show glossary items of all types
- **Print List** option, the Print dialog displays on which you define the printing parameters; when you click on **OK**, the currently-displayed list prints out
- **Delete** option, a prompt displays to confirm the deletion; click on the **Yes** button to remove the term from the glossary

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions

**3.6.3.3.2 The Glossary Dialog**

The Glossary dialog enables you to create and maintain definitions of terms used in your project, as a Glossary.

**Access:** [Project](#) | [Documentation](#) | [Glossary](#)

**Use to:**

- Add, modify and delete glossary entries
- Filter the dialog display to list entries of a specific type only

**How to:**

Select the **Glossary** menu option and complete the Glossary dialog as indicated below

Field	Usage	See also
<b>Glossary Term</b>	Type the term to include in the glossary	
<b>Glossary Type</b>	(Mandatory) Select the required type  If you require a different glossary type, click on the ( ... ) (browse) button and specify the name of the new type  This field applies the type <i>only</i> to the selected term; you can <i>rename</i> a type for all terms of that type <sup>[364]</sup> , using the Project Glossary tab of the Project Information window	<a href="#">Project Glossary Tab</a> <sup>[364]</sup>
<b>Description</b>	(Mandatory) Type the definition or description of the term  If necessary, format the text of this description using the Notes toolbar at the top of the field	<a href="#">Notes</a> <sup>[772]</sup>
<b>Limit Display To</b>	Select the appropriate glossary type to filter the <b>Type   Term</b> list to show entries of that type only  Select <b>All</b> to display all glossary entries	
<b>New</b>	Clear the dialog fields so that you can define a new Glossary term	
<b>Type   Term</b>	Review the list of defined glossary terms; click on an entry to edit it in the dialog fields	
<b>Save</b>	Save the new or updated glossary entry	
<b>Delete</b>	Delete the entry selected from the <b>Type   Term</b> list	
<b>Report</b>	Generate and print a glossary report <sup>[366]</sup>	<a href="#">Generate a Report</a> <sup>[366]</sup> <a href="#">Glossary Report Output Sample</a> <sup>[367]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Glossary** permission in order to create, update or delete Glossary items; if security is not enabled, you can manage Glossary items without any permissions

**3.6.3.3.3 Generate a Report**

You can generate a rich text format file of your model's glossary, which you can either print or attach to any other appropriate document file.

The file can contain all glossary entries, or just those of selected types.

**Access:** [Project](#) | [Documentation](#) | [Glossary: Report](#)

**Use to:**

- Generate a formatted RTF document file of your model glossary

**How to:**

To generate an RTF report of the project glossary, follow the steps below:

Step	Action	See also
1	Select the <b>Glossary</b> menu option The Glossary dialog displays	
2	Click on the <b>Report</b> button The Glossary Report dialog displays	
3	In the <b>Filename</b> field, type or select a filename for the glossary	
4	In the <b>Heading</b> field, type a suitable heading for the glossary	
5	In the <b>Include Glossary Items</b> panel, select the checkbox for each type of glossary entry to include To select all types of entry, click on the <b>Select All</b> button	
6	If necessary, to define the page setup and language for the report, click on the <b>Page Setup</b> and/or <b>Language</b> buttons	
7	To include page breaks, select the <b>Page break between sections</b> checkbox	
8	Click on the <b>Generate</b> button to generate the report	
9	Click on the <b>View</b> button to open the report	<a href="#">Glossary Report Output Sample</a> <sup>[367]</sup>

**3.6.3.3.3.1 Glossary Report Output Sample**

An example of the output from a Glossary report is shown below:

## Glossary

### ***Business Terms***

***Accounting Periods***

A defined period of time whereby performance reports can be extracted. (normally 4 week periods).

***Customer***

A person or a company that requests An entity to transport goods on their behalf.

## Technical Terms

### Association

A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.

### Component Model

The component model provides a detailed view of the various hardware and software components that make up the proposed system. It shows both where these components reside and how they inter-relate with other components. Component requirements detail what responsibilities a component has to supply functionality or behavior within the system.

### Deployment Model

A model of the system as it is physically deployed.

### Extends Relationship

A relationship between two Use Cases in which one Use Case 'extends' the behavior of another. Typically this represents optional behavior in a Use Case scenario - for example a user might optionally request a list or report at some point in a performing a business Use Case.

## 3.6.4 Project Task Allocation

The Project Task Allocation window enables you to review the allocation of work to elements in the project, focussing on either the elements that require work, or the resources required to perform the work. The window primarily shows information that is entered through other windows and dialogs, but once a record exists in the window you can edit it and, for example, add to or change the resources on an element.

**Access:** [View | Task Allocations](#)

### Topics:

Topic	Detail	See also
<b>Resource View</b>	The Resource View shows the current commitments of each allocated resource in the project as a list of allocation records and a GANTT chart of the progress of the allocations	<a href="#">Resource View</a> 368
<b>Element View</b>	The Element View lists the elements in the project that have resources assigned to them, and the resources assigned to each element, as a list of allocation records and a GANTT chart of the progress of the allocations	<a href="#">Element View</a> 370
<b>Report View</b>	A Resource report shows how your resources are deployed in your project, displaying a list of all elements that have resources allocated to them	<a href="#">Report View</a> 372

### 3.6.4.1 Resource View

The Resource View of the Project Task Allocation window shows the current commitments of each allocated resource in the project as a list of allocation records and a GANTT chart of the progress of the allocations.

The display initially shows the resources and their overall commitment; click on the 'plus-box' to the left of the name of the resource to expand the entry to show the elements and the allocation period for each element.

The display shows both complete allocations and those that are still in progress; an internal filter hides completed allocations two weeks after the end date, and incomplete allocations one month after the end date.

**Access:** [View | Task Allocations > Resource View](#)

**Use to:**

- Check the dates on which specific resources or all resources are currently allocated
- Check the elements to which each resource is allocated
- Check the dates on which a resource is allocated to work on a specific element
- Check the general progress of the resource in completing the work
- Check the specific details of the allocation of a resource to an element and task or role

**How to:**

On the Resource View tab, make selections from the options as indicated below:

Option	Usage	See also
<b>Filter the display</b>	Right-click on the window and select the <b>Apply Filter</b> context menu option  The Filter Bar displays at the top of the <b>Resource</b> and <b>Role or Task</b> columns; type in a text string to filter for <i>element names</i> and <i>role or task</i> names, respectively, that begin with the text	<a href="#">List Header</a> <sup>[460]</sup>
<b>Display the properties of the element to which the resource is assigned</b>	Right-click on the entry and select the <b>Object Properties</b> context menu option  The Properties dialog for the element displays	<a href="#">Properties Dialog</a> <sup>[662]</sup>
<b>Display the resource allocation details</b>	Right-click on the entry and select the <b>Task Properties</b> context menu option  The Assigned Resources dialog displays; you can edit the details and, if necessary, change the resource allocated to the element	<a href="#">Resource Allocation</a> <sup>[351]</sup>  <a href="#">The Project Management Window</a> <sup>[349]</sup>
<b>Refresh the report</b>	Right-click on the entry and select the <b>Refresh</b> context menu option  The content of the display is refreshed and collapsed to resource level	
<b>Display the Resource Allocation records for the element</b>	Right-click on the entry and select the <b>Locate in Resource Window</b> context menu option  The Project Management window opens at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel  You can edit the details and, if necessary, change the resource allocated to the element	<a href="#">Resource Allocation</a> <sup>[351]</sup>  <a href="#">The Project Management Window</a> <sup>[349]</sup>
<b>Reposition the GANTT chart to</b>	Right-click on the entry and select the required option: <ul style="list-style-type: none"> <li>• <b>Go To   Task Start</b></li> </ul>	

Option	Usage	See also
show the start date or end date of an allocation, or today's date	<ul style="list-style-type: none"> <li>• <b>Go To   Task End</b></li> <li>• <b>Go To   Today's Date</b></li> </ul> <p>The display shifts to put the required date in the center of the chart</p>	
Locate the element in the Project Browser	<p>Right-click on the element name and select the <b>Find in Project Browser</b> context menu option</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted</p>	
Save an image of the GANTT chart to file	<p>Right-click on the tab and select the <b>Save Image to File</b> context menu option</p> <p>The Save As Image dialog displays, on which you specify the file name, location and graphics file type to save to</p>	
Save an image of the GANTT chart to the clipboard	<p>Right-click on the tab and select the <b>Copy Image to Clipboard</b> context menu option</p> <p>You can paste the image from the clipboard into your preferred graphics package</p>	

### 3.6.4.2 Element View

The Element View of the Project Task Allocation window lists the elements in the project that have resources assigned to them and the resources assigned to each element, as a list of allocation records and a GANTT chart of the progress of the allocations. An allocation can be partial, in that a role or task is assigned but no specific resource has been identified.

The display initially shows the elements and their overall resource commitment; click on the 'plus-box' to the left of the name of the element to expand the entry to show the resources and the allocation period for each resource.

The display shows both complete allocations and those that are still in progress; an internal filter hides completed allocations two weeks after the end date, and incomplete allocations one month after the end date.

**Access:** [View | Task Allocations > Element View](#)

#### Use to:

- Check the dates on which specific elements have resources currently allocated
- Check which resources are currently allocated to an element
- Assign further resources to the element
- Check the dates on which a resource is allocated to work on a specific element
- Check the general progress of the resource in completing the work
- Check the specific details of the allocation of a resource to an element and task or role

#### How to:

On the Element View tab, make selections from the options as indicated below:

Option	Usage	See also
<b>Filter the display</b>	<p>Right-click on the window and select the <b>Apply Filter</b> context menu option</p> <p>The Filter Bar displays at the top of the <b>Element</b> and <b>Role or Task</b> columns; type in a text string to filter for <i>resource names</i> and <i>role or task</i> names, respectively, that begin with the text</p>	<a href="#">List Header</a> <sup>[460]</sup>
<b>Display the properties of the element</b>	<p>Right-click on the element and select the <b>Properties</b> context menu option</p> <p>The Properties dialog for the element displays</p>	<a href="#">Properties Dialog</a> <sup>[662]</sup>
<b>Display the resource allocation details</b>	<p>Right-click on the resource and select the <b>Properties</b> context menu option</p> <p>The Assigned Resources dialog displays; you can edit the details and, if necessary, change the resource allocated to the element</p>	<a href="#">Resource Allocation</a> <sup>[351]</sup> <a href="#">The Project Management Window</a> <sup>[349]</sup>
<b>Assign a new resource to the element</b>	<p>Right-click on the resource and select the <b>Assign Resource</b> context menu option</p> <p>The Assigned Resources dialog displays; complete this as for the Resource Allocation tab of the Project Management window</p>	<a href="#">Resource Allocation</a> <sup>[351]</sup> <a href="#">The Project Management Window</a> <sup>[349]</sup>
<b>Refresh the report</b>	<p>Right-click on the display and select the <b>Refresh</b> context menu option</p> <p>The content of the display is refreshed and collapsed to element level</p>	
<b>Display the Resource Allocation records for the element</b>	<p>Right-click on the entry and select the <b>Locate in Resource Window</b> context menu option</p> <p>The Project Management window opens at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel</p> <p>You can edit the details and, if necessary, change the resource allocated to the element</p>	<a href="#">Resource Allocation</a> <sup>[351]</sup> <a href="#">The Project Management Window</a> <sup>[349]</sup>
<b>Reposition the GANTT chart to show the start date or end date of an allocation, or today's date</b>	<p>Right-click on the entry and select the required option:</p> <ul style="list-style-type: none"> <li>• <b>Go To   Task Start</b></li> <li>• <b>Go To   Task End</b></li> <li>• <b>Go To   Today's Date</b></li> </ul> <p>The display shifts to put the required date in the center of the chart</p>	
<b>Locate the element in the Project Browser</b>	<p>Right-click on the element name and select the <b>Find in Project Browser</b> context menu option</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted</p>	
<b>Save an image of the GANTT chart to file</b>	<p>Right-click on the tab and select the <b>Save Image to File</b> context menu option</p> <p>The Save As Image dialog displays, on which you specify the file name, location and graphics file type to save to</p>	

Option	Usage	See also
<b>Save an image of the GANTT chart to the clipboard</b>	<p>Right-click on the tab and select the <b>Copy Image to Clipboard</b> context menu option</p> <p>You can paste the image from the clipboard into your preferred graphics package</p>	

### 3.6.4.3 Report View

The *Report View* shows how your resources are deployed in your project, displaying:

- a list of all elements that have resources allocated to them, and the type of each element
- the resource allocated, and the role played by that resource
- the start and end dates of the allocation
- the time allocated, expected and expended
- the percentage completion of the allocation

You can tailor the displayed information by:

- Hiding columns of information
- Grouping types of information
- Filtering the data by status
- Filtering the data by start date or end date
- Filtering any column to show only a specific value

Having displayed the information you require, you can print it.

**Access:** [View | Task Allocations > Report View](#)

#### Use to:

Identify, for example:

- What elements each resource is working on
- What resources are assigned to an element or package
- How close to completion your resources are, or
- How long a resource is assigned to a particular area.

#### How to:

On the Report View tab, make selections from the options as indicated below:

Option	Usage	See also
<b>Run the report</b>	<p>Click on the first icon in the Report View toolbar (the rotating arrows)</p> <p>The report results display</p> <p>If you have the report open for a while, you can update the information; either:</p> <ul style="list-style-type: none"> <li>• Run the report again or</li> <li>• Right-click on the content and select the <b>Refresh</b> context menu option</li> </ul>	
<b>Adjust column</b>	Drag and drop column headings into the sequence you	<a href="#">List Header</a> <sup>[460]</sup>

Option	Usage	See also
headings	<p>require</p> <p>Right-click on the column headings and select the <b>Field Chooser</b> context menu option, to add or remove columns using the Field Chooser dialog</p>	
Group entries by column heading	<p>Right-click on the column headings and select the <b>Enable Group Box</b> context menu option, to cluster the report information according to your preferred hierarchy of column headings</p>	<a href="#">List Header</a> <sup>[460]</sup>
Filter columns	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the third toolbar icon from the <i>right</i> (the spy glass), or</li> <li>• Right-click on the column headings and select the <b>Toggle Filter Bar</b> context menu option</li> </ul> <p>The filter field displays at the top of every column</p> <p>Type in whatever text string you require in the appropriate column to filter the report to show only entries containing that text string in that column</p>	<a href="#">List Header</a> <sup>[460]</sup>
Filter by degree of completion	<p>In the first field in the toolbar, click on the drop-down arrow and select one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>All</b> - Display all entries regardless of degree of completion</li> <li>• <b>Completed</b> - Display only those entries where the allocation is 100% completed</li> <li>• <b>Above cut-off</b> - Display only those entries that are more than a certain percentage complete</li> <li>• <b>Below cut-off</b> - Display only those entries that are less than a certain percentage complete</li> </ul> <p>In the second field, either type a threshold value or increment to the value using the up/down arrows, to set the percentage completion for the <b>Above/Below cut-off</b> options</p>	
Filter according to start/end date	<p>Click on the fourth toolbar icon from the right (the funnel)</p> <p>The Resource Filters dialog displays</p> <p>In the <b>Start Date</b> and/or <b>End Date</b> field, click on the drop-down arrow and select the appropriate qualifier:</p> <ul style="list-style-type: none"> <li>• <b>After</b></li> <li>• <b>Before</b></li> <li>• <b>Equal To</b></li> <li>• <b>Not Equals</b></li> </ul> <p>In the date fields, click on the checkbox to activate the fields and either type in the day, month and year or click on the drop-down arrow to select the date from a calendar</p> <p>The fields have an AND relationship; an entry must satisfy both date criteria before it is displayed</p>	
Display the properties of the element to which the resource is assigned	<p>Right-click on the entry and select the <b>Object Properties</b> context menu option</p> <p>The Properties dialog for the element displays</p>	<a href="#">Properties Dialog</a> <sup>[662]</sup>

Option	Usage	See also
Display the resource allocation details	Right-click on the entry and select the <b>Task Properties</b> context menu option  The Assigned Resources dialog displays	<a href="#">Resource Allocation</a> [351]  <a href="#">The Project Management Window</a> [349]
Display the Resource Allocation records for the element	Right-click on the entry and select the <b>Locate in Resource Window</b> context menu option  The Project Management window opens at the Resource Allocation tab, with the details of the selected entry shown in the fields and the other resource allocations for the element listed in the left-hand panel	<a href="#">Resource Allocation</a> [351]  <a href="#">The Project Management Window</a> [349]
Locate the element in the Project Browser	Right-click on the entry and select the <b>Find in Project Browser</b> context menu option  The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted	
Print the report	Either: <ul style="list-style-type: none"> <li>Click on the second toolbar icon from the right (the printer) or</li> <li>Right-click on an entry in the report and select the <b>Print</b> context menu option</li> </ul> <p>The Print dialog displays, on which you specify the printer to use and the characteristics of the print job</p>	

### 3.6.5 Spell Checking

Enterprise Architect provides a powerful spell checking facility. This operates at both project level and package level.

#### Topics:

Topic	Detail	See also
Automatic Spell Checking	The spell checker can be set to run automatically, so that it highlights possible errors in text as it is created or pasted in: <ul style="list-style-type: none"> <li>Select <b>Tools   Options &gt; Objects</b></li> <li>Deselect or select the <b>Disable spelling</b> checkbox</li> </ul>	
Spelling Configuration	You can configure what types of text error the spell checker should detect, using the Spelling Options dialog	<a href="#">Select Spell Checker Options</a> [375]
Using Languages	Enterprise Architect is supplied with dictionaries for US	<a href="#">Use Languages</a>

Topic	Detail	See also
<b>Other Than English</b>	English and British English; you can download a set of dictionaries for other languages from the Sparx Systems website	<a href="#">Other Than English</a> <sup>[377]</sup>
<b>Using the Spell Checker</b>	You can run the spell checker manually on the whole model, or on a selected package	<a href="#">Using the Spell Checker</a> <sup>[378]</sup>
<b>Correcting Text</b>	As the spell check progresses, Enterprise Architect highlights any errors or unknown words; you have several options for responding to these potential spelling errors	<a href="#">Correcting Words</a> <sup>[379]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>

**3.6.5.1 Select Spell Checker Options**

You can configure the spell checker to ignore or detect specific types of text conformation. Ignoring the conformation means to skip over the text without identifying it as an error.

**Access:** [Tools](#) | [Spelling Tools](#) | [Spelling Options](#)

**How to:**

To configure the spell checker, select the options for the checks you require on the Spelling Options dialog, as described below:

Option	Action	See also
<b>Ignore capitalized words</b>	Ignore any words beginning with a capital letter, such as <i>David</i> You might enable this option if the text being checked contains many proper names	
<b>Ignore all-caps words</b>	Ignore any words containing all capital letters, such as <i>RADAR</i> You might enable this option if the text being checked contains many acronyms	
<b>Ignore Words with Numbers</b>	Ignore any words containing embedded digits, such as <i>Win95</i> and <i>Q4</i> You might enable this option if the text being checked contains many code words or other symbols containing digits	
<b>Ignore Words with Mixed Case</b>	Ignore any words containing an unusual mixture of upper- and lower-case letters, such as <i>MicroHouse</i> and <i>CapsLock</i> . You might enable this option if the text being checked contains many variable names or other symbols that use case changes to	

Option	Action	See also
	distinguish words	
<b>Ignore Domain Names</b>	Ignore any words that appear to be Internet domain names, such as <i>wintertree-software.com</i>	
<b>Report Doubled Words</b>	Detect any word appearing twice in a row, such as <i>the the</i>	
<b>Case Sensitive</b>	Distinguish between capitalized and non-capitalized words For example, <i>canada</i> would be considered as different from <i>Canada</i> , and therefore reported as a misspelling When the option is <b>disabled</b> , <i>canada</i> and <i>Canada</i> are considered to be identical Note that the performance of the spell checker is reduced if this option is disabled	
<b>Phonetic Suggestions</b>	Suggest alternative words based on phonetic (sounds-like) similarity to the misspelled word; this option tends to improve the correction of badly misspelled words Enabling this option increases the time required to locate suggestions Note that either this option or the <b>Typographical Suggestions</b> option must be enabled in order to list suggestions of alternative words	
<b>Typographical Suggestions</b>	Suggest alternative words based on typographical (looks-like) similarity to the misspelled word. This option is appropriate for people who are generally good spellers Note that either this option or the <b>Phonetic Suggestions</b> option must be enabled in order to list suggestions of alternative word	
<b>Suggest Split Words</b>	Suggest two separate words as a replacement for a misspelling containing two joined words For example, <i>is the</i> would be suggested as a replacement for <i>isthe</i>	
<b>Auto Correct</b>	Automatically change words marked with <i>Auto Change</i> actions to their specified replacements When this option is <b>disabled</b> , a confirmation prompt displays before the words are changed	
<b>Main Dictionary Language</b>	Set the language of the main dictionary used to check spelling; the drop-down list shows only languages for which dictionaries are installed on your system To check spelling in a different language, select the language in the list	<a href="#">Use Languages Other Than English</a> <sup>[377]</sup>
<b>Suggestions</b>	Determine the speed and accuracy of the initial automatic search for suggested replacements for misspelled words Click on the appropriate radio button for your choice	
<b>OK</b>	Close the <b>Options</b> dialog, and save any changes made to the option settings	

Option	Action	See also
Cancel	Close the <b>Options</b> dialog, and discard any changes made to the option settings	

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

**Learn More:**

- [List of Available Permissions](#) <sup>[206]</sup>

### 3.6.5.2 Use Languages Other Than English

Enterprise Architect is supplied with three dictionaries, for US English, Canadian English and British English. Additional dictionaries are available as a set, for download from the registered pages of the Sparx Systems website.

**Use to:**

- Download and install the language pack of dictionaries so that you can select another language in which to perform the spell check

**How to:**

To download the additional language dictionary pack, follow the steps below:

Step	Action	See also
1	Access the registered user page on the Sparx Systems web site	<a href="#">Registered User page</a>
2	At the end of the page, download the <i>EADict.zip</i> file from the Enterprise Architect Dictionary section	
3	Unzip the file into the Enterprise Architect install directory - <i>C:\Program Files\Sparx Systems\EA</i>  This makes the non-English spelling dictionaries available to the Enterprise Architect spell checker	<a href="#">Select Spell Checker Options</a> <sup>[375]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options
- Enterprise Architect .EAP files default to use Jet 3.5 as the database engine; this does not support unicode character sets, which makes the use of certain languages - such as Polish - difficult, including spell checking words in those languages

If you use such languages, it is recommended that you either upsize to a DBMS repository or set JET 4.0 as the database engine

If your .EAP project is not in a Jet 4.0 database, you should also download a copy of the Jet 4.0 EABase

model from the Sparx Systems website, and do an EAP to EAP transfer of your model into the Jet 4.0 file

**Learn More:**

- [Server Based Repositories](#) <sup>[149]</sup>
- [General](#) <sup>[424]</sup>
- [EABase Jet4 page of the website](#)
- [Perform a Project Data Transfer](#) <sup>[345]</sup>
- [List of Available Permissions](#) <sup>[206]</sup>

### 3.6.5.3 Using the Spell Checker

Enterprise Architect has an inbuilt spell checker, which you can configure to detect a range of types of possible spelling error in your project, and to use one of several language dictionaries other than English.

**Access:** **Tools | Spelling Tools | Spell Check Project**  
**Tools | Spelling Tools | Spell Check Current Package**

**How to:**

To run the spell checker, follow the steps below:

Step	Action	See also
1	Select the <b>Spell Check Project</b> or <b>Spell Check Current Package</b> menu option, as required  The Spell Check dialog displays	
2	( <b>Spell Check Project</b> option) Select the checkbox against each of the items to spell check within your model	
3	Click on the <b>Start</b> button to begin the spell check  As the spell check proceeds, the text being checked displays in the text panel at the bottom of the screen; if an error is detected, the Check Spelling dialog displays, offering several options to correct the error	<a href="#">Correcting Words</a> <sup>[379]</sup>

**Notes:**

- The **Spell Check Project** menu option enables you to check spelling for the entire project
- The **Spell Check Current Package** option only checks the package currently open, and does not enable you to select items to check
- Enterprise Architect currently supports checking an entire model or a single package; a future release should support more detailed spell checking at the element and diagram level
- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Spell Check** permission to perform any spell check or change any spell check options

**Learn More:**

- [List of Permissions](#) <sup>[206]</sup>

### 3.6.5.3.1 Correcting Words

As a spell check progresses, Enterprise Architect highlights any errors or unknown words in the Check Spelling dialog. The inbuilt spell check stores user-defined words in the user dictionary (*userdict.txt*) stored in the Enterprise Architect installation directory. During the spell check process, if you add a word, it is written into this file for later reference.

**Use to:**

- Correct the spelling of a word
- Ignore the error
- Add the word to the user dictionary
- Suggest alternatives or
- Otherwise assist in the spelling correction process

**How to:**

As the Spell Checker identifies possibly mis-spelled words, make the appropriate response:

Action	See also
<ul style="list-style-type: none"> <li>• Modify the spelling by hand and click on the <b>Change</b> or <b>Change All</b> button to change the word to that spelling</li> <li>• Click on a suggested alternative and click on the <b>Change</b> or <b>Change All</b> button to change the word to that spelling</li> <li>• Click on the <b>Ignore</b> or <b>Ignore All</b> button to exclude the word from the spell check</li> <li>• Click on the <b>Add</b> button to add the word to the user dictionary</li> <li>• Click on the <b>Suggest</b> button to list alternative spellings or words</li> <li>• Click on the <b>Cancel</b> button to abort the spell check entirely</li> </ul>	

### 3.6.6 Personal Information

The Personal Information window enables you to record and manage your personal work within the project. The window operates on your identity as a defined Author on the project.

**Access:** [View | Personal Information](#)

**Topics:**

Topic	Detail	See also
<b>Model Mail</b>	You have the facility to send simple emails to registered project team members, and to receive messages from your team members	<a href="#">Internal Mail</a> <sup>[380]</sup>
<b>Allocated Work</b>	Presents a GANTT chart on which you record the work that you are currently engaged in.	<a href="#">Recording Work</a> <sup>[384]</sup>
<b>Project Tasks</b>	Enables you to monitor and maintain the work tasks that have been assigned to you, or that you have created yourself	<a href="#">Monitor Your Tasks</a> <sup>[387]</sup>
<b>Workflow</b>	Enables you to list and run your workflow scripts	<a href="#">Monitor Workflow</a> <sup>[388]</sup>

Topic	Detail	See also
<b>Working Sets</b>	Enables you to capture your current work area (diagrams and facilities currently open) as a working set for subsequent re-use	<a href="#">Working Sets</a> <sup>[389]</sup>

### 3.6.6.1 Internal Mail

The *Model Mail* tab shows all emails that you have received from project team members within the project, under your User Security ID. You can open and respond to these emails and create new ones.

The *Sent Items* tab shows all the emails you have sent to project team members under your User Security ID. You can forward these emails and make further responses (see the final table in this topic).

This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with User Security enabled; the mail system uses the individual and group users defined in User Security.

**Access:** [View | Personal Information > Model Mail](#)  
[View | Personal Information > Sent Items](#)

#### Use to:

- Read messages from other project team members
- Read and respond to messages sent to you as a member of a group that holds a group mailbox
- Organize and sort both sent and received messages
- Create new messages, and reply to and forward received messages
- Delete messages from your In tray and Sent Items mailboxes

#### How to:

On the Model Mail tab, review your messages as indicated below:

Option	Usage	See also
<b>Open a message</b>	Double-click on the message If the message contains a hyperlink, click on the link to open or display the target file or object	
<b>Flag</b>	Check the flag color to establish the significance of the message (the meanings of the flag colors should be defined within the project team)	
<b>Status</b>	Check for the read or unread icon; unread message items are anyway displayed in bold	
<b>Sender</b>	The name of the project team member who sent the message	
<b>Subject</b>	The topic of the message	
<b>Date</b>	Indicates the age of the message, whether it was sent: <ul style="list-style-type: none"> <li>• Today</li> <li>• Yesterday</li> <li>• This week</li> <li>• This Month</li> <li>• Last Month</li> <li>• Older</li> </ul>	

Option	Usage	See also
<b>Sent</b>	The exact date and time the message was sent	
Select Columns	<p>Right-click on the column headings and select the <b>Field Chooser</b> menu option, which enables you to add or remove specific columns from the display</p> <p>You can also click on the column headings and drag them across the header bar to reposition the columns in a different sequence</p> <p>Select the <b>To</b> column to display the names of the people to whom the email was sent; this is very useful to identify whether the email was sent to you as an individual or as a member of a group - if you received the email as a member of a group, remember that your actions on this single instance of the email affect all other recipients</p>	<a href="#">List Header</a> [460]
Reorganize messages in the list	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the column heading and click on the arrow head to list items in order or reverse order, or</li> <li>• Right-click on the column head and select the <b>Enable Group Box</b> option to organize the messages into groups</li> </ul>	

On the Model Mail tab, make selections from the toolbar options as indicated below:

Option	Usage	See also
<b>Compose Message</b>	Open the Model Message dialog, through which you create and send a mail message	<a href="#">Create a Message</a> [383]
<b>Delete Messages</b>	Delete a selected message or messages; you are prompted to confirm the deletion	
<b>Reply</b>	Open the Model Message dialog, through which you create a response to the sender of the message, which includes a copy of the message and any earlier messages in the thread	<a href="#">Create a Message</a> [383]
<b>Reply to All</b>	Open the Model Message dialog, through which you create a response to the sender of the message and the other recipients, which includes a copy of the message and any earlier messages in the thread	
<b>Forward</b>	Open the Model Message dialog, through which you forward the message to other project team members with, if necessary, your own comments	
<b>Mark as Unread</b>	Mark the selected messages as unread	
<b>Mark as Read</b>	Mark the selected messages as read	
Viewing Panel	<p>Select to:</p> <ul style="list-style-type: none"> <li>• Display the message text viewing panel underneath or to the right of the message list, or</li> <li>• Hide it so that you have to open the message to read it</li> </ul>	
<b>Help Contents</b>	Display this Help topic	

On the Model Mail tab, make selections from the context menu options as indicated below:

Option	Usage	Shortcut	See also
<b>Compose New Message</b>	Click to open the Model Message dialog, through which you create and send a mail message		
<b>Reply</b>	Create a response to the sender of the message, which includes a copy of the message and any earlier messages in the thread	<b>Ctrl + R</b>	<a href="#">Create a Message</a> [383]
<b>Reply to All</b>	Create a response to the sender of the message and the other recipients, which includes a copy of the message and any earlier messages in the thread	<b>Ctrl + Shift + R</b>	
<b>Forward</b>	Forward the message to other project team members with, if necessary, your own comments	<b>Ctrl + F</b>	
<b>Set Message Flag</b>	Select the appropriate flag color to establish the significance of the message (the meanings of the flag colors should be defined within the project team)		
<b>Mark as Unread</b>	Mark the selected messages as unread	<b>Ctrl + U</b>	
<b>Mark as Read</b>	Mark the selected messages as read	<b>Ctrl + Q</b>	
<b>Delete</b>	Delete a selected message or messages; you are prompted to confirm the deletion		

On the Sent Items tab, manage the messages you have sent as indicated below:

Option	Usage	See also
<b>Open a message</b>	Double-click on the message  From the open message you can reply to the sender, reply to the sender and all other recipients, or forward the message to other team members	<a href="#">Create a Message</a> [383]
<b>Flag</b>	Check the flag color to establish the significance of the message (the meanings of the flag colors should be defined within the project team)	
<b>To</b>	Check the name(s) of the project team member(s) to whom the message was sent	
<b>Subject</b>	The topic of the message	
<b>Date</b>	Indicates the age of the message, whether it was sent: <ul style="list-style-type: none"> <li>• Today</li> <li>• Yesterday</li> <li>• This week</li> <li>• Last Week</li> <li>• This Month</li> <li>• Last Month</li> <li>• Older</li> </ul>	
<b>Sent</b>	The exact date and time the message was sent	
<b>Select Columns</b>	Right-click on the column headings and select the <b>Field Chooser</b> menu option, which enables you to add or remove specific columns from the display	

Option	Usage	See also
	<p>You can also click on the column headings and drag them across the header bar to reposition the columns in a different sequence</p> <p>Add the <b>Sender</b> column to your window; this is useful to identify whether you have responded to an email as an individual or as a member of a user group</p>	<a href="#">List Header</a> [460]
Reorganize messages in the list	<p>Either:</p> <ul style="list-style-type: none"> <li>Click on the column heading and click on the arrow head to list items in order or reverse order, or</li> <li>Right-click on the column head and select the <b>Enable Group Box</b> option to organize the messages into groups</li> </ul>	
<b>Delete messages</b>	<p>Right-click on the message and select the <b>Delete</b> context menu option</p> <p>You are prompted to confirm the deletion</p>

<b>Forward</b>	<p>Right-click on the message and select the <b>Forward</b> context menu option</p> <p>The Model Message dialog displays</p>	

### 3.6.6.1.1 Create a Message

The *Model Message* dialog enables you to compose messages to project team members within the project, under your Author ID.

**Access:** [View | Personal Information > Model Mail](#)

#### Use to:

- Create messages to other project team members
- Reply to messages from other team members
- Forward messages to other team members
- Link model components to the message, or add hyperlinks to files or other objects of relevance

#### How to:

To create a message to another project team member as a new message, a reply to a message, or a forwarded message, follow the steps below:

Step	Action	See also
1	If your message or response concerns a diagram or model object, you could click on that object in the Project Browser now so that it is immediately available to be linked to your message	
2	<p>Select the appropriate toolbar icon, context menu option or message button to create, reply to or forward a message</p> <p>The Model Message dialog displays</p>	<a href="#">Internal Mail</a> [380]
3	If you are creating or forwarding a message, or you want to send a reply to a wider	

Step	Action	See also
	audience, for <i>each</i> person you intend to send the message to: <ul style="list-style-type: none"> <li>Click on the <b>To:</b> button A list of project team member and group IDs displays</li> <li>Scroll to the required name and double-click on it The name is added to the <b>To:</b> field</li> </ul>	
4	In the <b>Subject</b> field, type or edit the subject of the message as necessary	
5	In the <b>Flag</b> field click on the drop-down arrow and on the appropriate flag color or option for your message	
6	In the text panel, write the text of your message You can format the text using the facilities of the Notes toolbar at the top of the field	<a href="#">Notes Toolbar</a> <sup>[772]</sup>
7	If you intend to link a diagram or model object to this message, place the cursor at the appropriate position in your message text and click on the <b>Insert Quick Link</b> button  Select the object you highlighted in Step 1; a hyperlink to that object is inserted in the message text	
8	If you did not select a model object and now intend to link to one, or you want to link to another target such as a file, Model Search or Team Review message, click on either: <ul style="list-style-type: none"> <li>The <b>Hyperlink</b> icon in the toolbar or</li> <li>The <b>Insert Quick Link</b> button and select the <b>Other</b> option</li> </ul> The Hyperlink Details dialog displays; create the required link	<a href="#">Hyperlinks</a> <sup>[1295]</sup>
9	Click on the <b>Send</b> button to send the message to the recipients	

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with User Security enabled

**3.6.6.2 Recording Work**

The Allocated Work tab lists the elements to which *your* model Author ID has been allocated as a resource, where your Author ID is the same as:

- Your Enterprise Architect security user ID, if security has been enabled, or
- Your workstation login ID if security has not been enabled

For each element, the tab:

- In the left-hand panel lists the roles or tasks assigned to you as a resource on that element, for which the **Complete %** field value is less than **100**
- In the right hand panel displays a GANTT chart showing your progress in performing each role or task

You can add further work items for an element through the Allocated Work tab; however, you cannot delete any records. A record is no longer listed when the **Complete %** field value is **100**.

You or your supervisors can also add records through the Resource Allocation tab of the Project Management window.

**Access:** [View | Personal Information > Allocated Work](#)

**Use to:**

- View the elements to which you have been allocated as a resource, and the tasks you have been set to complete
- View and edit the properties of the elements you have been allocated to as a resource
- View and edit the details of each assigned role or task including, if you follow your project team procedures, re-assigning your task to another resource
- Add further tasks to an element
- Filter the display to show only items having a specific text element in the title, or restrict selected items to show just the element, not the tasks
- Locate the elements in the Project Browser
- Locate the tasks in the Resource Allocation tab of the Project Management window
- Print a list of tasks
- Capture an image of the display to a file or to the clipboard

**How to:**

On the Allocated Work tab, make selections from the options as indicated below:

Option	Usage	See also
<b>Review element properties</b>	<p>Double-click on the element name</p> <p>(Alternatively, right-click on the element name and select the <b>Properties</b> context menu option)</p> <p>The Properties dialog for the element displays; review the pages as required</p>	<a href="#">Properties Dialog</a> <small>[662]</small>
<b>Review resource task details</b>	<p>Double-click on the task item</p> <p>(Alternatively, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the progress bar for the item on the GANTT chart, or</li> <li>• Right-click on the task or role name and select the <b>Properties</b> context menu option)</li> </ul> <p>The Assigned Resources dialog displays, which has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode</p> <p>Should it be necessary to reassign the item to another resource, click on the drop-down arrow on the <b>Resource</b> field and select the appropriate Author ID; when you save the changes, the item no longer appears in the list of tasks assigned to you</p>	<a href="#">Resource Allocation</a> <small>[351]</small>  <a href="#">The Project Management Window</a> <small>[349]</small>
<b>Create new task item</b>	<p>Right-click on the element name and select the <b>Assign Resource</b> context menu option</p> <p>The Assigned Resources dialog displays, with your Author ID in the <b>Resource</b> field</p> <p>Complete the dialog as for the Resource Allocation tab of the Project Manager window</p>	<a href="#">Resource Allocation</a> <small>[351]</small>
<b>Refresh display to incorporate changes</b>	<p>Your work item can be edited in a number of places in Enterprise Architect, such as the Project Task Allocation window and the Resource Allocation tab; the element to which it is assigned can be edited in these and many other areas</p>	<a href="#">Resource Allocation</a> <small>[351]</small>  <a href="#">Project Task Allocation</a> <small>[368]</small>

Option	Usage	See also
	To refresh the display with any changes made elsewhere, right-click on the display and select the <b>Refresh</b> context menu option	<a href="#">Properties Dialog</a> [662]
<b>Display the Resource Allocation tab of the Project Management window</b>	Right click on the list of items and select the <b>Show Resources Window</b> context menu option  The Resource Allocation tab of the Project Management window displays, listing all items for all resources associated with the element, and displaying the details for the first item in the list	<a href="#">Resource Allocation</a> [351]
<b>Locate the item in the Resource Allocation tab of the Project Management window</b>	Right-click on the work item and select the <b>Locate in Resource Window</b> context menu option  The Resource Allocation tab of the Project Management window displays, showing the item details for the selected item only	<a href="#">Resource Allocation</a> [351]
<b>Locate the element in the Project Browser</b>	Right-click on either the element or the work item and select the <b>Find in Project Browser</b> context menu option  The appropriate package hierarchy expands in the Project Browser, and the selected element is highlighted	
<b>Expose hidden sections of the work item progress</b>	Some items might cover a long period of time, and you might not be able to display the complete progress line for the item in the GANTT chart  To locate the start point, expected end point, or today's date on the progress line for an item, right-click on either the item or the progress line and select the appropriate context menu option: <ul style="list-style-type: none"> <li>• <b>Go To   Task Start</b></li> <li>• <b>Go To   Task End</b></li> <li>• <b>Go To   Today's Date</b></li> </ul> The GANTT chart shifts left or right to position the required point in the center of the display	
<b>Filter the work items</b>	You can refine the list of work items to show only those containing text that matches the filter item  Right-click on the tab and select the <b>Apply Filter</b> context menu option  The filter bar displays at the top of the panel; type in the filter text  As you type, the items listed and the GANTT chart are filtered to show only items where the item names match the text string  The filter does not operate on the element names  If you do not want to use the filter, right-click on the tab and select the <b>Hide Filter Bar</b> context menu option	
<b>Capture an image of the Allocated Work data as a graphics file</b>	Right-click on the tab and select the <b>Save Image to File</b> context menu option  The Save As Image dialog displays, on which you specify the file name, location and graphics file type to save to	

Option	Usage	See also
<b>Copy an image of the Allocated Work data to the clipboard</b>	<p>Right-click on the tab and select the <b>Copy Image to Clipboard</b> context menu option</p> <p>You can paste the image from the clipboard into your preferred graphics package</p>	

### 3.6.6.3 Monitor Your Tasks

The Project Tasks tab lists the tasks that you either:

- Own, or
- Are assigned to

These tasks can be created through the:

- Project Tasks tab itself
- Tasks tab of the Project Information window
- Project Tasks view of the Resource Calendar

**Access:** [View | Personal Information > Project Tasks](#)

**Use to:**

- Review the status and progress of tasks that you are responsible for
- Create new tasks
- Update existing tasks
- Delete tasks
- Modify and filter the display of task information

**How to:**

On the Project Tasks tab, make selections from the options as indicated below:

Option	Usage	See also
<b>Add or Modify a task</b>	You add or modify a task through the Task Detail dialog, which displays when you double-click on an entry (edit) or blank line (create)	<a href="#">Add, Modify and Delete Tasks</a> <sup>[359]</sup>
<b>Delete a task</b>	<p>Right-click on the message and select the <b>Delete</b> context menu option</p> <p>You are prompted to confirm the deletion</p>	
<b>Select columns</b>	<p>Right-click on the column headings and select the <b>Field Chooser</b> menu option, which enables you to add or remove specific columns from the display</p> <p>You can also click on the column headings and drag them across the header bar to reposition the columns in a different sequence</p>	<a href="#">List Header</a> <sup>[460]</sup>
<b>Reorganize tasks in the list</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the column heading and click on the arrow head to list items in order or reverse order, or</li> <li>• Right-click on the column headings and select the</li> </ul>	<a href="#">List Header</a> <sup>[460]</sup>

Option	Usage	See also
	<p><b>Enable Group Box</b> option to organize the messages into groups</p> <p>You can also use the filter bar to filter the display on an appropriate column value, such as the value <b>New</b> in the <b>Status</b> column; to display or hide the filter bar, right-click on the column headings and select the <b>Toggle Filter Bar</b> context menu option</p>	
<p><b>Set persistent Status filter</b></p>	<p>Right click on the tab and select the <b>Set term filter</b> context menu option</p> <p>The Filter by Status dialog displays, which enables you to select to list tasks of any status or only of one specific status</p> <p>The filter you set persists when you close the Personal Information window or exit from Enterprise Architect</p>	
<p><b>Print the task list</b></p>	<p>Right click on the tab and select the <b>Print List</b> context menu option</p> <p>The Print dialog displays, on which you specify the local printer and the print characteristics</p>	

**Learn More:**

- [Project Task Display](#)<sup>[400]</sup>
- [Project Tasks](#)<sup>[358]</sup>

### 3.6.6.4 Monitor Workflow

The Workflow tab lists all of the workflow scripts that you have created:

You can execute any of the scripts listed on the tab.

**Access:** [View | Personal Information > Workflow](#)

**Use to:**

- Select and execute your workflow scripts

**How to:**

On the Workflow tab, double-click on the required script to execute it.

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

**Learn More:**

- [Workflow Scripts](#)<sup>[232]</sup>

### 3.6.6.5 Working Sets

The Working Sets tab lists the working sets that you have created.

A working set, rather like a project shortcut, is a group of diagrams and *views* that you have either captured from a work session or specifically drawn together, in either case using the Create Working Set dialog. It is a personal list, not visible to or active for any other user.

A *view* is:

- A Relationship Matrix profile to open
- The Team Review
- A Model Search to perform

**Access:** [View | Personal Information > Working Sets](#)

**Use to:**

- Capture your currently-open diagrams and views to resume work in the same configuration in a subsequent work session
- Create a working set by selecting diagrams, searches and profiles to open
- Open an existing working set to resume work in the required configuration (manually and automatically)
- Change a working set to remove, replace or add to the diagrams and views defined in it
- Delete a working set

**How to:**

On the Working Sets tab, select the required option as indicated below:

Option	Usage	See also
<b>Open Working Set</b>	<p>Click on a working set name and either:</p> <ul style="list-style-type: none"> <li>• Select the third icon in the toolbar or</li> <li>• Right-click and select the <b>Open Working Set</b> context menu option</li> </ul> <p>Enterprise Architect opens all the diagrams and views listed in that set</p> <p>If you already have a working set open, the 'new' set of views is added to the original set, with the last-listed diagram or view on top and in focus</p> <p>You can open only one Model Search, Matrix profile or Team Review at a time; therefore, the last-opened Search, profile or Team Review replaces the previous instances</p>	
<b>Create New Working Set</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the first icon in the toolbar or</li> <li>• Right-click on the body of the tab and select the <b>Create Working Set</b> context menu option</li> </ul> <p>The Create Working Set dialog displays</p> <p>In the <b>Name</b> field, type a name for the working set</p> <p>If you have diagrams and views <i>open</i>, the dialog lists them in the order in which they were opened; you can change the order using the '</p>	

Option	Usage	See also
	<p><b>hand</b> buttons at the bottom of the dialog</p> <p>Either select the checkbox against each diagram or view to include in the working set, or click on the <b>Include All</b> button</p> <p>To add more diagrams or views that are not currently open, click on the <b>Add Other</b> button and select an option from the list:</p> <ul style="list-style-type: none"> <li>• <b>Add Diagram</b></li> <li>• <b>Add Matrix Profile</b></li> <li>• <b>Add Search</b></li> <li>• <b>Add Team Review</b></li> </ul> <p>You are prompted to select the required diagram, profile, search or Team Review topic; the view is then added to the list with its checkbox selected</p> <p>Click on the <b>OK</b> button to create the working set</p>	
<p><b>Build a Working Set from open diagrams or files</b></p>	<p>A variation on creating a working set is to generate the set from diagrams or files that are currently open</p> <p>Right-click on the body of the tab and select the <b>Create Working Set From</b> context menu option, and either the <b>Open Diagrams</b> or <b>Open Files</b> sub-option as appropriate</p> <p>The Create Working Set dialog displays</p> <p>In the <b>Name</b> field, type a name for the working set</p> <p>The dialog lists the diagrams and views that are currently open, in the order in which they were opened; with the checkboxes against the open diagrams or the open files already selected</p> <p>You can either:</p> <ul style="list-style-type: none"> <li>• Immediately click on the <b>OK</b> button to create the working set from the current environment, or</li> <li>• Change the content and selections as described for <i>Create New Working Set</i> (above)</li> </ul>	
<p><b>Add an open view or diagram to a working set</b></p>	<p>If, in your work, you open a diagram or view that you decide to add to a working set:</p> <ol style="list-style-type: none"> <li>1. Open the Working Sets tab</li> <li>2. Right-click on the required set name and select the <b>Add Active View</b> context menu option</li> </ol> <p>The open view is added to the working set</p>	
<p><b>Duplicate a Working Set</b></p>	<p>If you want to use a variation of a working set without losing the original, you can create a copy and amend that copy as required</p> <p>Right-click on the source working set and select the <b>Copy as New</b> context menu option</p> <p>The Create Working Set dialog displays</p> <p>In the <b>Name</b> field, type a name for the working set</p> <p>Each of the listed diagrams and views is already selected; make any changes you require, and click on the <b>OK</b> button to save the list as a new working set</p>	
<p><b>Edit a working set</b></p>	<p>To change the diagrams and views in a working set, or change the set name, click on the set name and either:</p>	

Option	Usage	See also
	<ul style="list-style-type: none"> <li>Click on the second icon in the toolbar or</li> <li>Right-click and select the <b>Edit</b> context menu option</li> </ul> <p>The Create Working Set dialog displays</p> <p>Make any changes you require, and click on the <b>OK</b> button to save the changes</p>	
<b>Delete Working Set, or View in Working Set</b>	<p>Expand the working set and select a specific item (to remove that item) or the set name (to move the whole set)</p> <p>Either:</p> <ul style="list-style-type: none"> <li>Click on the fifth icon in the toolbar or</li> <li>Right-click on the set and select the <b>Delete Working Set Item</b> context menu option</li> </ul> <p>A prompt displays to confirm the deletion; click on the <b>Yes</b> button</p> <p>The item or set is removed</p> <p>If you delete a working set that you have opened, the diagrams and views from that set remain open until you specifically close each one or close Enterprise Architect</p>	
<b>Automatically apply the working set when the model is opened</b>	<p>Right-click on the working set name and select the <b>Apply when model opens</b> context menu option</p> <p>This option is a toggle that turns the same option off for the previous working set on which it was selected</p> <p>The folder turns green, indicating that the option is on for this working set</p> <p>When you close the model and subsequently open it, the diagrams and views in the working set are automatically opened</p>	
<b>Track working set/ views last opened</b>	<p>You might use several working sets in a work session, and close some views and open others</p> <p>To capture the diagrams and views you actually have open when you close down Enterprise Architect, right click on the body of the tab and select the <b>Store Main Tab View History</b> context menu option</p> <p>When you reopen the model in a new work session, the working set at the top of the tab - <i>Windows open when Model was last closed</i> - is populated with the list of open diagrams and views; this is a read-only set that cannot be edited</p> <p>You can expand the set and double-click on specific windows to re-open them, or right-click on the set and use the <b>Open Working Set</b> option to reopen all the diagrams and views you had open before</p> <p>However, it is recommended that you use the <b>Apply when model opens</b> context menu option on the set; thereafter, whenever you open the model, all the diagrams and views you had open when you closed the model are automatically re-opened</p>	
<b>Locate item in Project Browser</b>	<p>To find a diagram from your working list in the Project Browser, right-click on the diagram name and select the <b>Find in Project Browser</b> context menu option</p> <p>The section of the Project Browser containing the diagram is expanded, and the diagram name is highlighted</p>

**3.6.7 Project Calendar**

The Project Calendar provides a project management overview in calendar format of the deployment of resources, timeframes for tasks, and upcoming project events such as meetings and milestones. The calendar displays in the Diagram View workspace, consisting of a:

- Calendar panel, displaying months of the year
- Diary panel sectioned into days or weeks
- Toolbar at the top of the window, which enables you to define what information is displayed and how it is formatted

**Access:** [View | Project Calendar](#)

Topic	Detail	See also
<b>Calendar Panel</b>	<p>The calendar panel, when viewed normally on the screen, displays a calendar of six months that by default includes the current month</p> <p>By closing or reducing other panels on the screen, and depending on the size of your screen, you can show the months for a period of up to 3 years and six months</p> <p>You can review data for up to several decades into the past, if such data has been recorded, and plan ahead for up to several decades into the future; to display future or past months, either:</p> <ul style="list-style-type: none"> <li>• Click on the arrows in the names of the months on the left and right of the top row of months, or</li> <li>• Click and hold the mouse on the name of a month so that a list of months and years displays, and move the mouse forwards to scroll up the list or backwards to scroll down the list; when you reach the required month, ensure that it is highlighted and release the mouse button</li> </ul> <p>On the calendar, today's date has a red border; if you have scrolled the calendar so that today's date is not shown, click on the second icon in the toolbar () to position the current month in the top left of the calendar with today's date highlighted</p>	
<b>Diary Panel</b>	<p>The diary panel displays a set of day fields, each of which can contain one or more markers for an event or task</p> <p>The content of the display is determined by the selections you make in the toolbar, and principally by the object type you select from the first drop-down field:</p> <ul style="list-style-type: none"> <li>• Project Calendar</li> <li>• Allocated Resources</li> <li>• Project Tasks</li> </ul> <p>The structure of the display depends on the period you want to review, specified using the icons on the toolbar:</p>	<p><a href="#">Calendar</a><sup>[394]</sup></p> <p><a href="#">Allocated Resources</a><sup>[398]</sup></p> <p><a href="#">Project Tasks</a><sup>[358]</sup></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• 1 day (Project Calendar only)</li> <li>• 5 days (Mon - Fri) (Project Calendar only)</li> <li>• 7 days (Mon - Sun)</li> <li>• 31 days</li> </ul> <p>However, in the Calendar panel you can highlight specific periods of between 1 and 7 days (Project Calendar only) and 14, 21, 28, 35 and 42 days, to display just those periods in the Diary panel</p> <p>If you select a period of between 1 and 7 days, each day is divided into one hour time intervals; you can adjust the time intervals for these periods, using the toolbar (see below)</p> <p>For the current day, the current time is also highlighted</p> <p>Also, if you click on today's date in the Calendar panel the Diary panel changes to show the shortest period (7 days or 1 day) for the object type, again with adjustable time intervals for the times of day</p> <p>For displays of 7 or more days, you can scroll up or down to display the information for earlier or later dates; if you scroll away from today's date, you can return to it by right-clicking anywhere on the display and selecting the <b>Show Today</b> context menu option (not Project Calendar)</p>	
<p><b>Toolbar</b></p>	<p>The toolbar options modify what is displayed on the Diary panel, and enable you to add certain kinds of information</p> <p>The icons and fields in the toolbar, from left to right, have the following functions:</p> <ul style="list-style-type: none"> <li>• <b>Add New &lt;object&gt;</b> - enables you to create a new record for an event or task</li> <li>• <b>Assign Resource</b> - for Allocated Resources, enables you to assign a new resource to the task</li> <li>• <b>Show Today</b> - re-focuses the Diary panel and Calendar panel on today's date, for any object type</li> <li>• <b>1, 5, 7, 31</b> - sets the number of days displayed in the Diary panel</li> <li>• First drop-down - identifies the type of information to display: Calendar events, allocated Resources, or Tasks</li> <li>• Second drop-down - identifies the type or characteristic of object to filter for (and depends on the value selected in the first field)</li> <li>• Third drop-down - for Allocated Resources, identifies the element type to filter for</li> <li>• Options:             <ul style="list-style-type: none"> <li>• <b>Configure Event Subtypes</b> - Displays the Configure Subtype dialog, which you use to define categories of event to record on the Calendar</li> <li>• <b>Time Scale</b> - where the display includes times of day, enables you to reset the time interval</li> <li>• <b>Show End Time</b> - for the Project Calendar, where the times of day are NOT shown and an event occurs within one day, this shows or hides the time at which the event finishes (the start time</li> </ul> </li> </ul>	<p><a href="#">Configure Event Subtypes</a> <sup>397</sup></p>

Topic	Detail	See also
	<p>displays automatically)</p> <ul style="list-style-type: none"> <li>• <b>Show Time As Clocks</b> - toggle between showing start and end times in digital format and as a clock face</li> <li>• <b>Compress Weekend Days</b> - in 31-day format, toggle between showing Saturday and Sunday as separate fields and a pair of half-fields</li> <li>• <b>Show ToolTips</b> - toggle between showing and hiding mouse roll-over tooltips</li> </ul>	

**Notes:**

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them

**3.6.7.1 Calendar**

Project Calendar is a display mode of the project Calendar facility. In Project Calendar mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic) containing flags for each *event* that takes place in or through that period. These events can be, for example, meetings, staff absences or commitments, product releases or public holidays.

You can customize the range of events that you record, using the Configure Subtype dialog.

**Access:** [View | Project Calendar > Project Calendar](#)

**How to:**

To record an event in the Project Calendar, follow the steps below:

Step	Action	See also
1	Double click on the required day, or the first day in a longer period The Project Event dialog displays	
2	In the <b>Subject</b> field, type the name of the event	
3	If the event is to take place at a specific place, in the <b>Location</b> field type the name of the place or room	
4	In the <b>Category</b> field, click on the drop-down arrow and select the appropriate categorization: <ul style="list-style-type: none"> <li>• <b>Event</b> (such as an external trade show, or internal presentation)</li> <li>• <b>Meeting</b> (whether internal or external)</li> <li>• <b>Milestone/Objective</b> (such as a product test or release)</li> <li>• <b>People</b> (an absence or commitment of a specific staff member)</li> </ul>	
5	If the event is likely to occupy one complete day, select the <b>All day event</b> checkbox; this: <ul style="list-style-type: none"> <li>• Places the event icon at the top of the day field in the Diary, above any time sections</li> <li>• Hides the time sections of the <b>Start time</b> and <b>End time</b> fields</li> </ul>	

Step	Action	See also
6	<p>In the <b>Start time</b> and <b>End time</b> fields, specify the start and end dates and/or times of the event</p> <p>In the date section of each field, either:</p> <ul style="list-style-type: none"> <li>• Click on the drop-down arrow to display the current month and select the month and date, or</li> <li>• Click on the 'spin' arrows to roll the date forwards or backwards by one day at a time</li> </ul> <p>In the time section of each field, click on the hour or minute components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>• Type in the required time or</li> <li>• Click on the 'spin' arrows to roll the time backwards or forwards</li> </ul>	
7	<p>In the <b>Event Type</b> field, click on the drop-down arrow and select an appropriate type label for the event; the options change depending on the value you selected for the <b>Category</b> field</p> <p>This provides the fill color for the event icon, as indicated by the fill box next to each option</p>	
8	<p>In the <b>Defined as</b> field, click on the drop-down arrow and select the indicator for whether the event is internal or external to your organization</p>	
9	<p>If the event consists of a telephone call, select the <b>Phone Call</b> checkbox</p>	
10	<p>In the description field, type any notes required on the event; these display in the mouse roll-over tool tip for the event on the Diary panel</p>	
11	<p>If this event repeats at regular intervals, click on the <b>Recurrence</b> button and complete the Event Recurrence dialog (see below)</p>	
12	<p>Click on the <b>OK</b> button to save the event and display it on the Calendar</p>	

To define a recurring event on the Event Recurrence dialog, follow the steps below (some information defaults from the Project Event dialog, but you might have to edit it to accurately define the recurrence details):

Step	Action	See also
1	<p>In the <b>Start</b> and <b>End</b> fields, specify the start and end times of the event; click on the hour or minute components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>• Type in the required time or</li> <li>• Click on the 'spin' arrows to roll the time backwards or forwards</li> </ul>	
2	<p>In the <b>Duration</b> field, click on each of the day(s), hours and minutes portions and either type or 'spin' to the required value</p> <p>The hours and minutes portions are linked to the <b>Start</b> and <b>End</b> fields, so that:</p> <ul style="list-style-type: none"> <li>• As you edit the <b>Start</b> field or the <b>Duration</b> field, the <b>End</b> field adjusts to maintain the duration relative to the start time</li> <li>• As you edit the <b>End</b> field, the <b>Duration</b> field changes to match the difference between the start and end times</li> </ul>	
3	<p>In the Recurrence pattern panel, select the appropriate radio button for the frequency of</p>	

Step	Action	See also
	<p>the event</p> <p>As you select the radio button, the fields on the right of the panel change to further define when the event recurs</p>	
4	<p>Select the appropriate radio buttons and field values, with the following guidance:</p> <ul style="list-style-type: none"> <li>• <i>Daily</i> can be every 1, 2, 3, 4, 5 or 6 days, or every day of the working week</li> <li>• <i>Weekly</i> is on one or more specific days of the week, the events being separated by a period of between 1 and 51 complete weeks</li> <li>• <i>Monthly</i> can be on a specific date or a specific day of the month, the events being separated by a period of between 1 and 11 complete months</li> <li>• <i>Yearly</i> can be on a specific date or a specific day of a specific month</li> </ul>	
5	<p>In the Range of recurrence panel, in the <b>Start</b> field, specify the date on which the event cycle begins</p> <p>Click on the day, month and year components (which are separate) and either:</p> <ul style="list-style-type: none"> <li>• Type in the required value or</li> <li>• Click on the 'spin' arrows to roll the date backwards or forwards</li> </ul>	
6	<p>Select the appropriate radio buttons to indicate that the recurrence cycle:</p> <ul style="list-style-type: none"> <li>• Has no defined end point</li> <li>• Ends after a specific number of occurrences of the event (type in the number)</li> <li>• Ends by a specific date (enter the date)</li> </ul>	
7	<p>Click on the <b>OK</b> button, and again on the Project Event dialog</p> <p>The event icon displays at all points in the Calendar where it is scheduled to occur, as defined in the Event Recurrence dialog; the recurrence is indicated by a graphic depicting two recirculating arrows</p>	
8	<p>If the recurrence is no longer required:</p> <ul style="list-style-type: none"> <li>• Double-click on the icon for any occurrence of the event, to display the Project Event dialog</li> <li>• Click on the <b>Recurrence</b> button to display the Event Recurrence dialog</li> <li>• Click on the <b>Remove Recurrence</b> button; the Event Recurrence dialog closes</li> <li>• Click on the <b>OK</b> button; the Project Event dialog closes</li> </ul> <p>Only the first occurrence of the event remains in the Calendar</p>	

**Notes:**

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the above editions, if security is enabled you must have **Manage Project Calendar** permission in order to create, update or delete Project Calendar events; if security is not enabled, you can change data without this permission
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them

**Learn More:**

- [Project Calendar](#)<sup>[392]</sup>
- [Configure Event Subtypes](#)<sup>[397]</sup>
- [List of Available Permissions](#)<sup>[206]</sup>

### 3.6.7.1.1 Configure Event Subtypes

The Configure Subtype dialog enables you to define additional types of event to record on the Project Calendar.

**Access:** [View](#) | [Project Calendar: Toolbar Options](#) | [Configure Event Subtypes](#)

**Use to:**

- Define a new event type within a select event category
- Change an existing event type
- Delete an existing event type

**How to:**

To manage the event types for your project, follow the steps below:

Step	Action	See also
1	On the Configure Subtype dialog, in the <b>Category</b> field, click on the drop-down arrow and select the appropriate category for the event	
2	Click on the <b>Type</b> field and type a suitable name for the event type (or select an existing event from the list below the <b>Category</b> field)	
3	In the <b>Color</b> field, click on the drop-down arrow and select or define a color for the event icon	
4	Click on the <b>Save</b> button to save the new or edited event type to the list for the specified category Click on the <b>New</b> button if you are going to create another event type	
5	If the event type is no longer required, click on the <b>Delete</b> button	
6	If required, you can change the sequence of the event types in the displayed list, using the ' <b>Up Hand</b> ' and ' <b>Down Hand</b> ' buttons at the bottom of the dialog	
7	Click on the <b>OK</b> button to close the dialog; any new event types are available for use in the Project Calendar	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Project Calendar** permission in order to create or delete Project Calendar event subtypes; if security is not enabled, you can change data without this permission

**Learn More:**

- [Calendar](#)<sup>[394]</sup>

### 3.6.7.2 Allocated Resources

Allocated Resources is a display mode of the project Calendar facility.

In Allocated Resources mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic), with at least one icon representing each element in the project to which a resource has been allocated during that period. If an element has more than one allocated resource, each element:resource combination is represented separately.

Each icon shows the element name and resource name, and indicates the status of the assigned work with one of the following symbols:

- a green square, indicating that the resource has been assigned the work
- a green tick, indicating that the resource has completed the assigned work
- a red square, indicating that the resource has not completed the assigned work
- a square divided diagonally with green and red halves, indicating that the assigned work is to be completed within one working day

Typically, while the work is in progress a resource is represented by:

- An icon with a green square on the day the work is planned to start, and
- An icon with a red square on the day the work is planned to finish

When the work is complete, the icons on both days display the green tick.

Resources are initially allocated to elements through the:

- Resource Allocation tab of the Project Management window, or
- Allocated Work tab of the Personal Information window

You can then *edit* these allocations through either of those windows or through the Allocated Resources Calendar itself.

**Access:** [View | Project Calendar > Allocated Resources](#)

#### Use to:

- Review the allocation of resources across the project over a period of time
- Review the status of the work assigned to those resources
- Display and edit the details of the task assigned to a resource
- Allocate further resources to an element
- Delete a resource allocation from an element
- Create and send an email to the resource allocated to an element

#### How to:

On the Allocated Resources Calendar, make selections from the options as indicated below:

Option	Usage	See also
<b>Display/edit details of an allocated resource</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on any icon for that element:resource combination, or</li> <li>• Right-click on the icon and select the <b>Properties</b> context menu option</li> </ul> <p>The Assigned Resources dialog displays, showing the details of the assignment of the resource to a task on the element</p>	<p><a href="#">Resource Allocation</a> <sup>[35]</sup></p> <p><a href="#">The Project Management Window</a> <sup>[349]</sup></p>

Option	Usage	See also
	This dialog has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode	
<b>Add resource to element</b>	<p>Right-click on any icon for the element and select the <b>Assign Resource to &lt;element name&gt;</b> context menu option</p> <p>The Assigned Resources dialog displays, showing the start and end dates both set to the date from which you selected the icon, and the <b>Allocated Time</b> field set to 1; all other fields are blank</p> <p>This dialog has the same content, format and functions as the Resource Allocation tab of the Project Manager window, in Item mode</p> <p>Specify the resource and the role or task that resource is performing, and define the period for which the resource is allocated to the element</p>	<a href="#">Resource Allocation</a> [357]  <a href="#">The Project Management Window</a> [349]
<b>Message Resource</b>	<p>Right-click on any icon for the element:resource combination and select the <b>Message Resource &lt;resource name&gt;</b> context menu option</p> <p>The Model Message dialog displays, on which you create and send your message to the resource allocated to the element</p>	<a href="#">Create a Message</a> [383]
<b>Delete resource from element</b>	<p>Right-click on any icon for the element:resource combination, and select the <b>Delete Resource from &lt;element name&gt;</b> context menu option</p> <p>A prompt displays to confirm the deletion; click on the <b>Yes</b> button</p> <p>The icon and any corresponding icons for that element:resource combination are deleted from the calendar, and the resource is no longer allocated to that element</p>	
<b>Locate element in diagrams in which it is used</b>	<p>Right-click on any icon for the element, and select the <b>Find in all Diagrams</b> context menu option</p> <p>If the element is used in only one diagram, that diagram displays</p> <p>If the element is used in more than one diagram the Element Usage dialog displays, listing the diagrams in which the element occurs</p> <p>Select the required diagram and click on the <b>Open</b> button to display that diagram</p>	<a href="#">Show Element Use</a> [632]
<b>Locate element in Project Browser</b>	<p>Right-click on any icon for the element, and select the <b>Find in Project Browser</b> context menu option</p> <p>The area of the Project Browser containing the element is brought into focus and expanded, and the element is highlighted</p>

	display scrolls to show the start date and the start date cell is highlighted	
<b>Locate resource allocation end date corresponding to allocation start date</b>	<p>Firstly, click on the start date icon for the element:resource combination to highlight it; the corresponding end date icon is also highlighted</p> <p>If the end date icon is not in view, right-click on the start date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the end date and the end date cell is highlighted</p>	
<b>Refocus display on today's date</b>	<p>Right-click anywhere on the display and select the <b>Show Today</b> context menu option</p> <p>The display returns to today's date, which is highlighted and outlined</p>	

**Notes:**

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the above editions, if security is enabled you must have **Manage Project Information** permission in order to allocate resources to or remove resources from the project Calendar; if security is not enabled, you can change data without this permission
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them
- As the start and end icons for a *completed* task are identical, and one-day tasks have only one icon, the methods to show the corresponding start date or end date for an icon are also useful to show whether the icon *is* for a start or end date, or for a one-day task; alternatively, double-click on the icon and review the allocation dates

**Learn More:**

- [Project Calendar](#)<sup>[392]</sup>
- [List of Available Permissions](#)<sup>[206]</sup>

**3.6.7.3 Project Tasks**

*Project Tasks* is a display mode of the project Calendar facility.

In Project Tasks mode, the Diary panel shows the selected period of time (see the *Project Calendar* topic), with at least one icon representing each *project task* scheduled during that period. The icon represents an independent record of the task - there are no comparisons or validations of the tasks. Therefore you can have separate icons for the same task, with different resources allocated or no resources allocated; you can even have identical task records, if these serve a purpose for you.

Each icon shows the task name and resource name, and indicates the status of the task with one of the following symbols:

- a green square, indicating that the task has been scheduled
- a green tick, indicating that the task is complete
- a red square, indicating that the task is incomplete
- a square divided diagonally with green and red halves, indicating that the task is to be completed within one working day

Typically, while a task is in progress it is represented by:

- An icon with a green square on the day the work is planned to start, and
- An icon with a red square on the day the work is planned to finish

When the work is complete, the icons on both days display the green tick.

Tasks can be created and managed through this view of the Project Calendar, or the:

- Project Tasks tab of the Project Information window, or
- Project Tasks tab of the Personal Information window

**Access:** [View | Project Calendar > Project Tasks](#)

**Use to:**

- Review the tasks across the project over a period of time
- Review the progress of those tasks
- Create new tasks
- Display and edit the details of the task
- Allocate a resource to a task
- Delete a task
- Create and send an email to the resource assigned to a task
- Create and send an email to the owner of the task

**How to:**

On the Project Tasks display, make selections from the options as indicated below:

Option	Usage	See also
<b>Create a task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on the date cell in which the task is to start</li> <li>• Right-click on the cell and select the <b>Add New Task</b> context menu option, or</li> <li>• Click on the down-arrow next to the first icon in the Calendar toolbar, and select the <b>New Task</b> option</li> </ul> <p>The Task Details dialog displays, through which you create the task</p>	<a href="#">Add, Modify and Delete Tasks</a> <sup>[359]</sup>
<b>Display and edit a task</b>	<p>Either:</p> <ul style="list-style-type: none"> <li>• Double-click on the task</li> <li>• Right-click on the cell and select the <b>Properties</b> context menu option, or</li> <li>• Click on the down-arrow next to the first icon in the Calendar toolbar, and select the <b>Properties</b> option</li> </ul> <p>The Task Details dialog displays; if necessary, edit the information</p>	<a href="#">Add, Modify and Delete Tasks</a> <sup>[359]</sup>
<b>Allocate a resource to a task</b>	<p>Certain tasks might not initially be assigned to a resource, but might later require specific assignment to finish them off</p> <p>Open the task to edit it, click on the drop-down arrow in the <b>Assigned</b> field and select the required resource</p>	
<b>Delete a task</b>	<p>Right-click on any icon for the required task and select the <b>Delete '&lt;task-name&gt;'</b> context menu option</p> <p>You are prompted to confirm the deletion; click on the <b>Yes</b> button</p>	

Option	Usage	See also
<b>Create and send a message to the task owner</b>	<p>Right-click on any icon for the task and select the <b>Message Owner</b> context menu option</p> <p>The Model Message dialog displays, on which you create and send your message to the user who owns the task (as identified in the Task Details dialog)</p> <p>If the task does not have a defined owner, this option does not operate</p>	<a href="#">Create a Message</a> [383]
<b>Create and send a message to the resource assigned to the task</b>	<p>Right-click on any icon for the task and select the <b>Message Assigned &lt;resource name&gt;</b> context menu option</p> <p>The Model Message dialog displays, on which you create and send your message to the resource assigned to complete the task (as identified in the Task Details dialog)</p> <p>If the task does not have a defined resource, this option does not operate</p>	
<b>Locate task start date corresponding to task end date</b>	<p>Firstly, click on the end date icon for the task to highlight it; the corresponding start date icon is also highlighted</p> <p>If the start date icon is not in view, right-click on the end date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the start date and the start date cell is highlighted</p>	
<b>Locate task end date corresponding to task start date</b>	<p>Firstly, click on the start date icon for the task to highlight it; the corresponding end date icon is also highlighted</p> <p>If the end date icon is not in view, right-click on the start date icon and select the <b>Show Start/End</b> context menu option; the display scrolls to show the end date and the end date cell is highlighted</p>	
<b>Refocus display on today's date</b>	<p>Right-click anywhere on the display and select the <b>Show Today</b> context menu option</p> <p>The display returns to today's date, which is highlighted and outlined</p>	

**Notes:**

- The Project Calendar is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- In the Lite edition of Enterprise Architect, you can view Calendar entries but not change them

**3.6.8 Use Case Estimation**

Project estimation is the task of working out how much time and effort is required to build and deploy a solution.

The Use Case metrics facility in Enterprise Architect provides a starting point for estimating project effort;

using this facility you can get a rough measure of the complexity of a system and some indication of the effort required to implement the model. Like all estimation techniques, Use Case metrics requires some experience with previous projects to 'calibrate' the process.

There is additional information available on Use Case metrics on the Sparx Systems website.

**Topics:**

Topic	Detail	See also
<b>Calibrating</b>	The following values must be carefully calibrated in order to gain the best possible estimates: <ul style="list-style-type: none"> <li>• Technical Complexity Factors, which are values that attempt to quantify the difficulty and complexity of the work in hand</li> <li>• Environment Complexity Factors, which are values that attempt to quantify non-technical complexities such as team experience and knowledge</li> <li>• Default Hour Rate, which sets the number of hours per Use Case point</li> </ul>	<a href="#">Technical Complexity Factors</a> <sup>[403]</sup> <a href="#">Environment Complexity Factors</a> <sup>[404]</sup> <a href="#">Default Hours</a> <sup>[406]</sup>
<b>Estimating</b>	Once you have entered all the calibration values, you can estimate the project timescale through the Use Case Metrics dialog	<a href="#">Estimating Project Size</a> <sup>[406]</sup>

**Learn More:**

- [Project Estimation Using Use Case Metrics](#)

**3.6.8.1 Technical Complexity Factors**

*Technical Complexity Factors* (TCFs) are used in the Use Case Metrics estimation technique.

The EABase.eap model contains a default set of TCFs, which you can add to or modify using the Estimation Factors dialog. This set of factors should include all factors that could affect the technical complexity of the project environment.

**Access:** [Settings](#) | [Project Types](#) | [Estimation Factors](#) > [Technical Complexity Factors](#)

**How to:**

To maintain Technical Complexity Factors, follow the steps below:

Step	Action	See also
1	On the Technical Complexity Factors tab, either: <ul style="list-style-type: none"> <li>• Click on the <b>New</b> button to add another TCF, or</li> <li>• Click on the required factor in the <b>Defined Technical Types</b> list to edit it (go to step 3)</li> </ul>	
2	In the <b>Factor Number</b> field, type the appropriate TCF number	

Step	Action	See also
3	In the <b>Description</b> field, type or edit the TCF description	
4	In the <b>Weight</b> field, type or edit the technical complexity weighting This indicates how much technical complexity you assign to a factor; for example, <i>the system is to be developed in ADA</i> might warrant a higher weight than <i>the system is to be a shell script</i>	
5	In the <b>Value</b> field, type or edit a value representing the degree of influence the factor has on the project As a suggested gauge: <ul style="list-style-type: none"> <li>• <b>0</b> indicates no influence</li> <li>• <b>3</b> indicates average influence</li> <li>• <b>5</b> indicates strong influence</li> </ul>	
6	Click on the <b>Save</b> button	
7	Examine the <b>Defined Technical Types</b> list, and scroll across it to show the <b>Ex Value</b> column ( <b>Weight x Value</b> ) The summed <b>Ex Values</b> yield the <b>Unadjusted TCF</b> value (at the bottom of the dialog) The <b>Unadjusted TCF</b> value is combined with the Environment Complexity Factors to skew the overall complexity up or down, depending on the level of technical complexity and the corresponding level of environmental support	<a href="#">Environment Complexity Factors</a> <sup>[404]</sup>

**Notes:**

- The TCF Weight evaluates its respective factor, but is irrelevant to a project; the **Value** field assesses each factor's role within a project and, for most purposes, is the only field requiring adjustment
- The supplied factors and their associated weights are defined by the *Use Case Points Method*, although they can be adjusted to suit a project's specific requirements
- You can transport the Technical Complexity Factors between models, using Export Reference Data and Import Reference Data

**Learn More:**

- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

**3.6.8.2 Environment Complexity Factors**

*Environment Complexity Factors* (ECFs) are used in the Use Case Metrics estimation technique.

The EABase.eap model contains a default set of ECFs, which you can add to or modify using the Estimation Factors dialog. This set of factors should include all factors that could affect the general design and development environment, including team experience and knowledge, team size, expertise and other non-functional environmental factors.

**Access:** [Settings | Project Types | Estimation Factors > Environment Complexity Factors](#)

**How to:**

To maintain Environment Complexity Factors, follow the steps below:

Step	Action	See also
1	On the Environment Complexity Factors tab, either: <ul style="list-style-type: none"> <li>Click on the <b>New</b> button to add another ECF, or</li> <li>Click on the required factor in the <b>Defined Environment Types</b> list to edit it (go to step 3)</li> </ul>	
2	In the <b>Factor Number</b> field, type the appropriate ECF number	
3	In the <b>Description</b> field, type or edit the ECF description	
4	In the <b>Weight</b> field, type or edit the environment complexity weighting This indicates how much complexity you assign to a factor	
5	In the <b>Value</b> field, type or edit a value representing the degree of influence the factor has on the project  As a suggested gauge: <ul style="list-style-type: none"> <li><b>0</b> indicates no influence</li> <li><b>3</b> indicates average influence</li> <li><b>5</b> indicates strong influence</li> </ul>	
6	Click on the <b>Save</b> button	
7	Examine the <b>Defined Environment Types</b> list, and scroll across it to show the <b>Ex Value</b> column ( <b>Weight x Value</b> )  The summed <b>Ex Values</b> yield the <b>Unadjusted ECF</b> value (at the bottom of the dialog)  The <b>Unadjusted ECF</b> value is combined with the Technical Complexity Factors to skew the overall complexity up or down, depending on the level of technical complexity and the corresponding level of environmental support	<a href="#">Technical Complexity Factors</a> <sup>[403]</sup>

**Notes:**

- The ECF Weight evaluates its respective factor, but is irrelevant to a project; the **Value** field assesses each factor's role within a project and, for most purposes, is the only field requiring adjustment
- The supplied factors and their associated weights are defined by the *Use Case Points Method*, although they can be adjusted to suit a project's specific requirements
- You can transport the Environment Complexity Factors between models, using Export Reference Data and Import Reference Data

**Learn More:**

- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

### 3.6.8.3 Default Hours

Setting an hourly rate is the most difficult factor in an accurate estimation. Typical ranges can vary from 10 to 30 hours per Use Case point.

Studying the *Use Case Points Method*, from which this variable is defined, can help you to understand its role in the estimation and facilitate selection of a suitable initial value.

The best way to estimate this value is through analysis of previous completed projects. By calculating the project estimation on a completed project for which the Use Cases and environment are configured within Enterprise Architect, you can adjust the hour rate to render an appropriate value for your unique work environment.

**Access:** [Settings | Project Types | Estimation Factors > Default Hour Rate](#)

#### How to:

To set the default hour rate per adjusted Use Case point, follow the steps below:

Step	Action	See also
1	In the <b>Duration</b> field, type the number of hours per Use Case Point	
2	In the <b>Hourly Rate</b> field, type the cost per hour	
3	Click on the <b>Close</b> button	

#### Notes:

- The values you enter are stored as local settings on your computer only
- This option is also active in the 'Lite', read-only version of Enterprise Architect

#### Learn More:

- [Project Estimation Using Use Case Metrics](#)
- [The Read-only 'Lite' Edition](#) <sup>[18]</sup>

### 3.6.8.4 Estimating Project Size

Enterprise Architect uses a simple estimation technique based on the established:

- Number of Use Cases to be built
- Difficulty level of those Use Cases
- Project environment factors and
- Build parameters

This technique is of value only once you have developed a couple of known projects to use as a baseline. Please DO NOT use the provided 'guesstimates' as a real world measure until you have some real world base lines to measure against.

**Access:** Select package in Project Browser:

**Project | Use Case Metrics**  
**Right-click | Documentation | Package Metrics**

**How to:**

On the Use Case Metrics dialog, work through the fields as indicated in the following table:

Field	Usage	See also
<b>Root Package</b>	Confirm the root package in the hierarchy All Use Cases under this package could potentially be included in the report	
<b>Reload</b>	Re-run the load from the selected package, usually after you change the filter criteria	
<b>Phase like</b>	Include Use Cases with a phase that matches the wildcard value in the field Use * to match any characters, for example 1.* for 1.1 and 1.2	
<b>Keyword like</b>	Include Use Cases with a keyword that matches the wildcard value in the field Use * to match any characters	
<b>Bookmarked</b>	Include all Use Cases, or only those that are tagged, or those that are not tagged	
<b>Use Cases</b>	Check the total count of Use Cases in the estimate The Use Cases and their parameters are listed in the panel underneath this field	
<b>Include Actors</b>	Select to include Actors in the estimate	
<b>Technical Complexity Factor</b>	Review the parameters that describe the degree of technical complexity of the project While the <b>Unadjusted TCF Value</b> comes from the Technical Complexity Factors tab of the Estimation Factors dialog, the other values compose the Use Case Points Method formula Modify these fields with caution The final project estimate is directly proportional to the TCF	<a href="#">Technical Complexity Factors</a> [403]
<b>Environment Complexity Factor</b>	Review the parameters that calculate the degree of environmental complexity of the project, from factors such as programmer motivation or experience The listed parameters compose the formula calculating the ECF, defined by the Use Case Points Method; the only parameter affected by the project is the <b>Unadjusted ECF Value</b> , derived from the Environment Complexity Factors [1323] tab of the Estimation Factors dialog The final project estimate is directly proportional to the ECF	<a href="#">Environment Complexity Factors</a> [404]
<b>Unadjusted Use Case Points (UUCP)</b>	Check the sum of the Use Case complexity numbers	
<b>Ave Hours per Use Case</b>	Check the average number of hours assigned to easy, medium and difficult Use Cases You cannot change these figures	

Field	Usage	See also
<b>Total Estimate</b>	Review the detailed breakdown of the final figure  You must tailor the hours per Use Case Point figure to the level that matches your type of project and capability based on known previous project outcomes	
<b>Default Rate</b>	Set the default hours <sup>[406]</sup> to be fed into the final calculation	<a href="#">Default hours</a> <sup>[406]</sup>
<b>Re-Calculate</b>	Re-run the estimate, usually after you change the hours or Use Case point number	
<b>Report</b>	Produce a rich text formatted report from the current estimate	

### 3.6.9 SPEM

#### Topics:

Topic	Detail	See also
<b>Introduction</b>	<p>According to the Object Management Group (OMG) Software &amp; Systems Process Engineering Meta-Model Specification (Version 2.0, April 01 2008):</p> <ul style="list-style-type: none"> <li><i>The Software and Systems Process Engineering Meta-model (SPEM) is a process engineering meta-model as well as conceptual framework, which can provide the necessary concepts for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes. An implementation of this meta-model would be targeted at process engineers, project leads, project and program managers who are responsible for maintaining and implementing processes for their development organizations or individual projects.</i></li> </ul> <p>In 1999, the OMG placed a Request for Proposal concerning Software Process Engineering (SPE). In November 2002, the OMG released the Software Process Engineering Meta-model Specification 1.0. SPEM was defined as a Profile of UML, which used UML as a notation and took an object-oriented approach. To accommodate UML 2, the SPEM specification was upgraded to 2.0 in April 2008.</p>	<a href="http://www.omg.org/spec/SPEM2.0/PDF">http://www.omg.org/spec/SPEM2.0/PDF</a> (Online Resource)
<b>SPEM in Enterprise Architect</b>	<p>SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM, to describe an actual development process.</p> <p>Enterprise Architect enables you to develop SPEM diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The SPEM facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>A SPEM diagram type, accessed through the New Diagram dialog</li> <li>A set of SPEM pages in the Toolbox, providing SPEM elements (stereotyped UML elements)</li> <li>SPEM element and relationship entries in the</li> </ul>	<a href="#">Add New Diagram</a> <sup>[570]</sup> <a href="#">SPEM Toolbox</a> <sup>[409]</sup> <a href="#">Toolbox Shortcut Menu</a> <sup>[553]</sup> <a href="#">Quick Linker</a> <sup>[624]</sup>

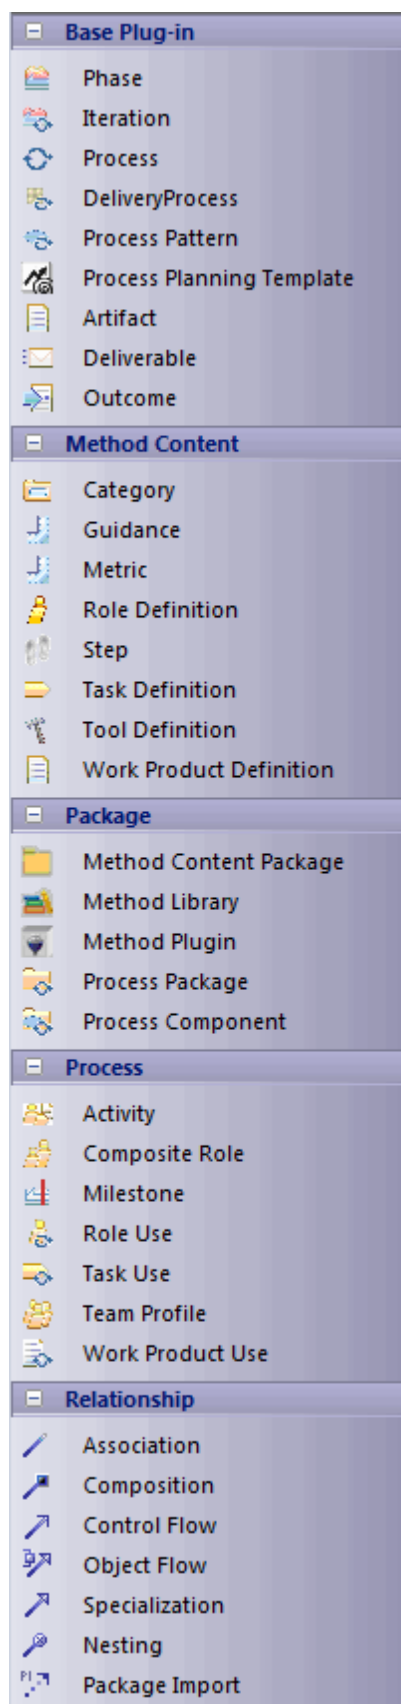

Topic	Detail	See also
	Toolbox Shortcut Menu and Quick Linker	
<b>Disable SPEM</b>	If you prefer not to use SPEM in Enterprise Architect, you can disable it (and subsequently re-enable it) using the <b>MDG Technologies</b> dialog ( <b>Settings   MDG Technologies</b> ).	<a href="#">MDG Technologies</a> 

### 3.6.9.1 SPEM Toolbox Pages

These pages provide the graphical SPEM elements for drawing the diagrams.

**Access:** From the Diagram Toolbox: More Tools | SPEM

**Example:**

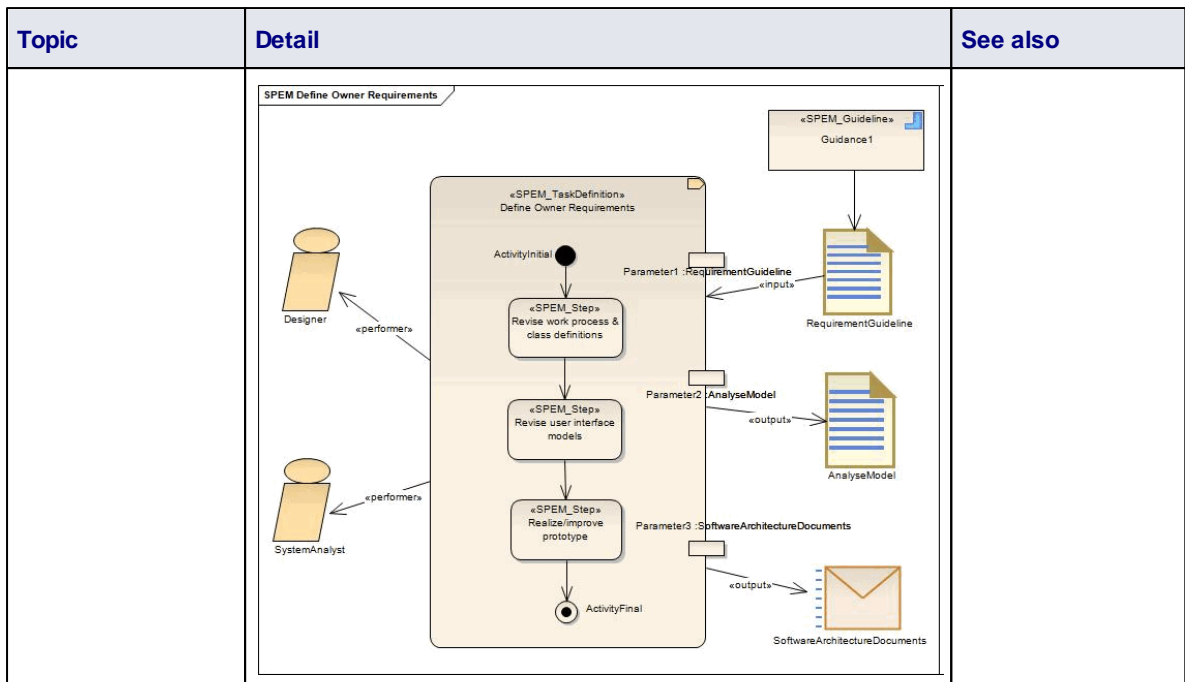

**Reference:**

<b>Page</b>	<b>Item</b>	<b>Action</b>
<b>Base Plug-in</b>	<b>Phase</b>	Create a predefined special Activity representing a significant period in a project.
	<b>Iteration</b>	Group a set of nested Activities that are repeated more than once. Typically, Iteration is an Activity for which the default value of the <i>isRepeatable</i> attribute is <b>True</b> .
	<b>Process</b>	Represent a special Activity that describes a structure for particular types of development projects, or parts of them.
	<b>Delivery Process</b>	Represent a special Process describing a complete and integrated approach for implementing a specific project type.
	<b>Process Pattern</b>	Represent a special Process to describe a reusable cluster of Activities in a general process area that provides a consistent development approach to common problems.
	<b>Process Planning Template</b>	Represent a special Process that is prepared for instantiation by a project planning tool.
	<b>Artifact</b>	Represent a Work Product Definition that provides a description and definition for tangible work product types.
	<b>Deliverable</b>	Represent a Work Product Definition that provides a description and definition for packaging other Work Products, and that can be delivered to an internal or external party.
	<b>Outcome</b>	Represent a Work Product Definition that provides a description and definition for non-tangible work products.
<b>Method Content</b>	<b>Category</b>	Categorize content based on the user's criteria.
	<b>Guidance</b>	Identify reference items such as Guidelines, Templates, Checklists, Tool Mentors, Estimates, Supporting Materials, Reports and Concepts.
	<b>Metric</b>	Define a standard measurement for instances of Method Content elements.
	<b>Role Definition</b>	Define a set of related skills, competencies, and responsibilities.
	<b>Step</b>	Represent parts or subunits of a Task Definition.
	<b>Task Definition</b>	Describe an assignable unit of work. Every Task Definition is assigned to specific Role Definitions. A Task is associated with input and output Work Products.
	<b>Tool Definition</b>	Describe the tools that are recommended or necessary for completing a specific Task.
	<b>Work Product Definition</b>	Define any forms of document, report or outcome that are consumed, produced or modified by Tasks.
<b>Package</b>	<b>Method Content Package</b>	Create a physical container to organize the Method Content elements.

Page	Item	Action
	<b>Method Library</b>	Create an overall physical container for all SPEM 2.0 elements.
	<b>Method Plugin</b>	Create a physical container for Method Content Package and Process Packages. It can be used stand-alone as well as extended to many other Method Plugins.
	<b>Process Package</b>	Create a physical container that contains different kinds of Process element.
	<b>Process Component</b>	Create a special Process Package that provides the mechanism of encapsulation.
<b>Process</b>	<b>Activity</b>	Define basic units of work within a Process as well as the Process itself.
	<b>Composite Role</b>	Represent an aggregation of Role Definition references for an Activity.
	<b>Milestone</b>	Represent any significant events in a development project.
	<b>Process</b>	Create a special Activity that describes a structure for particular types of development project.
	<b>Role Use</b>	Represent a Role Definition in the context of one specific Activity.
	<b>Task Use</b>	Represent a Task Definition in the context of one specific Activity.
	<b>Team Profile</b>	Define a nested hierarchy of teams and team members.
	<b>Work Product Use</b>	Represent a Work Product Definition in the context of one specific Activity.

#### Topics:

Topic	Detail	See also
<b>Presentation</b>	<p>In Enterprise Architect, every SPEM stereotype can be presented in one of two ways:</p> <ul style="list-style-type: none"> <li>• Iconic presentation, or</li> <li>• Textual presentation.</li> </ul> <p>The <i>iconstyle</i> tag is used for switching between these presentations. For example, in the SPEM diagram below, if you want the <i>SPEM_TaskDefinition</i> to have iconic presentation you set the <i>iconstyle</i> Tagged Value to <b>True</b>, and display the element as an icon. To get the textual presentation for <i>SPEM_TaskDefinition</i>, as an outline with a decoration in the top right corner, set the Tagged Value to <b>False</b>.</p>	

### 3.6.10 Update Package Status

Elements in Enterprise Architect can be assigned a current status, such as *Proposed*, *Validated* or *Mandatory*.

Often a complete package structure moves from one status to another (such as for release) in one operation. To help facilitate this, Enterprise Architect supports a 'bulk' update of element status.

**Access:** [Project Browser package context menu | Package Control | Update Package Status](#)

**Use to:**

- Update the status of all elements in a package at the same time

**How to:**

To update the status of all elements in a package, using the Status Update dialog, follow the steps below:

Step	Action	See also
1	Select: <ul style="list-style-type: none"> <li>• The new status</li> <li>• Whether to recursively descend the package tree</li> <li>• Whether to include elements</li> <li>• Whether to include element requirements</li> <li>• Whether to include element constraints</li> </ul>	
2	Click on the <b>OK</b> button Enterprise Architect updates all required elements to the new status	

### 3.6.11 Manage Bookmarks

A bookmark is a visual clue that something is different about an element; it is represented by a small red triangle that displays above the element in the diagram.

You can assign any meaning to the bookmark as is appropriate to your model.

You can bookmark:

- Single elements manually, or
- All elements in a package automatically when they assume a defined status

#### How to:

To work with bookmarks, select from the options described below:

Option	Usage	See also
<b>Bookmark a selected element in a diagram</b>	Either: <ul style="list-style-type: none"> <li>• Press (<b>Shift+Spacebar</b>), or</li> <li>• Select the <b>Edit   Bookmark Selected</b> menu option</li> </ul>	
<b>Clear a bookmark on a selected element</b>	Use either of the above two options again	
<b>Bookmark Multiple Elements in a Package</b>	Select <b>Project Browser package context menu   Bookmarks</b> The Manage Bookmarks dialog displays, enabling you to automatically bookmark any elements (and, if required, their children) in the package that have: <ul style="list-style-type: none"> <li>• New changes defined in the Maintenance window</li> <li>• New defects defined in the Maintenance window, and/or</li> <li>• Test scripts defined in the Testing window</li> </ul> This is useful to highlight elements that have additional project information	
<b>Clear all elements of bookmarks</b>	To clear all bookmarks: <ul style="list-style-type: none"> <li>• Throughout the current package, click on the <b>Clear All</b> button on the Manage Bookmarks dialog</li> <li>• In the current diagram, select the <b>Edit   Clear All Bookmarks</b> menu option</li> </ul>	

#### Notes:

- You should reload the project to update it with the new or cleared bookmarks
- The Model Search window enables searching based on bookmarked elements

#### Learn More:

- [Create & Modify Searches](#)<sup>[484]</sup>

### 3.6.12 Monitor Change Events

You can automatically monitor work events in your project, using the Model Views facility.

**Guide:**

Topic	Detail	See also
<b>Model Views</b>	<p>This facility enables you to:</p> <ul style="list-style-type: none"> <li>• Automatically refresh a search in a View at an interval that you define</li> <li>• Notify you if the results of the search change between two consecutive searches</li> </ul> <p>You can therefore use Model Views to monitor various events in the development project, depending on how you set up the search in a View</p>	<p><a href="#">Model Views Operations</a><sup>[477]</sup></p>
<b>Example</b>	<p>You could set up a search to detect:</p> <ul style="list-style-type: none"> <li>• Change items, or Issue items, so that Enterprise Architect would notify you as new items were created</li> <li>• Element Status, Type, Phase, Version, Priority and/or date of last update, so that Enterprise Architect would notify you as items were progressed to:                             <ul style="list-style-type: none"> <li>• Fall in to the level of work represented by the search categories or</li> <li>• Move out of the categories into the next level of work</li> </ul> </li> <li>• Tagged Values, so that - again - as items were changed to satisfy the criteria of a sequence of searches, the progression of items through a set of stages could be checked and managed</li> </ul>	
<b>Personalization</b>	<p>People responsible for different stages in a process could have their own Model View searches so that:</p> <ul style="list-style-type: none"> <li>• As a development, validation or authorization task falls due the responsible person is automatically notified, and</li> <li>• When the work is complete both the next person in line and the overseeing manager are notified</li> </ul>	

**Notes:**

- This facility is available in the Enterprise Architect Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions

## 3.7 Project Maintenance

This topic highlights some administrative functions you might have to carry out to maintain your model.

### Topics:

Topic	Detail	See also
<b>Check the integrity of the data in a project</b>	If you have a failed XML import, network crash or other unforeseen event that could disrupt the integrity of information in the model, it is recommended that you run a Project Integrity Check	<a href="#">Check Project Data Integrity</a> <sup>[416]</sup>
<b>Reset Auto Increment Columns in Tables</b>	XML Import/Export can affect the table auto increment column values and push them towards the maximum datatype value; you can re-sequence the columns to avoid this problem	<a href="#">Reset Table Auto Increment or Identity Columns</a> <sup>[418]</sup>
<b>Upgrade an old project to enable use of new features</b>	The structure of Enterprise Architect project files is occasionally changed to support more features; when this happens, existing project files must be upgraded to the new format to ensure correct operation and to take advantage of all the new features	<a href="#">Upgrade Projects</a> <sup>[419]</sup>
<b>Rename a project</b>	If you want to rename an Enterprise Architect project, you can do so through Windows Explorer	<a href="#">Rename a Project</a> <sup>[420]</sup>
<b>Compact a project</b>	After some time, a project .EAP file might benefit from compacting to conserve space	<a href="#">Compact a Project</a> <sup>[420]</sup>
<b>Repair a project if it did not close properly</b>	If a project has not been closed properly, such as during system or network outages, on rare occasions the .EAP file does not re-open correctly.	<a href="#">Repair a Project</a> <sup>[421]</sup>

### Notes:

- You only rename, compact and repair models created as .EAP files; these processes are not required for models stored in a DBMS

### 3.7.1 Check Project Data Integrity

If you have a failed XML import, network crash or other unforeseen event that could disrupt the integrity of information in the model, it is recommended that you run the *Project Integrity Check* function.

You can select a variety of items to check. The integrity check examines all database records and ensures there are no 'orphaned' records or inaccurate or unset identifiers. This function does NOT check UML conformance, only the data relationships and repository structure.

You can run the integrity checker first in report mode to discover if anything should be corrected, and then run it again in 'recover/clean' mode.

When Enterprise Architect 'cleans' the model, it attempts to recover lost packages and elements, and generates a new package at the model root level called *\_recovered\_*. Check through any elements that are found and, if required, drag them into the model proper. If they are not required, delete them.

**Access:** [Tools](#) | [Data Management](#) | [Project Integrity Check](#)

**Use to:**

- Ensure that your project data is structurally complete

**How to:**

To check the data integrity of your project, follow the steps below:

Step	Action	See also
1	Select the <b>Project Integrity Check</b> menu option The Project Integrity Check dialog displays	
2	Select the checkbox for each check to run: <ul style="list-style-type: none"> <li>• Package Structure</li> <li>• Object Structure</li> <li>• Object Features</li> <li>• All GUIDs</li> <li>• Cross References</li> <li>• Connectors</li> <li>• UML 2.0 Migration (see below)</li> </ul>	
3	Select either: <ul style="list-style-type: none"> <li>• the <b>Report Only</b> option to just view a report on the state of your model, or</li> <li>• the <b>Recover/Clean</b> option to recover and clean your project; before selecting this option back up your project file first</li> </ul>	
4	To write a log of the integrity check, click on the <b>Save Results</b> button and select a log file	
5	Click on the <b>Go</b> button to run the check  If you want to display the resulting information in a more readable layout, you can resize the dialog and its columns	

**UML 2.0 Migration**

The UML 2.0 Migration check enables you to migrate the project from UML 1.3 semantics to UML 2.0 semantics. The migration process currently converts activities that are invocations of operations into called operation actions as per the UML 2.0 specification.

The UML 2.0 Migration option is an exclusive process that does not enable any of the other checks to be selected. When you click on the **Go** button to perform the migration, a prompt displays for you to confirm the operation.

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Check Data Integrity** permission to perform a data integrity check

- [List of Permissions](#)<sup>[206]</sup>
- [Run SQL Patches](#)<sup>[420]</sup>

### 3.7.2 Reset Table Auto Increment or Identity Columns

This topic explains possible impacts of XML Export/Import on table auto increment columns, and how to re-sequence the columns whose value approaches the maximum datatype value.

Topics:

Topic	Detail	See also
<b>XML Export/Import</b>	<p>XML Export/Import can cause gaps in the numbering sequence of auto increment columns</p> <p>Each XML Import deletes rows from several tables; the import then adds rows starting from the maximum value of the auto increment column</p> <p>Repeated XML imports can result in the value of the auto increment approaching the maximum value of the database datatype; for example, SQL Server's <i>int</i> datatype has a maximum value of <b>2,147,483,647</b></p>	
<b>Replication</b>	<p>Large auto increment values can also arise where the project originated as an EAP replica or design master</p> <p>The Jet engine assigns random values for auto increment columns with each XML Import into the project</p> <p>These random values can approach the maximum range of the repository data type, which could present a problem when the EAP project is transferred to a repository</p>	<a href="#">Replication</a> <sup>[189]</sup>

Access: **Tools | Data Management | Reset IDs**

How to:

To re-sequence auto increment columns, follow the steps below:

Step	Action
1	Open the project
2	<p>Select the <b>Reset IDs</b> menu option</p> <p>A dialog displays listing all non-empty tables that contain an auto increment or identity column</p> <ul style="list-style-type: none"> <li>• The <b>Rows</b> column shows the number of rows in the table</li> <li>• The <b>Maximum ID</b> column shows the current maximum value of the auto increment column</li> <li>• The <b>Action</b> column shows either <b>No Action</b> or <b>Reset</b>, depending on how close the column value is to the datatype's maximum</li> </ul>

Step	Action
	Tables requiring a reset are automatically selected in the list
3	Click on the <b>Go</b> button to reset the auto increment column values

### 3.7.3 Project Upgrade

The structure of Enterprise Architect project files is occasionally changed to support more features. In such cases, the project might have to be upgraded.

Topic	Detail	See also
<b>Upgrading</b>	Upgrading to the new file structure is a simple and quick process that brings your project to the current level to: <ul style="list-style-type: none"> <li>• Ensure correct operation and</li> <li>• Support all the latest Enterprise Architect features</li> </ul>	
<b>Initial Check</b>	When you load a project that was created in an early release of Enterprise Architect (for example, an archived project) using a recent release of Enterprise Architect, the system determines whether the project should be upgraded and, if the upgrade is necessary, displays the Upgrade Wizard	
<b>The Upgrade Project Wizard</b>	The Upgrade Project Wizard takes you through the upgrade process and: <ul style="list-style-type: none"> <li>• Advises you of the necessity to upgrade</li> <li>• Advises you to back up the current project; it is essential to back up before any changes are made</li> <li>• Checks which upgrade path is required</li> <li>• Guides you through the steps to perform the upgrade</li> <li>• Opens the newly converted project</li> </ul>	

#### Notes:

- If you are using replication in your models, and the upgrade wizard detects that the project you are opening is a replica and not a Design Master, a different upgrade path is required
- Once upgraded, the project cannot be opened with the version of Enterprise Architect in which it was created

#### Learn More:

- [Replication](#)<sup>[189]</sup>
- [Upgrade Replicas](#)<sup>[419]</sup>

#### 3.7.3.1 Upgrade Replicas

Models that have replication features added might have to be upgraded differently from regular projects.

- If the model is a Design Master (the root model of all other replicas) then you can upgrade the model to suit the current version of Enterprise Architect; after upgrading a Design Master you should re-create the replicas, rather than synchronizing
- If the model is not a Design Master, Enterprise Architect must first remove the replication features, then upgrade the project in the normal manner; the Upgrade Wizard guides you through the steps

#### Learn More:

- [Project Upgrade](#) <sup>[419]</sup>
- [Replication](#) <sup>[189]</sup>
- [Design Masters](#) <sup>[191]</sup>

### 3.7.4 Run SQL Patches

Occasionally, Sparx Systems might release a patch to correct a model fault.

**Access:** [Tools](#) | [Data Management](#) | [Run Patch](#)

The patch generally checks how many records are to be updated, and reports on what is to be done.

### 3.7.5 Rename a Project

If you want to rename a project, you can only do so at the Windows file system level, using Windows Explorer.

#### How to:

To rename an Enterprise Architect project .EAP file, follow the steps below:

Step	Action
1	If you have the project open, shut it down
2	Ensure no other users have the file open
3	Open Windows Explorer and navigate to the project
4	Rename the project file using Windows Explorer
5	You should keep the .EAP extension the same to preserve compatibility with the default project type, as installed in the registry at installation time

### 3.7.6 Compact a Project

After a long period of use and development, a project .EAP file might benefit from compacting to conserve space.

Always compact and repair projects on a local drive, never on a network drive.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Compact .EAP File](#)

#### How to:

To compact a project, follow the steps below:

Step	Action
1	If you have the project open, shut it down
2	Ensure no other users have the file open
3	Select the <b>Compact .EAP File</b> menu option

Step	Action
4	Follow the on-screen instructions to complete the process

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Administer Database** permission to compact a project

**Learn More:**

- [List of Permissions](#)<sup>[206]</sup>

**3.7.7 Repair a Project**

If a project has not been closed properly, such as during system or network outages or on poor network connections, on rare occasions the .EAP file does not open correctly. A message displays informing you the project is of an unknown database format or is not a database file.

You can repair the project; however, never attempt to repair a project over a network connection; copy it to a local drive first.

**Access:** [Tools](#) | [Data Management](#) | [Manage .EAP File](#) | [Repair .EAP File](#)

**How to:**

To repair a project that was not closed properly, follow the steps below:

Step	Action	See also
1	Ensure that all users are logged off the project you are attempting to repair	<a href="#">General</a> <sup>[424]</sup>
2	Copy the project file to a local drive on your PC	
3	In Enterprise Architect, select <b>Tools   Options</b> to display the Options dialog On the General page, deselect the <b>Use Jet 4.0 - requires restart</b> checkbox	
4	Close and restart Enterprise Architect and open a <i>copy</i> of the project you intend to repair as a <i>place holder</i> project, to enable access to the <b>Repair .EAP File</b> facility	
5	Select the <b>Repair .EAP File</b> menu option, and follow the on-screen instructions	
6	Once you have repaired the project, it is recommended that you perform a data integrity check	<a href="#">Check Project Data Integrity</a> <sup>[416]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Administer Database** permission to repair a project

**Learn More:**

- [List of Permissions](#)<sup>[206]</sup>

## 3.8 Local Options

There are many options for customizing how Enterprise Architect displays and works with models and model elements. This topic describes those settings that are local to a particular user and machine.

Most of these settings are stored in your registry so they are set for your use only. For a networked workplace, registry settings can be copied down to any network workstation you log in to. Otherwise, the settings are valid for the current machine only.

**Access:** **Tools | Options**

Select the required page of options by clicking on the appropriate category name in the left hand list on the dialog. For information on the options on a specific page, select the appropriate page title link below.

Topic	Detail	See also
<b>General Options</b>	Set options that define how Enterprise Architect operates as a whole	<a href="#">General</a> <sup>[424]</sup>
<b>Standard colors of objects</b>	Define the display and background colors of objects and properties across Enterprise Architect	<a href="#">Standard Colors</a> <sup>[426]</sup>
<b>Diagram actions</b>	Configure overall options for new diagrams and general diagram behavior	<a href="#">Diagram</a> <sup>[428]</sup>
<b>Diagram appearance</b>	Define how diagrams and their contents appear on display	<a href="#">Diagram Appearance</a> <sup>[429]</sup>
<b>Diagram behavior</b>	Define how a diagram responds to actions taken on it	<a href="#">Diagram Behavior</a> <sup>[432]</sup>
<b>Options for Sequence diagrams</b>	Configure various font settings and the focus of the control indicator for Sequence diagrams	<a href="#">Diagram Sequence</a> <sup>[433]</sup>
<b>Object appearance</b>	Configure how elements look and respond in diagrams	<a href="#">Objects</a> <sup>[434]</sup>
<b>Link or Connector appearance</b>	Define options for the creation, behavior and notation of connectors	<a href="#">Links</a> <sup>[436]</sup>
<b>Colors of communication messages</b>	Configure the colors used in Communication diagrams	<a href="#">Communication Message Colors</a> <sup>[437]</sup>
<b>XML Specification options</b>	Configure various settings for working with XML	<a href="#">XML Specifications</a> <sup>[438]</sup>
<b>Source code engineering options</b>	Set general options that apply to all languages when generating code from Enterprise Architect, including the default language in which to generate code	<a href="#">Source Code Engineering</a> <sup>[1528]</sup>
<b>DDL and code</b>	Configure options for Enterprise Architect's internal editor,	<a href="#">Code Editors</a> <sup>[1528]</sup>

Topic	Detail	See also
editors	and for the default editor for DDL scripts	
Constructor/ Destructor options	Configure options for Object Lifetimes	<a href="#">Object Lifetimes</a> <sup>[1530]</sup>
Attribute and Operation specifications	Configure Attribute and Operation specifications	<a href="#">Attribute/Operations</a> <sup>[1531]</sup>
Code language specifications	Define how Enterprise Architect handles a particular language when generating code, including the default source directory and the default editor for a specific code language	<a href="#">ActionScript</a> <sup>[1539]</sup>
		<a href="#">C</a> <sup>[1540]</sup>
		<a href="#">C#</a> <sup>[1541]</sup>
		<a href="#">C++</a> <sup>[1542]</sup>
		<a href="#">Delphi</a> <sup>[1542]</sup>
		<a href="#">Java</a> <sup>[1544]</sup>
		<a href="#">PHP</a> <sup>[1545]</sup>
		<a href="#">Python</a> <sup>[1545]</sup>
		<a href="#">Visual Basic</a> <sup>[1548]</sup>
		<a href="#">VB.Net</a> <sup>[1546]</sup>

### 3.8.1 General

**Access:** **Tools | Options > General**

**Use to:**

- Set general options

**Reference:**

Field	Usage	See also
Author	Set the default author when new elements are created and modifications made	
Clipboard Format	Set the graphic format in which to save image to the clipboard; <b>Metafile</b> has the best detail	
Double-click on Browser	Configure the Project Browser behavior	<a href="#">Set Default (Project Browser) behavior</a> <sup>[457]</sup>
Use Jet 4.0 - requires restart	Set JET 4.0 as the database engine; this ensures compatibility with .EAP files that are in turn compatible with versions of MS Access later than Access 97, and that support unicode character sets  If your project is not in a Jet 4.0 database, you should also download a copy of the Jet 4.0 EABase Model from the Sparx	<a href="#">Perform a Project Data Transfer</a> <sup>[349]</sup>  Download link: <a href="#">Sparx Systems website</a>

Field	Usage	See also
	Systems website, and do an EAP to EAP transfer of your model into the Jet 4.0 file	
<b>Use extended « and » characters</b>	Apply the guillemet characters to stereotypes For some double byte character sets, it is best to select this checkbox.	
<b>Allow custom RTF tags in reports</b>	Enable you to use customized rich text format code in report templates when generating reports <b>with the Legacy RTF Report Generator</b>  From release 7.0 of Enterprise Architect, with the Notes formatting facility, this option is not really necessary	<a href="#">Legacy RTF Report generator</a> <sup>[180]</sup> <a href="#">Notes toolbar</a> <sup>[772]</sup>
<b>Project Directory</b>	Specify the default location of Enterprise Architect projects	
<b>File Directory</b>	Specify the default location for file	
<b>Web Home</b>	Specify the default home page to open when you click on the <b>Home</b> button in the internal web browser	
<b>Web Search</b>	Specify the default web page to open when clicking on the <b>Web Search</b> button in the internal web browser	<a href="#">The Web Browser</a> <sup>[129]</sup>
<b>Web Mail</b>	Specify the email server address (http://xxxx/exchange/) for accessing email through the web browser within Enterprise Architect	
<b>Confirm Deletes</b>	Use or bypass the Confirm Delete dialog; only clear this checkbox if you are an experienced user	
<b>Allow Free Sorting</b>	Enable you to re-order elements within a package regardless of element type, in the Project Browser	
<b>Show Stereotypes</b>	Show element and feature stereotypes in the Project Browser	
<b>Always open maximized</b>	Ensure that Enterprise Architect always starts up in a maximized window	
<b>Hide Properties Info Section</b>	Hide or show the properties information status bar on the Properties window	
<b>Docked Windows Tabs on Bottom (requires restart)</b>	Display the docked window tabs at the bottom of the window (default) Clear the checkbox to show the tabs at the top of the windows	
<b>Main Diagram Tabs at Bottom (requires restart)</b>	Display the diagram tabs at the bottom of the main view (default) Clear the checkbox to show the tabs at the top of the main view	
<b>File Loading Strategy</b>	Select the Enterprise Architect model loading behavior for .EAP files; choose either: <ul style="list-style-type: none"> <li>• <b>Load on Demand (Lazy Load)</b></li> <li>• <b>Preload Entire Model</b></li> </ul> <b>Load on Demand</b> does not load the full project view when the model is loaded; instead, only the parts that are necessary to display the visible portion of the tree are loaded	

Field	Usage	See also
	<p>This means that a model loads faster and users can begin work sooner, but at the expense of later small delays as Enterprise Architect loads specific portions of the model</p> <p>For server connections, the <b>Load on Demand</b> option is set when the connection is created</p>	

### 3.8.2 Standard Colors

The Standard Colors page of the Options dialog enables you to set the display color of a range of objects and their backgrounds. On first use, the page displays the system default colors. To display the range of colors available for an item, or to define a new color, click on the down arrow at the end of the appropriate field.

**Access:** [Tools | Options > Standard Colors](#)

**Use to:**

- Set global colors

**Reference:**

Field	Usage	See also
<b>Paper</b>	Define the paper (background) color in diagrams	
<b>Element Fill</b>	Define the fill color of elements	
<b>Element Line</b>	Define the line color of elements	
<b>Shadow</b>	Define the color of element outline shadows	
<b>Attribute</b>	Define the color of attribute text	
<b>Method</b>	Define the color of method (operation) text	
<b>Note Color</b>	Define the note background color	
<b>Note Compartment Text</b>	Define the color of text in the element Note compartment	
<b>Screen</b>	Define the screen (element) color	
<b>Connector Line</b>	Define the connector line color	
<b>Behavior</b>	Define the color for behaviors in Activity diagrams	
<b>Custom Colors</b>	<p>Click on the <b>Define Colors</b> button to define up to 16 custom colors to be used in changing the appearance of elements on diagrams</p> <p>The <b>Show Project Custom Colors in Color Combo Boxes</b> checkbox must be selected in order for this button to operate</p>	<a href="#">Create Project Colors</a> <sup>[427]</sup>
<b>Show Project Custom Colors in Color Combo Boxes</b>	<p>Enable the use of project custom colors within the Default Appearance dialog</p> <p>When you select this option, the last 16 squares on the color selection palettes on the Default Appearance dialog are reserved</p>	<a href="#">Set an Element's Default Appearance</a> <sup>[643]</sup>

Field	Usage	See also
	for the custom colors  You must restart Enterprise Architect for changes to this option to take effect	

**Notes:**

- Using this page of the Options dialog, you can set the background of all diagrams to be a specific color; you can also use the Diagram Appearance page to set all diagram backgrounds to be either a uniform color or to have a fade gradient from top to bottom
- As an alternative, you can create a background image for the diagram
- To override the default appearance of a specific element on all diagrams on which it is found, right-click on the element and select the **Appearance | Default Appearance** context menu option; the Default Appearance dialog displays
- To change the appearance of a specific element on the current diagram only, use the Format toolbar; if this toolbar is not displayed, select the **View | Toolbars | Format Tool** menu option

**Learn More:**

- [Diagram Appearance](#)<sup>[429]</sup>
- [Create Custom Diagram Background](#)<sup>[597]</sup>
- [Default Appearance](#)<sup>[643]</sup>
- [Format Toolbar](#)<sup>[543]</sup>

### 3.8.2.1 Create Project Colors

This topic explains how you set the project colors to be made available in the element Default Appearance dialog.

**Access:** **Tools | Options > Standard Colors: Define Colors**

**Use to:**

- Set the project colors

**How to:**

To define the custom colors for a project, follow the steps below:

Step	Action	See also
1	Click on the <b>Define Colors</b> button The <b>Color</b> dialog displays	
2	Click on the <b>Define Custom Colors »</b> button The Color dialog is extended to provide color selection fields on the right of the dialog	
3	Click on an empty block in the <b>Custom Colors</b> palette (or, if you are <i>replacing</i> a color, click on that color block in the palette)	
4	Create the required project color using the Luminosity slide bar, color mixer panel, <b>Hue/Sat/Lum</b> fields and/or <b>Red/Green/Blue</b> fields	

Step	Action	See also
5	Click on the <b>Add to Custom Colors</b> button to add the color to the selected <b>Custom colors</b> block	
6	Repeat steps 3, 4, and 5 for any other project colors you want to define	
7	Click on the <b>OK</b> button to close the Color dialog, then click on the <b>Close</b> button to close the Options dialog  The custom colors are made available for use in the last 16 squares on the color selection palettes on the Default Appearance dialog	

### 3.8.3 Diagram

The **New Diagram Defaults** page of the **Options** dialog enables you to configure overall options for new diagrams and general diagram behavior.

**Access:** **Tools | Options > Diagram**

**Use to:**

- Configure diagram options and behaviours

**Reference:**

Field	Usage	See also
<b>Default Page Size</b>	Show the default page size for new diagrams, which you set by clicking on the <b>Page Setup</b> button to display the Page Setup dialog.	
<b>Print with Border</b>	Print pages with a border.	
<b>Landscape</b>	Print pages in landscape orientation. This checkbox is controlled from the Page Setup dialog.	
<b>Show Public Features</b> <b>Show Protected Features</b> <b>Show Private Features</b>	Set the default visibility of Class features.	
<b>Show Diagram Notes</b>	Display the diagram details in the top left corner of all diagrams in the model; details include diagram name, package, version and author.	
<b>Use Opaque Diagram Labels</b>	Specify where opaque diagram labels should display. <b>Screen</b> and <b>Printing</b> are best, <b>Clipboard and Files</b> might not be desirable.	
<b>Strict UML Syntax</b>	Enforce compliance with UML syntax when adding new connectors and other structures  The syntax check is not performed for stereotyped elements that have had the <code>_metatype</code> attribute set	<a href="#">Define a Stereotype as a Metatype</a> <small>1056</small>
<b>Disable fully scoped object names</b>	Disable fully scoped object names, when an element is in a diagram; don't use when the element is in its home package.	

Field	Usage	See also
	A scoped name is of the format <i>MyClasses::foo</i> , the <code>::</code> character indicating that the Class is within another namespace.	
<b>Allow change of Created Date</b>	Enable the creation date on the Diagram Properties dialog to be altered.	
<b>Zoom to best scale</b>	Resize diagrams to neatly fit the screen.	
<b>Auto-pan with middle mouse button</b>	Turn on auto-panning using the middle mouse button. With this option off, the middle mouse button causes a different type of panning.	
<b>Scale Saved Bitmaps to</b>	Enable Enterprise Architect to save bitmaps at a higher <i>resolution</i> , suitable for using in published works.	
<b>Image Memory Limit</b>	Set an image memory limit when generating images for RTF or HTML and when saving images to file. It is important when you have very large diagrams, as it affects the point at which Enterprise Architect starts to scale down the image; a low memory setting means it scales the image sooner.	
<b>Diagram Frames</b>	Select whether diagram frames are to be automatically added to images of diagrams in files saved to disk, print-outs, and the default Enterprise Architect clipboard.  A diagram frame is a labeled outline around the diagram image, providing both a border and a reference.	<a href="#">Diagram Frame</a> <sup>[890]</sup>

### 3.8.3.1 Appearance

The Diagram **Appearance** page of the **Options** dialog enables you to define how diagrams and their contents appear on display.

**Access:** **Tools | Options > Appearance**

**Use to:**

- Configure the appearance settings of a diagram and elements

**Reference:**

Field	Usage	See also
<b>Configure Default Element Fonts</b>	Set the default model and user text fonts.	<a href="#">Set default fonts</a> <sup>[431]</sup>
<b>Renderer</b>	Render smooth curves and diagonal lines in diagrams, so that staggered vertical or horizontal pixels are less obvious. Select the type of renderer you prefer to use: <ul style="list-style-type: none"> <li>• <b>Basic</b> is GDI32; it does not provide anti-aliasing and gradient fills</li> <li>• <b>Enhanced-1</b> is parallel to Windows GDI+ but internal to Enterprise Architect; it provides anti-aliasing and gradient fills,</li> </ul>	

Field	Usage	See also
	<p>and operates well across different platforms</p> <ul style="list-style-type: none"> <li>• <b>Enhanced-2</b> is Windows GDI+; this can vary across different platforms, performing better than <b>Enhanced-1</b> in some environments, and less well in others</li> </ul> <p>Experiment with these options and see which works best for your system and requirements.</p>	
<b>Default Element Border Width</b>	Set the default element border width (in pixels).	
<b>Scale view by</b>	<p>Automatically increase the size of all objects on a diagram by up to 50%, without affecting other users reading that diagram.</p> <p>You can perform the same function with the Zoom Slider on the Status bar; changes in the 'zoomed' display scale of a diagram update this field and affect any other diagrams that you open.</p> <p>This has no impact any other diagram Zoom facility in Enterprise Architect.</p>	<a href="#">Status bar</a> <sup>[118]</sup>
<b>Print in Color</b>	Print your diagrams in color. Deselect the checkbox to print the diagrams in black and white.	
<b>Anti-aliased text</b>	<p>Force text anti-aliasing in diagrams.</p> <p>If you deselect the checkbox, Enterprise Architect applies the MS Windows default setting. Therefore, if you do not want to use anti-aliasing, ensure that the Windows anti-aliasing default is also set to OFF.</p>	
<b>Compress text to fit within Element</b>	Determine the behavior of Enterprise Architect when text at <i>zoom</i> levels other than 100% would not fit inside the boundary of an element. Enterprise Architect either compresses the text to fit within the boundary, or expands the element.	
<b>Bold Element Names</b>	Display element names in bold text.	
<b>Element Shadows On</b>	Display a shadow around the bottom and right edges of each element in a diagram.	
<b>Invert rotated text for metafiles</b>	Use different text format when external metafile readers are causing issues.	
<b>Use Watermark</b>	Add a watermark to any diagrams you print.	
<b>Text</b>	Define the watermark text, if a watermark is to be used.	
<b>Show Gradient Fill for Paper Color</b>	Switch between having a color gradient in the diagram background, or having a solid, uniform background color.	
<b>Gradient Fill Direction For an Element</b>	Select the direction for the color gradient within element boxes, or <b>&lt;none&gt;</b> for no color gradient.	

### 3.8.3.1.1 Set Default Fonts

Enterprise Architect enables you to define a standard font to apply across the model, or a font to apply to any diagrams you create personally.

You can define both, but the model font overrides any user font, to ensure that all members of a project team have a consistent and coherent view of the model. This avoids the problem of one user creating a diagram in a small font, and another user trying to view it in a larger font, which distorts the diagram.

It is recommended that a project authority sets the model default, and all project members abide by it and do not change it without project approval.

**Access:** **Tools | Options > Appearance : Configure Default Fonts**

#### Use to:

- Configure Font/s as the default for the model
- Configure Font/s as the default for diagrams created by the user

#### Reference:

Field	Usage	See also
<b>Model Font : Font Face</b>	Specifies the font face used by the overall model.	
<b>Model Font : Font Size</b>	Specifies the font size used by the overall model.	
<b>Clear</b>	Clears the selections made for Font Face and Font Size.	
<b>User Font: Font Face</b>	Specifies the Font Face used on diagrams if no model font is specified.	
<b>User Font: Font Size</b>	Specifies the Font Size used on diagrams if no model font size is specified.	

#### Notes:

- Both model and user fonts are overridden by specifically-defined element fonts, so that the element is viewed as designed regardless of the model or user defaults. To define the font for a specific element, right-click on the element in a diagram and select the **Appearance | Set Font** context menu option
- If you cannot read the diagrams because the default font makes the objects and text too small, you can scale up all objects (that is, all diagram displays) to a more readable size for you only; the objects are not scaled up for other users. Everything on the diagram is enlarged to the same extent, so it remains in proportion and readable. To do this, return to the **Diagram Appearance** page of the Options dialog and enter a suitable percentage value in the Scale view by field

#### Learn More:

- [Set Element Font](#)<sup>[659]</sup>
- [Appearance](#)<sup>[429]</sup>

### 3.8.3.2 Behavior

The **Diagram Behavior** page of the **Options** dialog enables you to define how a diagram responds to actions taken on it.

**Access:** **Tools | Options > Diagram : Behaviour**

**Use to:**

- Define diagram behaviour

**Reference:**

Field	Usage	See also
<b>Auto Instance</b>	Automatically create object instances when dragging certain element types - such as Class and Component - from the Project Browser, with the dragged element as the classifier	
<b>Instance has Classifier style</b>	Automatically apply the classifier style of the element an instance is instantiated from when the instance is created	
<b>Show Life Lines</b>	Show life lines for Sequence elements in non-Sequence diagrams	
<b>Layout uses all relations</b>	Show all relationships in a diagram layout; deselect the checkbox to show only Generalizations and Associations	
<b>Auto Save Changes</b>	Automatically save your changes as you work, without having to confirm prompts to do so	
<b>Show 'Hidden' Parents</b>	Display any parents of elements in the diagram that are not part of the diagram	
<b>Auto Group Elements</b>	Also move visually composed elements when moving diagram nodes; a node is considered composed if it is contained by the moved element and has a higher Z-order  Press and hold ( <b>Alt</b> ) whilst moving an element to toggle this option	<a href="#">Diagram Context Menu</a> <sup>[540]</sup>
<b>Show Linked Items in Package</b>	Display connected items on packages	
<b>Show Package Item Scope</b>	Display the + and - indicators representing the scope of the items	
<b>Shift-Mouse Autoscroll</b>	Enable you to press and hold ( <b>Shift</b> ) and use the mouse to autoscroll around diagrams	
<b>Use Automatic SubActivities</b>	Generate a new Structured Activity linked to the diagram from a Structured Activity diagram dragged from the Project Browser	
<b>Always Highlight Context Element</b>	Show a hatch border around a selected element	<a href="#">Highlight Context Element</a> <sup>[647]</sup>

Field	Usage	See also
<b>Objects Snap to Grid</b>	Snap all elements to the grid lines	
<b>Show Grid</b>	Display the grid	
<b>Grid Size</b>	Specify the grid size, if you have selected <b>Objects Snap to Grid</b>	
<b>Auto Tidy</b>	Automatically tidy line angles for custom connectors; this 'nudges' the custom line into horizontal and vertical increments	<a href="#">Connector Styles</a> [750]
<b>Tidy line gap</b>	Specify the amount Enterprise Architect should enable you to move a line away from horizontal and vertical when you are tidying lines for custom connectors. (See <b>Auto Tidy</b> above)	<a href="#">Connector Styles</a> [750]
<b>Alias only</b>	Display the alias instead of the element name on elements with aliases	
<b>Alias and Name</b>	Display both the element name and the Alias in the format ( <i>Alias</i> ) <i>name</i>	
<b>Use alias field for role</b>	Replace the Alias property of instances with a Role property	

### 3.8.3.3 Sequence

The **Sequence** page of the **Options** dialog enables you to configure various font settings and the focus of the control indicator for Sequence diagrams.

**Access:** **Tools | Options > Diagram : Sequence**

**Use to:**

- Configure font settings
- Configure the focus of the control indicator for Sequence diagrams

**Reference:**

Field	Usage	See also
<b>Message Spacing</b>	Specify the vertical gap (in points) between Sequence messages (can be overridden manually by dragging a message up or down).	
<b>Default page layout is Landscape</b>	Set the default orientation of Sequence diagrams to landscape.	
<b>Show Sequence Numbering</b>	Show sequence numbers on Sequence messages.	
<b>Assume right to left messages are Return</b>	Automatically generate return messages.	
<b>Default concurrency is Asynchronous</b>	Set the default concurrency for Sequence Messages to <b>Asynchronous</b> ; deselect to set the default concurrency to <b>Synchronous</b> .	<a href="#">Message (Sequence Diagram)</a> [989]

Field	Usage	See also
<b>Width</b>	Select the line width (in points) of the 'focus of control' rectangle (thick part of lifeline).	
<b>Assume message returns</b>	Assume implicit returns when none are explicitly drawn (recommended).	
<b>GarbageCollect</b>	Automatically truncate lifelines for created elements after the last message (that is, assume garbage collect rather than explicit delete).	
<b>Name</b>	Display the MS Windows Font dialog click on ( ... ) and define the font of the caption bar heading (above your diagram); this is particularly useful for non-English character sets.	
<b>Size</b>	Specify the size of the heading font (this overrides the font size in the Font dialog, above).	
<b>Use System</b>	Apply the Enterprise Architect system default heading font.	

### 3.8.4 Objects

The **Objects** page of the **Options** dialog enables you to configure how elements look and respond in diagrams.

**Access:** **Tools | Options > Objects**

**Use to:**

- Change how elements look and respond

**Reference:**

Field	Usage	See also
<b>Version</b>	Set the default version for new elements.	
<b>Phase</b>	Set the default phase for new elements.	
<b>Highlight References</b>	Highlight parameters in operations that are passed by reference rather than value.	
<b>Reference Char(s)</b>	Specify a character to use for the reference.	
<b>Prefix/Suffix</b>	Indicate whether to use the Reference Char(s) value as a prefix (before) or a suffix (after).	
<b>Warn about spaces in class names</b>	Enable or hide the warning message that a Class, operation or attribute name has embedded spaces (which can cause coding problems).	
<b>Classes honor analysis stereotypes</b>	Show Classes as their stereotype; for example, if a Class is stereotyped as a Boundary, it appears as a Boundary rather than a Class.	
<b>Show stereotype icon for requirements</b>	Show or hide a code letter in the top right corner of Requirement (E, for external), Change (C) and Issue (I)	

Field	Usage	See also
	elements.	
<b>Support for Composite Objects</b>	Enable you to drag child elements onto parent elements in a diagram, and automatically embed them (and drag embedded child elements out of parent elements, breaking the child-parent relationship).	<a href="#">Move Elements Within Diagrams</a> [634]
<b>Auto-resize marks diagram 'dirty'</b>	Ensure that auto-resizing of elements (such as Classes) marks the current diagram as changed (asterisk on the diagram name tab), so it should be saved.	
<b>Highlight {abstract} elements</b>	Highlight abstract elements with a suitable tag <i>{abstract}</i> in the top right of the Class.	
<b>Allow elongated Use Cases</b>	Stretch Use Cases or Use Case extension points with long names to enable space for the name  If you deselect the checkbox, Use Case re-sizing is proportional and the 'make same' menu options are blocked	<a href="#">Position Submenus</a> [88]
<b>Show status colors on diagrams</b>	Enable color coding [1405] for Requirements and similar elements.	<a href="#">Status Types</a> [785]
<b>Copy inheritance links on duplicate</b>	Duplicate Inheritance and Realization connectors when an edit/copy is performed.	
<b>Port and Part type visible by default</b>	Enable Port and Part types to be shown by default.	
<b>Show buttons for selected Object on diagram</b>	Display the floating toolbar buttons to the left of the selected object. For example: 	
<b>Edit Object on New</b>	Automatically show the element Properties dialog when a new element is added.	
<b>Show «column» stereotype</b>	Hide or show the «column» stereotype used when data modeling.	
<b>Extend Complexity</b>	Extend levels of complexity to five levels in the Complexity option in the Properties window. Otherwise only three levels are available.	
<b>UML 1.5 Components</b>	Use UML 1.5 components (Enterprise Architect versions 4.0 and later support UML 2.x).	
<b>Show State Compartment</b>	Show or hide the State Compartment divider under the state name.	
<b>Show Duplicate Tags</b>	Enable duplicate tags to be shown.	
<b>Group Operations by Stereotype</b>	Group an element's operations by their stereotype on the diagram.	
<b>Group Attributes by Stereotype</b>	Group an element's attributes by their stereotype on the diagram.	
<b>Sort Features Alphabetically</b>	Sort element features alphabetically. Features include Attributes, Operations, Tags, Constraints and Test	

Field	Usage	See also
	Cases.	
<b>Disable spelling</b>	Turn off automatic spell checking. Deselect to resume automatic spell checking.	
<b>Advanced</b>	Set the visibility of certain elements in reports and in diagram packages	<a href="#">Element Visibility</a> [436]

### 3.8.4.1 Element Visibility

Some elements do not appear in packages and in RTF output by default. Click on the **Advanced** button on the Objects page of the Options dialog to specify which elements should be visible.

**Access:** **Tools | Options > Objects : Advanced**

**Use to:**

- Specify which elements should be visible within RTF reports

**Learn More:**

- [Objects](#) [434]
- [Customize Visibility of Elements](#) [640]

### 3.8.5 Links

The **Links** page of the **Options** dialog provides options for the creation, behavior and notation for connectors.

**Access:** **Tools | Options > Links**

**Use to:**

- Provides options for connector behaviour

**Reference:**

Field	Usage	See also
<b>Edit Connector on New</b>	Automatically show the connector Properties dialog when a new connector is added.	
<b>Association default = source --&gt; target</b>	Set the direction of new Associations to source->target (that is, with an arrow head at the target).	
<b>Generalization link style Default = Tree</b>	Show Generalizations as tree style hierarchies.	
<b>Shade Qualifier boxes</b>	Lightly shade all Qualifier boxes.	

Field	Usage	See also
<b>Draw Aggregations Reversed</b>	Draw Aggregate and Composite connectors from target element to source element. When deselected (the default), these connectors are drawn from source to target.	
<b>Prompt on connector deletes</b>	Display a prompt before deleting connectors, offering the choice of hiding the connector on the diagram or deleting it completely.  If you deselect this option, the delete operation defaults to the last setting on the dialog.	<a href="#">Delete Connectors</a> [752]
<b>Suppress Link Constraints</b>	Suppress connector constraints in diagrams.	
<b>Suppress Qualifier boxes</b>	Suppress boxes when displaying qualifiers.	
<b>Show Uses arrowheads</b>	Show an arrowhead on Actor->Use Case Associations.	
<b>Show Override Operation dialog on new connector</b>	Show the Override Operation dialog automatically when adding generalizations and realizations between Classes and Interfaces, if the target element has features that can be overridden.	
<b>Suppress ' + ' Role Scope</b>	Ensure that the role and scope are not displayed on the diagram.	
<b>Pen Width</b>	Set the default connector width.	
<b>Routing</b>	Set the default connector style for new connectors.	
<b>Enable</b>	Enable the Quick Linker.	<a href="#">The Quick Linker</a> [624]
<b>Show Help</b>	Add a 'help' menu option to the end of the Quick Linker menu.	
<b>Center to center</b>	Change the position of the dashed guide line for new connectors.	
<b>Exact placement</b>		
<b>Force perpendicular line</b>		

**Notes:**

- For **Draw Aggregations Reversed**, all tools have the parent as the target and the child as the source of the connector, that is a requirement of UML; only the direction in which you drag the mouse to draw the connector is changed

**3.8.6 Communication Message Colors**

The Communication Message Coloring page in the Options dialog enables you to configure the colors used in Communication diagrams.

**Access:** **Tools | Options > Communication Colors**

**Use to:**

- Configure colors used in Communication diagrams

**Notes:**

- Select the **Use Communication Message Coloring** checkbox to turn on colored messages. When you enable this option, Communication messages appear in different colors depending on the sequence group they belong to on a diagram; for example, 1.n are black, 2.n are red, 3.n are green
- Click on the down arrow in each color field, and click on the appropriate color for the message group. Set the color sequence as required; the pattern repeats after 8 sequence groups

**3.8.7 XML Specifications**

The XML Specifications page of the Options dialog enables you to configure various settings for working with XML.

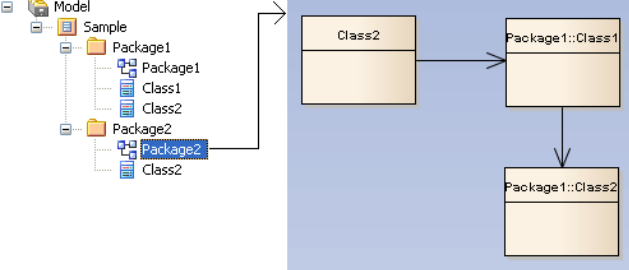

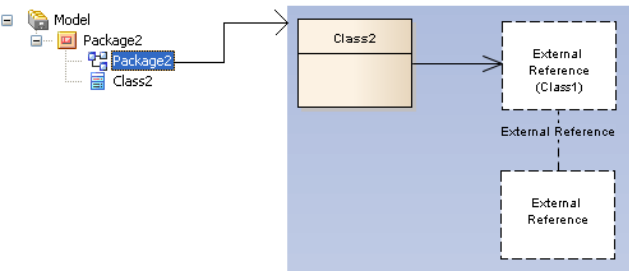

**Access:** **Tools | Options > XML Specifications**

**Use to:**

- Configure various XML Settings

**Reference:**

Field	Usage	See also
<b>Editor</b>	Set the default editor for any XML documents you open within Enterprise Architect	
<b>Format XMI Output</b>	Set whether or not formatting is applied to your XMI output	
<b>Write Log</b>	Set whether or not to write to a log file when you import or export XML	
<b>Use DTD</b>	Set whether or not to use a Data Type Definition	
<b>Export Diagrams</b>	Set whether or not to export diagrams when you export XML	
<b>Export Alternate Images</b>	Set whether or not to export the alternative images used in the model when you export to XML	<a href="#">Using the Image Manager</a> <sup>[595]</sup> <a href="#">Check in a Package</a> <sup>[286]</sup> <a href="#">Sharing Reference Data</a> <sup>[237]</sup>
<b>Default XMI Version</b>	Set the XMI version to use: <b>Enterprise Architect</b> or <b>Rose</b>	
<b>Code Page</b>	Set the Code Page to use  Setting a NULL encoding string results in the encoding tag being entirely omitted from the XML output  Click on the <b>Default</b> button to restore the setting to the default Code Page.	
<b>Export Diagram Images</b>	Set whether or not to export diagrams as images when you export XML	
<b>Image Type</b>	Define the format of the image to export to if <b>Export Diagram Images</b> is selected	

Field	Usage	See also
<p><b>Create placeholders for missing External References during XMI 1.1/2.1 Import</b></p>	<p>Set this option to show, during an Enterprise Architect exported XML 1.1/2.1 file import, any missing:</p> <ul style="list-style-type: none"> <li>• Diagram elements, using a Boundary element as a placeholder</li> <li>• Diagram connectors, using a Dependency connector as a placeholder</li> </ul> <p>When importing an Enterprise Architect exported XML 1.1/2.1 file with cross-package references, use this option to visually show the diagram items that are not yet in the model</p> <p>A sample scenario would be exporting <i>Package2</i> to XML 1.1 from <i>Master.EAP</i> and importing it into <i>New.EAP</i> - the Classes <i>Class1</i> and <i>Class2</i> and the connector between them are shown using a placeholder on the diagram <i>Package2</i></p> <p>Master.EAP :</p>  <p>New.EAP :</p> 	
<p><b>Prefix EA Tagged Values in XMI 1.0 with ea\$</b></p>	<p>Set whether or not to prefix any Enterprise Architect Tagged Values within any XML 1.0 you create, with <b>ea\$</b></p>	
<p><b>Update Last Save Time</b></p>	<p>Set whether to update the timestamp of the last time controlled packages were saved</p>	
<p><b>Report Cross Package Reference Deletions (XMI 1.1)</b></p>	<p>Set this option to report any package cross-references that would be deleted when a Controlled Package is exported to XML 1.1</p>	<p><a href="#">Report Deletion of Cross-Package References</a> <sup>[337]</sup></p>
<p><b>Default XML Directory</b></p>	<p>Define the default XML directory to use when importing and exporting XML</p>	

**Notes:**

- If **Export Alternate Images** is set, and you have packages in your model under version control, then any alternative images used in those packages are also exported to the version control repository

when you check in the packages; in this case, you would only select the checkbox if the alternative images are subject to frequent change

Otherwise, do not select this option and instead use **Export/Import Reference Data** to manage alternative images

## 4 Navigate, Search & Trace

This section explains how you **navigate** through the model structures in Enterprise Architect, locate and display specific information, and trace the origins, development and fate of the model elements. While the **Project Browser** provides an effective hierarchical view of the model, large models can present particular challenges, and tracing **dependencies** and **relationships** is not always a simple task. Fortunately, Enterprise Architect has a number of tools designed to meet just these requirements.

Finding and working with <b>Element Relationships</b>	<a href="#">The Relationships Window</a> <sup>[506]</sup>

## 4.1 Navigate: Exploring Your Model

Navigating is the process of systematically exploring the structure of your model using the hierarchical and list based views, such as the Project Browser. It is particularly useful when you are familiar with the structure of a model and its packaged contents. Whereas Searching provides a flat and random set of results, the Project and Package Browsers provide a highly structured viewpoint, reflecting the exact structure of your model.

### 4.1.1 The Project Browser

The Project Browser enables you to navigate through the Enterprise Architect project space. It displays packages, diagrams, elements and element features in a tree like structure, reflecting the arrangement of elements and packages within your model. The Project Browser is the primary mechanism for browsing and exploring your model and is the jumping off point for many of the most important features in Enterprise Architect.

**Access:** **View | Project Browser ( Alt + 0 )**

#### Use to:

- Navigate your model
- Drill down to specific elements
- Drag and drop elements and packages within the model
- Copy (duplicate) whole packages
- Import/export model information

- Set up version control, locking, execution analysis and many other aspects of the model tied to a particular package
- Document models
- Import code, xmi and csv files, database schema and other external data sources

If you right-click on an item in the Project Browser to display the context menus, you can perform additional actions such as adding new packages, creating diagrams, renaming items, creating documentation and other reports, and deleting model elements. You can also edit the name of any item in the Project Browser by selecting the item and pressing ( **F2** ).

### Views

The Project Browser can be divided into Views, each of which contains diagrams, packages and other elements. A default View hierarchy is described below, but you can create different Views to suit your requirements:

View	Description
Use Case View	The functional and early analysis View. Contains Business Process and Use Case models.
Dynamic View	Contains State Charts, Activity and Interaction diagrams. The dynamics of your system.
Logical View	The Class Model and Domain Model View.
Component View	A View for your system components. The high level view of what software is to be built (such as executables, DLLs and components).
Deployment View	The physical model; what hardware is to be deployed and what software is to run on it.
Custom View	A work area for other Views, such as formal requirements, recycle bin, interview notes and non-functional requirements.

### Selective Collapse:

When you are working on an expanded project in the Project Browser, you might want to locate the parent element or package of an item, and/or collapse the structure under that parent element or package.

### How to:

To focus on the parent element or package, follow the steps below:

Step	Action	See also
1	Position the cursor on an item within the element or package	
2	Press ( ← ) on the keyboard to highlight the parent.	
3	Press the key again to collapse the structure under that parent element or package.	

### Learn More:

- [Views](#) <sup>[532]</sup>

#### 4.1.1.1 Project Browser Context Menus

This section describes the many options available to work on objects in the **Project Browser**, selected from the following context menus:

- [Model \(Root Node\) context menu](#) <sup>[445]</sup>
- [Package Context Menu](#) <sup>[446]</sup>
- [Element Context Menu](#) <sup>[450]</sup>
- [Diagram Context Menu](#) <sup>[453]</sup>
- [Operation Context Menu](#) <sup>[454]</sup>

##### 4.1.1.1.1 Model (Root Node) Context Menu

The *Root Node* in the Project Browser is the *Model* element. You can have more than one model element.

The first level packages beneath the Model node are sometimes referred to as *Views* as they commonly divide a model into categories such as Use Case Model and Logical Model.

Right-click on the Root Node to display the **Model** context menu.

Action	Usage	Shortcut	See also
<b>Add-In</b>	Access the facilities of each Add-In currently enabled for the project		
<b>Scripts</b>	List the scripts enabled for execution directly from the Project Browser (Does not display if no Project Browser scripts exist)		
<b>Package Control</b>	Display the <b>Package Control</b> submenu		<a href="#">Package Control</a> <sup>[329]</sup>
<b>Rename Model</b>	Rename the current model		
<b>Add</b>	Display the <b>Add</b> submenu; see below		
<b>Copy Package to Clipboard</b>	Copy the selected package to the clipboard, to be copied into another package in the same .eap file or a different .eap file		<a href="#">Copy the selected package</a> <sup>[537]</sup>
<b>Paste Package from Clipboard</b>	Paste a package from the clipboard into the selected package		<a href="#">Paste a package</a> <sup>[537]</sup>
<b>Find in Project Browser</b>	Find a specified term in the Project Browser	<b>Ctrl + Shift + F</b>	
<b>Expand Branch</b>	Expand all items		
<b>Collapse Branch</b>	Collapse all items		
<b>Import Model from XMI</b>	Import a model from an XMI file	<b>Ctrl + Alt + I</b>	<a href="#">Import a model</a> <sup>[320]</sup>
<b>Export Model to XMI</b>	Export a model to XMI	<b>Ctrl + Alt + E</b>	<a href="#">Export a model</a> <sup>[320]</sup>
<b>Rich Text Format (RTF) Report</b>	Produce RTF documentation for the model	<b>F8</b>	<a href="#">Produce RTF documentation</a>

Action	Usage	Shortcut	See also
			<a href="#">[1738]</a>

Generate WSDL		<a href="#">Generate WSDL</a> <sup>[1630]</sup>
Import WSDL		<a href="#">Import WSDL</a> <sup>[1631]</sup>
Reset Options for this Package		<a href="#">Reset Options</a> <sup>[1549]</sup>
Reset DBMS Options		<a href="#">Reset DBMS Options</a> <sup>[1362]</sup>
Set as Namespace Root/ Clear Namespace Root		<a href="#">Namespaces</a> <sup>[1504]</sup>

Action	Shortcut	See also
<b>Live Code Generation</b> - Toggle between using and not using live code generation; that is, to update your source code instantly as you make changes to your model		

#### 4.1.1.1.2.4 Execution Analyzer Sub-Menu

In the Project Browser, right-click on a package and select the [Execution Analyzer](#)<sup>[164]</sup> context menu option. This menu option displays the Execution Analyzer window and highlights the Analyzer Scripts for the selected Package. If no any Analyzer Scripts have been configured you are given the opportunity to create one.

#### 4.1.1.1.2.5 Import/Export Sub-Menu

In the **Project Browser**, right-click on a package and select the **Import/Export** context menu option.

Action	Shortcut	See also
<b>Import package from XMI file</b>	Ctrl + Alt + I	<a href="#">Import package</a> <sup>[324]</sup>
<b>Export package to XMI file</b>	Ctrl + Alt + E	<a href="#">Export package</a> <sup>[322]</sup>
<b>CSV Import / Export</b>		CSV <a href="#">Import</a> <sup>[344]</sup> / <a href="#">Export</a> <sup>[342]</sup>

#### 4.1.1.1.2.6 Contents Sub-Menu

In the Project Browser, right-click on a package and select the **Contents** context menu option.

Menu Option	Action	See also
<b>Expand Branch</b>	Expand all of the items in the <b>Project Browser</b> .	
<b>Collapse Branch</b>	Collapse all of the items in the <b>Project Browser</b> .	
<b>Reset Sort Order</b>	Return sorting of package contents to list in alphabetical order.	
<b>Reload current package</b>	Refresh the current package in the <b>Project Browser</b> .	<a href="#">Refresh Model View</a> <sup>[188]</sup>

#### 4.1.1.1.3 Element Menu - Project Browser

Right-click on an *element* (such as Class, Object, Activity, State) in the Project Browser to display the element's context menu.

Command	Action	Shortcut	See also
<b>Add-In</b>	Access the facilities of each Add-In currently enabled for the project		
<b>Scripts</b>	List the scripts enabled for execution directly from the Project Browser		<a href="#">Scripts</a> <sup>[1834]</sup>

Command	Action	Shortcut	See also
	(Does not display if no Project Browser scripts exist)		
<b>Properties</b>	View and modify the element properties		
<b>Add</b>	Create a child element and diagram (Classifier elements) or a connector to another element		<a href="#">Add sub menu</a> <sup>[452]</sup>
<b>Paste Diagram</b>	Pastes a copy of a diagram from the clipboard as a child diagram of the selected element  The Copy Diagram dialog displays, offering the choice between a shallow copy and a deep copy		<a href="#">Copy (Duplicate) Diagram</a> <sup>[585]</sup>
<b>Rule Composer</b>	For a Rule Task element, invoke the Rule Composer tab in Business Rule Modeling		<a href="#">Rule Composer</a> <sup>[1214]</sup> tab
<b>Attributes</b>	Display the Attribute dialog ready to create a new attribute		
<b>Operations</b>	Display the Operations dialog ready to create a new operation		
<b>Create Workbench Instance</b>	Create workbench variables from the selected Class  When you select this option, Enterprise Architect prompts you to name the variable, which then displays in the Workbench window	<b>Ctrl + Shift + J</b>	<a href="#">Create workbench variables</a> <sup>[1676]</sup> <a href="#">Workbench</a> <sup>[1674]</sup> window
<b>Generate Code</b>	Generate the source code for this element	<b>F11</b>	<a href="#">Generate Source Code</a> <sup>[1499]</sup>
<b>Synchronize with Code</b>	Synchronize the element in the diagram with the source code	<b>F7</b>	<a href="#">Import Source Code</a> <sup>[1517]</sup>
<b>View Source Code</b>	View the source code of the element	<b>F12</b>	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>
<b>Open Source Directory</b>	Open the source directory	<b>Ctrl + Alt + Y</b>	
<b>Find In All Diagrams</b>	Locate the element in all open diagrams	<b>Ctrl + U</b>	
<b>Locate in Current Diagram</b>	Select the element in the currently-visible diagram  If the element is not in the diagram, this option is grayed-out		
<b>Copy RTF Bookmark</b>	Copy a bookmark in RTF format to the clipboard		<a href="#">Bookmark</a> <sup>[1811]</sup>
<b>Linked Document</b>	Create a Linked Document (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions)	<b>Ctrl + Alt + D</b>	<a href="#">Linked Documents</a> <sup>[731]</sup>
<b>Delete Linked Document</b>	Delete the linked document attached to the selected element		
<b>Add Custom</b>	Set up cross references between elements in a	<b>Ctrl + J</b>	<a href="#">Cross references</a>

Command	Action	Shortcut	See also
Reference	diagram and the selected element in the Project Browser		<a href="#">[632]</a>
Copy Element(s) to Clipboard	Copy the selected element or elements to the clipboard to be pasted into another package in this .eap file or another .eap file		<a href="#">Copy the selected element</a> <a href="#">[636]</a>
Copy Reference	Copy a reference to the element to the Enterprise Architect clipboard. Select the appropriate sub-option to copy the: <ul style="list-style-type: none"> <li>selected element hierarchy structure (node path) or</li> <li>node GUID</li> </ul>		
Move Up	Move the element up in the list of elements within this package		
Move Down	Move the element down in the list of elements within this package		
Delete '<element Name>'	Delete the element		
Help	Display the Help topic for the Project Browser		

#### 4.1.1.1.3.1 Add Sub Menu

**Access:** **Right-click element in Project Browser: ( Insert )**  
**Right-click element | Add**

Menu Option	Action	See also
Activity	Add an Activity behavior element and one of its associated diagrams to the selected Classifier element	<a href="#">Activity</a> <a href="#">[875]</a> <a href="#">Object Classifiers</a> <a href="#">[707]</a>
Interaction	Add an Interaction behavior element and one of its associated diagrams to the selected Classifier element	<a href="#">Interaction Occurrence</a> <a href="#">[908]</a> <a href="#">Object Classifiers</a> <a href="#">[707]</a>
State Machine	Add a State Machine Behavior element and one of its associated diagrams to the selected Classifier element	<a href="#">State Machine</a> <a href="#">[927]</a> <a href="#">Object Classifiers</a> <a href="#">[707]</a>
RuleFlow Activity	Add a Rule Flow Activity element and associated diagram to a Class, in Business Rule Modeling	<a href="#">Create a Rule Flow Model</a> <a href="#">[1209]</a>
Add Diagram	Create a diagram to explain or expand on the selected Classifier element, using the New Diagram dialog	<a href="#">Add New Diagrams</a> <a href="#">[570]</a>
Create Link	Create a connector to another element	<a href="#">Create Connector in Project Browser</a> <a href="#">[750]</a>

**Notes:**

- Elements such as Actors, Classes and Activities can define a large amount of information that can be conveniently represented by or expanded in a child diagram; the **Add** sub-menu for these elements

provides all of the options listed above

- Elements such as Timing, Exit and History have much more specific functions that do not require expansion; the **Add** sub-menu for these elements only provides the **Create Link** option

#### 4.1.1.1.4 Diagram Menu - Project Browser

Right-click on a diagram in the **Project Browser** to open the **Diagram** context menu. The example below illustrates the functions available from this menu.

Action	Usage	Shortcut	See also
<b>Add-In</b>	Access the facilities of each Add-In currently enabled for the project.		
<b>Scripts</b>	List the scripts enabled for execution directly from the <b>Project Browser</b> .  (Does not display if no <b>Project Browser</b> scripts exist.)		<a href="#">Scripts</a> <sup>[1834]</sup>
<b>Properties</b>	View and modify a diagram's properties.	<b>F5</b>	
<b>Open</b>	Open the diagram in the <b>Diagram View</b> .		
<b>View Diagram As List</b>	Display the Diagram List, listing the elements in the selected diagram.		<a href="#">Diagram List</a> <sup>[464]</sup>
<b>Copy Diagram</b>	Copy the diagram for pasting into another location.		<a href="#">Copy a Diagram</a> <sup>[585]</sup>
<b>Copy RTF Bookmark</b>	Copy a bookmark in RTF format to the clipboard.		<a href="#">Bookmark</a> <sup>[1811]</sup>
<b>Add Custom Reference</b>	Add this diagram as a cross reference to other elements.		<a href="#">Cross reference</a> <sup>[632]</sup>
<b>Print Diagram(s)</b>	Print the currently-selected diagram or diagrams (hold <b>( Ctrl )</b> or <b>( Shift )</b> while selecting).		
<b>Copy Reference</b>	Copy a reference to the diagram node to the Enterprise Architect clipboard. Select the appropriate sub-option to copy the: <ul style="list-style-type: none"> <li>• selected hierarchy structure (node path) or</li> <li>• node GUID.</li> </ul>		
<b>Move up</b>	Move the diagram up in the list of diagrams within this package.		
<b>Move down</b>	Move the diagram down in the list of diagrams within this package.		
<b>Delete '&lt;diagram name&gt;'</b>	Delete the selected diagram.		
<b>Delete selected items</b>	Delete several selected diagrams (hold <b>( Ctrl )</b> or <b>( Shift )</b> while selecting).		
<b>Help</b>	Display the Help topic for the <b>Project Browser</b> .		

#### 4.1.1.1.5 Operation Menu - Project Browser

To display the **Operation** (or Method) context menu, right-click on an Operation in the **Project Browser**.

Action	Usage	Shortcut	See also
<b>Add-In</b>	Access the facilities of each Add-In currently enabled for the project		
<b>Scripts</b>	List the scripts enabled for execution directly from the Project Browser  (Does not display if no Project Browser scripts exist.)		<a href="#">Script Group Properties</a> [1834]
<b>Generate Code</b>	Generate code for the operation	<b>F11</b>	
<b>Synchronize With Code</b>	Synchronize the operation with the code	<b>F7</b>	
<b>View Source Code</b>	Open the Source Code Viewer and display the operation	<b>F12</b>	<a href="#">The Source Code Viewer</a> [1417]
<b>Operation Properties</b>	Display the Properties dialog for the operation		
<b>Copy Reference</b>	Copy a reference to the operation to the Enterprise Architect clipboard  Select the appropriate sub-option to copy the: <ul style="list-style-type: none"> <li>selected hierarchy structure (node path)</li> <li>node GUID</li> </ul>		
<b>Delete Operation</b>	Delete the operation		
<b>Help</b>	Display the Help topic for the Project Browser		

#### Notes:

- You can display an equivalent context menu for an attribute by right-clicking on the attribute in the Project Browser.

#### 4.1.1.2 Project Browser Toolbar

The Project Browser toolbar enables you to perform a range of operations on your project structure.

**Access:** **View | Project Browser**

#### Use to:

- Perform a variety of operations on the project structure and components

#### Reference:

Action	Usage	Shortcut	See also
<b>New Model from Pattern</b>	Create a new Model Package in the project, from a predefined UML or Technology pattern		<a href="#">Model Wizard</a> <sup>[520]</sup>
<b>Add a Package</b>	Create a new child package under the selected package		<a href="#">Add a Package</a> <sup>[536]</sup>
<b>New Diagram</b>	Create a new child diagram under the selected package or element		<a href="#">Add New Diagrams</a> <sup>[570]</sup>
<b>Create Element</b>	Create a new child element under the selected package or element		<a href="#">Add Elements Directly to Packages</a> <sup>[629]</sup>
<b>Find in Project Browser</b>	Perform a simple search for a text string in the Project Browser		
<b>Documentation</b>	Provide options to generate an: <ul style="list-style-type: none"> <li>• RTF report</li> <li>• HTML report or</li> <li>• Diagram Only report</li> </ul> on the selected package in the Project Browser	<b>(F8)</b> <b>(Shift+F8)</b> <b>(Ctrl+Shift+F8)</b>	<a href="#">Generate RTF Documents</a> <sup>[1739]</sup> <a href="#">HTML Reports</a> <sup>[1817]</sup> <a href="#">Diagrams Only Report</a> <sup>[1798]</sup>
<b>Code and DB Generation</b>	Provide options to: <ul style="list-style-type: none"> <li>• Generate source code</li> <li>• Generate DDL</li> <li>• Import a source directory</li> <li>• Import a binary module</li> <li>• Import a database schema</li> <li>• Generate package contents to synchronize with package code</li> <li>• Reset the source code language</li> </ul> All for the selected package		<a href="#">Generate a Package</a> <sup>[1502]</sup> <a href="#">Generate DDL for a Package</a> <sup>[1386]</sup> <a href="#">import a Directory Structure</a> <sup>[1522]</sup> <a href="#">Import Binary Module</a> <sup>[1522]</sup> <a href="#">Import Database Schema</a> <sup>[1381]</sup> <a href="#">Update Package Contents</a> <sup>[1503]</sup> <a href="#">Reset Options</a> <sup>[1549]</sup>
<b>Move Element Up</b>	Move the selected package or element further up the Project Browser, within its parent package		
<b>Move Element Down</b>	Move the selected package or element further down the Project Browser, within its parent package		
<b>Help</b>	Open the Enterprise Architect Help on the Project Browser.		

### 4.1.1.3 Project Browser Icon Overlays

The **Project Browser** displays the status of each package in the model by overlaying status icons on the package icon. The following table describes what each overlaid icon means.

Icon Overlay	Indicates that...	See also
	This package is controlled and is represented by an XMI file on disk. Version control either is not being used or is not available. You can edit the package.	<a href="#">Controlled Packages</a> <sup>[328]</sup>
	This package is version controlled and checked out to you, therefore you can edit the package.	<a href="#">Use Version Control</a> <sup>[276]</sup>
	This package is version controlled and not checked out to you, therefore you cannot edit the package (unless you check the package out).	<a href="#">Use Version Control</a> <sup>[276]</sup>
	This package is version controlled, but you checked it out whilst not connected to the version control server. You can edit the package but there could be version conflicts when you check the package in again.	<a href="#">Offline Version Control</a> <sup>[251]</sup>
	This package is a namespace root. It denotes where the namespace structure starts; packages below this point are generated as namespaces to code.	<a href="#">Namespaces</a> <sup>[1504]</sup>
<MDG Add-In icon>	MDG Add-Ins specify their own icon to denote that this branch of the model belongs to that Add-In. All packages connected to an MDG Add-In correspond to a namespace root, so the namespace root icon is not displayed.	<a href="#">MDG Add-Ins</a> <sup>[2057]</sup>

Similarly, the **Project Browser** indicates attribute and operation scope status with icons. The following table describes what each indicator icon means.

Icon Overlay	Indicates that...	See also
 	The attribute or operation is scoped as protected.	
 	The attribute or operation is scoped as private.	

#### Notes:

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, if project User Security is on, the Project Browser also has element locking indicators (red and blue exclamation marks) that indicate the lock status of individual elements and packages

The availability of these elements for editing depends on whether user locks are required or not

#### Learn More:

- [Configure User Security](#) <sup>[195]</sup>
- [Locked Element Indicators](#) <sup>[215]</sup>

#### 4.1.1.4 Order Package Contents

Ordering elements is very important when it comes to structuring your model, especially packages. RTF documents honor any custom ordering when printing documentation. Enterprise Architect enables you to change the order of elements listed in the Project Browser.

By default, elements are first listed in:

- order of type, then
- order of set position, then
- alphabetically

You can use the context menu options to move an element up or down within its type, but not outside its type. This means you can re-sequence Packages or Diagrams or Use Cases, but you cannot mix up elements.

However, you can change this default behavior to allow elements to be re-ordered within the package, regardless of type.

**Learn More:**

- [Set Default Behavior](#)<sup>[457]</sup>

#### 4.1.1.5 Set Default Behavior

The General page of the Options dialog provides several options for altering the look and behavior of the Project Browser.

**Access:** **Tools | Options > General**

Panel	Option	Effect	See also
Double-click On Browser	Shows Properties	When an item in the Project Browser is double-clicked, the item's Properties dialog (if available) displays	
	Opens Branch	When an item in the Project Browser is double-clicked, the hierarchy expands to show the item's children  If there are no children, nothing happens	
	Opens Branch & Diagram	As above, but also opens the first diagram beneath the item, if applicable	
Project Browser	Allow Free Sorting	Enables you to re-order elements within a package regardless of type, within the Project Browser	<a href="#">Order Package Contents</a> <sup>[457]</sup>
	Show Stereotypes	When a stereotype is defined for an element, the stereotype name then displays in front of the element name  You set the stereotype of an element in its Properties dialog  Shut down and restart Enterprise Architect to enable this change to take	

Panel	Option	Effect	See also
		effect	

### 4.1.2 Package Browser

The **Package Browser** is a tabular, editable view of elements in a selected package, which can be displayed in the main workspace.

**Access:** **Project Browser > package | View | Package Browser (Ctrl+Alt+R)**  
**Project Browser > Right-click package | Package Browser**  
**Diagram > Right-click package | Package Browser**

#### Use to:

- Streamline the process of creating and updating elements in a package selected from the Project Browser; this can be particularly useful for analysts to create and maintain formal requirement definitions within the model
- Print the list or generate an RTF document directly from the entries on the list

#### Topics:

Topic	Detail	See also
<b>The Package Browser</b>	The Package Browser is related to the Diagram List, which lists the elements in a selected diagram; however, the Package Browser has a wider range of options	<a href="#">Diagram List</a> <sup>[464]</sup>
<b>Formats</b>	<p>The Package Browser has two formats:</p> <ul style="list-style-type: none"> <li>• <i>User Defined</i> format, where you can change how the element information is structured on the screen using the value-grouping band below the toolbar</li> <li>• <i>Model Hierarchy</i> format, where the package and element hierarchies are represented in the display</li> </ul> <p>Switch between these formats using the <b>Show Hierarchy</b> button () in the toolbar</p>	<a href="#">List Header</a> <sup>[460]</sup>
<b>Change display</b>	<ul style="list-style-type: none"> <li>• Sort the items by any column value in ascending or descending order, by clicking on the column header; initially the elements are listed in numerical order (if level numbering is turned on in the Project Browser) or alphabetical order within type</li> <li>• Apply a diagram filter for elements (the <b>Fade</b>, <b>Gray Scale</b> and <b>Hide</b> modes reduce the number of elements listed; <b>Select</b> mode has no effect)</li> <li>• Change the sequence of columns, by dragging column headers left or right</li> <li>• In <i>Model Hierarchy</i> format, the <b>Name</b> column is always on the left; you cannot move any other column into that position, although you can rearrange the order of the rest of the columns</li> </ul> <p>Because of this, if you group or sort information in <i>User Defined</i> format and switch to <i>Model Hierarchy</i> format your information structure is altered, and it is not restored when you switch back to</p>	<a href="#">Diagram filters</a> <sup>[491]</sup>

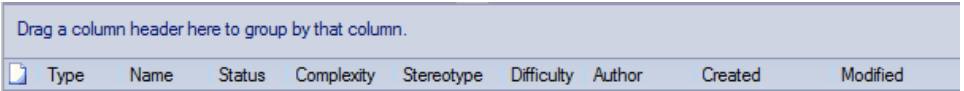

Topic	Detail	See also
	<i>User Defined</i> format	
<b>Display Element Properties</b>	Double-click on the element entry	
<b>Show Elements in a Child Package</b>	Double-click on the child package in the list	
<b>Select Items</b>	Select: <ul style="list-style-type: none"> <li>• an element by clicking on it</li> <li>• a specific value by clicking twice on it (not double-clicking); either the value becomes directly editable or the Properties dialog displays in which you can edit the value</li> <li>• several individual elements by holding ( <b>Ctrl</b> ) as you click on them</li> <li>• a range of elements by holding ( <b>Shift</b> ) as you click on the first and last in the range</li> </ul>	
<b>Add new items to the package</b>	Click on a listed element and press ( <b>Ctrl+N</b> ) or ( <b>Insert</b> ), or right-click and select the <b>Add New</b> context menu option <ul style="list-style-type: none"> <li>• in <i>Model Hierarchy</i> format, new elements are inserted in the order in which they appear in the Project Browser</li> <li>• in <i>User Defined</i> format, new items are inserted to comply with any sort order and/or grouping; if the list is not sorted or grouped, the items are added to the end</li> </ul>	
<b>Add a child element to the selected element</b> ( <i>Model Hierarchy</i> format)	Press ( <b>Esc</b> ) and then ( <b>Ctrl+N</b> ), otherwise, elements are added as siblings of the selected element  You can add child elements only when the whole row is selected, with none of the row cells or fields highlighted; press ( <b>Esc</b> ) to remove selection from an individual cell	
<b>Add elements to the Package Browser</b>	Drag them from anywhere in the Project Browser  You can also drag elements <i>from</i> the Package Browser <i>into</i> the Project Browser	
<b>Delete elements from the list</b>	Select the item and press ( <b>Ctrl+D</b> )  In <i>Model Hierarchy</i> format, you cannot delete a parent element until all its child elements have been removed or deleted	
<b>Include each element's notes</b> (documentation)	Notes are shown underneath the element  To add or edit notes, click on the item and press ( <b>Ctrl+Space</b> ) to transfer control to the Notes window, in which you create or edit the note text	<a href="#">Package Browser Options</a> 
<b>Review the element's custom</b> (advanced) properties	Click on the item and press ( <b>Ctrl+Enter</b> )  The Custom Properties dialog for the element displays

Further Work	You can do further work on the Package Browser using the toolbar and context menu options	<a href="#">Package Browser Options</a> <sup>46</sup> ↑

#### 4.1.2.1 List Header

This topic describes the organization of the column headings and contents for various reports in Enterprise Architect.

##### Topics:

Topic	Description
View Header	 <p>The View Header defines the columns of information that are presented by the report, and the order in which data items are presented</p> <p>To review the column headings:</p> <ul style="list-style-type: none"> <li>Right-click on the header to display the <b>Field Chooser</b> context menu option; the Field Chooser dialog displays</li> </ul> <p>This enables you to add columns to or remove columns from the output; between them, the View Header and Field Chooser dialog show the full range of column headers available</p> <p>To add a column heading to the View Header:</p> <ul style="list-style-type: none"> <li>Drag it from the Field Chooser dialog onto the header to the position you want the column of data to display</li> <li>When you have selected the column headings you require, click on the red cross in the top right corner of the Field Chooser dialog to close it</li> </ul> <p>To remove a column from the output:</p> <ul style="list-style-type: none"> <li>Drag the column heading downwards out of the View Header</li> </ul> <p>To change the sequence of columns:</p> <p>Drag the required column header left or right, as appropriate</p>
Value Grouping	<p>For most reports, and when the Package Browser or Diagram List is in <i>User Defined</i> format, you can organize the reported data according to the value of one or more of the column categories (this facility is not available in the Package Browser in <i>Model Hierarchy</i> format)</p> <p>You might organize the data by <b>Type</b>, and within each Type by <b>Name</b>; if you then click on any of the other column headings, the data within this grouping is further sorted with the values of the selected column (for example, <b>Created</b>) in ascending or descending order</p> <p>To set up the value grouping, drag the column heading representing the primary grouping (such as <b>Author</b>) onto the <b>Drag a column header here to group by that column</b> field</p> <p>Now drag the column heading for the next level of grouping (such as <b>Status</b>) to the right of the first heading; the two heading titles display as connected blocks, as shown below:</p>

Topic	Description
	 <p>You can, if required, add further levels of grouping by dragging other column headings onto the hierarchy (such as <b>Created</b>), and restructure the order by dragging existing or additional headings into the level you want them to hold</p> <p>For example, you could make <b>Type</b> the secondary grouping by dragging it to the right of <b>Author</b>, or drop <b>Status</b> between <b>Author</b> and <b>Type</b></p> <p>To remove a grouping level, drag the appropriate column heading out of the sequence and below the View header; any subordinate groupings move up a level</p>
<p><b>Filter Bar</b></p>	<p>The Filter Bar displays underneath the column headings; you can hide or show it using the <b>Toggle Filter Bar</b> icon in the toolbar</p> <p>The Filter Bar consists of a row of fields, one field per column; as you type a value into one of these fields, the Package Browser results are automatically filtered to show entries with a value in the corresponding column that match the value in the field. The filter is case sensitive.</p> <p>For example, if you type the letter <b>F</b> in the Filter Bar field under the <b>Author</b> column, the results immediately reduce to entries for which the author name includes Fred, Frank, Felix, Felicity, Fairmile, Farmer or Fitzgibbon (but none where the name includes f only as a lower case letter, such as Rufus)</p> <p>If you then go on to type <b>Fi</b>, the results immediately reduce again to only entries for which the author name includes Fitzgibbon.</p>

**4.1.2.2 Package Browser Options**

You can add to or influence what information is displayed on the Package Browser by selecting the window's toolbar or context menu options.

**Toolbar:**

Icon	Action	Shortcut	Link
	Add a new element to the package	<b>Ctrl + N</b>	<a href="#">Add Elements Directly to Packages</a> <sup>[629]</sup>
	Display the Notes window, to add or edit notes for the selected element	<b>Ctrl + Space</b>	
	Delete the selected element	<b>Ctrl + D</b>	
	Print the current contents of the Package Browser		

	Display the Generate RTF Documentation dialog, to create one RTF report on all selected element(s)		<a href="#">Generate RTF Documentation Dialog</a> <sup>[1742]</sup>
	Select: <ul style="list-style-type: none"> <li>The appropriate element type from the drop-down list, or</li> <li>All to list all objects</li> </ul> The report then lists only elements of that specific type		
	Select a UML, Extended or MDG Toolbox category to specify the category of elements shown in the filter list (above)		
	Toggle between: <ul style="list-style-type: none"> <li>Including child packages and their contents in the list, and</li> <li>Showing only the first-level contents of the selected diagram or package</li> </ul>		
	Toggle the display between: <ul style="list-style-type: none"> <li>Model Hierarchy format and</li> <li>User-Defined, value-grouping format</li> </ul>		<a href="#">List Header</a> <sup>[460]</sup>
	Display a short menu from which you can select to: <ul style="list-style-type: none"> <li>Hide the contents of the Notes compartment of each element</li> <li>Display the first few words, or</li> <li>Display the full text</li> </ul>		
	Change the display to show the contents of the parent package of the selected package		
	Display Help on the Package Browser		

**Context Menu Options:**

Action	Usage	Shortcut	See also
<b>Properties</b>	Display the Properties dialog for the selected element		
<b>Edit Notes</b>	Add or edit notes on the element, in the Notes window	<b>Ctrl + Space</b>	
<b>Add New</b>	If the <b>Filter List</b> field in the toolbar is set to: <ul style="list-style-type: none"> <li><b>All</b>, display the New Element dialog, through which you create an element of the required type</li> <li>A specific element type, add an element of that type to the package or diagram in the Package Browser and the Project Browser</li> </ul>		
<b>Find in Diagrams</b>	Display: <ul style="list-style-type: none"> <li>The diagram that uses the element or,</li> </ul>		<a href="#">Show Element Use</a> <sup>[632]</sup>

Action	Usage	Shortcut	See also
	<ul style="list-style-type: none"> <li>If the element is used in multiple diagrams, display the Element Usage dialog, which lists the diagrams that contain the element</li> </ul>		
<b>Find In Project Browser</b>	Highlight the selected element in the Project Browser		
<b>Bookmark Item</b>	Bookmark the element		
<b>Create Linked Document</b> <b>(Edit Linked Document)</b>	Create (or edit) a Linked Document (Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions)	<b>Ctrl + Alt + D</b>	<a href="#">Linked Documents</a> <a href="#">Link Document to UML Element</a> <a href="#">Edit Linked Documents</a>
<b>Delete Linked Document</b>	(If the element has a linked document) Delete an existing linked document		
<b>Documentation</b>	Generate an RTF report; you have two options: <ul style="list-style-type: none"> <li>Generate a separate report on each selected object in the report</li> <li>Generate one report on all selected objects.</li> </ul> In either case, the Generate RTF Documentation dialog displays You also have the option to print out the Package Browser list itself		<a href="#">Generate RTF Documentation Dialog</a>
<b>Sort Contents</b>	In <i>Model Hierarchy</i> format, synchronize the list with the Project Browser hierarchy, to ensure that all element and package hierarchies and sequences are - if necessary - updated  Normally changes are updated automatically, but there can be delays if changes are made outside the Package Browser		
<b>Reload</b>	Reload the list of elements to refresh the order and content with any recent changes		
<b>Add Tag Value Column</b>	Add a column to show the values for a selected Tagged Value, for each element in the list (see below)		
<b>Print</b>	Print the Package Browser		
<b>Delete Selected</b>	Delete the selected element from the Package Browser		

#### Add Tagged Value Column:

If you want to show the value that an element has for a particular tag (and the value that any other element in the list has for that tag), you can add a *read-only* column for the tag. There are two ways in which to do this:

Method	Action	See also
1	Open the Tagged Values window for the element and drag the tag onto the Package Browser; a new column is added for each tag you drag onto the list.	
2	<p>Right-click on the element in the Package Browser and select the <b>Add Tag Value Column</b> context menu option; the Add Tag Value Column dialog displays</p> <p>Either type the tag name into the <b>Tag Value</b> field, or select one of the two options:</p> <ul style="list-style-type: none"> <li>• <b>Global Tag Values</b> - populates the <b>Tag Value</b> drop-down list with all global Tagged Values in the project; this enables you to select a Tagged Value that is applicable to a large number of elements</li> <li>• <b>Tag Values from the selected Element</b> - populates the <b>Tag Value</b> drop-down list with the Tagged Values defined for the selected element (as listed on the Tagged Values window for that element); this enables you to filter the initial selection to a specific set of tags</li> </ul> <p>When you have selected the required tag, click on the <b>OK</b> button to insert a column for that tag into the Package Browser list.</p>	

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if Auditing is turned on and the Package Browser is open, you can view a history of changes to any selected element or connector, in the Audit History tab of the Output window (if security is enabled, you must have at least **Audit View** permissions to display the audit history)

**Learn More:**

- [Auditing](#) <sup>[300]</sup>
- [Audit History](#) <sup>[308]</sup> tab
- [List of Permissions](#) <sup>[206]</sup>

**4.1.3 Diagram List**

The Diagram List is a tabular, editable view of elements in a selected diagram, which can be displayed in the main workspace.

**Access:** **diagram | Diagram | Switch To | List View**  
**Project Browser > Right-click diagram | View Diagram As | List View**  
**Project Browser > diagram ( Ctrl+Alt+R )**  
**diagram > Right-click | List View**

**Use to:**

- Streamline the process of creating and updating elements in a diagram selected from the Project Browser; this can be particularly useful for analysts to create and maintain formal requirement definitions within the model
- Print the list or generate an RTF document directly from the entries on the list

**Topics:**

Topic	Detail	See also
<b>The Diagram List</b>	The Diagram List is related to the Package Browser, which lists the elements in a selected package; however, the Package Browser has a wider range of options	<a href="#">Package Browser</a> <sup>[458]</sup>
<b>Formats</b>	The Diagram List is displayed in <i>User Defined</i> format, where you can change how the element information is structured on the screen using the value-grouping band below the toolbar	<a href="#">List Header</a> <sup>[460]</sup>
<b>Change display</b>	<ul style="list-style-type: none"> <li>Sort the items by any column value in ascending or descending order, by clicking on the column header; initially the elements are listed in numerical order (if level numbering is turned on in the Project Browser) or alphabetical order within type</li> <li>Apply a diagram filter for elements (the <b>Fade</b>, <b>Gray Scale</b> and <b>Hide</b> modes reduce the number of elements listed; <b>Select</b> mode has no effect)</li> <li>Change the sequence of columns, by dragging column headers left or right</li> </ul>	<a href="#">Diagram filters</a> <sup>[491]</sup>
<b>Display Element Properties</b>	Double-click on the element entry	
<b>Select Items</b>	Select: <ul style="list-style-type: none"> <li>an element by clicking on it</li> <li>a specific value by clicking twice on it (not double-clicking); either the value becomes directly editable or the Properties dialog displays in which you can edit the value</li> <li>several individual elements by holding ( <b>Ctrl</b> ) as you click on them</li> <li>a range of elements by holding ( <b>Shift</b> ) as you click on the first and last in the range</li> </ul>	
<b>Add new items to the diagram</b>	Create new elements on the Diagram List, using the toolbar or context menu options; these elements are automatically added to the diagram	<a href="#">Package Browser Options</a> <sup>[461]</sup>
<b>Delete elements from the list</b>	Select the item and press ( <b>Ctrl+D</b> )	
<b>Include each element's notes (documentation)</b>	Notes are shown underneath the element To add or edit notes, click on the item and press ( <b>Ctrl+Space</b> ) to transfer control to the Notes window, in which you create or edit the note text	<a href="#">Package Browser Options</a> <sup>[461]</sup>
<b>Review the element's custom (advanced) properties</b>	Right-click on the item and select the Properties context menu option, then select the Advanced page	
<b>Further Options</b>	You can do further work on the Diagram List using the same toolbar and context menu options as for the Package Browser, except that the Diagram List <i>does not have</i> : <ul style="list-style-type: none"> <li>The <i>Model Hierarchy</i> format and hence does not have the <b>Show Hierarchy</b> button (  ) in the toolbar</li> </ul>	<a href="#">Package Browser Options</a> <sup>[461]</sup> <a href="#">Diagram Properties</a>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>The  toggle button</li> <li>The  toggle button</li> </ul> <p>The Diagram List <i>does have</i> these additional context menu options:</p> <ul style="list-style-type: none"> <li><b>Diagram View</b> - show the elements of the selected diagram as a diagram instead of as the Diagram List</li> <li><b>Gantt View</b> - show the list as a Gantt chart of resource allocations</li> <li><b>Diagram Properties</b> - display the Diagram Properties dialog for the diagram</li> </ul>	<a href="#">57</a>

#### 4.1.4 Model Views

The Model Views window enables you to encapsulate your model into the areas you are interested in.

**Access:** [View | Model Views](#)

**Topics:**

Topic	Detail	See Also
<b>View Root Nodes</b>	<p>There are three types of View root-node available:</p> <ul style="list-style-type: none"> <li><i>Model Views</i> - stored in the model and visible to all users; you can have many of these</li> <li><i>My Views</i> - stored locally on your machine and visible only to you; you can have only one of these</li> <li><i>Technology-defined Views</i> - read only; each View is stored with and populated by the corresponding active MDG Technology</li> </ul> <p>Additionally, there is a <i>Recent Discussions</i> folder that contains current correspondence from the Team Review concerning items that are held in any of the Views; this folder has a separate repository of postings for each team review server connection you access through the model. You can control how recent these postings must be, and how many are to be listed.</p> <p>When you open the Model Views window for the first time on a project, a <i>Model Views</i> root section, <i>My Views</i> root section and <i>Recent Discussions</i> folder are added for you. These can not be deleted or renamed; however, you can create further Model View root nodes that you can modify and delete</p>	<a href="#">Model Views Operations</a> <a href="#">47</a> <a href="#">Team Review Tools</a> <a href="#">21</a> <a href="#">Team Review Connections</a> <a href="#">23</a> <a href="#">Model Views Context Menus</a> <a href="#">46</a>
<b>Subordinate Folders</b>	<p>Under the <i>My Views</i> root node you can add a single level of <i>View</i> folders, which enable you to group <i>Search View</i> folders as best suit your requirements</p> <ul style="list-style-type: none"> <li>A <i>Search View</i> is a folder of elements or structures that you</li> </ul>	<a href="#">Model Views Operations</a> <a href="#">47</a> <a href="#">Diagram Slide</a>

Topic	Detail	See Also
	<p>assemble by assigning a model search to the folder; when you double-click on or expand the folder, the search runs and refreshes the folder contents</p> <ul style="list-style-type: none"> <li>You can also set a search to refresh at a defined interval, and to notify you if new results are found</li> </ul> <p>Under a <i>Model View</i> root node you can create Views folders that can contain Search View folders, <i>Slideshow</i> folders and <i>Favorites</i> folders</p> <ul style="list-style-type: none"> <li>A <i>Slideshow folder</i> contains diagrams only, which you can display as a slide show with diagrams being shown in the sequence in which they are listed in the folder. One folder represents one slide show - you can run the slide show automatically or manually; in either case the diagrams are closed after they have been displayed.</li> <li>A <i>Favorites</i> folder gives you easy access to commonly-used items in the Project Browser; to create hyperlinks in a Favorites folder to the required items in the Project Browser, drag items from the Project Browser into the Favorites folder</li> </ul> <p>You can also export all of the View folders containing Views from any root section as an XML file, and import a <i>Views XML file</i> as an additional, editable <i>Model View</i> root node</p> <p>These are single-level items; if you drag a package into the Favorites folder, you cannot expand that package there</p> <p>To select specific items inside a package, expand it in the Project Browser and then drag the items into the Favorites folder</p>	<p><a href="#">Show</a> <sup>[473]</sup></p>
<p><b>Key to Model View Contents</b></p>	<p>Items on the model view can be identified by their accompanying icons:</p> <ul style="list-style-type: none"> <li> - A Model View root node</li> <li> - A View Folder</li> <li> - A Favorites Folder</li> <li> - A View (search-based)</li> <li> - A Slideshow Folder</li> <li> - The My Views root node</li> <li> - The DoDAF-MODAF View (a Technology-defined View)</li> <li> - The Recent Discussions folder</li> <li> - A repository of postings from a selected team review, concerning elements in the Model Views</li> <li> - The recent posts folder for the selected team review</li> </ul>	
<p><b>Accessing Operations</b></p>	<p>To perform operations on the Model View contents, you can use the:</p> <ul style="list-style-type: none"> <li>Model Views window Toolbar or the</li> <li>Item context menus</li> </ul> <p>Each level of the Model Views hierarchy has a slightly different context menu.</p>	<p><a href="#">Model Views Toolbar</a> <sup>[468]</sup></p> <p><a href="#">Model Views Context Menus</a> <sup>[469]</sup></p>

#### 4.1.4.1 Model Views Toolbar

**Access:** View | Model Views > Toolbar

**Reference:**

The availability of the **Model Views** toolbar options depends on the type of object selected. The options are, from left to right:

Icon	Usage	Shortcut	See Also
	Displays the appropriate <b>Properties</b> dialog for the item selected	<ul style="list-style-type: none"> <li>• Double-click on the item</li> <li>• <b>Enter</b></li> </ul>	
	Locates the selected object in any diagrams in which it has been used in the model, and either: <ul style="list-style-type: none"> <li>• Displays the single diagram with the object highlighted or</li> <li>• Lists the several diagrams in which the object has been located</li> </ul>		
	Locates and highlights the selected object in the Project Browser		
	Creates a new <i>Model View</i> root node, and displays the New Model View dialog in which you enter the root node name		
	Creates a new <i>Views</i> folder in the currently-selected root node		
	Creates a new <i>Favorites</i> folder in the currently-selected <i>Views</i> folder		
	Creates a new Slideshow folder in the currently-selected <i>Views</i> folder		<a href="#">Diagram Slideshow</a> <sup>473</sup>
	Creates a new <i>View</i> in the currently-selected <i>Views</i> folder, and displays the Create New View dialog to define the search that populates the View		<a href="#">Model Views Operations</a> <sup>474</sup>
	Refreshes the selected <i>Model Views</i> root node, folder, <i>View</i> or <i>Favorites</i> ; for a <i>View</i> , this runs the Model Search defined in the View properties		<a href="#">Model Views Operations</a> <sup>474</sup>
	Moves the currently-selected object up or down <b>within its type</b> ; you cannot move - for example - a package below a diagram, or a <i>View</i> above a <i>Favorites</i> folder		
	Displays a prompt to confirm deletion of the selected object and - if appropriate - its contents  You cannot delete the original <i>Model Views</i> , <i>My Views</i> or <i>Recent Discussions</i> root nodes, or any technology-defined <i>Views</i>		
	Displays Help on Model Views		

#### 4.1.4.2 Model Views Context Menus

**Access:** View | Model Views: Right-click on object

**Reference:**

The **Model Views** window context menus display different options, depending on which level of the **Model Views** hierarchy you right-click on. The options are described below:

Menu Option	Action	Shortcut	See also
<b>Properties</b>	<p>(Not the <i>My Views</i>, <i>Recent Discussions</i>, initial <i>Model Views</i> or <i>Technology-defined</i> root nodes)</p> <p>Display the appropriate Properties dialog for the selected object</p> <p>You can edit any of the properties, if required; changes to objects populated from the model are reflected in all other views (Properties window, diagrams, reports) of that object</p> <p>The <b>Properties</b> option for the <i>Recent Posts</i> folder displays the Recent Post Options dialog, which enables you to specify the number of days back from which to extract postings from the Team Review, and the number of postings to list</p> <p>The <b>Properties</b> option for a <i>Slideshow</i> folder displays the Slideshow Properties dialog, which enables you to automate the slide show and set the number of seconds for which each diagram is displayed</p> <p>If you deselect the <b>Enable</b> checkbox, you must press <b>(Spacebar)</b> to display each diagram</p>		<a href="#">Diagram Slide Show</a> <sup>[473]</sup>
<b>New Views Folder</b>	<p>(Root node only)</p> <p>Display a prompt for the <i>Views folder</i> name and create the folder in the selected root node</p>		
<b>Import Views From XML</b>	<p>(Root node only)</p> <p>Prompt for the XML file location and create a new <i>Model Views</i> node to hold the imported Views</p>		<a href="#">Model Views Operations</a> <sup>[474]</sup>
<b>Export to XML (Views Only)</b>	<p>(Root node only)</p> <p>Prompt for a file path and name, and copy all Views under the selected root node to an XML file at that location</p>		<a href="#">Model Views Operations</a> <sup>[474]</sup>
<b>Remove Model View</b>	<p>(Not the <i>My Views</i>, initial <i>Model Views</i> or <i>Technology-defined</i> root nodes)</p> <p>Display a prompt to delete the selected user-defined Model View and, if confirmed, delete the root node and all contents</p>		
<b>New Search Folder</b>	<p>(View folder only)</p> <p>Display the Create New View dialog (similar to the</p>		<a href="#">Model Views Operations</a> <sup>[474]</sup>

Menu Option	Action	Shortcut	See also
	View Properties dialog) for you to define the search that populates the View		
<b>New Favorites Folder</b>	( <i>View</i> folder only) Display the Create a new favorites based folder dialog, which prompts for the folder name		
<b>New Slideshow</b>	( <i>Model View</i> , <i>View</i> folder only) Display the Create a new slideshow dialog, in which you type the name of the slide show  You must use the Properties dialog to define the properties of the slide show		<a href="#">Diagram Slide Show</a> <sup>[473]</sup>
<b>Open Search</b>	( <i>View</i> only) Display the Model Search tab in the main work area, listing the full results of the search and giving access to all the facilities of the Model Search	<b>Shift+Space</b>	<a href="#">Customizing the Search View</a> <sup>[483]</sup>
<b>Refresh</b>	Refresh the search and open the View or Postings Repository to show the elements or Posts retrieved by the search	<b>Space</b>	
<b>Double Click Opens Search</b>	Enable you to perform the Open Search function by double-clicking on the View  If you deselect this option, double-click refreshes the search and opens the View to show the elements retrieved by the search		
<b>Find Post</b>	Open the Project Team Review and highlight the selected post		
<b>Open Team Review</b>	Open the Project Team Review at the top level (Category)		
<b>Edit Connections</b>	Display the Team Review Server Connections dialog, to select which review to open		<a href="#">Team Review Connections</a> <sup>[231]</sup>
<b>Remove Folder</b>	( <i>View</i> folder only) Display a prompt to delete the selected Views folder and, if confirmed, delete the folder and all contents		
<b>Remove View</b>	Display a prompt to delete the selected View and, if confirmed, delete the View and all contents		
<b>Remove Favorites</b>	Display a prompt to delete the selected <i>Favorites</i> folder and, if confirmed, delete the folder and all contents		
<b>Remove Slideshow</b>	Display a prompt to confirm deletion of the selected slide show and, if confirmed, delete the slide show and all its diagrams		
<b>Run Slideshow</b>	Run the slide show in the Diagram View		<a href="#">Diagram Slide Show</a> <sup>[473]</sup>
<b>Run Slideshow Full Screen</b>	Run the slide show in full screen mode, so that the slide show fills the whole screen		<a href="#">Diagram Slide Show</a> <sup>[473]</sup>

Menu Option	Action	Shortcut	See also
Stop Slideshow	Cancel execution of the slide show running in the Diagram View	Esc	<a href="#">Diagram Slide Show</a> <sup>[473]</sup>
In Project Browser	(Element / Diagram / Package object only) Highlight the selected item in the Project Browser		
In Diagrams	(Element / child Package object only) Locate the selected object in any diagrams in which it has been used in the model, and either: <ul style="list-style-type: none"> <li>• Display the single diagram with the object highlighted or</li> <li>• List the several diagrams in which the object has been located</li> </ul>		
Remove Linked Item	(Element / Diagram / Package object only) Display a prompt to delete the selected object and, if confirmed, remove the object from the folder  This has no effect on the object in the Project Browser or any diagrams  You would not delete an object in a View, as it is replaced the next time the View is refreshed.		
Help	Display Help on Model Views		

#### 4.1.4.3 Model Views Operations

This topic describes the operations you can perform in the Model Views window.

**Access:** [View | Model Views](#)

**Topics:**

Topic	Detail	See Also
Define View Search	<p>When you:</p> <ul style="list-style-type: none"> <li>• Create a View, the Create New View dialog displays</li> <li>• Display the View properties, the View Properties dialog displays</li> </ul> <p>These dialogs are identical</p> <p>In the <b>Name</b> field, type a name for the View</p> <p>In the <b>Search</b> field, either:</p> <ul style="list-style-type: none"> <li>• Click on the drop-down arrow and select an existing search from the lists, or</li> <li>• Click on the ( ... ) (Browse) button to display the Manage Searches dialog, edit an existing search or define a new one, then <b>Close</b> the dialog and select that search name in the <b>Search</b> field</li> </ul> <p>A custom SQL search statement should return the <i>guid</i> and <i>type</i> of the object found so that Enterprise Architect can search for the selected</p>	<a href="#">Create &amp; Modify Searches</a> <sup>[484]</sup>

Topic	Detail	See Also
	<p>item in the Project Browser; for example:</p> <pre>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</pre> <p>If required, in the <b>Search Term</b> field type a specific value to search for</p> <p>If you are working with the Corporate or extended versions of Enterprise Architect, and you want the search to run automatically and refresh the results, select the <b>Refresh this search</b> checkbox.</p> <p>The <b>Frequency</b> field has three sections, for hours, minutes and seconds; click on the appropriate section and use the up and down arrows at the end of the field to set the interval for refreshing the search results</p> <p>You can also set the refresh to display a pop-up notification if the search results change. To do this, select the <b>Notify me when new results found</b> checkbox</p> <p>Click on the <b>OK</b> button; the View is created (or updated) in a collapsed state</p> <p>When you expand the View, the search executes and populates the View</p>	
<b>Display Recent Postings</b>	<p>If a new post is added to the Team Review, and that post refers to any Model View items, that post is also added automatically to the <i>Recent Discussions   &lt;Connection&gt;   Recent Posts</i> folder in the Model View</p> <p>To open a post, double-click on the entry; the Team Review tab displays, showing the selected message</p> <p>You can control how many posts are displayed, and for what period of time, using the Model Views context menu for the <i>Recent Discussions</i> folder</p>	<p><a href="#">Model Views</a> 466</p> <p><a href="#">Model Views Context Menus</a> 469</p>
<b>Move Objects Into Favorites</b>	<p>Drag any required package, diagram or element from the Project Browser into the required <i>Favorites</i> folder</p>	
<b>Move Objects Between Views</b>	<p>Views and <i>Favorites</i> folders are fixed in the <i>Views</i> folder in which you create them, and you cannot move them</p> <p>However, you can:</p> <ul style="list-style-type: none"> <li>• Copy (by dragging) objects from any View into any <i>Favorites</i> folder, and</li> <li>• Move (by dragging) objects between any two <i>Favorites</i> folders</li> </ul>	
<b>Use Objects From Model Views</b>	<p>To make use of an element, diagram or package held in any View or <i>Favorites</i> folder, click on the item and drag it into a diagram or a Team Review posting</p> <p>The item behaves in the same way as if you dragged it from the Project Browser.</p>	<p><a href="#">Team Review</a> 217</p>
<b>Export/Import Views</b>	<p>You export Views to create an XML file that you can:</p> <ul style="list-style-type: none"> <li>• Import into another model as a user-created Model View or</li> <li>• Call from an MDG Technology Selection (MTS) file to access the Technology-defined View provided by the active MDG Technology.</li> </ul> <p>The export and import functions are available from the Model Views root-node context menus</p>	<p><a href="#">Model Views Context Menus</a> 469</p>

Topic	Detail	See Also
	<p>When you use the export function, it acts on the complete set of View folders in the selected <i>My Views</i> root node, <i>Model Views</i> root node, or user-generated root node; you cannot export individual Views, nor can you export Favorites folders</p> <p>The function displays the Save As dialog, on which you browse for the directory location for the exported XML file, and specify the file name</p> <p>When you use the import function, it displays the Select Import Filename dialog on which you browse for the directory and XML file you want to import; the import creates a new Model View folder with the same name as the copied root node</p>	
<b>Set Up a Technology-Defined View</b>	<p>To set up the Technology-defined View for an MDG Technology, you:</p> <ol style="list-style-type: none"> <li>1. Create a user-generated Model View in Enterprise Architect while using the technology</li> <li>2. Populate it with the required View folders and Views</li> <li>3. Export the Views from that Model View as an XML file to an appropriate location</li> <li>4. Create a call to the file from the technology's MTS file</li> </ol> <p>Thereafter, any model for which the MDG Technology is active automatically displays those Views in a Technology-defined View</p>	<a href="#">Working with MTS Files</a> <sup>[1075]</sup>

#### 4.1.4.4 Diagram Slide Show

The Slide show facility in the Model Views window enables you to create and run screen-based presentations of sets of diagrams:

When you run a slide show, it displays the diagrams in the folder in the sequence in which they are listed in the folder. After each diagram has been displayed, it is closed.

**Access:** [View | Model Views](#)

**Use to:**

- Create a slide show as a folder within a Views folder under a Model View node
- Run a slide show manually
- Run a slide show automatically with each diagram displaying for a period that you define
- Display a slide show within the Enterprise Architect work area
- Display a slide show in full screen mode
- Delete a slide show

**How to:**

To create a slide show, follow the steps below:

Step	Action	See also
1	Under a Model Views node, click on the Views folder to contain the slide show	
2	Either: <ul style="list-style-type: none"> <li>• Right-click on the Views folder and select the <b>New Slideshow</b> option</li> </ul>	

Step	Action	See also
	<p>or</p> <ul style="list-style-type: none"> <li>Click on the <b>New Slideshow folder</b> icon in the Model Views toolbar</li> </ul> <p>The Create a New Slideshow Folder dialog displays</p>	
3	In the <b>Name</b> field, type the name of the slide show	
4	Click on the <b>OK</b> button	
	The new slide show folder is added to the selected View folder	
5	Dock the Project Browser window separately from the Model Views window.	<a href="#">Dock Windows</a> <sup>[103]</sup>
6	<p>Drag the diagrams to be displayed as part of the slide show from the Project Browser into the new slide show folder</p> <p>Organize the diagrams in the order in which they are to be displayed, using the up/down green arrows in the Model Views toolbar</p> <p>To remove a diagram that is not required, right-click on it in the slide show folder and select the <b>Remove Linked Item</b> context menu option</p> <p>The diagram items in the slide show folder are links to the diagrams in the Project Browser, not copies of the diagrams or the diagrams themselves; any actions you take in the slide show have no impact on the original diagrams</p>	<a href="#">Model Views Toolbar</a> <sup>[468]</sup>
7	Close the folder	

To define how the slide show is to operate, automated or manual, follow the steps below

Step	Action	See also
1	Right-click on the slide show folder and select the <b>Properties</b> context menu option	
	The Slideshow Properties dialog displays	
2	To automate the slide show, select the <b>Enable</b> checkbox	
	To run the slide show manually, deselect the checkbox	
3	If you are automating the slide show, in the <b>Time</b> field type the number of seconds that each diagram is to remain on display	
4	Click on the OK button	

To run a slide show of diagrams, either in the Diagram View or full screen, follow the steps below:

Step	Action	See also
1	<p>Right-click on the slide show folder and select either the:</p> <ul style="list-style-type: none"> <li><b>Run Slideshow</b> option, to run the slideshow in the Diagram View</li> <li><b>Run Slideshow Fullscreen</b> option to run the slideshow using the full screen</li> </ul> <p>The first diagram in the slide show displays</p>	

Step	Action	See also
2	If you have set up the slide show to run automatically, you can leave it to display the diagrams as defined You can also moderate the slide show using manual commands	
3	If you are controlling the slide show manually, right-click on a slide The following toolbar displays: 	
4	Control the slide show using the toolbar icons and other aids, as follows: <ul style="list-style-type: none"> <li>• Display the next slide - , ( <b>Spacebar</b> ) or ( <b>↑</b> )</li> <li>• Display the previous slide - , ( <b>←</b> )</li> <li>• Display the first slide - , ( <b>↑</b> )</li> <li>• Display the final slide - , ( <b>↓</b> )</li> <li>• Pause the slide show - </li> <li>• Resume the slide show - </li> <li>• Stop the slide show -  or, in Diagram View, right-click on the slide show folder and select the <b>Stop Slideshow</b> option</li> </ul>	

To delete a slide show, follow the steps below:

Step	Action	See also
1	Right-click on the slide show folder and select the <b>Remove Slideshow</b> context menu option Enterprise Architect prompts you to confirm the deletion	
2	Click on the Yes button The folder and its list of links to diagrams in the model is removed	

### 4.1.5 The Pan & Zoom Window

The Pan & Zoom window provides a 'birds-eye' view of diagrams. It enables you to navigate quickly around large diagrams.

**Access:** **View | Pan & Zoom**

**Reference:**

Topic	Detail	See also
<b>View</b>	The window shows a reduced image of the whole diagram The shaded box represents the viewed area, displayed on the open diagram	
<b>Toolbar</b>	The toolbar provides the following functions (in order): <ul style="list-style-type: none"><li>• Zoom In</li><li>• Zoom Out</li><li>• Zoom to fit diagram</li><li>• Zoom to fit page</li><li>• Zoom to 100%</li><li>• Zoom Slider</li></ul>	
<b>Use</b>	Open the required diagram Move the cursor onto the shaded box inside the Pan & Zoom window Hold down the mouse button as you move the cursor to move the shaded box over the open diagram To zoom, use either the Zoom Slider or the buttons located on the tool bar	

## 4.2 Search: Finding Information

Searching involves using ad hoc search terms and various search types to locate elements and information within your model, regardless of location or context.

The result sets can be used to manage elements, to create documentation or to find the location of elements within the complete model structure.

### Topics:

Topic	Link
Model Search - how to use the searching capability within Enterprise Architect to find and display various kinds of information	<a href="#">Model Search</a> <sup>[477]</sup> <a href="#">Model Search Context Menu</a> <sup>[479]</sup> <a href="#">Model Search Toolbar</a> <sup>[480]</sup> <a href="#">Pre-defined Searches</a> <sup>[481]</sup> <a href="#">Customizing the View</a> <sup>[483]</sup>
Create and Modify Searches - how to modify and work with search definitions	<a href="#">Create &amp; Modify Searches</a> <sup>[484]</sup>
Adding Filters - further modifications to searches	<a href="#">Add Filters</a> <sup>[489]</sup>
Diagram Filters- how to suppress or highlight information in a diagram using customizable filtering mechanisms based on element properties such as status and complexity	<a href="#">Diagram Filters</a> <sup>[491]</sup>

### 4.2.1 Model Search

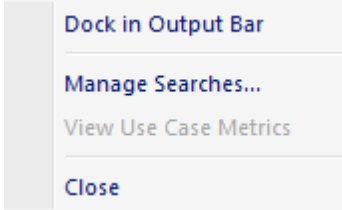

The Model Search allows you to quickly navigate and find elements within your model. It lists each element that meets the search criteria you specify within the search terms and search type. Many different kinds of searches are already built into Enterprise Architect, and it is possible to create very detailed and specific searches of your own. It is even possible to export and share your favorite searches.

**Access:** **Edit | Model Search** ( **Ctrl + Alt + A** ) or ( **Ctrl + F** )

#### Use to:

- Search for elements within your model based on various criteria
- Generate targeted reports based on your result set
- Manage result sets - for example set properties and delete elements

Field	Usage	See also
-------	-------	----------

<b>Search Term</b>	The word, phrase or characters to search on  Search filters enable you to perform customized searches on a Search Term in order to locate model elements having specific characteristics	
<b>Search</b>	The Model Search window provides a set of <i>built in</i> searches for your convenience; the Search drop-down list provides several pre-defined searches including. <ul style="list-style-type: none"> <li>• Simple</li> <li>• Extended</li> <li>• Find Orphans</li> <li>• Recently Modified Elements</li> </ul> In the drop-down list, the built in searches are followed by searches that: <ul style="list-style-type: none"> <li>• You have created yourself</li> <li>• Your organization has created for use within the project</li> <li>• Have been created as part of workflow script</li> <li>• Have been created in the Enterprise Architect Scripting facility</li> </ul>	<a href="#">Pre-defined searches</a> <sup>[487]</sup> <a href="#">Functions - Create a Search With User Tasks</a> <sup>[235]</sup> <a href="#">Workflow Data Structures You Fill</a> <sup>[236]</sup> <a href="#">Script Group Properties</a> <sup>[1834]</sup>
<b>Run</b>	Run the search using the entered text and selected Search	
<b>Options</b>	<p>The <b>Options</b> button displays the <b>Search Options</b> submenu, which enables you to display the search results as a tab of the Output window rather than in the Model Search View</p> <p>An advantage of moving the search results to the Output window is that you can select items from the search results and drag them onto a diagram, which you cannot do when the results are in the Model Search View</p> <p>If you select the <b>Dock in Output Bar</b> menu option, when you next display the menu this option becomes <b>Dock in Main View</b></p> <p>The <b>Search Options</b> submenu also provides the means of performing advanced searches on your project, and displaying project metrics</p>  <p>The <b>Options</b> button also enables you to perform advanced searches</p>	<a href="#">The System Output Window</a> <sup>[128]</sup> <a href="#">Advanced Search Options</a> <sup>[488]</sup> <a href="#">Estimating Project Size</a> <sup>[406]</sup>
	Show the Search Builder facility	<a href="#">Create Search Definitions</a> <sup>[486]</sup>
<b>Result List</b>	Displays the results of your search	

**Learn More:**

- Display the properties of an element (**Double Click or Enter**)
- Drag an item(s) onto a diagram (**Ctrl + drag a selected item**)
- Toggle between the Notes and the **Model Search** window (**Ctrl + Shift + Enter**)
- Open the Linked Document window for the selected Element (**Ctrl + Alt + D**)
- Select All Items (**Ctrl + Alt + A**)

**Notes:**

- You can access the Model Search facilities and perform specific searches indirectly, from Add-Ins, from MDG Technologies, from a hyperlink and from a shortcut to access your model.; this entails setting up a search profile either in the appropriate tool, or as an XML file accessed by the tool

Searching from	See
An MDG Technology Selection (MT ) File (using an exported search definition)	<a href="#">Working With MTS Files</a> <sup>[1075]</sup> <a href="#">Create &amp; Modify Searches</a> <sup>[484]</sup>

**4.2.1.2 Model Search Toolbar**

The Model Search toolbar displays at the top of the Model Search window, enabling you to operate on the results of your model search.

**Access:** **Edit | Model Search**

**Use to:**

- Edit the text of notes for an item
- Delete selected items from the model

- Print the search results
- Generate and print an RTF report on selected items
- Hide or abbreviate notes text in the output
- Hide or show the filter bar under the column headings
- Display Help text

**Reference:**

Action	Usage	Shortcut	See also
<b>Edit Notes</b>	For the selected item, opens the Notes window (if it is not already open) so that you can edit the text of the notes	<b>Ctrl + Spacebar</b>	<a href="#">Notes</a> [77↑]
<b>Delete</b>	For a selected item or group of items, deletes them from the model; refresh the project to check that the items have been deleted	<b>Ctrl + D</b>	
<b>Print</b>	Prints the complete set of search results		
<b>Rich Text Report</b>	For a selected item or group of items, generates and prints an RTF report		<a href="#">Generate RTF Documentation Dialog</a> [1742]
<b>View Notes</b>	Displays a short menu that enables you to select whether, for all items, to: <ul style="list-style-type: none"> <li>• Hide any Notes text from display in the search results</li> <li>• Display the first few words of the Notes text in the search results</li> <li>• Display the full Notes text in the search results</li> </ul>		
<b>Toggle Filter Bar</b>	Hides or reveals the filter bar underneath the column headings		<a href="#">Customizing the Search View</a> [483]
<b>Help</b>	Displays the Enterprise Architect Help, starting with the Model Search Help topic		

**4.2.1.3 Pre-defined Searches**

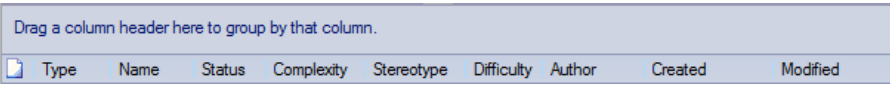

The following pre-defined searches are provided with Enterprise Architect, and are listed in the *Built-In* category in the **Search** drop-down list.

Search	Description	See also
<b>Simple</b>	Searches the <b>Name</b> , <b>Alias</b> and <b>Notes</b> fields of all elements for the given search term	
<b>Extended</b>	Searches many additional fields relating to the element, including <b>Attributes</b> , <b>Operations</b> , <b>Tagged Values</b> and <b>Test</b>	

	Cases	
<b>Element Name</b>	Searches for an exact match against the element name, alias, method or operation; the default search in the <b>Search in Model</b> menu option in the Code Editor	<a href="#">Code Editor Context Menu</a> <small>[412]</small>
<b>Attribute Details</b>	Searches for elements with attributes relating to the search term, including Tagged Values, constraints, and common attribute data fields	
<b>Find Orphans</b>	Searches for orphaned elements throughout the model, with the ability to filter on common element fields using a search term  An 'orphaned' element is an element that does not appear on any diagram in the model	
<b>Failed Internal Tests</b>	Searches for elements containing internal test cases where the search term is in any common Test Case field and the <b>Status</b> value is <i>Fail</i>	
<b>Method Details</b>	Searches for elements with operations and methods relating to the search term, including Tagged Values, constraints and common operation and method data fields	
<b>Responsibility</b>	Searches for elements with internal responsibilities/ requirements where the search term relates to any common <b>Responsibility/Requirement</b> field	
<b>Resources</b>	Searches for elements with assigned resources where the search term relates to any common <b>Resource</b> field	
<b>Requirements</b>	Searches for Requirement element types where the search term relates to any common element field	
<b>Find Bookmarked Elements</b>	Searches for elements that have been bookmarked, anywhere in the project	
<b>Recently Modified Elements</b>	Searches for elements that have been recently modified, anywhere in the project  The search term relates to any common element field  The default is to show elements modified in the last three days, but you can set an alternative interval by typing the appropriate number of days in the <b>Search Term</b> field	
<b>Recently Modified Diagrams</b>	Searches for diagrams that have been recently modified, anywhere in the project  The search term relates to any common diagram properties field  The default is to show diagrams modified in the last three days, but you can set an alternative interval by typing the appropriate number of days in the <b>Search Term</b> field	
<b>My Checked Out Packages</b>	Searches for packages that are marked as checked out by the currently-logged in user	

### 4.2.1.4 Customizing the Search View

This topic explains how to customize the display of search results after they are generated.

Topic	Detail	See also
<p><b>Sort and Select</b></p>	<p>In the Model Search you can:</p> <ul style="list-style-type: none"> <li>Sort the items by any column value in ascending or descending order, by clicking on the column header</li> <li>Display element or diagram properties, by double-clicking on the item</li> <li>Select:                             <ul style="list-style-type: none"> <li>An element or diagram by clicking on it</li> <li>Several individual elements or diagrams by holding ( <b>Ctrl</b> ) as you click on them</li> <li>A range of elements or diagrams by holding ( <b>Shift</b> ) as you click on the first and last in the range</li> <li>All elements or diagrams in the list by pressing ( <b>Ctrl+A</b> )</li> </ul> </li> </ul>	
<p><b>The View Header</b></p>	 <p>The View Header defines the columns of information that are presented by the Model Search, and the order in which data items are presented</p> <p>To review the column headings:</p> <ul style="list-style-type: none"> <li>Right-click on the header to display the <b>Field Chooser</b> context menu option; the Field Chooser dialog displays</li> </ul> <p>This enables you to add columns to or remove columns from the output; between them, the View Header and Field Chooser dialog show the full range of column headers available</p> <p>To add a column heading to the View Header:</p> <ul style="list-style-type: none"> <li>Drag it from the Field Chooser dialog onto the header to the position you want the column of data to display</li> <li>When you have selected the column headings you require, click on the red cross in the top right corner of the Field Chooser dialog to close it</li> </ul> <p>To remove a column from the output:</p> <ul style="list-style-type: none"> <li>Drag the column heading downwards out of the View Header</li> </ul> <p>To change the sequence of columns:</p> <p>Drag the required column header left or right, as appropriate</p>	
<p><b>Value Grouping</b></p>	<p>You can organize the reported data hierarchically according to the value of one or more of the column categories</p> <p>You might organize the data by <b>Type</b>, and within each Type by <b>Name</b>; if you then click on any of the other column headings, the data within this grouping is further sorted with the values of the selected column (for example, <b>Created</b>) in ascending or descending order</p> <p>To set up the value grouping, drag the column heading representing the primary grouping (such as <b>Author</b>) onto the <b>Drag a column header here to group by that column</b> field</p> <p>Now drag the column heading for the next level of grouping (such as <b>Status</b>) to</p>	

Topic	Detail	See also
	<p>the right of the first heading; the two heading titles display as connected blocks, as shown below:</p>  <p>You can, if required, add further levels of grouping by dragging other column headings onto the hierarchy (such as <b>Created</b>), and restructure the order by dragging existing or additional headings into the level you want them to hold</p> <p>For example, you could make <b>Type</b> the secondary grouping by dragging it to the right of <b>Author</b>, or drop <b>Status</b> between <b>Author</b> and <b>Type</b></p> <p>To remove a grouping level, drag the appropriate column heading out of the sequence and below the View header; any subordinate groupings move up a level</p>	
<b>Filter Bar</b>	<p>The Filter Bar displays underneath the column headings; you can hide or show it using the <b>Toggle Filter Bar</b> icon in the toolbar.</p> <p>The Filter Bar consists of a row of fields, one field per column; as you type a value into one of these fields, the Model Search results are automatically filtered to show entries with a value in the corresponding column that match the value in the field. The filter is case sensitive.</p> <p>For example, if you type the letter <b>F</b> in the Filter Bar field under the <b>Author</b> column, the results immediately reduce to entries for which the author name includes names such as Fred, Frank, Felix, Felicity, Fairmile, Farmer or Fitzgibbon (but none where the name includes f only as a lower case letter, such as Rufus)</p> <p>If you then go on to type <b>Fi</b>, the results immediately reduce again to only entries for which the author name includes names such as Fitzgibbon.</p>	

#### 4.2.1.5 Create & Modify Searches

You provide search filters and create new search definitions using the Search Builder panel, displayed underneath the **Search Term** and **Search** fields on the Model Search window.

This facility is not available for searches created through the Enterprise Architect scripting facilities.

Access: **Edit | Model Search: Show Search Builder** ()

#### Use to:

- Create new search definitions and edit them

#### Search Builder Toolbar:

The search builder toolbar enables you to configure the system-provided searches, and to create and edit your own searches

The toolbar icons, from left to right, provide access to the following functions:

Option	Usage	See also
<b>New Search</b>	Create a new search definition, with new search criteria	<a href="#">Create Search Definitions</a> <sup>[486]</sup>
<b>Save Search</b>	Save a modified or new search	
<b>Copy Search</b>	Copy the existing search selected in the <b>Search</b> field, to modify You can copy: <ul style="list-style-type: none"> <li>• Searches you or other users have created</li> <li>• Predefined searches and edit the copies, but you cannot edit the predefined searches themselves</li> </ul>	
<b>Restore Default</b>	Restore any changed parameters to the default settings and format	
<b>Delete Search</b>	Delete the search definition from the <b>Search</b> drop-down list	
<b>Add Filter</b>	Add a new set of parameters to filter the search on	<a href="#">Add Filters</a> <sup>[489]</sup>
<b>Remove Filter</b>	Delete the selected filter from the search	
<b>Export Search</b>	Display a selection box that enables you to select searches to export to an external directory as an XML Search file	
<b>Import Search</b>	Display the Windows Directory Explorer Open dialog to enable you to import searches as XML Search files from an external directory	
<b>Search Options</b>	Display the Advanced Options dialog, to define where the search should operate and how the search should match filters  This icon is available only for searches created with the Query-Builder, and not for those created with the SQL Editor	<a href="#">Advanced Search Options</a> <sup>[488]</sup>  <a href="#">Create Search Definitions</a> <sup>[486]</sup>

**Search Builder:**

You use the main body of the Search Builder panel to configure the element search filters that are contained in the selected search.

The Search Builder panel defaults to a **Simple** search, which changes as you select to create a new search or select the search to modify.

Column	Usage	See also
<b>Search In</b>	Select the type and name of each element feature (the element field name) to search on.	
<b>Condition</b>	Select the condition of the search parameter (the condition placed on the field value)  The available options are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b>	<a href="#">Fields and Conditions</a> <sup>[491]</sup>
<b>Look for</b>	Specify the search term (the actual value or delimiting value) to perform the conditional search on  This value can pertain to the selected element type; for example, the value	

Column	Usage	See also
	could be a date for <i>DateCreated</i> or a text value for other fields The search term can contain multiple values, separated by commas	
<b>Required</b>	Indicate whether the field is mandatory - that is, whether the search results must include elements with your search term in that field  The following provides example of using the <b>Required</b> checkbox, illustrated by the default <b>Simple</b> search, which checks the <b>Name, Alias</b> and <b>Notes</b> fields of all elements: <ul style="list-style-type: none"> <li>• If the <b>Required</b> checkbox is not ticked for any field, then if the search term is found in the <b>Name, Alias</b> OR <b>Notes</b> field for an element, that element is listed in the results</li> <li>• If the <b>Required</b> checkbox is ticked for all fields in the search, then the search term must be found in all of those fields before the element is listed in the results; that is: <b>Name AND Alias AND Notes</b></li> <li>• If the <b>Required</b> checkbox is ticked for some fields but not others, the search term must be found in all fields for which the checkbox is ticked, and <i>at least one</i> of the fields in which the checkbox is not ticked; that is: <b>Name AND (Alias OR Notes)</b></li> </ul>	

#### 4.2.1.5.1 Create Search Definitions

User-defined searches are created using the Search Builder panel, and are stored in the Program Files directory (not in the project repository).

**Access:** [Edit | Model Search: Options | Manage Searches](#)

#### Use to:

- Create a search definition using the SQL Editor, Query Builder, or an Add-In Search

#### How to:

To create a new search definition, follow the steps below:

Step	Action	See also
1	Click on the <b>New Search</b> icon in the toolbar The Create New Search Query dialog displays	
2	In the <b>Search Name</b> field, type a name for the search	
3	Select the radio button for the type of search you require: <ul style="list-style-type: none"> <li>• <b>Query Builder</b> - provides an interface that enables you to design your own search</li> <li>• <b>SQL Editor</b> - enables advanced users to directly write SQL Select statements</li> <li>• <b>Add-In Search</b> - enables you to supply the name of your Add-In and a method (for example <i>MyAddin.RunThisMethod</i>), which is called whenever the search is run; this search can be exported and distributed as a part of your Add-In</li> </ul>	<a href="#">Enterprise Architect Add-In Model</a> <sup>[1982]</sup>

Step	Action	See also
4	Click on the <b>OK</b> button, and refer to the following table	

**Search Types:**

Search	Description	See also
<p><b>Query Builder</b></p>	<p>Your search definition appears as being selected in the <b>Search</b> drop-down field</p> <p>You can now click on the <b>Add Filter</b> toolbar icon to add filters</p>	<p><a href="#">Add Filters</a> [489]</p>
<p><b>SQL Editor</b></p>	<p>The Custom SQL dialog displays, enabling you to input your <i>SELECT</i> statement</p> <p>The SQL editor is based on the common Code Editor, and provides an intellisense autocompletion list populated with Enterprise Architect's repository structure; to display the autocompletion list, press ( <b>Ctrl+Spacebar</b> )</p> <p>Enterprise Architect also enables you to use #xxx# macros as string replacers in <i>WHERE</i> statements, so that the same search can be used by different people in different environments; these macros include:</p> <ul style="list-style-type: none"> <li>• #WC# - Gets the appropriate wild card for the current database, and so enables the search to be performed on models on different databases; for example:  <i>t_object.Name LIKE 'WC#Test#WC#'</i></li> <li>• #Author# - Takes the value of the <b>Author</b> field in the Options dialog General page, and enables the defined search to be performed on objects created by that user (this value can be manually re-set in the Options dialog)</li> <li>• #DB=&lt;DBNAME&gt;# where &lt;DBNAME&gt; can be one of the following:             <ul style="list-style-type: none"> <li>• MYSQL</li> <li>• JET</li> <li>• ORACLE</li> <li>• SQLSVR</li> <li>• ASA</li> <li>• OPENEDGE</li> <li>• POSTGRES</li> </ul> <p>For example:  <i>#DB=ORACLE# t_object.ModifiedDate &gt;= (SYSDATE - INTERVAL '&lt;Search Term&gt;' DAY)</i></p> </li> <li>• #UserName# - Gets the name of the person logged into version control; for example:  <i>t_package.PackageFlags LIKE 'WC#VCCFG=#WC#CheckedOutTo=#UserName##WC#'</i></li> </ul> <p>(this is from Enterprise Architect's built in search <i>My Checked Out Packages</i>)</p>	<p><a href="#">Code Editors</a> [1403]</p>

	<ul style="list-style-type: none"> <li>• <i>#Package#</i> - gets the currently-selected package's package_ID</li> <li>• <i>#Branch#</i> - gets the IDs of the child packages of the currently-selected package</li> </ul> <p>For all Enterprise Architect functions in which you use a custom SQL statement (such as RTF reporting or Model Views) the statement must return the <i>guid</i> and <i>type</i> of the object found so that Enterprise Architect can search for the selected item in the Project Browser; for example:</p> <pre>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</pre> <p>You can extend the usability of your SQL searches using the aliases <i>CLASSGUID</i> and <i>CLASSTYPE</i>, which enable Enterprise Architect to display the Properties dialog and icon for elements, connectors, attributes or operations, as well as selecting them in the Project Browser</p> <p>Some simple examples for using these aliased fields are provided below:</p> <ul style="list-style-type: none"> <li>• <code>SELECT ea_guid AS CLASSGUID, Object_Type AS CLASSTYPE, Name FROM t_object</code></li> <li>• <code>SELECT ea_guid AS CLASSGUID, Connector_Type AS CLASSTYPE, Name FROM t_connector</code></li> <li>• <code>SELECT ea_guid AS CLASSGUID, 'Operation' AS CLASSTYPE, Name FROM t_operation</code></li> <li>• <code>SELECT ea_guid AS CLASSGUID, 'Attribute' AS CLASSTYPE, Name FROM t_attribute</code></li> </ul> <p>When you have defined the <i>SELECT</i> statement, click on the <b>Save</b> button to save this search; the search is then available from the Search drop-down list</p>	
<b>Add-In Search</b>	<p>Type in:</p> <ul style="list-style-type: none"> <li>• The name of your Add-In</li> <li>• A period (full stop) and</li> <li>• The name of the method to be called (for example, <i>MyAddin.RunThisMethod</i>)</li> </ul> <p>Your search is automatically saved and available from the <b>Search</b> drop-down list</p>	

**Learn More:**

	<div data-bbox="438 338 869 936" style="border: 1px solid black; padding: 5px;">           Element            Diagram            Attribute            Attribute.AttConstraint            Attribute.AttTagValue            Change            Custom Property            Constraint            Method            Method.MethodTagValue            Method.Parameter            Method.PostCondition            Method.PreCondition            Method.Parameter.ParamTagValue            File            Issue            Defect            Scenario            TagValue            Task            Test            Responsibility            Resource         </div> <p data-bbox="411 972 1177 1104">If you are adding filters to an existing search, the list contains only items appropriate to the initial filter</p> <p data-bbox="411 1048 1177 1104">For example, if the initial filter is on diagram properties, the list for any subsequent filters for the search only contains the <b>Diagram</b> option</p>	
<b>Include</b>	Select each field item to include in your search (select the checkbox)	
<b>Field</b>	Identify the name of the field to search The list presents items specific to the filter <i>Search On</i> item	
<b>Condition</b>	Specify the condition of the search parameter	<a href="#">Fields and Conditions</a> <sup>491</sup>
<b>Value</b>	Type a value pertaining to the selected element field For example, the value could be a date for <i>DateCreated</i> or a text value for other fields The search term can contain multiple values separated by commas	
<b>Required</b>	Select a particular field to generate a result set that <i>must</i> contain your search term in that field	
<b>Check All</b>	Select all the items to include them in the search definition	
<b>Uncheck All</b>	Deselect all the items to omit them from the search definition	
<b>OK</b>	Apply the filter The fields selected are added to the search definition	

**Notes:**

- You can add multiple search definitions as necessary; however, if you select the **Required** field in multiple definitions the search rapidly becomes impractical
- Multiple search definitions are better for 'and/or' searches

**Learn More:**

- [Create Search Definitions](#)<sup>[486]</sup>
- [Create & Modify Searches](#)<sup>[484]</sup>
- [Generate RTF Documentation Dialog](#)<sup>[1742]</sup>

**4.2.1.5.3.1 Fields and Conditions**

When you click on a condition for a particular field, a selection of condition options becomes available. The list of options varies dependent on the type of information required.

For some conditions, the **Value** field contains an ellipsis (...). Click on this to display a selection dialog. This dialog varies dependant on the information required.

**Learn More:**

- [Create Search Definitions](#)<sup>[486]</sup>
- [Add Filters](#)<sup>[489]</sup>

**4.2.2 Diagram Filters**

*Diagram Filters* (Dynamic Visual filters) enable you to modify the display of diagram components, so that the relevant items are immediately identified for the reader's attention without damaging the structure and integrity of the model. Currently the feature operates on elements and connectors, and filters according to properties such as Author, Status, Date Created or Stereotype.

**Access:** [View | Diagram Filters](#)

**Topics:**

Topic	Detail	See also
<b>Use</b>	<p>Use Diagram Filters to tailor the display of diagrams:</p> <ul style="list-style-type: none"> <li>• For different users, so that - for example - technical staff and stakeholders each have a view that highlights the information pertinent to them</li> <li>• To show what elements have been recently developed or changed</li> <li>• To show which part of a model was developed by a particular person</li> <li>• To show which parts of a diagram are at a particular phase, status or version</li> </ul> <p>Filters for elements can also be applied to the Package Browser and Diagram List; the <i>Select</i> filter effect does not, however, make a difference in</p>	<p><a href="#">Package Browser</a><sup>[458]</sup></p> <p><a href="#">Diagram List</a><sup>[464]</sup></p> <p><a href="#">Work With Diagram Filters</a><sup>[493]</sup></p>

Topic	Detail	See also
	these contexts	
<b>Develop Diagram Filters</b>	<p>You create and define as many filters as you require, setting up each filter by defining which element or connector properties to specifically check for and (depending on how you set up the filter parameters) whether to include or exclude elements or connectors having particular property values</p> <p>You cannot combine element and connector properties in one filter, but you can apply an element filter and a connector filter to a diagram at the same time</p> <p>You can select to:</p> <ul style="list-style-type: none"> <li>• Mute the irrelevant items in grayscale or a faded color</li> <li>• Hide the irrelevant items completely, or</li> <li>• Highlight (with a hashed line) the items that <b>are</b> relevant</li> </ul>	<a href="#">Work With Diagram Filters</a> 493
<b>Filter Action - Mute or Hide</b>	<p>If you select to <b>Mute</b> or <b>Hide</b> items, the action of the filters is to <i>exclude</i> items that <i>do not</i> match the parameters rather than <i>include</i> items that do</p> <p>If, for example, you selected to filter on element name, looking for elements with the word <i>Class</i> in the name, the filter would apply the following logic:</p> <p style="padding-left: 40px;">Does <b>Name</b> contain string <i>Class</i>? If <b>No</b>, apply effect; if <b>Yes</b>, take <i>no</i> action</p> <p>The elements you want are therefore what is left on the diagram, rather than what was operated on</p> <p>The filter effect remains in force while you do other work on the diagram, until such time as you disable the filter</p>	<a href="#">Work With Diagram Filters</a> 493
<b>Filter Action - Highlight</b>	<p>If you select the <i>Highlight</i> effect, the logic is reversed:</p> <p style="padding-left: 40px;">Does <b>Name</b> contain string <i>Class</i>? If <b>No</b>, take <i>no</i> action. If <b>Yes</b>, apply effect.</p> <p>In this case, the filter effect is not permanent, and clicking off the items deselects them</p> <p>This effect is excellent for selecting items having the same characteristics across a large diagram, to be processed in a single task; instead of having to locate the items and select them with ( <b>Shift</b> ) +<b>click</b> individually, you can apply the filter</p> <p>If you inadvertently lose the selection by clicking off the items, you can get it back again almost immediately by re-applying the filter.</p>	<a href="#">Work With Diagram Filters</a> 493
<b>Application</b>	<p>You can use filters singly, in sequence, or in combination; for example, you could:</p> <ul style="list-style-type: none"> <li>• Set up a filter for immediate use on a diagram, and modify that filter as you review the diagram so that you highlight elements with different values for the same properties - perhaps, by filtering on Phase, to compare 'as-is' and 'to-be' elements</li> <li>• Set up a filter and leave it active so that all diagrams you display are automatically filtered the same way</li> <li>• Set up a series of filters to use: <ul style="list-style-type: none"> <li>• in one or more sequences to progressively highlight a diminishing set of items, or</li> <li>• alternately to highlight contrasting views of the diagram</li> </ul> </li> </ul>	

**Learn More:**

- [A Quick-Start Guide to Using Diagram Filters](#)

**4.2.2.1 Work With Diagram Filters**

The Diagram Filters window is a dockable window, which you can move around or fix next to the Diagram View while you activate, deactivate and edit the filters.

**Access:** [View | Diagram Filters](#)

**Use to:**

- Create and edit filters
- Set the effect of the filter
- Enable and disable filters
- Delete filters

**How to:**

To create a filter to be applied to your diagrams, follow the steps below:

Step	Action	See also
1	Perform one of the following actions: <ul style="list-style-type: none"> <li>• On the Diagram Filter toolbar, click on the <b>New Filter</b> icon - the first on the left</li> <li>• Right-click on the list panel and select the <b>New Filter</b> context menu option</li> </ul> The Create New Diagram Filter dialog displays	
2	In the <b>Enter Filter Name</b> field, type a name for the filter, then click on the <b>OK</b> button The Diagram Filter dialog displays	
3	In the <b>Search On</b> field, either: <ul style="list-style-type: none"> <li>• Use the default value of <b>Element</b> or</li> <li>• Click on the drop-down arrow and select <b>Connector</b></li> </ul> If you select <b>Connector</b> , the dialog changes to offer a smaller set of properties	
4	Scroll through the properties to filter on, and select the checkbox against each property you require	
5	For each property, click on the <b>Condition</b> field and select, from the drop-down list, the comparison condition to be applied  Consider how the combination of <b>Condition - Equal To / Not Equal To</b> and <b>Filter Effect</b> might affect the results on the diagram	<a href="#">Diagram Filters</a> 
6	For each property, double-click on the <b>Value</b> field and type or select any specific value to filter on	
7	Click on the <b>OK</b> button to save the filter and return to the Diagram Filters window	

**Other Operations:**

Topic	Detail	See also
<b>Edit a Filter</b>	<p>To edit an existing filter on the Diagram Filters window, either:</p> <ul style="list-style-type: none"> <li>• Double-click on the filter name</li> <li>• Click on the filter name and select the <b>Properties</b> icon from the toolbar (the second icon from the left), or</li> <li>• Right-click on the name and select the <b>Properties</b> context menu option</li> </ul> <p>The Diagram Filter dialog displays; adjust the filtered fields as described above</p>	
<b>Change the Name of the Filter</b>	<p>Right-click on the name and select the <b>Change Name</b> context menu option</p> <p>The <b>Create New Diagram Filter</b> dialog displays</p> <p>Type over the existing name with the new name, and click on the <b>OK</b> button</p>	
<b>Set Effect of Filters</b>	<p>To set how your filters identify selected items on your diagrams, click on the drop-down arrow of the toolbar <b>Filter Effect</b> field, and select one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Fade</b> - display all items that do <i>not</i> match the filter criteria in a pale version of the diagram background color.</li> <li>• <b>Gray Scale</b> - display all items that do <i>not</i> match the filter criteria in pale gray.</li> <li>• <b>Hide</b> - conceal all items that do <i>not</i> match the filter criteria.</li> <li>• <b>Select</b> - select and highlight (with a hashed line) all those items that <i>do</i> match the filter criteria.</li> </ul>	
<b>Enable Filters</b>	<p>To enable a filter so that it takes immediate effect on your diagrams, select the check box against the filter name</p> <p>You can select more than one filter at a time, to combine their effects</p>	
<b>Disable/ Clear Filters</b>	<p>To disable a filter and clear the effect of the filter on the diagram so that it displays in full, clear the checkbox</p> <p>To disable all filters, either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>Reload Filters</b> icon in the toolbar (third option from the left), or</li> <li>• Right-click on the list panel and select the <b>Reload Filters</b> context menu option</li> </ul>	
<b>Delete a Filter</b>	<p>To remove a filter from the Diagram Filters window, either:</p> <ul style="list-style-type: none"> <li>• Click on the filter name and click on the <b>Delete</b> icon in the toolbar, or</li> <li>• Right-click on the filter name and select the <b>Delete Filter</b> context menu option</li> </ul>	

### 4.3 Trace: Tracking Dependencies

*Traceability* helps to identify the way a given requirement or process has been implemented in a system, enabling you to follow the path of dependencies from the initial request, through a modeled solution and up to the deployed physical system or process.

**Topics:**

Topic	Link
<p><b>Application</b> - A well developed model provides full traceability in any direction - providing answers to questions such as "why was that particular hardware used in the solution"; assuming there is traceability back to a requirement that specified particular response times or functional capability</p> <p>The result sets can be used to manage elements, to create documentation or to find the location of elements within the complete model structure</p>	
<p><b>Tools Overview</b> - There are various tools in Enterprise Architect that enable you to trace the definition and implementation of a process from initial requirement to generated code or technical deployment, or vice versa</p> <p>A good starting point is to look at the topics listed to the right, which detail some of the more useful tools</p> <p>The Traceability window, in particular, is designed to provide very detailed information about an elements immediate and distant relationships and dependencies</p>	<p><a href="#">The Traceability Window</a> <sup>[497]</sup></p> <p><a href="#">Relationship Matrix</a> <sup>[498]</sup></p> <p><a href="#">Gap Analysis Matrix</a> <sup>[512]</sup></p> <p><a href="#">The Relationships Window</a> <sup>[508]</sup></p> <p><a href="#">The Project Browser</a> <sup>[443]</sup></p> <p><a href="#">Example Diagram</a> <sup>[507]</sup></p> <p><a href="#">Traceability Tools</a> <sup>[496]</sup></p>
<p><b>Tracing Transformations</b> - If you have performed any Transformations in developing your model and code, Enterprise Architect automatically creates <i>Transformation Dependency</i> connectors that you can trace - with the Traceability window - to establish what objects and code have been generated from each PSM element, or what the initial PSM element was for a generated object</p> <p>Whether you use transformations or develop the stages of the model in other ways, you can build up a range of <i>Traceability diagrams</i> (<i>Custom</i> diagrams) to identify the development pathway and the dependencies between entities such as Requirements, Use Cases, Classes, Packages, Test Cases and other model artefacts, or possibly between these entities and the overall business process model</p>	<p><a href="#">Model Transformation</a> <sup>[1307]</sup></p> <p><a href="#">The Traceability Window</a> <sup>[497]</sup></p> <p><a href="#">Example (Traceability) Diagram</a> <sup>[507]</sup></p> <p><a href="#">A Complete Business Process</a> <sup>[1207]</sup></p>

**Learn More:**

- [Packages and Elements](#) <sup>[508]</sup>

### 4.3.1 Traceability Tools

The model structure and a Traceability diagram act as starting points for tracing the definition, design and implementation of a feature of a system or process.

By applying tools such as the Relationship Matrix and Traceability window to these, you can follow threads throughout the model to determine how the feature is implemented and tested.

You can also obtain information on what elements realize and are realized by the elements in a given package, using the Dependency report and Implementation report, respectively.

Topic	Detail	See also
<b>Traceability Window</b>	<p>The Traceability window is a most useful and versatile traceability tool; starting with a Traceability diagram or a package structure in the Project Browser, you use the Traceability window to quickly explore the relationship chain of which any element is a component</p> <p>When you click on <b>an element</b>, it immediately becomes the top point in the Traceability window</p> <p>When you click on the <b>background of a diagram</b>, <i>all</i> elements in the diagram are listed in the Traceability window, and you can follow the threads starting at each element through the diagram</p> <p>If you require a rapid, broad-brush view of <b>relationship flows</b> in the project structure, starting with a general list of - say - all functional Requirements, you can use a combination of Model Search, Project Browser and Traceability window; this is a powerful tool for scanning your project, identifying how elements have been organized, and how they interact</p> <p>For example: the Model Search would list all the requirements; you could rapidly click on each element and immediately see in the Project Browser where it has been grouped, and at the same time - in the Traceability window - how that element interacts with other elements in the model</p> <p>By moving the cursor around a diagram or the Project Browser, and/or changing the relationship type combinations in the Traceability window, you can quickly see how elements are connected and how they influence each other</p> <p>For example, you can see that - say - REQ017 is realized by two Use Cases, so you might then explore what else influences and is influenced by these two Use Cases; the Traceability window takes you well beyond what is likely to be depicted on any single diagram.</p> <p>If you have used <b>transformations</b> to develop your model, the <b>T</b> icon displays the transformation dependencies that exist between an element in a PIM and elements in the PSMs</p>	<p><a href="#">Example diagram</a> <sup>[507]</sup></p> <p><a href="#">The Traceability Window</a> <sup>[497]</sup></p> <p><a href="#">Model Search</a> <sup>[477]</sup></p> <p><a href="#">The Project Browser</a> <sup>[443]</sup></p>
<b>Relationship Matrix</b>	<p>Using the Relationship Matrix, you can both create and study the relationships between, for example, the Requirements and Use Cases for a module</p> <p>You might identify the 'theme' package (for example, <i>Manage Users</i>) in the Requirements model and in the Use Case model as the source and target packages, and explore the likely element and connector types in the packages; this, like the Traceability diagram, identifies which Requirements are (or should be) realized by which Use Cases</p> <p>You can then perform similar checks with the <i>Manage Users</i> packages in, say, the Use Case and Implementation models</p> <p>The <b>Source</b> and <b>Target</b> field browsers ( ... ) enable you to examine child</p>	<p><a href="#">Relationship Matrix</a> <sup>[498]</sup></p>

Topic	Detail	See also
	packages within the 'theme' package, and obtain further detail on how the feature at this stage is defined	
<b>Relationships Window</b>	The Relationships Window shows a single level of relationships from the currently selected element  Each line corresponds to a single relationship and provides information about that relationship and the element at the other end of the relationship	<a href="#">The Relationships Window</a> <sup>[506]</sup>
<b>Dependency Report</b>	The Dependency report provides a list of dependencies for all elements in the model	<a href="#">Dependency Report</a> <sup>[1797]</sup>
<b>Implementation Report</b>	The Implementation report provides a list of all elements in the model that have to be implemented, and the elements that implement them	<a href="#">Implementation Report</a> <sup>[1799]</sup>

### 4.3.2 The Traceability Window

The Traceability window enables you to quickly see how elements are connected and how they influence each other.

- When an element is selected, it immediately becomes the top point in the Traceability window
- When a diagram is selected, all elements in the diagram are listed in the Traceability window, enabling you to use any of them as a starting point.

**Access:** **View | Traceability (Ctrl+Shift+4)**

**Use to:**

- Locate related elements in the Project Browser
- View the properties of related elements
- Show the diagrams where related elements are used
- Add related elements to the current diagram
- View the source code for related elements
- Change the display using the window toolbar options below:

Option	Action	See also
<b>Generalizations</b>	Show Generalization connectors	
<b>Aggregations</b>	Show Aggregation and Composition connectors	
<b>Nesting</b>	Show Element nesting and Nesting connectors	
<b>Realizations</b>	Show Realization connectors	
<b>Dependencies</b>	Show Dependency connectors	
<b>Transitions</b>	Show State Transition, Control Flow, and Object Flow connectors	
<b>Other Links</b>	Show the following connectors: <ul style="list-style-type: none"> <li>• Association</li> <li>• Use Case</li> <li>• Delegate</li> </ul>	

Option	Action	See also
	<ul style="list-style-type: none"> <li>• Assembly</li> <li>• Deployment</li> <li>• Information Flow</li> <li>• Manifest</li> </ul>	
<b>Classifiers</b>	Show where an element is used as the classifier of another element	
<b>Embedded Element Reuse</b>	Show where a Port or Part is also represented in another part of the model	
<b>Transformations</b>	Show where an element is created by running a Transformation from another element	<a href="#">Model Transformation</a> <sup>[1307]</sup>
<b>Custom References</b>	Show the Custom References that have been added between elements	<a href="#">Set Up Cross References</a> <sup>[632]</sup>
<b>Qualified Names</b>	Show element names including the names of owning objects	

**Notes:**

- Restricting the relationship types shown to the smallest set you are interested in makes it easier and faster to find the elements you are interested in
- As an alternative view or to include the information in documentation, the Traceability window aids you in creating a Traceability diagram

**Learn More:**

- [Create Traceability Diagrams](#) <sup>[507]</sup>

### 4.3.3 Relationship Matrix

The Relationship Matrix is a spreadsheet display of relationships between model elements within packages.

Topic	Detail	See also
<b>Overview</b>	<p>The Relationship Matrix is a convenient method of visualizing relationships quickly and definitively</p> <p>It also enables you to create, modify and delete relationships between elements with a single mouse click - another quick way to set up complex sets of element relationships with a minimum of effort</p> <p>On the Relationship Matrix, you select:</p> <ul style="list-style-type: none"> <li>• A source package</li> <li>• A target package</li> <li>• The relationship type and</li> <li>• The relationship direction</li> </ul> <p>Enterprise Architect identifies all the relationships between source and target elements by:</p> <ul style="list-style-type: none"> <li>• Listing the source package elements down the side of the matrix</li> <li>• Listing the target package elements across the top of the matrix and</li> <li>• If a relationship exists between a source and target element,</li> </ul>	<a href="#">Include Other Users' Packages</a> <sup>[290]</sup>

Topic	Detail	See also
	<p>highlighting the intersecting grid square and displaying an arrow indicating the direction of the relationship</p> <p>The direction is a reflection of which elements are the source elements and which the target (it does <i>not</i> indicate the <b>Direction</b> property of the connector, as defined in the connector Properties dialog); the display might also show a 'bent arrow' icon, indicating that connectors exist in both directions between the source and target elements</p> <p>The highlighted squares are normally green, indicating that the <i>source</i> element is not locked (because the parent package has not been checked in under version control); if the element <i>is</i> locked (the parent package has been checked in) the highlight is pink</p> <p>If you click on any square in the matrix, the square, the row header and the column header are highlighted</p>	
<b>Operations</b>	<p>Once you open the Relationship matrix, you can:</p> <ul style="list-style-type: none"> <li>• Update, delete and create relationships through the Relationship Matrix</li> <li>• Select options for modifying the type of information the Relationship Matrix displays</li> <li>• Export the contents of the Relationship Matrix to a CSV file, a .png file or a .emf file</li> <li>• Print the contents of the Relationship Matrix, scaled down if required</li> <li>• Save a profile of the Relationship Matrix settings to monitor development of the same source and target packages</li> <li>• Investigate the Source and Target elements in the relationship</li> </ul>	<p><a href="#">Open the Relationship Matrix</a> <sup>[499]</sup></p> <p><a href="#">Creating and Deleting Relationships</a> <sup>[502]</sup></p> <p><a href="#">Relationship Matrix Options</a> <sup>[503]</sup></p> <p><a href="#">Matrix Profiles</a> <sup>[501]</sup></p> <p><a href="#">Review Source and Target Elements</a> <sup>[505]</sup></p>

### 4.3.3.1 Open the Relationship Matrix

**Access:** **View | Relationship Matrix**  
**Project Browser Package Context Menu | Documentation | Open in Relationship Matrix | As Source** or **| As Target**

Once the Relationship Matrix opens you:

- [Select which element type to show](#) <sup>[499]</sup>
- [Select the connector type and direction to show](#) <sup>[500]</sup>
- [Set the source and target packages](#) <sup>[500]</sup>

The Relationship Matrix refreshes after every change you make to the input parameters.

### 4.3.3.2 Set Element Type

The Relationship Matrix defaults to show all element types, or you can specify which types to show.

**How to:**

To set the source and/or target element types, follow the steps below:

Step	Action	See also
1	Click on the drop-down arrow in the <b>Type</b> field for the source package, and/or for the target package	
2	Find the required element type in the list and click on it Enterprise Architect refreshes the Relationship Matrix content	

#### 4.3.3.3 Set Connector Type and Direction

In the Relationship Matrix, you must set the connector type to report on and the connector direction.

##### How to:

To set the connector type and direction, follow the steps below:

Step	Action	See also
1	Click on the drop-down arrow in the <b>Link Type</b> field	
2	Find the required connector type in the list and click on it	
3	Click on the drop-down arrow in the <b>Direction</b> field	
4	Find the required direction in the list and click on it Enterprise Architect refreshes the Relationship Matrix content <ul style="list-style-type: none"> <li>If you set <b>Direction</b> to <b>Both</b>, each relationship is indicated by two arrows - a <i>From-To</i> arrow and a <i>To-From</i> arrow</li> <li>The direction is a reflection of which elements are the source elements and which are the target.; it does not indicate the <b>Direction</b> property of the connector, as defined in the connector Properties dialog</li> </ul>	

#### 4.3.3.4 Set Source and Target Package

You must set both the source and target packages for the Relationship Matrix before relationships can be displayed.

You set the source and target packages AFTER setting the connector and element types/details; as Enterprise Architect refreshes the content after each change, this is usually faster.

The Relationship Matrix includes ALL child elements in a hierarchy. Sometimes in a large model this can be a lot of elements, possibly too many to be useful. Take care in selecting the source and target package.

##### How to:

To set the source and target packages, follow the steps below:

Step	Action	See also
1	In the Project Browser, click on the required source package, then press ( <b>Ctrl</b> ) and	

Step	Action	See also
	click on the required target package, to select the two packages together	
2	Drag the selected packages over the <b>Source</b> and <b>Target</b> fields The first-selected package name displays in the <b>Source</b> field, and the second-selected package name displays in the <b>Target</b> field	
<i>Alternatively</i>		
1	Select and drag a single package name over the <b>Source</b> OR <b>Target</b> field, to change just the source or the target package If you drop the package name anywhere else on the Relationship Matrix, the system prompts you to specify whether to add it to the <b>Source</b> or <b>Target</b> field	
<i>Alternatively</i>		
1	Click on the ( ... ) (Browse) button at the end of the <b>Source</b> or <b>Target</b> field A short menu displays, with options to: <ul style="list-style-type: none"> <li>• Locate a package using the Browse Project dialog or</li> <li>• Run a Model Search (selected from a drop-down list) on a search term; the name of the search is displayed in the <b>Source</b> or <b>Target</b> field</li> </ul> <p>The target of the search depends on whether the <b>Return matching items for the selected Package</b> option is selected in the Search definition; if it is selected, the search operates on the current package, otherwise the search operates on the whole model</p> If required, you can browse for a package in one field and run a search in the other	<a href="#">Advanced Search Options</a> <sup>[488]</sup>
2	Select the required package, or the required Model Search and search term, and click on the <b>OK</b> button	

In all cases, Enterprise Architect immediately:

- Populates the Relationship Matrix axes with the elements identified in the Source and Target packages or the searches that meet the selection criteria, and
- Shows any relationships between the sets of elements that also meet the selection criteria.

### 4.3.3.5 Matrix Profiles

If you use a particular combination of field values often, you can save that combination as a profile to make it easier to recall them for use.

#### How to:

To save a certain Relationship Matrix configuration as a named profile for later recall, follow the steps below:

Step	Action	See also
1	Set up the Relationship Matrix with the required: <ul style="list-style-type: none"> <li>• source and target packages or Model Searches</li> <li>• source and target element types and</li> <li>• connector type and direction</li> </ul>	<a href="#">Set Element Type</a> <sup>[499]</sup> <a href="#">Set Connector Type and Direction</a> <sup>[500]</sup> <a href="#">Set Source and Target Package</a> <sup>[500]</sup>

Step	Action	See also
2	Click on the <b>Options</b> button on the Relationship Matrix and select the <b>Profiles   Save as New Profile</b> menu option A short dialog displays	
3	In the <b>Enter Value</b> field, type a profile name of up to 12 characters Click on the <b>OK</b> button	
4	Once you have created a profile, you can select it by clicking on the <b>Profile</b> drop-down arrow at the top of the Relationship Matrix screen and selecting the profile name from the list	

**Notes:**

- You can modify an existing profile by:
  - Selecting the profile name from the **Profile** drop-down list
  - Selecting the **Options: Profiles | Update Current Profile** menu option
  - Changing the field values, then
  - Saving the profile under the same profile name
- To delete an existing profile, select it in the **Profile** drop-down list and select the **Options: Profiles | Delete Current** menu option

**4.3.3.6 Creating and Deleting Relationships**

From the Relationship Matrix, you can:

- Modify relationships
- Delete relationships
- Create new relationships

**Use to:**

- Quickly create and manage relationships like Realization and Aggregation between Requirements and implementation elements (such as Use Cases)

**How to:**

To modify or delete a relationship on the Relationship Matrix, follow the steps below:

Step	Action	See also
1	Right-click the required highlighted relationship square on the matrix, and select the appropriate context menu option: <ul style="list-style-type: none"> <li><b>View relationship</b> - opens the Properties dialog for the selected relationship</li> <li><b>Source element properties</b> - opens the Properties dialog for the source element</li> <li><b>Target element properties</b> - opens the Properties dialog for the target element</li> <li><b>Delete relationship</b></li> </ul>	
2	If you have selected <b>Delete relationship</b> , Enterprise Architect prompts you to confirm this action	

Step	Action	See also
	Click on the <b>Yes</b> button The <b>Delete relationship</b> option is not available if: <ul style="list-style-type: none"> <li>• The source element (that is, the owner) is locked</li> <li>• You have selected <b>Both</b> in the <b>Direction</b> field - you are effectively trying to delete half a relationship</li> </ul>	
3	If you have selected one of the other options, modify the properties in the dialog fields as required Click on the <b>OK</b> button to save the changes	

To create a new relationship, follow the steps below:

Step	Action	See also
1	In the <b>Link Type</b> field, select the required relationship type	
2	Right-click on the empty square at the intersection of the appropriate source row and target column	
3	Select the <b>Create new relationship</b> context menu option A submenu displays, listing the types of relationship you can create	
4	Click on the required type of relationship; a connector of that type is created between the two elements	

#### 4.3.3.7 Relationship Matrix Options

The Relationship Matrix provides a number of menu options for modifying the output of information, for preserving the settings for such modifications, and for capturing the output.

**Access:** [View | Relationship Matrix: Options](#)

**Use to:**

- Output the information on the Relationship Matrix to the printer or to a metafile, .png file or .csv file
- Create and update profiles of the configurations of the matrix that you have designed
- Define local settings to control what the Relationship Matrix displays

**How to:**

Topic	Detail	See also
<b>Print Relationship Matrix</b>	Click on the <b>Matrix   Print</b> menu option The Print dialog displays, on which you select the output printer and specify the printer properties, the range of pages to print, and the number of copies	

Topic	Detail	See also
	The output is a WYSIWYG representation of the Relationship Matrix contents	
<b>Display a preview of printout</b>	Click on the <b>Matrix   Print Preview</b> menu option The Print Preview screen displays, showing the Relationship Matrix printout	<a href="#">Print Preview</a> [542]
<b>Scale printout</b>	When you print the Relationship Matrix, by default it prints on as many pages wide and long as the matrix requires  You can scale the printout into a fixed number of pages wide, and the row height is automatically adjusted to maintain the proportions of the matrix; this reduces the overall size of the printout and improves appearance, especially when used in conjunction with the <b>Landscape</b> option in the printer properties  For example, a 16-page printout without scaling can, with a scaling of 2 pages wide, be reduced to 6 pages	
	To set the page scaling: <ol style="list-style-type: none"><li>1. Click on the <b>Matrix   Scale Setting</b> menu option The Scale Matrix dialog displays</li><li>2. Select the <b>Scale Matrix Width Into Pages</b> checkbox, and type or select the number of pages in width to scale to</li><li>3. Click on the <b>OK</b> button to apply the setting</li></ol>	
<b>Save Relationship Matrix as graphic file</b>	Click on the <b>Matrix   Save as Metafile</b> or <b>Matrix   Save as PNG</b> menu options A Browser dialog displays that enables you to select the target file location and specify the filename of the .emf or .png file in which to save the output  You can incorporate these files in an RTF or HTML report, as a hyperlinked file or an included file	
<b>Export output to CSV file</b>	The contents of the Relationship Matrix can be exported to a CSV file, which provides a convenient mechanism for moving the matrix data to a spreadsheet environment such as Microsoft Excel  This option is also active in the 'Lite', read-only version of Enterprise Architect  To export to CSV: <ol style="list-style-type: none"><li>1. Select the <b>Matrix   Export to CSV</b> menu option The Windows Browser dialog displays</li><li>2. Browse to the required file location and type in a .CSV filename to export to</li><li>3. Click on the <b>Save</b> button to export the data</li></ol>	<a href="#">The Read-only 'Lite' Edition</a> [18]
<b>Create and manage matrix profiles</b>	If you use a particular combination of field values often, you can save that combination as a profile to make it easier to recall them for use	<a href="#">Matrix Profiles</a> [50]
<b>Manage display content</b>	Select the <b>Options</b> menu option  The Matrix Options dialog displays; select one or more of the following checkboxes as required: <ul style="list-style-type: none"><li>• <b>Include Source Children</b> - to recursively include child packages and contents under the Source</li></ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Include Target Children</b> - to recursively include child packages and contents under the Target</li> <li>• <b>Include All Extended Meta Types</b> - to include elements that are extensions of a specified meta-type; for example, if there are Block elements (extending Class) in the package, selecting this option and specifying the type Class includes Class and Block elements, and any further derivatives of Block in the matrix</li> <li>• <b>Sort Axes</b> - to ensure package elements display in alphabetical order</li> <li>• <b>Show Package Names</b> - to hide or show package names in the Relationship Matrix; this is useful for shortening the displayed texts, especially in circumstances where packages have long names</li> <li>• <b>Use Element Alias If Available</b> - to display an element's alias instead of the element name, if an alias has been defined</li> <li>• <b>Show Level Numbering If Available</b> - to reproduce level numbering in the Relationship Matrix, if it is turned on in the Project Browser</li> </ul>	

#### 4.3.3.8 Review Source and Target Elements

As well as providing information on connectors and relationships, the Relationship Matrix enables you to obtain information on the source and target elements in a relationship.

Topic	Detail	See also
<b>Identify elements in relationships with a source or target element</b>	<p>Click on the source or target element name in the row or column titles</p> <p>The entire row or column is highlighted</p> <p>Scroll across or down the highlighted row or column and quickly identify where the relationships are; this is very useful if the row or column is long</p>	
<b>Display the Properties dialog for the selected element</b>	Right-click on the element name and select the <b>Properties</b> option	
<b>Identify diagrams in which the element is used</b>	<p>Right-click on the element name and select the <b>Find in Diagrams</b> option</p> <p>Either:</p> <ul style="list-style-type: none"> <li>• The only diagram in which the element is used displays, with the element highlighted, or</li> <li>• A list of the diagrams in which the element is used displays; you then double-click on the required diagram to open it</li> </ul>	
<b>Highlight the element name in the Project Browser</b>	<p>Right-click on the element name and select the <b>Locate in Project Browser</b> option</p> <p>The Project Browser expands to the location of the element, and the element name is highlighted</p>	
<b>Make the element the focus in any docked screens or windows that are open</b>	Right-click on the element name and select the <b>Set Context Item</b> option; the selected element becomes the subject of any open windows or screens	

### 4.3.4 The Relationships Window

The Relationships window displays all connectors between an element selected from a diagram or the Project Browser, and other elements. This provides a quick overview of an element's relationships in the model.

**Access:** [View | Relationships](#)

**Topics:**

Topic	Detail	See also
<b>Content</b>	<p>The Relationships window shows, for each connector, the:</p> <ul style="list-style-type: none"> <li>• Connector type</li> <li>• Any stereotype on the connector</li> <li>• The Source and Target elements in the relationship</li> <li>• The direction of the relationship</li> <li>• Any stereotype on the Target element</li> <li>• The Target element type</li> <li>• The Target and Source element roles, if any</li> </ul> <p>It also has a <b>Target in Diagram</b> column which, if the Target element for a connector is visible in the currently loaded diagram, contains the value <b>Yes</b>; this is very useful when you are dragging related elements from the Relationships list onto the current diagram</p> <p>Adding the target element to the diagram does not change the context to that element; the originally-selected element (the subject of the Relationships window) remains in context, and you continue working with that element</p>	
<b>Facilities</b>	<p>Double-click on a connector in the list to display the &lt;connector type&gt; Properties dialog, on which you can edit the connector attributes</p> <p>Right-click on a connector to open the context menu, which provides options to:</p> <ul style="list-style-type: none"> <li>• locate the related element in the Project Browser</li> <li>• view the related element properties</li> <li>• delete the connector</li> <li>• hide certain connectors in diagrams</li> <li>• show hidden connectors</li> <li>• locate the selected element in any other diagrams in which it occurs</li> <li>• place the related element in the current diagram (if it is not currently visible in the diagram); this is useful in building a picture of what an element interacts with, especially when reverse engineering an existing code base</li> </ul>	

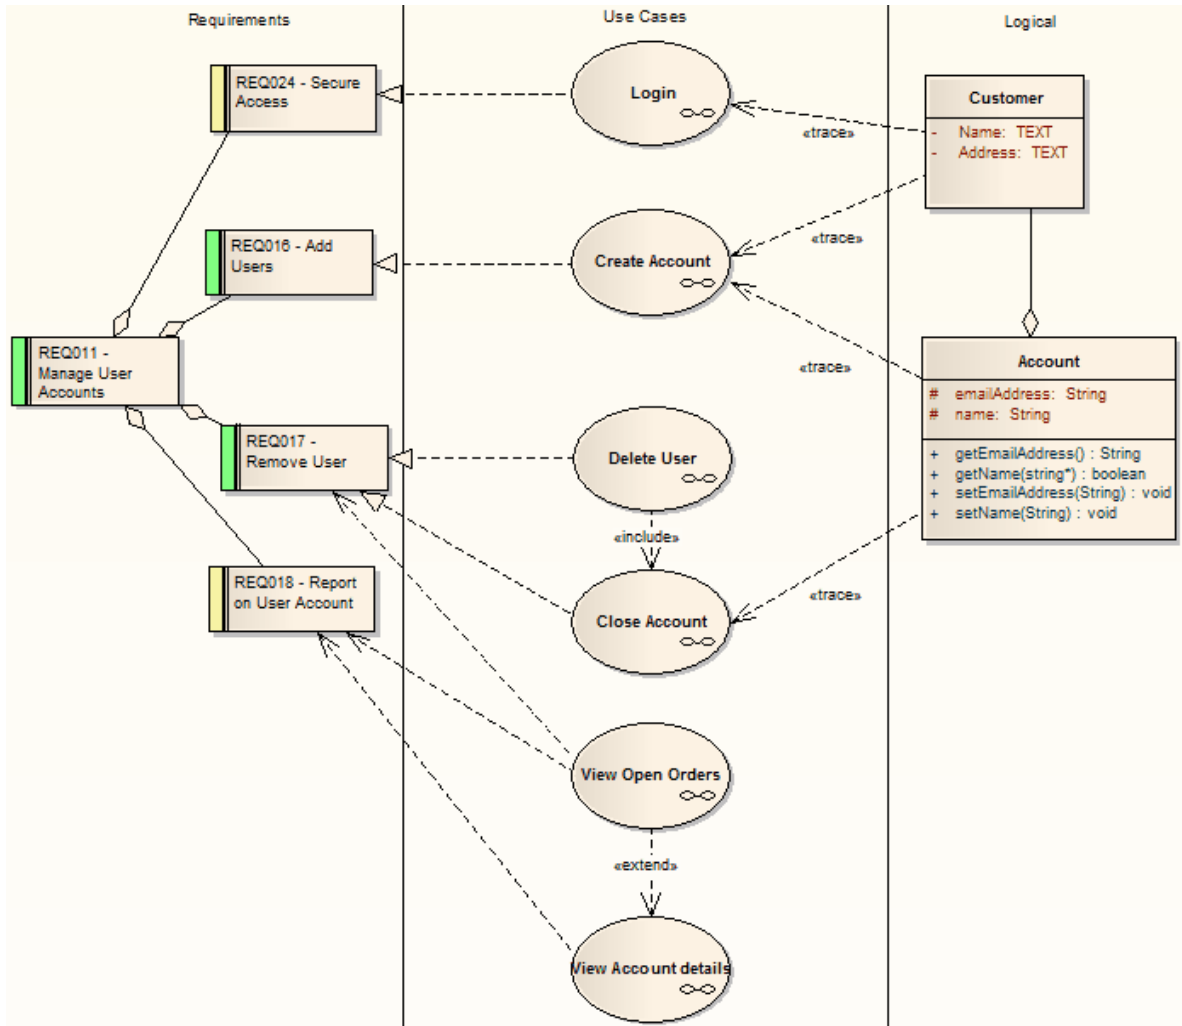

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, with security on, the diagram and the source and target elements must be free for editing before some of these options are available for use

### 4.3.5 Example Diagram

A wide variety of relationships can be shown on diagrams; you are not restricted to having a single element type or elements from a single phase on a diagram. This can help you to create appropriate relationships (such as Realize or Trace) to elements where no relationship was previously defined.

Consider the following diagram:

Topic	Detail	See also
<b>Diagram Contents</b>	<p>The example diagram above shows how a series of requirements are traced to Use Cases and then Classes</p> <p>The diagram instantly shows:</p> <ul style="list-style-type: none"> <li>• That two levels of Requirements are realized by Use Cases</li> <li>• Which Requirement is realized by which Use Case(s)</li> <li>• How some of the Use Cases are implemented by Class elements</li> </ul> <p>You can drill down on each Use Case (or, in other Traceability diagrams, any other composite element) to display more detailed diagrams showing how the Use Case meets the Requirement; the Close Account Use Case, for example, contains a Communication diagram and a Sequence diagram.</p>	

Topic	Detail	See also
	<p>You can tailor your Traceability diagrams to depict any level of granularity and any stages of development that are appropriate; for example, you might:</p> <ul style="list-style-type: none"> <li>• Narrow the above diagram to show development from just the Remove User Requirement, or</li> <li>• Extend it to include Interfaces, Components, Test Case elements or any other facet of the system or process</li> </ul>	
<b>Building a Diagram</b>	<p>A number of tools are available to for creating diagrams that show traceability:</p> <ul style="list-style-type: none"> <li>• The diagram context menu <b>Add   Related Elements</b> option enables you to automatically bring in elements linked to the selected element</li> <li>• The Relationships window enables you to add elements to the diagram that are directly linked to the currently selected element</li> <li>• The Traceability window enables you to add elements that are indirectly linked</li> </ul>	<a href="#">Insert Related Elements</a> <a href="#">[654]</a>

**Notes:**

- Whilst the Traceability diagram itself provides information on the definition, design and implementation of a business process feature, much more information can be obtained using the Traceability tools

**Learn More:**

- [The Traceability Window](#) [\[497\]](#)

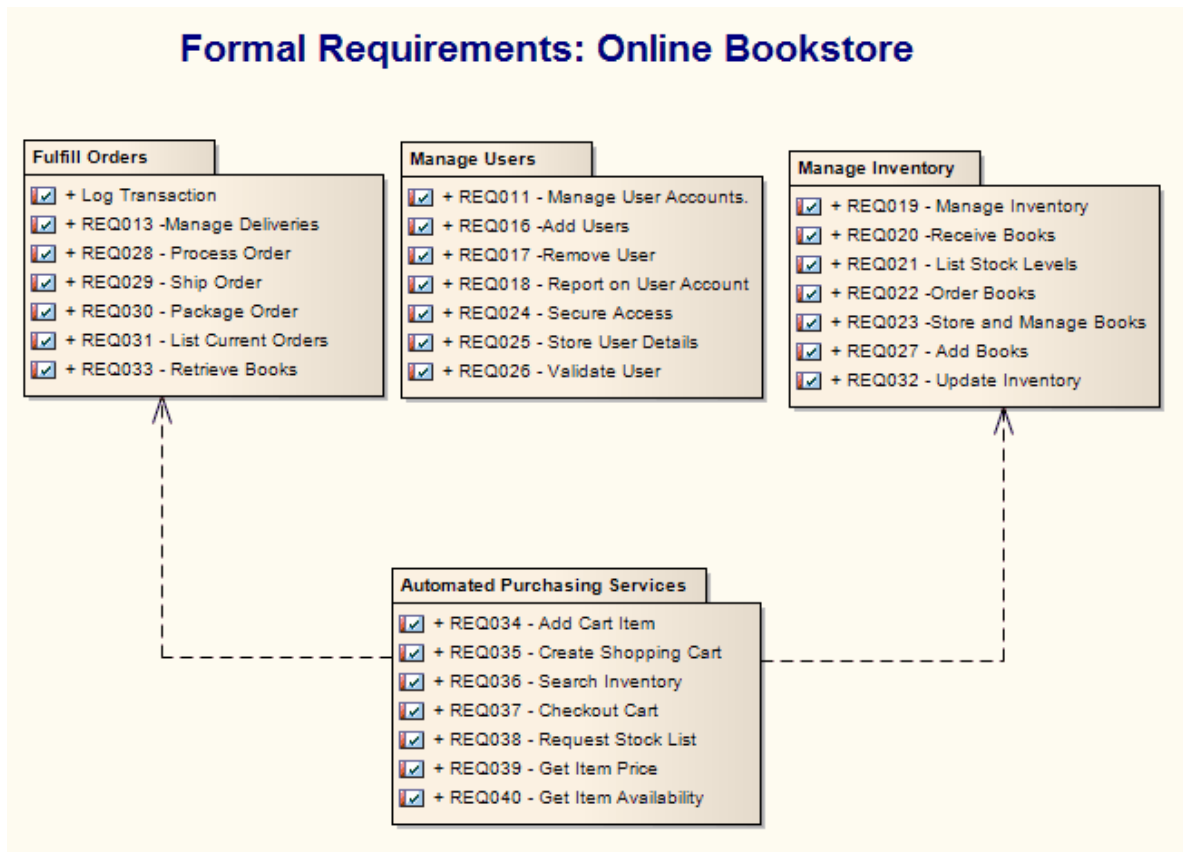

### 4.3.6 Packages and Elements

Analyzing the requirements of a system or process helps you identify units of functional activity in that system or process. You can represent these units with Packages, which you then populate with elements of relevance to the functional units and to the stage of development.

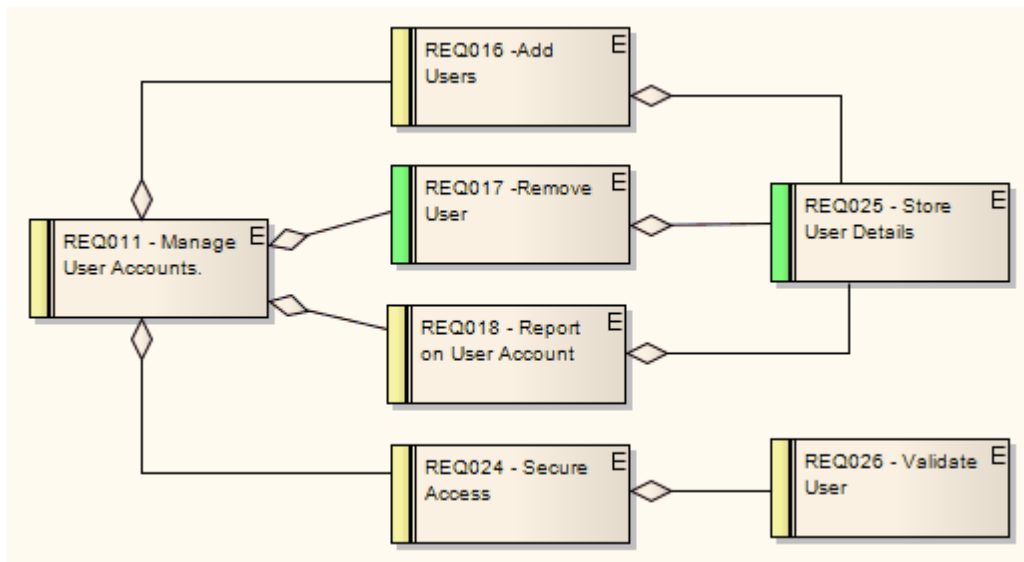

In the following four diagrams, you can see how Requirements and Use Case Packages are created to group the Requirements elements and Use Case elements that define and start to implement each of several functional areas.

By maintaining the same structure in each model in the project you also make it easy to trace the project development through the stages.

#### Requirement Packages for Online Bookstore Process:

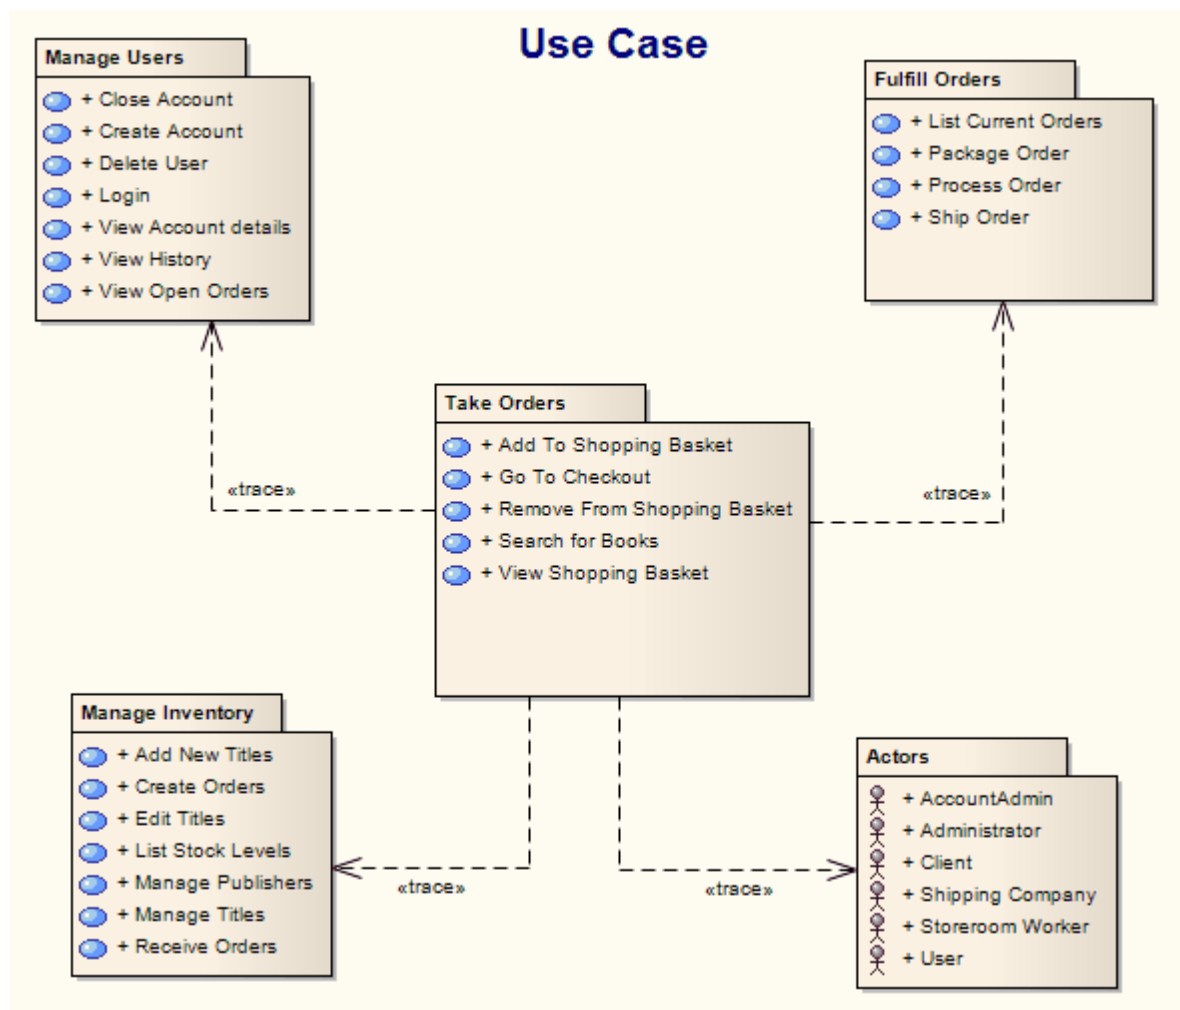

**Requirements in Manage Users Unit of Online Bookstore Process:**

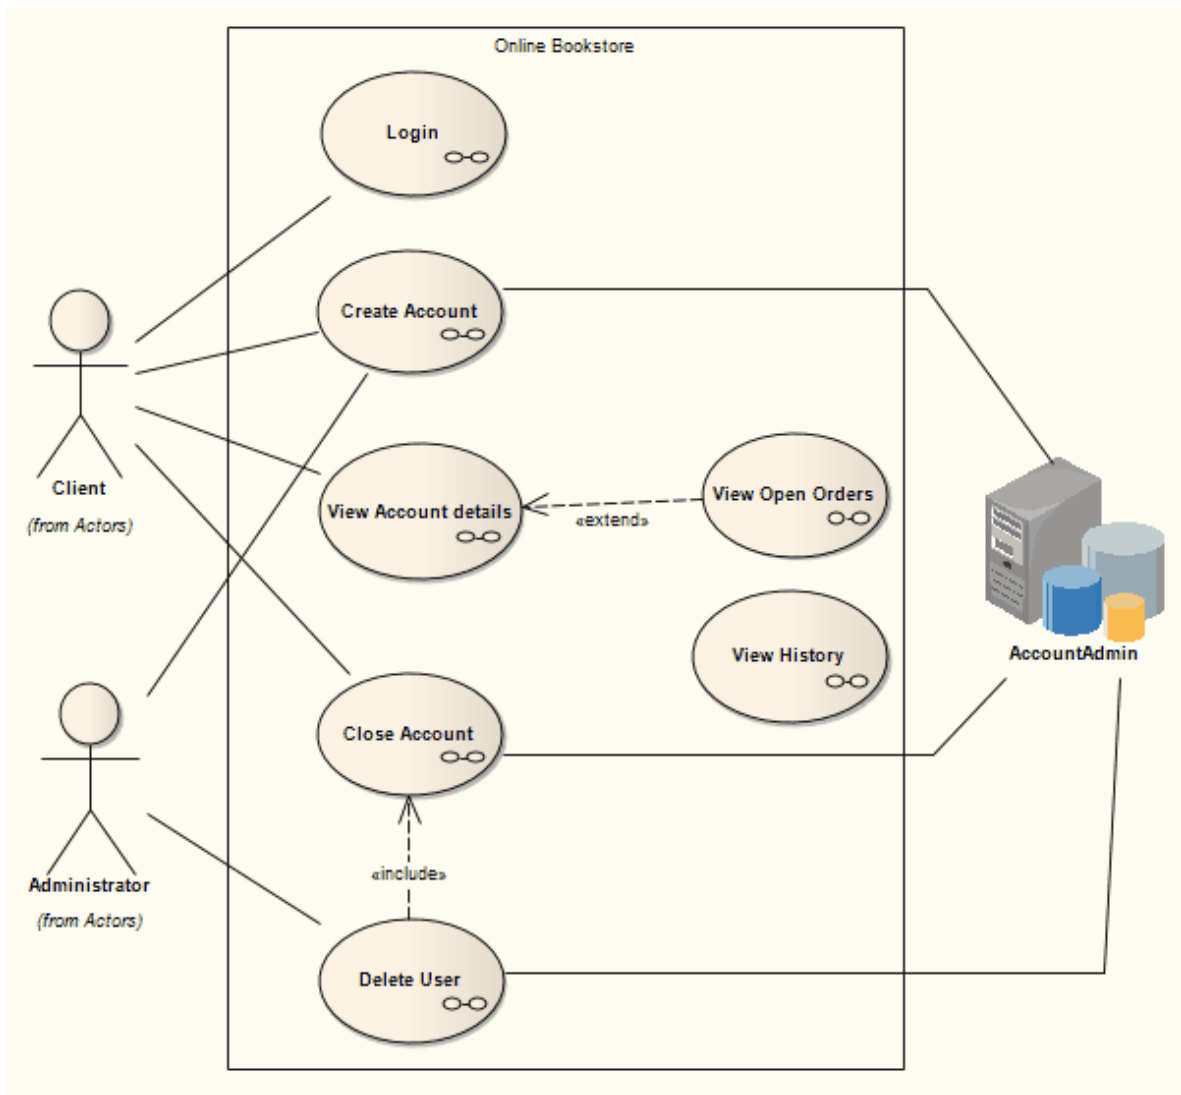

The Requirements diagram also makes it clear what Requirements form subsets of others, or are components of more than one other Requirement.

**Use Case Packages For Online Bookstore Process:**

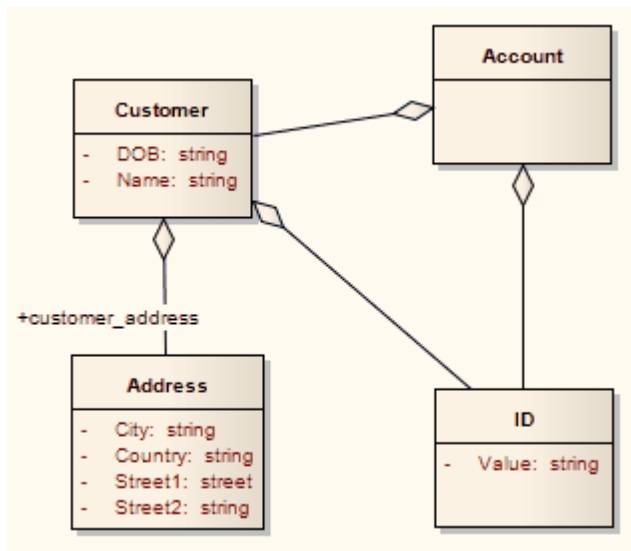

Use Cases in Manage Users Unit of Online Bookstore Process:

The Use Case diagrams can also clarify what aspects of a process require or enable human intervention, and which require or enable system intervention.

#### **Implementation Stage:**

For completeness, you could also consider the next stage, the implementation of some of these Use Cases, as represented by Class elements associated with this functional unit.

### 4.3.7 Gap Analysis Matrix

The Gap Analysis Matrix is a tool to analyze model artifacts for potential gaps in solutions.

The idea is to highlight a shortfall between the Baseline Architecture and the Target Architecture; that is, items that have been deliberately omitted, accidentally left out, or not yet defined.

**Access:** [View | Gap Analysis Matrix](#)

Topic	Detail	See also
<b>Overview</b>	<p>The Gap Analysis Matrix is a convenient method of identifying gaps between solution architectures</p> <p>It enables you to model the gaps in the repository, which can later be addressed and assigned as tasks; the identified gaps can also be used to prioritize activities</p> <p>On the Gap Analysis Matrix, you select the:</p> <ul style="list-style-type: none"> <li>• Target Architecture package</li> <li>• Baseline Architecture package</li> <li>• Type of Target Architecture artifact</li> <li>• Type of Baseline Architecture artifact</li> <li>• Type of element to model the gap</li> </ul>	<a href="#">Include Other Users' Packages</a> <sup>290</sup>
<b>Operations</b>	<p>Once you open the Gap Analysis Matrix, you can:</p> <ul style="list-style-type: none"> <li>• Create, update and delete Gap Matrix Profiles to monitor development of the Baseline and Target packages</li> <li>• Edit Gap notes during a discussion session for Gap analysis</li> <li>• Create elements to address gaps</li> </ul>	<a href="#">Edit Gap Notes</a> <sup>514</sup>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Add links to existing elements to address gaps</li> <li>• Remove links to existing elements modeled as gap</li> </ul>	
<b>Select Package</b>	<p>Click on the ( ... ) (Browse) button at the end of the <b>Target Architecture</b> or <b>Baseline Architecture</b> field</p> <p>The Browse Project dialog displays</p> <p>Select the required package and click on the <b>OK</b> button; by default all the elements under the package are displayed</p>	
<b>Set Element Type</b>	<p>Click on the drop-down arrow in the <b>Filter</b> field for the Target Architecture package, and/or for the Baseline Architecture</p> <p>Find the required element type in the list and click on it; Enterprise Architect refreshes the matrix content</p>	
<b>Set Gap Type</b>	<p>Click on the drop-down arrow in the <b>Record Gap As</b> field</p> <p>Find the required element type in the list and click on it</p> <p>When you create a gap, the specified type of element is created; for example, if you want to address the gap with an issue element then select <b>Issue</b> for this field</p>	
<b>Baseline Architecture</b>	<p>The Baseline Architecture artifacts are listed along the rows of the matrix</p> <p>The last row is for capturing the new elements in the target architecture along the columns but not in the baseline architecture, hence the name <b>New</b></p>	
<b>Target Architecture</b>	<p>The Target Architecture artifacts are listed along the columns of the matrix</p> <p>The last column is for capturing the missing or intentionally eliminated elements in the baseline architecture along the rows but not in the target architecture; hence the name <b>Missing / Eliminated</b></p>	
<b>Modeling Gap</b>	<p>Right-click on a cell in the <b>New</b> row or <b>Missing / Eliminated</b> column</p> <p>The context menu displays options to:</p> <ul style="list-style-type: none"> <li>• Create a Gap element</li> <li>• Add a link to an existing Gap element</li> </ul> <p>If a link to Gap element already exists in the cell then the following options are displayed:</p> <ul style="list-style-type: none"> <li>• Edit Gap element</li> <li>• Find in Project Browser...</li> <li>• Remove Gap element link</li> </ul>	
<b>Create Gap</b>	<p>Right-click on the cell and select the <b>Create Gap Element</b> context menu option</p> <p>The Browse Project dialog displays</p> <p>Select the package in which to create the Gap element and click on the <b>OK</b> button; a Gap element is created in the selected package and its Properties dialog displays to enable you to enter the element name and other required properties</p>	
<b>Link to Existing Gap</b>	<p>If you intend to use a Gap element that is already available in the model, right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Link to Existing Gap Element</b> context menu option</p>	

Topic	Detail	See also
	The Select Classifier dialog displays, enabling you to select the existing Gap element	
<b>Remove Link to Gap</b>	<p>If you intend to remove a link to the Gap element in a cell, right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Remove Link to Gap Element</b> context menu option</p> <p>The link is removed from the cell but the element still exists in the Project Browser</p>	
<b>Review Gap Element</b>	<p>Right-click on the appropriate cell in the <b>Missing / Eliminated</b> column or <b>New</b> row and select the <b>Edit Gap Element</b> context menu option</p> <p>The Properties dialog displays, enabling you to edit the selected Gap element</p> <p>To locate the element in the Project Browser select the <b>Find in Project Browser...</b> context menu option, which highlights the element in the Project Browser</p>	
<b>Gap Analysis Matrix Profiles</b>	<p>On the Gap Analysis Matrix, you can create and manage profiles to save commonly-used combinations of Target Architectures, Baseline Architectures and stereotypes</p> <p>To work on Gap Analysis Matrix profiles, click on the <b>Options</b> button in the top right corner of the matrix; a submenu displays, listing options to:</p> <ul style="list-style-type: none"> <li>• Create / Save the current matrix settings and content</li> <li>• Update the currently selected profile in the <b>Profile</b> field</li> <li>• Delete the currently selected profile in the <b>Profile</b> field</li> </ul>	
<b>Open a saved Profile</b>	<p>The <b>Profile</b> field drop-down list shows all the saved Gap Analysis Matrix profiles</p> <p>Click on the drop-down arrow in the <b>Profile</b> field, find the required Profile in the list and click on it to load the content of the selected profile in the matrix</p>	

**Notes:**

- The Gap Analysis Matrix is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect

**4.3.7.1 Edit Gap Notes**

The Gap Analysis Matrix provides a way to record notes during the initial phase or during a discussion session for Gap Analysis. These notes are saved in profiles, which can later be reviewed and the appropriate model elements created to address these gaps.

**How to:**

To edit gap notes, follow the steps below:

Step	Action	See also
1	Right click on the cell at the intersection of a Target and Baseline element and select the <b>Edit Gap Note</b> option from the context menu  Alternatively, double click on the cell  The Gap Note dialog displays	<a href="#">Gap Analysis Matrix</a> <sup>512</sup>
2	Edit the notes as required and click on the <b>OK</b> button	
3	The edited notes display in the selected cell in the matrix	
4	Update or save the matrix to retrieve it when the Gap Matrix profile is loaded at a later stage	

**Part**

## 5 Modeling Basics

Modeling can be described as graphically representing a business process or software system. The resulting model can be used to emphasize a certain aspect of the system being represented, and to record, document and communicate its detail. A study of such a model can enable insight or understanding of the system. Enterprise Architect's modeling platform is based on the Unified Modeling Language (UML), a standard that defines rules and notations for specifying business and software systems.

Using Enterprise Architect, you can quickly build a model using a hierarchy of *packages* to represent the structure and organization of the model.

### Topics:

Topic	Link
<p>Models - a model is the highest conceptual level, representing a distinct and complete representation of all or some part of a modeled system</p> <p>A Project can contain multiple models.</p>	<p><a href="#">Models</a> <sup>[520]</sup></p> <p><a href="#">Model Wizard</a> <sup>[520]</sup></p> <p><a href="#">Model Templates</a> <sup>[521]</sup></p>
<p>Views are the second level within a model and define a specific viewpoint of the system being modeled - for example a Use Case view, a Requirements View or a Dynamic (behavioral) View</p> <p>Views are simply packages which have an additional conceptual meaning.</p>	<p><a href="#">Views</a> <sup>[532]</sup></p> <p><a href="#">Add Views</a> <sup>[533]</sup></p>
<p>Packages are the basic containers that create the overall model structure. Packages hold other packages, elements, diagrams and similar model constructs.</p>	<p><a href="#">Packages</a> <sup>[535]</sup></p> <p><a href="#">Open Package in the Project Browser</a> <sup>[535]</sup></p>
<p>Diagrams are visual representations of how model elements are connected or behaviorally related. They can also display the characteristics of an element, such as attributes, methods, notes and tagged values in a convenient visual style.</p>	<p><a href="#">Diagrams</a> <sup>[540]</sup></p> <p><a href="#">Diagram Toolbox</a> <sup>[548]</sup></p> <p><a href="#">The Quick Linker</a> <sup>[624]</sup></p> <p><a href="#">Diagram Context Menu</a> <sup>[540]</sup></p> <p><a href="#">Diagram Context Menu</a> <sup>[540]</sup></p> <p><a href="#">Diagram Tabs</a> <sup>[545]</sup></p> <p><a href="#">Diagram Tasks</a> <sup>[569]</sup></p> <p><a href="#">Layout Diagrams</a> <sup>[606]</sup></p>
<p>Elements are the basic building blocks of models. They represent both structural constructs such as Classes and Interfaces, as well as behavioral constructs such as Activities, Actions and States.</p>	<p><a href="#">Elements</a> <sup>[627]</sup></p> <p><a href="#">Element Context Menu</a> <sup>[650]</sup></p> <p><a href="#">Visual Representation</a> <sup>[660]</sup></p>
<p>Connectors are the various kinds of relationships between elements within a model - including behavioral relationships, associations,</p>	<p><a href="#">Connectors</a> <sup>[738]</sup></p> <p><a href="#">Connector Context Menu</a> <sup>[738]</sup></p>

taxonomic relations and similar.	<a href="#">Connector Tasks</a> <sup>[742]</sup> <a href="#">Connector Properties</a> <sup>[758]</sup>
Tagged Values are customizable, profile or user defined properties which are generally related to a Stereotype and define additional attributes and characteristics of an element. They are one of the fundamental means of extending UML into more domain specific areas.	<a href="#">Tagged Values</a> <sup>[764]</sup> <a href="#">Quick Add - Tagged Value To Elements</a> <sup>[765]</sup> <a href="#">Modify Tagged Values</a> <sup>[768]</sup>
Notes are the standard common language based descriptions of what an element, diagram, feature or relationship is for and how it is used within the model. Notes are often used as a first step to eliciting the meaning and use of an element - which is later refined into something more concrete and precisely specified.	<a href="#">Notes</a> <sup>[771]</sup> <a href="#">Notes Toolbar</a> <sup>[772]</sup>
Reference Information - a variety of basic types and information that is used across a particular model - for example, Stereotypes, Tagged Values and similar.	<a href="#">Reference Data</a> <sup>[774]</sup> <a href="#">UML Types</a> <sup>[774]</sup>

## 5.2 Models

In Enterprise Architect a *model* is a special type of package, being the top level entry point to an Enterprise Architect project file.

### Topics:

Topic	Detail	See also
<b>Models</b>	<p>You can develop a project with one model, or with several. Each model is a root node of a hierarchy of Model Packages and Views and, below them, packages. A model contains the diagrams, elements, relationships and associated metadata that define the structure and function of a system or process.</p> <p>These components are organized through the package hierarchy, which helps to group and manage related components. By iterating through all models, you can access all the elements within the project.</p> <p>You can create the model or models when you first create the project, or you can add and develop new models later. You can also delete a model, but be aware that everything contained in the model is deleted as well.</p>	

### 5.2.1 Model Wizard

The Model Wizard enables you to add models from a range of technologies to your new project, both on initial creation and over time.

**Access:** **Automatically displays when creating a new project; otherwise Right-click on a Project Browser Package node | Add | Add a New Model using Wizard (Ctrl) + (Shift) + (M)**

### Use to:

- Add new models to a project

### Reference:

Field	Usage	See Also
<b>Technology</b>	<p>If you have advanced Add-Ins and MDG Technologies, this panel lists them</p> <p>Click on the required technology to list the associated templates in the Name panel</p> <p>To list the standard Enterprise Architect model templates , select <b>Basic</b></p>	

Field	Usage	See Also
	<b>UML 2 Technology</b>	
<b>Name</b>	Click on the check box for each model type you want to create in your project	<a href="#">Model templates</a> <sup>[521]</sup>
<b>All</b>	Select all of the models listed in the Name panel	
<b>None</b>	Clear all models selected	
<b>OK</b>	Create the Model Packages for your project	
<b>Cancel</b>	Abort the creation of model packages	
<b>Help</b>	Display this Help topic	

**Notes:**

- If you are a Technology Developer, you can also create and distribute custom templates as part of your own MDG Technology; the name of your technology displays in the Technology panel and, when you select the technology, the model template names display in the Name panel

### 5.2.2 Model Templates

The model templates contained in Enterprise Architect are designed to assist in the creation of projects and models for both new and experienced users.

Each template provides a framework on which you can create a model appropriate to your purpose, using the Model Wizard.

All model templates provided with Enterprise Architect follow the format described in the table below

**Topics:**

Topic	Detail	See also
<b>Note</b>	The note introduces you to the model template and outlines its purpose.	
<b>Help Links</b>	Help hyperlinks provide further information on how to use the model. Depending on the model template, links to examples and other useful information are also provided.	
<b>Template</b>	The Template section in the model template provides a framework for creating your own model.  Each template description provides an introduction to the terminology and icons used in the model templates, and gives a quick guide to the UML concepts important to the templates and how they are applied in Enterprise	<a href="#">Business Process Model Template</a> <sup>[522]</sup>  <a href="#">Requirements Model Template</a> <sup>[523]</sup>  <a href="#">Use Case Model Template</a> <sup>[523]</sup>

#### Learn More:

- [Model Wizard](#) <sup>[520]</sup>

### 5.2.2.1 Business Process Model Template

The *Business Process model* describes both the behavior and the information flows within an organization or system. As a model of business activity, it captures the significant events, inputs, resources, processing and outputs associated with relevant business processes.

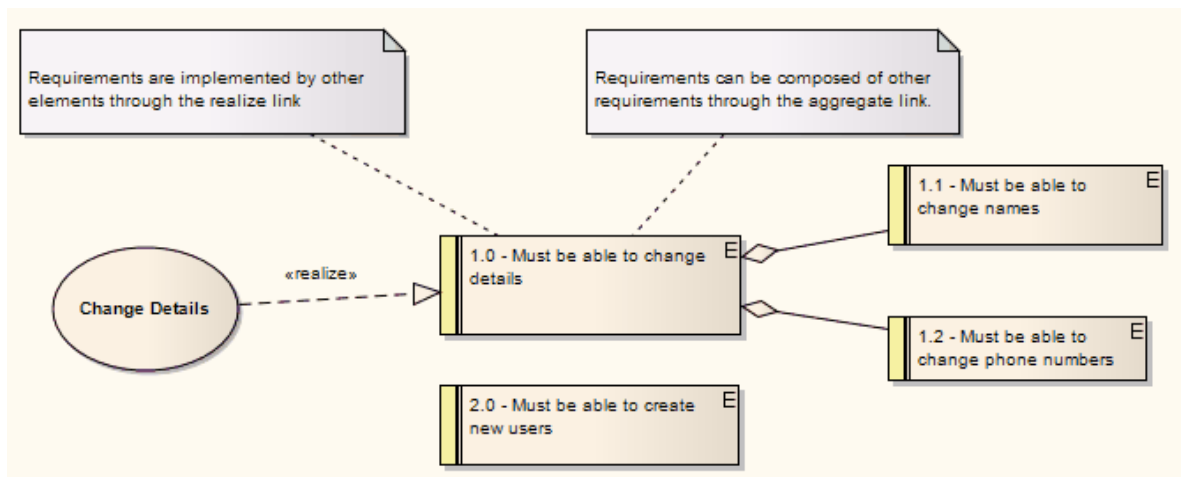

#### Learn More:

- [The Business Process Model](#)
- [Business Models](#) <sup>[1196]</sup>
- [Analysis Diagram](#) <sup>[1190]</sup>
- [Business Modeling/Interaction Diagrams](#) <sup>[1194]</sup>

### 5.2.2.2 Requirements Model Template

The *Requirements model* is a structured catalogue of end-user requirements and the relationships between them.

The Requirements Management facilities built into Enterprise Architect can be used to define Requirement elements, connect Requirements to other model elements, connect Requirements into a hierarchy and report on Requirements.

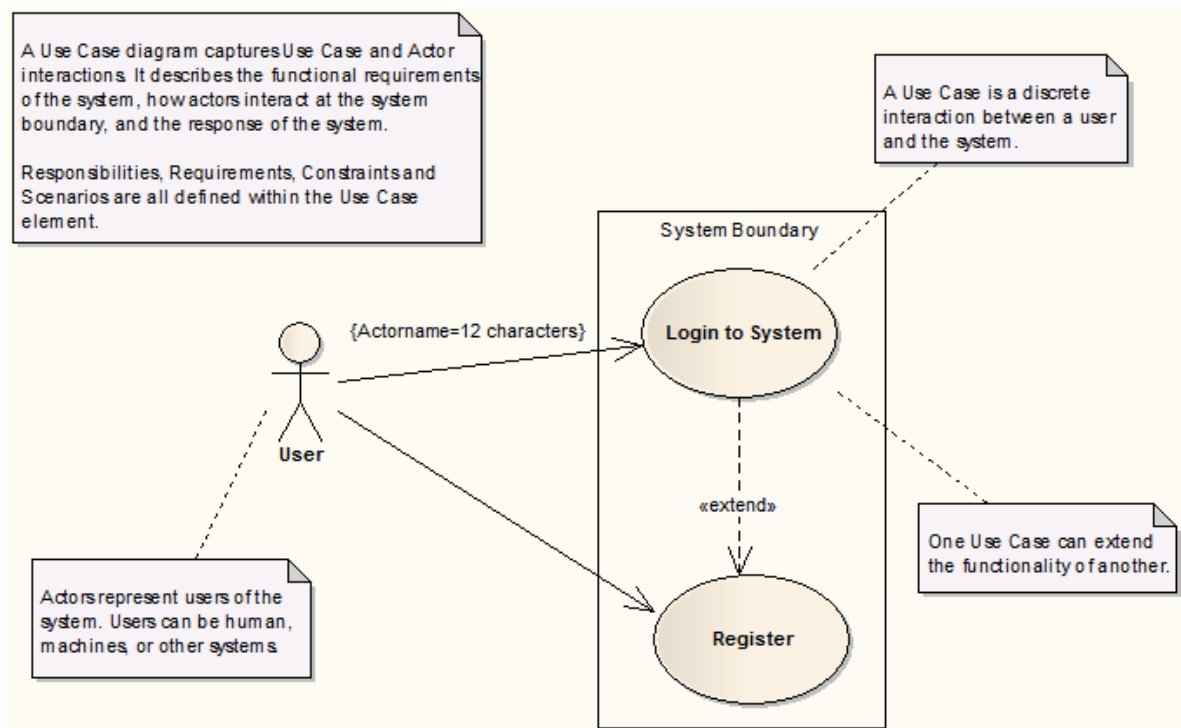

#### Learn More:

- [Requirements Management](#) <sup>[1155]</sup>
- [Requirements Management in Enterprise Architect](#)
- [Packages](#) <sup>[535]</sup>

### 5.2.2.3 Use Case Model Template

The *Use Case model* describes a system's functionality in terms of Use Cases.

Each Use Case represents a single repeatable interaction that a user or 'actor' experiences when using the system, emphasizing the user's perspective of the system and interactions.

**Learn More:**

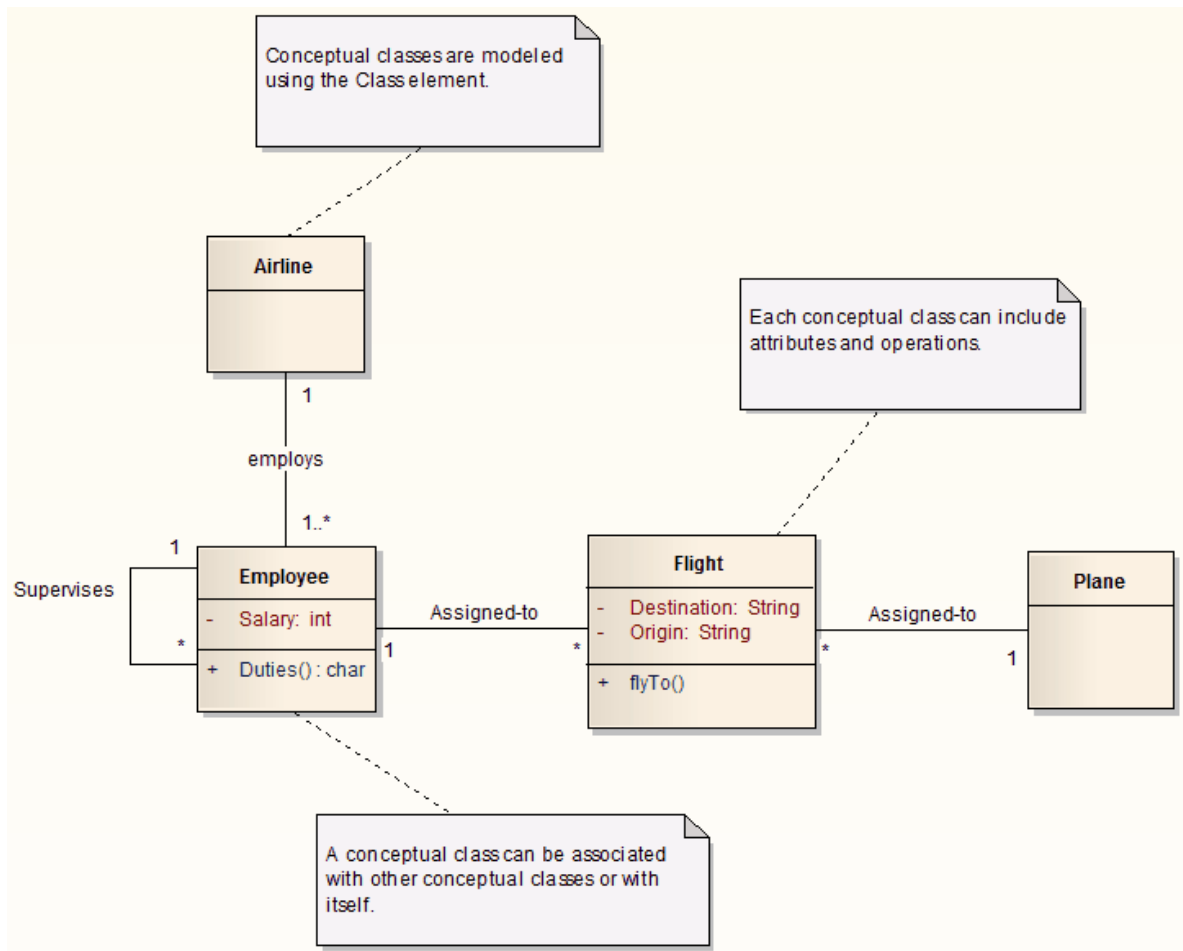

- [Use Case](#)<sup>[937]</sup>
- [Use Case Diagram](#)<sup>[815]</sup>
- [The Use Case Model](#)

**5.2.2.4 Domain Model Template**

A *Domain model* is a high-level conceptual model, defining physical and abstract objects in an area of interest to the Project.

The Domain model can be used to document relationships between and responsibilities of conceptual classes (that is, classes that represent the concept of a group of things rather than Classes that define a programming object).

It is also useful for defining the terms of a domain.

A Domain model shows:

- The physical and organizational units of the domain; for example, *Employee* and *Flight*
- The relationships between these units; for example, *Employee* is *assigned to* *Flight*
- The multiplicity of those relationships; for example, *one* employee can be assigned to *no* flights, *one* flight or *many* flights (represented by the 1 and the \* at the ends of that relationship)

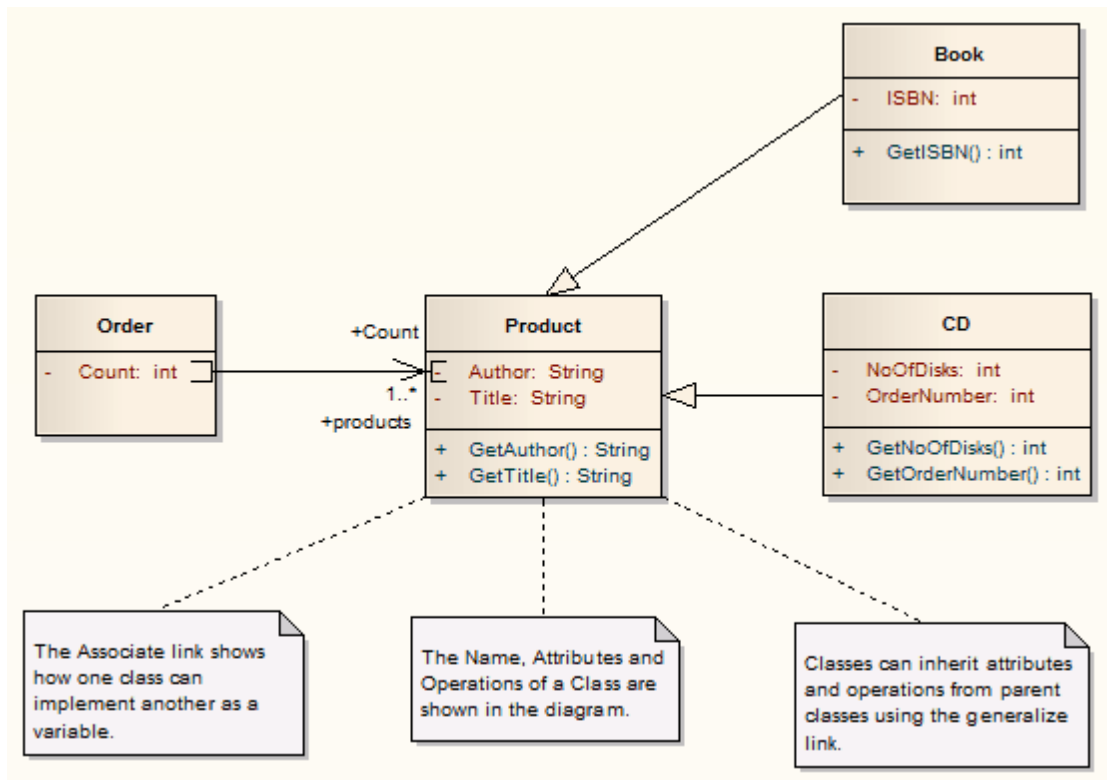

#### Learn More:

- [Multiplicity](#)<sup>[76]</sup>

### 5.2.2.5 Class Model Template

The *Class model* is a rigorous, logical model of the software system under construction.

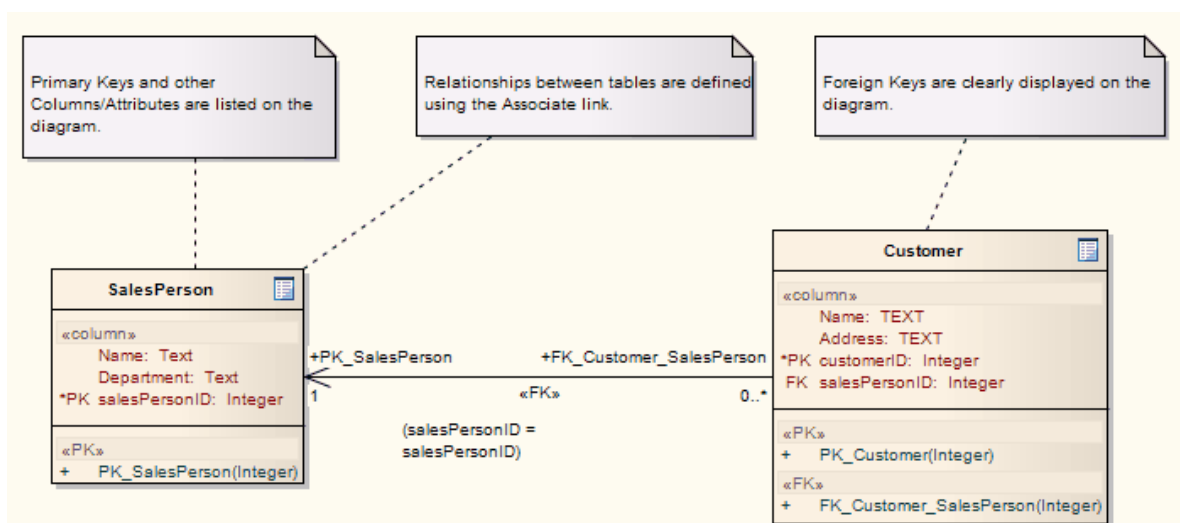

Classes generally have a direct relationship to source code or other software artifacts that can be grouped together into executable components.

**Learn More:**

- [Classes](#) <sup>[943]</sup>
- [Class Diagram](#) <sup>[800]</sup>
- [The Logical Model](#)

**5.2.2.6 Database Model Template**

The *Database model* describes the data that must be stored and retrieved as part of the overall system design. Typically this means relational database models that describe the tables and data in detail and enable generation of DDL scripts to create and set up databases.

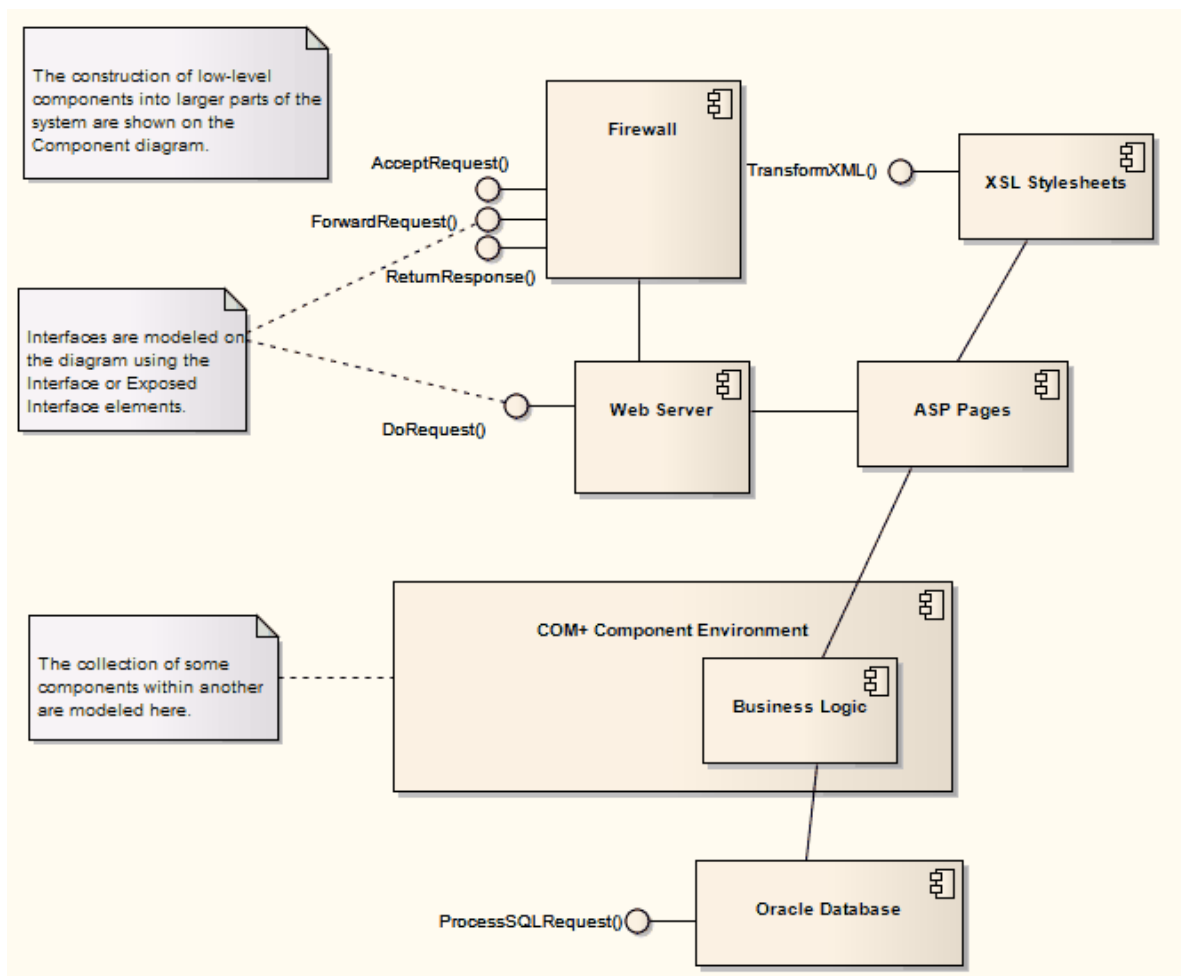

**Learn More:**

- [Data Models](#) <sup>[1279]</sup>
- [UML Database Modeling](#)

**5.2.2.7 Component Model Template**

The *Component model* defines how Classes, Artifacts and other low level elements are collected into high level components, and describes the interfaces and connections between them.

Components are compiled software artifacts that work together to provide the required behavior within the operating constraints defined in the Requirements model.

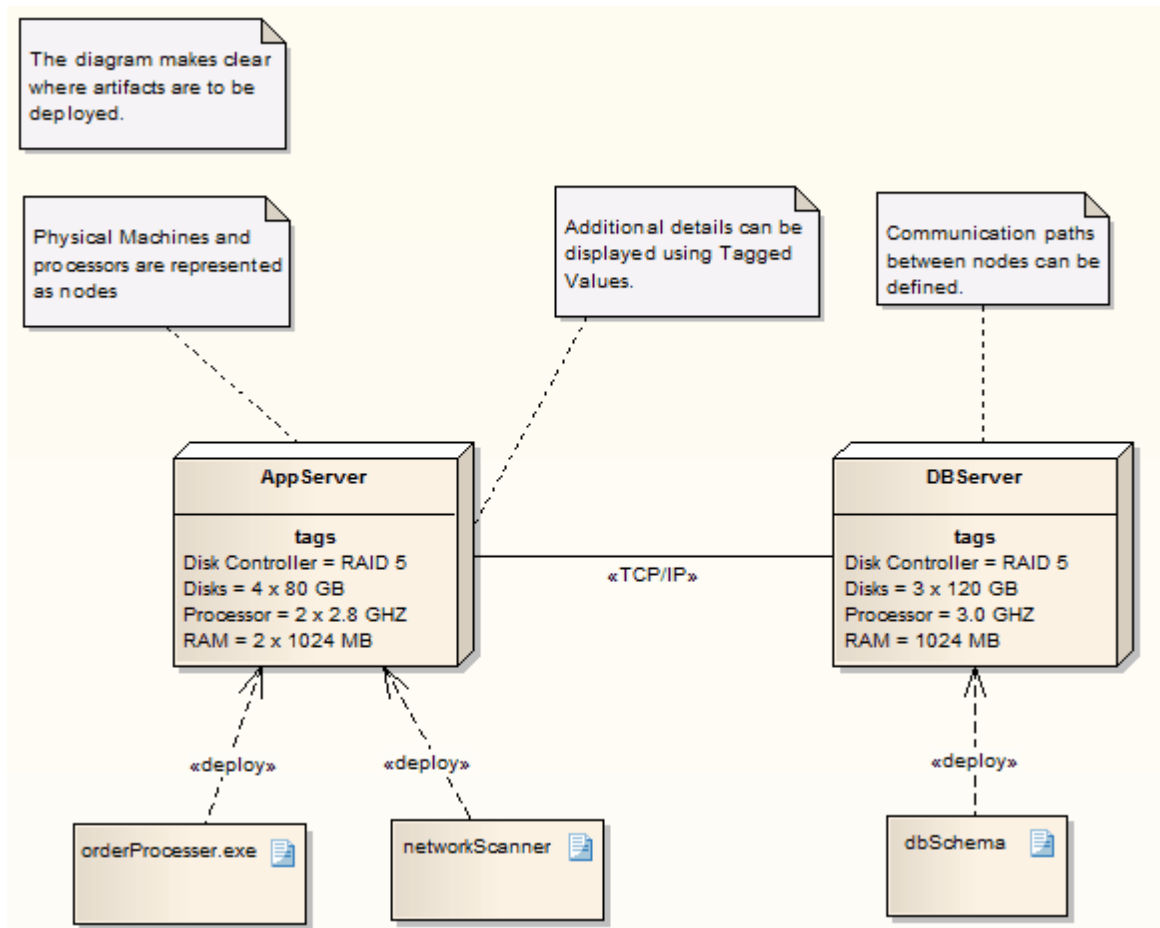

**Learn More:**

- [Components](#) <sup>[950]</sup>
- [Requirements Model](#) <sup>[523]</sup>
- [Component Diagram](#) <sup>[809]</sup>
- [The Component Model](#)

### 5.2.2.8 Deployment Model Template

The *Deployment model* describes how and where a system is to be deployed.

Physical machines and processors are represented by Nodes, and the internal construction can be depicted by embedding Nodes or Artifacts. As Artifacts are allocated to Nodes to model the system's deployment and roll out, the allocation is guided by the use of deployment specifications.

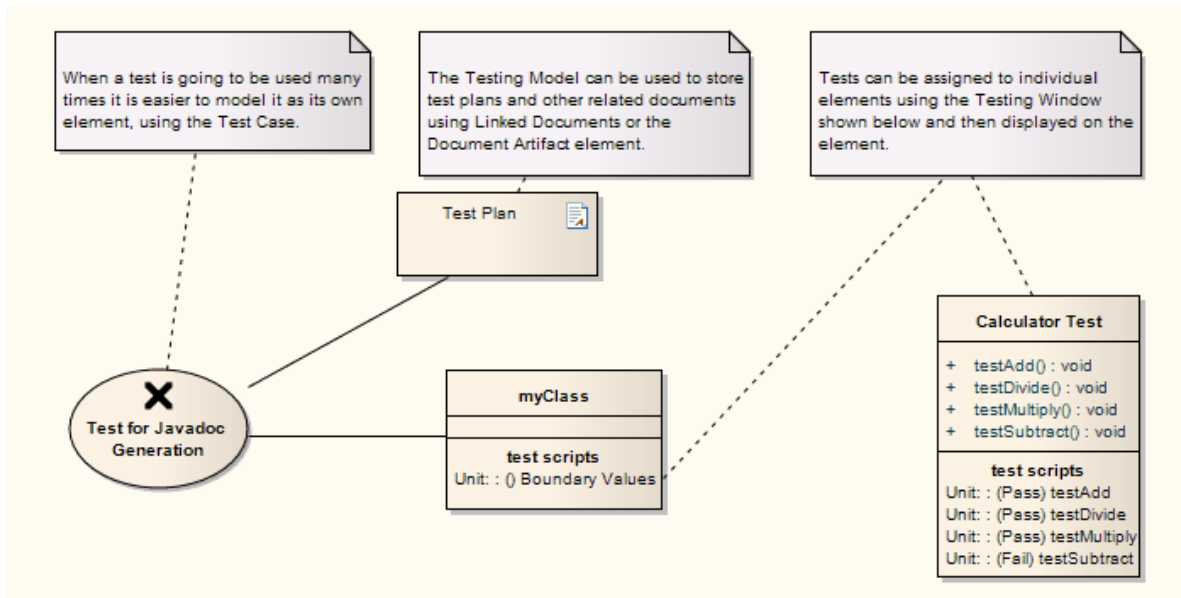

#### Learn More:

- [Nodes](#) <sup>[95]</sup>
- [Artifacts](#) <sup>[94]</sup>
- [Deployment and Roll Out](#) <sup>[65]</sup>
- [Deployment Diagram](#) <sup>[80]</sup>
- [Compartments - Tagged Values](#) <sup>[66]</sup>
- [The Physical Model](#)

### 5.2.2.9 Testing Model Template

The **Test model** describes and maintains a catalogue of tests, test plans and results that are executed against the current model.

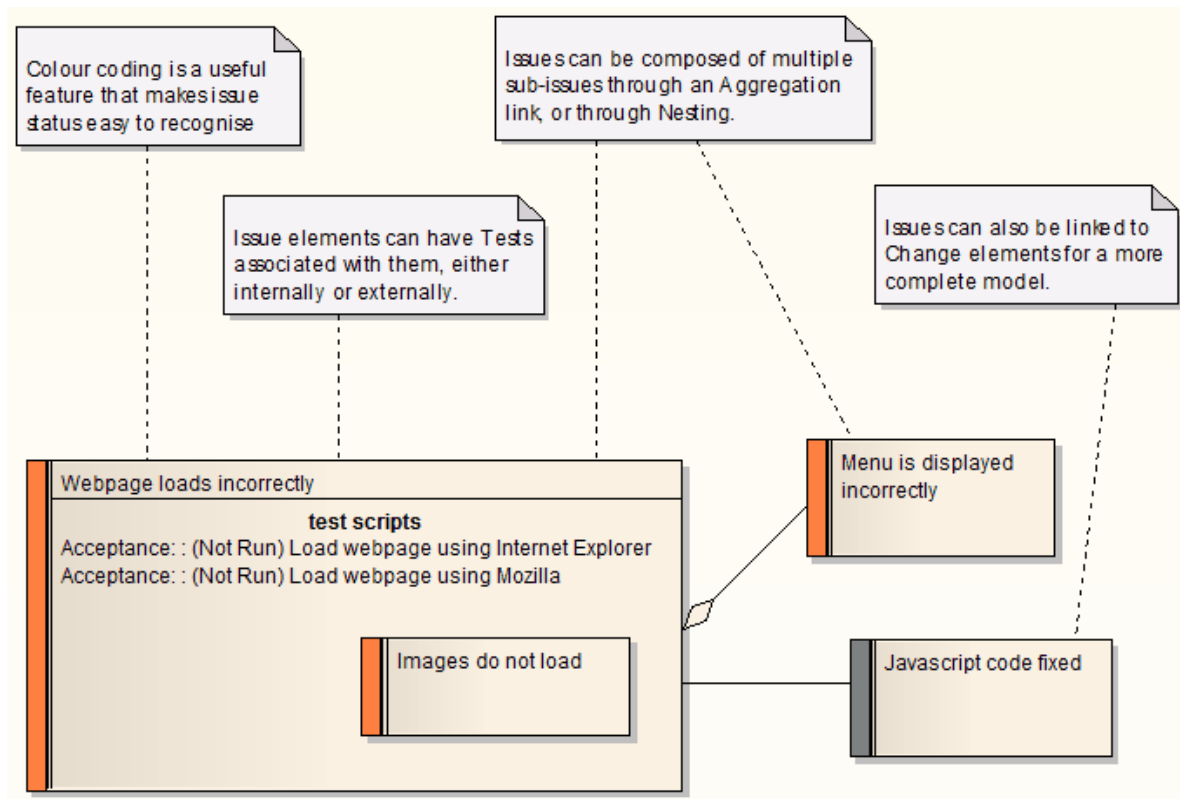

#### Learn More:

- [Testing](#)<sup>[1706]</sup>
- [Test Case](#)<sup>[1302]</sup>
- [Show Test Script Compartments](#)<sup>[1719]</sup>
- [Testing Support in Enterprise Architect](#)

### 5.2.2.10 Maintenance Model Template

The *Maintenance model* enables visual representation of issues arising during and after development of a software product. The model can be enhanced with the integration of change elements and testing.

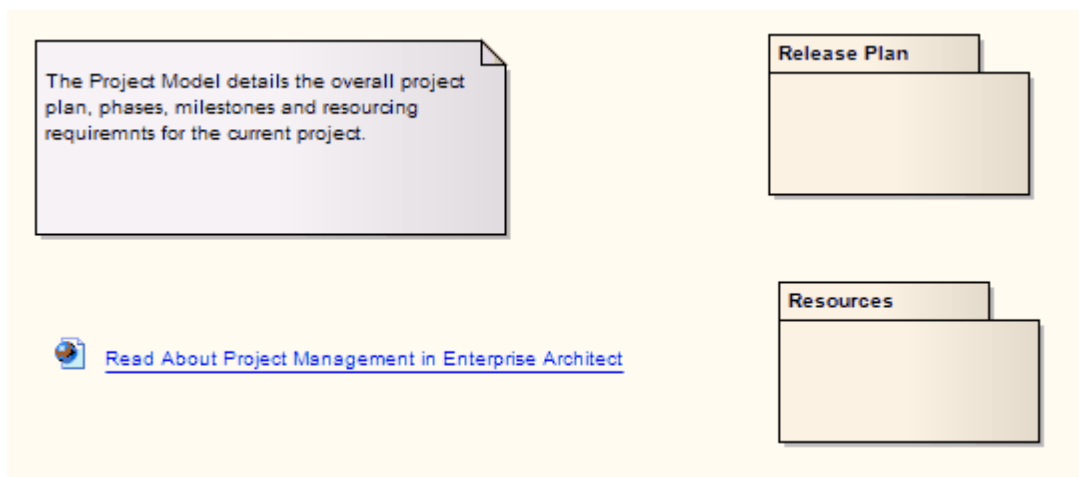

#### Learn More:

- [Development](#) <sup>[1725]</sup>
- [Color Code External Requirements](#) <sup>[1162]</sup>

### 5.2.2.11 Project Model Template

The *Project model* details the overall project plan, phases, milestones and resourcing requirements for the current project.

Project Managers can use Enterprise Architect to assign resources to elements, measure risk and effort and to estimate project size. Change control and maintenance are also supported.

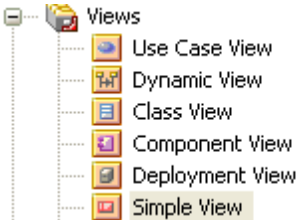

**Learn More:**

- [Project Management](#)<sup>348</sup>
- [Project Manager](#) (Online Resource)

## 5.3 Views

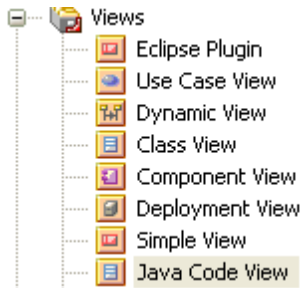

The top level packages in a model (below the project root nodes) can be created as *Views*.

### Topics:

Topic	Detail	See also
<b>Views</b>	<p>Views are used simply to subdivide the model into partitions such as Business Process, Logical View or Dynamic View. Unlike Model Packages, they do not have automatically-generated components and can be created only under a root node. They are a good way to extend the model depending on specific requirements and modeling techniques.</p> 	
<b>View Types</b>	<p>There are six main types of View, each with their own package icon:</p> <ul style="list-style-type: none"> <li>• Use Case View - containing, for example, Use Case diagrams, Analysis diagrams</li> <li>• Dynamic View - containing, for example, Activity diagrams, Communication diagrams, Sequence diagrams, State Machine diagrams</li> <li>• Class View - containing, for example, Class diagrams, Code Engineering, Data Models</li> <li>• Component View - containing, for example, Component diagrams</li> <li>• Deployment View - containing, for example, Deployment diagrams</li> <li>• Simple View - to customize your own type of view</li> <li>• You can use the first five categories, or devise your own based on the Simple View. You can create Views, rename them, move them into a different order, or delete them. Do this by right-clicking the mouse on the selected View to open the context menu, and choose the appropriate option</li> </ul>	<p><a href="#">Use Case diagrams</a> <sup>[815]</sup></p> <p><a href="#">Analysis diagrams</a> <sup>[1190]</sup></p> <p><a href="#">Activity diagrams</a> <sup>[813]</sup></p> <p><a href="#">Communication Diagrams</a> <sup>[861]</sup></p> <p><a href="#">Sequence Diagrams</a> <sup>[851]</sup></p> <p><a href="#">State Machine Diagrams</a> <sup>[817]</sup></p> <p><a href="#">Class Diagrams</a> <sup>[800]</sup></p> <p><a href="#">Code Engineering</a> <sup>[1392]</sup></p> <p><a href="#">Data Models</a> <sup>[1281]</sup></p> <p><a href="#">Component Diagrams</a> <sup>[809]</sup></p> <p><a href="#">Deployment Diagrams</a> <sup>[806]</sup></p> <p><a href="#">Add Additional Views</a> <sup>[533]</sup></p> <p><a href="#">Rename Views</a> <sup>[533]</sup></p> <p><a href="#">Delete Views</a> <sup>[534]</sup></p>

### 5.3.1 Add Views

The example below shows a customized view called *Java Code View*, which has been appended to the end of the Views list.

#### How to:

Step	Action	See Also
1	Right-click on the model root node in the Project Browser The context menu displays	
2	Select the <b>New View</b> menu option The Create New View dialog displays	
3	In the <b>Name</b> field, type the name of the View.	
4	In the Set View Icon Style panel, click on the radio button for the required View icon.	
5	If the model root node is under version control, the <b>Add to Version Control</b> checkbox displays, defaulted to selected  If you do not want the new View to also be under version control, deselect the checkbox.	<a href="#">Version Control</a> <sup>[243]</sup>
6	Click on the <b>OK</b> button.	

### 5.3.2 Rename Views

#### How to:

To rename a view, follow the steps below:

Step	Action	See Also
1	Right-click on the View in the <b>Project Browser</b> The context menu displays.	
2	Select the <b>Properties</b> menu option The Package Properties dialog displays	
3	In the <b>Name</b> field, type the new name and click on the <b>OK</b> button	

### 5.3.3 Delete Views

**How to:**

To delete a view, if necessary, follow the steps below

Step	Action	See Also
1	In the <b>Project Browser</b> , right-click on the view to delete The context menu displays	
2	Select the <b>Delete &lt;viewname&gt;</b> option A warning that child elements are to be deleted is displayed	
3	To delete the view and its contents, click on the <b>Yes</b> button To cancel the deletion, click on the <b>No</b> button	

**Notes:**

- If you delete a view, all its contents are deleted at the same time. It cannot be restored

## 5.4 Packages

A *package* is a container of model elements. It is represented in the **Project Browser** by the 'folder' icon familiar to Windows users.

This topic explores the tasks you can perform with packages, including:

- Open a package
- Add a package
- Rename a package
- Copy a package
- Drag a package onto a diagram
- Show or hide a package
- Delete a package
- List the elements in a package, with their properties, on the Package Browser.

### Notes:

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Element permission to update or delete a package

### Learn More:

- [Open a package](#) <sup>[587]</sup>
- [Add a package](#) <sup>[536]</sup>
- [Rename a package](#) <sup>[536]</sup>
- [Copy a package](#) <sup>[537]</sup>
- [Drag a package onto a diagram](#) <sup>[538]</sup>
- [Show or hide a package](#) <sup>[539]</sup>
- [Delete a package](#) <sup>[539]</sup>
- [Package Browser](#) <sup>[458]</sup>
- [Update Element](#) <sup>[206]</sup>

### 5.4.1 Open Package in the Project Browser

To open a package from the **Project Browser**, follow the steps below:

#### How to:

Step	Instruction	See Also
1	Double-click on a package; the contents display in the Project Browser	
2	Click on the + and - symbols next to the folder icon to open or close the package respectively	

### Notes:

- Package contents are arranged alphabetically and elements can be dragged from one package to another using the mouse

### 5.4.2 Add a Package

#### How to:

To add a package to the model hierarchy, follow the steps below:

Step	Instruction	See Also
1	In the Project Browser, select the package or view under which to add a new package.	
2	Right-click on the folder icon within the Project Browser. The context menu displays.	
3	Select the <b>Add   Add Package</b> menu option. The New Model Package dialog displays.	
4	In the Package Name field type the name of the new package.	
5	To immediately create a diagram for the package, leave the Automatically add new diagram checkbox selected. To avoid creating a diagram, deselect the checkbox.	
6	If you are adding a package to a parent package that is under version control, the Add to Version Control option displays, with the checkbox selected. Deselect the checkbox to exclude the new package from version control, otherwise leave it selected.	<a href="#">Version Control</a> <sup>[243]</sup>
7	Click on the OK button. The new package is inserted into the tree at the current location and, if you left the Automatically add new diagram checkbox selected, the New Diagram dialog displays.	<a href="#">New Diagrams</a> <sup>[570]</sup>
8	If you have selected to put the package under version control, the Package Control Options dialog displays. Complete this dialog as required.	<a href="#">Configure Packages</a> <sup>[331]</sup>

#### Notes:

- You can also add a new package element by dragging the Package icon from the Toolbox into a diagram. In this case the package is created under the diagram's owning package, and is created with a default diagram of the same type as that in which the package is created
- In a multi-user environment, other users do not see the change until they reload their project

#### Learn More:

- [Refresh View/Model](#) <sup>[188]</sup>

### 5.4.3 Rename a Package

#### How to:

To rename a package, follow the steps below.

Step	Instruction	See Also
1	Select the package to rename in the Project Browser	
2	Right-click to display the context menu	
3	Click on the <b>Package Properties</b> option	
4	In the Name field, type the new name	
5	Click on the <b>OK</b> button	

**Notes:**

- In a multi-user environment, other users do not see the change until they reload their project
- Alternatively, highlight the package to rename, and press **(F2)**

**Learn More:**

- [Refresh View/Model](#)<sup>[188]</sup>

### 5.4.4 Copy a Package

Enterprise Architect enables you to quickly duplicate a complete package, including its child packages, elements and diagrams.

**Topics:**

Topic	Detail	See Also
<b>Inserting a copy of a package</b>	<p>You can insert the copy of a package:</p> <ul style="list-style-type: none"> <li>• Under the same parent</li> <li>• Under one or more other packages in the same model or project, or</li> <li>• Under one or more other packages in any other model or project</li> </ul> <p>This procedure is effectively the same as exporting and importing the package XMI file, with the Strip GUIDs checkbox selected. You would tend to use this procedure for copying sections of a model within the project rather than reproducing an entire model or project, although copying these larger structures is equally feasible.</p>	<a href="#">Package XMI files</a> <sup>[346]</sup>
<b>Copying a package</b>	In the Project Browser, right-click on the required package and select the Copy Package to Clipboard context menu option (or click on the package and press ( <b>Ctrl+C</b> ) ). The Copy Package to Clipboard dialog briefly displays until the copy operation completes.	
<b>Pasting a package</b>	<p>In the Project Browser, right-click on the package into which to paste the copied package, and select the Paste Package from Clipboard context menu option (or click on the package and press ( <b>Ctrl+V</b> ) ). The Paste Package from Clipboard dialog briefly displays until the paste operation completes.</p> <p>The target package is expanded to expose the pasted package in the Project Browser. If you are pasting the package within the same model as the copied source, the source parent package</p>	

Topic	Detail	See Also
	<p>is also collapsed.</p> <p>If the target package already contains:</p> <ul style="list-style-type: none"> <li>• a package with the same name as the pasted package, the pasted package name has the suffix - Copy</li> <li>• a package with the same name as the pasted package including the - Copy suffix, the suffix becomes - Copy1 (or - Copy2, - Copy3 and so on, as copies of the package accumulate in the target parent package)</li> </ul> <p>You can keep the same package name as the source, or you can rename the package either by clicking twice on it and editing the name in the Project Browser, or by double-clicking on it and editing the name in the Properties dialog.</p>	

**Notes:**

- A copy of a package does not have the external cross references of the source package; that is, the following connectors are discarded:
  - Connectors coming from packages and elements outside the package being copied, into the package being copied
  - Connectors going to packages and elements outside the package being copied, from the package being copied
- You cannot paste a package into a parent package that is locked by another user or that is checked in. The **Paste...** option is grayed out in the context menu

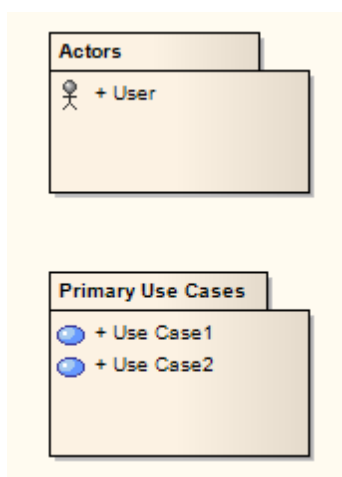

**Learn More:**

- [Locking Packages](#) <sup>[213]</sup>
- [Checking In/Checking Out Packages](#) <sup>[276]</sup>

**5.4.5 Drag a Package Onto a Diagram**

You can drag a package element from the **Project Browser** onto the current diagram, as an icon of the package listing its contents. This is a useful feature to help organize the display and documentation of models.

The following illustration shows how a package is displayed in a diagram; note the child Actor and Use Case icons.

**Learn More:**

- [Show or Hide Package Contents](#)<sup>[539]</sup>

**5.4.6 Show or Hide Package Contents**

To show or hide the contents of packages in a diagram, follow the steps below:

**How to:**

Step	Instruction	See Also
1	Load a diagram	
2	Double-click in the background area to open the Diagram Properties dialog	
3	Click on the Elements tab	
4	Select or clear the <b>Package Contents</b> checkbox as required	
5	Click on the <b>OK</b> button	

**5.4.7 Delete a Package****How to:**

To delete a package, follow the steps below:

Step	Instruction	See Also
1	Highlight the package in the <b>Project Browser</b> .	
2	Right-click to open the context menu.	
3	Click on the <b>Delete</b> option. A confirmation prompt displays.	
4	Click on the <b>OK</b> button.	

**Notes:**

- Deleting a package also deletes all contents of the package, including sub-packages and elements. Make very sure that you really want to do this before proceeding
- In a multi-user environment, other users do not see the change until they reload their project

**Learn More:**

- [Refresh View/Model](#)<sup>[188]</sup>

## 5.5 Diagrams

*Diagrams* are collections of project elements laid out and inter-connected as required.

Enterprise Architect supports all of the UML diagrams, as well as several custom extensions. Together with the Enterprise Architect elements and connectors, these form the basis of the model. Diagrams are stored in packages and can have a parent object (optional). Diagrams can be moved from package to package.

### Notes:

- If the diagram display is too small to read comfortably, click on the diagram, press and hold ( **Ctrl** ) and use the mouse wheel to temporarily expand or reduce the display magnification.

### Learn More:

- [Diagram Context Menu](#) <sup>[540]</sup>
- [Diagram Tasks](#) <sup>[569]</sup>

### 5.5.1 Diagram Context Menu

To open the diagram context menu, open the required diagram and right-click on the diagram background.

### Reference:

Option	Usage	Shortcut	See Also
<b>Properties</b>	Display the Diagram Properties dialog		<a href="#">Diagram Properties</a> <sup>[571]</sup>
<b>Scripts</b>	List the scripts enabled for execution directly from the diagram (does not display if no diagram scripts exist)		<a href="#">Scripts</a> <sup>[1832]</sup>
<b>Swimlanes and Matrix</b>	Add Swimlanes or a Swimlanes Matrix to the diagram		<a href="#">Swimlanes</a> <sup>[592]</sup> <a href="#">Swimlanes Matrix</a> <sup>[594]</sup>
<b>Lock Diagram</b>	Lock a diagram to protect it from inadvertent changes  This does not apply if security is enabled in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions, in which case you lock the model elements		<a href="#">Lock a Diagram</a> <sup>[604]</sup> <a href="#">Lock Model Elements</a> <sup>[211]</sup>
<b>List View Gantt View</b>	Display the diagram contents as a Diagram List or as a Gantt chart instead of as a diagram		<a href="#">Diagram List</a> <sup>[464]</sup>
<b>New Element or Connector</b>	Insert various elements and connectors into a diagram		<a href="#">Insert Elements &amp; Connectors</a> <sup>[542]</sup>

Option	Usage	Shortcut	See Also
<b>Insert Existing Element</b>	Locate an existing element, using the Select Element dialog, and insert it into the diagram as a linked element		
<b>Paste Element(s) as Link</b> <b>Paste Element(s) as New</b>	Paste copied element(s) as a link or as new elements		<a href="#">Paste copied element</a> <sup>[58]</sup>
<b>Paste Image from Clipboard</b>	Paste an image held on the clipboard into the diagram	<b>Ctrl + Shift + Insert</b>	<a href="#">Paste an image</a> <sup>[75]</sup>
<b>Make all elements selectable</b>	<p>Make all the elements on the diagram selectable</p> <p>If an element is:</p> <ul style="list-style-type: none"> <li>• Selectable, you can move it around the diagram and perform right-click context-menu operations</li> <li>• Unselectable, you cannot move it around the diagram and the only right-click operation available is to make the element selectable</li> </ul> <p>This option has no effect on double-click operations on the element, such as displaying child diagrams</p>		
<b>Modify Z Order</b>	<p>Re-order overlapping objects in the diagram</p> <p>This option both:</p> <ul style="list-style-type: none"> <li>• Numbers the objects in the diagram by Z-order, in red, and</li> <li>• Lists the objects by Z-order in the Modify Z Order dialog</li> </ul> <p>In the dialog, you select the required object and move it up or down in the Z-order using the <b>Up</b> and <b>Down</b> arrow keys, each click on an arrow key changes the Z-order by 1</p> <p>When you select the object in the list, that object is also selected on the diagram and its Z-order number is shown in blue</p> <p>Click on the <b>OK</b> button to save your changes</p>		
<b>Save as Profile</b>	Save the current diagram as a Profile		<a href="#">Export a Profile</a> <sup>[105]</sup>
<b>Import from source file(s)</b>	Import, or reverse engineer, source code (not available in the Desktop edition)		<a href="#">Import, or reverse engineer, source code</a> <sup>[151]</sup>
<b>Import DB schema from ODBC</b>	Import database tables from an ODBC data source (not available in the Desktop edition)		<a href="#">Import database tables from an ODBC data source</a> <sup>[138]</sup>
<b>Save Current Changes</b>	Save any changes to the current diagram	<b>Ctrl + S</b>	
<b>Help</b>	View the Enterprise Architect Help on the type of diagram currently displayed		

**Notes:**

- Not all the menu options described appear on all diagram context menus

**5.5.1.1 Insert Elements and Connectors**

When you click on the **New Element or Connector** option on the **Diagram** context menu, a list of elements and connectors displays.

**Topics:**

Topic	Detail	See Also
<b>Structure</b>	<p>The structure of this list is as follows:</p> <ul style="list-style-type: none"> <li>• <b>Other</b> - expands to offer options to select elements and connectors from diagram types other than either the current diagram type or pinned Toolbox pages</li> <li>• The expanded list of elements and connectors for the current diagram type</li> <li>• Collapsed lists of elements and connectors for pages that have been pinned in the Toolbox; if an MDG Technology: <ul style="list-style-type: none"> <li>• is active</li> <li>• automatically pins Toolbox pages, and</li> <li>• has pages that redefine UML or Extended pages</li> </ul> <p>The MDG Technology pages override the UML or Extended pages, which are not shown</p> </li> <li>• (At the end) <b>Common</b> - expands to display a list of the common elements and connectors</li> </ul>	

**5.5.2 Print Preview**

When you select the **File | Print Preview** menu option, the display initially shows the first two pages on one screen, with no scroll bar. To toggle between this two-page display and a single-page display, click on the  icon in the preview screen toolbar. In either mode, you can use the forward and back arrows to scroll through the pages of the diagram.

To display more than two pages on one screen, up to a maximum of ten pages, click on the **Zoom Out** button in the preview screen toolbar. The screen now includes the vertical scroll bar, which you can also use to scroll through the pages of the diagram.

**Access:** **File | Print Preview**

**Use to:**

- Preview pages before printing them

**5.5.3 Diagram View**

The Diagram View is the main workspace window that enables you to create and display diagrams.

**Topics:**

Topic	Detail	See Also
<b>Opening a Diagram</b>	<p>You open a diagram by double-clicking on the diagram name in the Project Browser; you can then open further diagrams in the same way</p> <p>You can also open a diagram from within an already open diagram by clicking on either hyperlinks or elements that contain other diagrams</p> <p>You can open many diagrams, but you can view only one at a time</p>	
<b>Caption Bar</b>	<p>Across the top of a diagram is the diagram caption bar, which includes the following:</p> <ul style="list-style-type: none"> <li>• Icon and text label for the diagram type</li> <li>• Diagram name</li> <li>• Date and time the diagram was created</li> <li>• Date and time the diagram was last modified</li> <li>• The current magnification (zoom) of the diagram</li> <li>• The diagram page size, in pixels</li> <li>• A drop-down arrow that lists the currently-open diagrams; click on a diagram name to switch to that diagram, or to redisplay the hidden Start Page</li> <li>• The Window 'close cross'; click on this to close the displayed diagram</li> </ul>	
<b>Format Toolbar</b>	Underneath the Caption Bar is the Format Toolbar, which enables you to apply a range of functions to the format and appearance of the elements in your diagram	<a href="#">Format Toolbar</a> <sup>[543]</sup>
<b>Diagram View</b>	<p>Use the Diagram View to build model relationships and elements</p> <p>Within the diagram, you can create new elements, drag in existing elements and generally organize the elements and relationships</p> <p>Most work on elements is carried out in the Diagram View, so understanding how it works and how to manipulate elements is essential; use the example project supplied with Enterprise Architect to explore the capabilities and behavior of the Diagram View</p>	

**Notes:**

- You can also use the Diagram List to manipulate elements

**Learn More:**

- [Diagram List](#)<sup>[464]</sup>
- [Diagram Tabs](#)<sup>[545]</sup>

**5.5.3.1 Format Toolbar**

The Format Tool toolbar can change the appearance of one or more selected elements by altering the font, color, line width and fill color. This can help to group, differentiate or make an element stand out.

An abbreviated Format Tool toolbar can also be displayed temporarily beside an element or connector. For elements, select one or more elements on the diagram, then click on the paintbrush icon beside the element. For connectors, right-click on the connector and the Format Tool toolbar appears above the context menu.

**Use to:**

- Modify the appearance of elements and connectors on a diagram

- Save a set of modifications as a user defined style
- Re-apply styles to other elements and connectors

**Reference:**

Action	Usage	Shortcut	See also
<b>Set Font</b>	Set the text font, style, size and effects for the selected element(s) using the Font dialog		<a href="#">Set Element Font</a> <sup>659</sup>
<b>Text Color</b>	Set the text color for the selected element(s) This option overrides the color setting of the <b>Set Font</b> option		
<b>Fill Color</b>	Set the fill color of the selected element(s)		
<b>Line Color</b>	Set the line color of the selected connector or element border		
<b>Line Width</b>	Set the line width of the selected connector or element border; choose a value between <b>1</b> (thinnest) and <b>5</b> (thickest)		
<b>Apply Style</b>	Apply a copied style to the selected elements or connector The style is copied using the <b>Get Style</b> option; if this is not used, the style defaults to the current setting of the <b>Style List</b> option		
<b>Get Style</b>	Copy the current style of the selected element or connector		
<b>Style List</b>	Apply a style from the saved style list to the selected element or connector These styles are saved to the list using the <b>Save Style</b> option		
<b>Save Style</b>	Click on the required element, click on the down arrow and select the appropriate option: <ul style="list-style-type: none"> <li>• Save the style of the element to the <b>Style List</b> as a new style; enter the name of the style when prompted to do so</li> <li>• Save the (updated) style of the element under its current style name in the <b>Style List</b></li> <li>• Refresh the <b>Style List</b> with any changes to the existing styles</li> <li>• Delete the style of the selected element from the <b>Style List</b> (refresh the list after selecting this option)</li> </ul>		
<b>Align Left</b>	Align the selected elements on the left border of the last-selected element	<b>Ctrl + Alt + Left Arrow</b>	
<b>Align Right</b>	Align the selected elements on the right border border of the last-selected element	<b>Ctrl + Alt + Right Arrow</b>	

<b>Align Top</b>	Align the selected elements on the top edge of the last-selected element	<b>Ctrl + Alt + Up Arrow</b>	
<b>Align Bottom</b>	Align the selected elements on the bottom edge of the last-selected element	<b>Ctrl + Alt + Down Arrow</b>	
<b>Move to Top</b>	Bring the selected element(s) to the top of the Z order		<a href="#">Diagram Context Menu</a> <sup>[540]</sup>
<b>Send To Back</b>	Move the selected element(s) to the bottom of the Z order		<a href="#">Diagram Context Menu</a> <sup>[540]</sup>
<b>Diagram Auto-layout</b>	Auto-layout the diagram (not for Behavioral diagrams) in one of the standard layouts, or modify a standard layout and apply that		<a href="#">Layout Diagrams</a> <sup>[606]</sup>
<b>Diagram Properties</b>	Display the Diagram Properties dialog for the diagram	<b>F5</b>	<a href="#">Diagram Properties</a> <sup>[571]</sup>
<b>Delete</b>	Delete the selected element(s)	<b>Ctrl + D</b>	
<b>Add or Remove Buttons</b>	This drop-down arrow at the right end of the toolbar enables you to: <ul style="list-style-type: none"> <li>• Display or hide icons currently defined for the toolbar, or</li> <li>• Customize the toolbar to include other icons, to initiate commands found on other toolbars or totally new commands</li> </ul> <p>(As an example, the last nine options on the Format toolbar are also found on the Diagram toolbar, which contains other options that could be duplicated here)</p>		<a href="#">The Customize Dialog</a> <sup>[119]</sup> <a href="#">Diagram Toolbar</a> <sup>[112]</sup>

**Notes:**

- To set the global appearance of all elements throughout a model, use the Options dialog; select the **Tools | Options** menu option, then select **Standard Colors** and **Diagram | Appearance** from the options tree
- To override the global appearance and define a default appearance of a selected element (or several selected elements) on all diagrams on which it occurs, set the Default Appearance for that element; right-click the element and choose the **Appearance | Default Appearance** context menu option

**Learn More:**

- [Standard Colors](#) <sup>[426]</sup>
- [Appearance](#) <sup>[429]</sup> (Diagram)
- [Set An Element's Default Appearance](#) <sup>[643]</sup>

**5.5.4 Diagram Tabs**

*Diagram tabs* are located, by default, at the bottom of the Diagram View. You can also move them to the top of the Diagram View, above the Status Bar.

**Topics:**

Topic	Detail	See Also
<b>Access</b>	<p>Each time you open a diagram, the diagram name and diagram type symbol are shown in the tab for easy identification and access</p>  <p>You can manipulate the tabs using the Diagram Tabs context menu (below) or the View Tab Switcher window</p>	<a href="#">View Tab Switcher</a> <sup>[547]</sup>
<b>The Diagram Tabs Menu</b>	To access the Diagram Tabs context menu, right-click on an appropriate tab	

**Reference:**

Option	Usage	Shortcut	See also
<b>Save Changes to '&lt;tab name&gt;'</b>	Save the changes made to the diagram.		
<b>Save All</b>	Save the model.		
<b>Reload '&lt;tab name&gt;'</b>	<p>Reopen the diagram without the unsaved changes; that is, revert to the state before any changes were made.</p> <p>Refresh the diagram<sup>[188]</sup> from the repository, to show any changes made by other users in a shared model.</p>		<a href="#">Refresh the diagram</a> <sup>[188]</sup>
<b>Close '&lt;tab name&gt;'</b>	<p>Close the diagram; Enterprise Architect prompts you to save changes to the diagram.</p> <p>You can also close the tab by clicking the <i>middle</i> mouse button/scroller.</p>		
<b>Close All</b>	Close all open diagrams; Enterprise Architect prompts you to save any diagrams with unsaved changes.		
<b>Close All Except '&lt;tab name&gt;'</b>	Close all diagrams except for '<tab name>'; Enterprise Architect prompts you to save any diagrams with unsaved changes.		
<b>Close All &lt;view type&gt;</b>	<p>(Where several views of the same type can be opened at the same time, such as diagrams, RTF documents, or text editors.)</p> <p>Close all views of the same type as the selected tab, leaving views of other types still open.</p>		
<b>Hide</b>	( <b>Start Page</b> only.) Hide the <b>Start Page</b> . To redisplay it, use the drop-down menu at the top right of the Diagram View, or select the <b>Window   Show Start Page</b> menu option.		

**Notes:**

- The **Component View** tab is white with bold text; this means that the Component View diagram is the

diagram currently displayed in the **Diagram View**

- The **Use Case View** tab has an asterisk. This means that there are unsaved changes in the Use Case View diagram
- There are also tabs for other types of view, such as the **Start Page** (as shown), RTF reports, code editors, the **Model Search** and the **Relationship Matrix**
- You can change the sequence of tabs by clicking on each tab and dragging it to a different position, as required. However, you cannot change the position of the **Start Page** tab. When displayed, it always sits at the left-hand end of the sequence

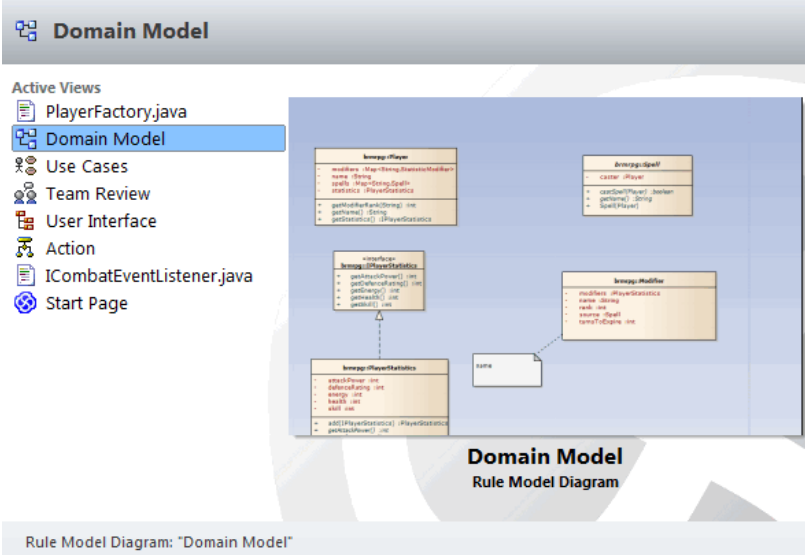

**Learn More:**

- [General Settings](#)<sup>[424]</sup>

**5.5.4.1 View Tab Switcher**

The **View Tab Switcher** facilitates navigation between tabs of the Diagram View (such as **Diagrams**, **Code Editors** and the **Model Search** screen) that are currently open in Enterprise Architect.

**Topics:**

Topic	Detail	See Also
<p><b>Usage</b></p>	 <p>To display the <b>View Tab Switcher</b> press and hold ( <b>Ctrl</b> ) and then press ( <b>Tab</b> ). The <b>View Tab Switcher</b> lists the currently opened tabs, in order of most recently activated to least recently activated. The selection cursor is on the tab that was activated just before the currently active one. Details of the selected tab are displayed on the right hand side of the screen, and include:</p> <ul style="list-style-type: none"> <li>• A preview thumbnail of the tab, and</li> <li>• A description of the tab and its contents</li> </ul> <p>Continue holding the ( <b>Ctrl</b> ) key to keep the window open. To move the selection cursor down the list of tabs press the ( <b>Tab</b> ) key; to move the selection cursor up the list, press the ( <b>Shift+Tab</b> ) keys. Alternatively, use the <b>arrow keys</b>.</p>	
<p><b>Activating a tab</b></p>	<p>To activate a tab in the <b>Diagram View</b>, either release the ( <b>Ctrl</b> ) key or press the ( <b>Enter</b> ) key. Alternatively, click the left mouse button on the</p>	

Topic	Detail	See Also
	required tab. Activating a tab moves it to the top of the <b>Active Views</b> list, whereas closing a tab removes it from the list completely.	

### 5.5.5 Diagram Toolbox

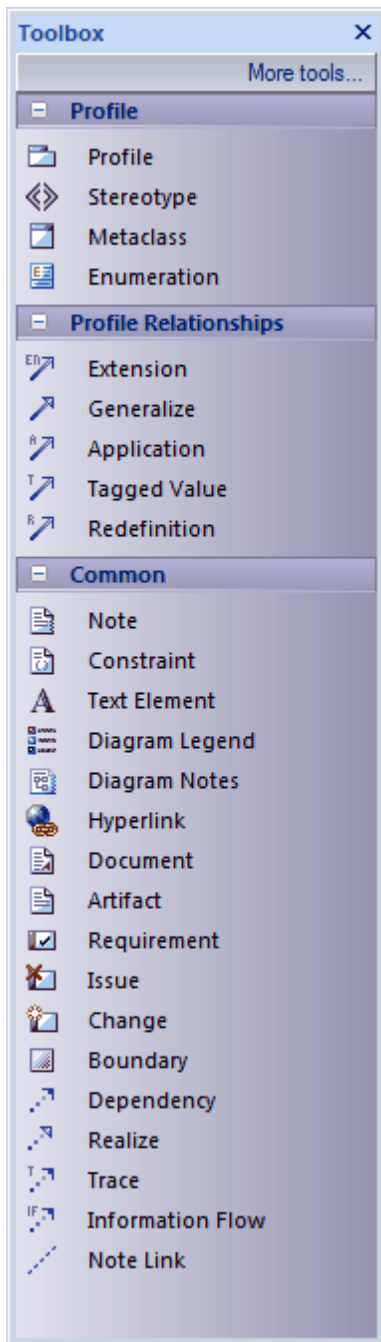

The Enterprise Architect Toolbox is a panel of icons that you use to create elements and connectors on a diagram.

Within the Toolbox, related elements and connectors are organized into pages, each page containing the elements or connectors used for a particular type of diagram. The diagrams include standard UML diagrams, Enterprise Architect Extended diagrams, and any MDG Technologies and Profiles that you have added to Enterprise Architect.

When you open a diagram, the Toolbox automatically provides the element and relationship pages corresponding to the diagram type. This does not prevent you using elements and connectors from other pages in a given diagram, though some combinations might not represent valid UML.

**Access:** [View | Toolbox \(Alt+5\)](#)

**Example:**

**Topics:**

Topic	Detail	See Also
<p><b>Displaying specific pages</b></p>	<p>To display specific pages in the Toolbox, select the <b>More Tools</b> option at the top of the Toolbox and select the appropriate UML, Extended or customized diagram type from the menu</p> <p>In most cases, three pages display: &lt;type&gt; elements, &lt;type&gt; Relationships and Common; if you select the &lt;default&gt; option, you display only the Common page</p>	

Topic	Detail	See Also
<b>Customizing the Toolbox</b>	You can customize the Toolbox pages by pinning them within the Toolbox, or by adding MDG Technologies and UML Profiles to the Toolbox	<a href="#">Toolbox Appearance Options</a> <sup>[55]</sup> <a href="#">MDG Technologies</a> <sup>[1035]</sup> <a href="#">UML Profiles</a> <sup>[1028]</sup>

#### How to Create Elements and Connectors:

Step	Instruction	See Also
1	In the Project Browser, double-click on the icon against the required diagram  The diagram opens with the appropriate Toolbox pages for that diagram type  If you want a different set of elements and connectors, click on <b>More tools</b> and select the appropriate diagram type as explained above	
2	Click on the required item; for example, the Class element or Associate relationship	
3	For element items, click anywhere on the diagram to place the new element	
4	For connector items, drag the cursor between the source and target elements on the diagram; the solid border of the elements changes to a hatched border as you pass the cursor over them, indicating the source and potential target elements  To add bends to the connector, press ( <b>Shift</b> ) as you change the drag direction of the cursor  Alternatively, drag from the source element to an empty area of the diagram; the Quick-linker enables you to create the target element	<a href="#">Quick-linker</a> <sup>[625]</sup>
5	Edit the element properties or connector properties, as required	<a href="#">Properties Dialog</a> <sup>[662]</sup> <a href="#">Connector Properties</a> <sup>[758]</sup>

#### Notes:

- Dropping a Package element from the Toolbox into a diagram creates a new package in the Project Browser, and a default diagram of the same type as the current diagram
- If you are creating several elements of one type, after creating the first just press ( **Shift+F3** ) or ( **Ctrl** ) + **click** to create the next element of that type; for connectors, click on the source element and press ( **F3** ) to create another connector of the same type
- You can change an unstereotyped element to one of its stereotyped elements by dragging the stereotyped element from the Toolbox onto the unstereotyped element in the diagram; for example, you can stereotype a Class by dragging a Table element or a Profiled Class element onto it
- As you drag the stereotyped element, you can press ( **Ctrl** ) to apply the element stereotype to the unstereotyped element, or ( **Shift** ) to add the stereotyped element as a new element; otherwise a small context menu displays offering these actions as options
- If the diagram element already has the stereotype, you can also drag the Toolbox element onto it to synchronize the element's stereotype Tagged Values
- The Toolbox can be docked on either side of the diagram, or free floated on top of the diagram to expose more surface for editing

- You can also hide and show the whole Toolbox using the  **Show Element Toolbox** button on the Workspace Views toolbar
- Enterprise Architect provides Toolbox pages for a wide range of MDG Technologies, such as ArchiMate, BPEL, BPMN, Data Flow Diagrams, ICONIX and Mind Mapping, as part of the initial install

**Learn More:**

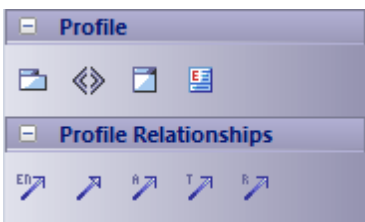

- [Stereotype Dialog](#) <sup>[1018]</sup>
- [Synchronize Tags and Constraints](#) <sup>[1031]</sup>
- [ArchiMate](#) <sup>[1275]</sup>
- [BPEL](#) <sup>[1238]</sup>
- [BPMN](#) <sup>[1222]</sup>
- [Data Flow Diagrams](#) <sup>[1187]</sup>
- [ICONIX](#) <sup>[1551]</sup>
- [Mind Mapping](#) <sup>[1185]</sup>

**5.5.5.1 Toolbox Appearance Options**

You can modify the appearance of the Toolbox pages in several ways, through the context menu.

**Access:** **Right-Click on the Toolbox page**

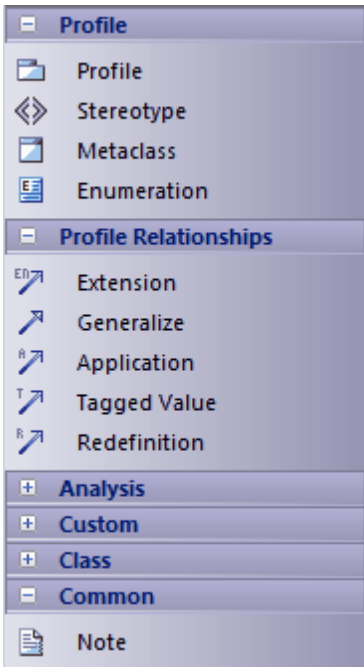

**Topics:**

Topic	Detail	See Also
<b>Hiding labels</b>	<p>To hide the element or relationship labels (and subsequently redisplay them), select the Hide Labels (or Show Labels) context menu option. The icons in the page then 'wrap' within the page, without text labels.</p>  <p>When you hide the labels, you can display the label of an individual element or relationship by moving the cursor over the icon.</p>	
<b>Pinning pages</b>	<p>To 'pin' the page so that it displays for any group in the Toolbox, select the Pin in Toolbox menu option. (This is not available on the Common page, which displays in all groups anyway.)</p> <p>For example, if you 'pinned' the Class elements page, and switched to the Communication pages, the Toolbox would include a collapsed Class elements page underneath the Communication pages.</p>	
<b>Unpinning pages</b>	<p>To unpin the page so that it displays only in its own Toolbox group, right-click on it and select the Unpin from Toolbox context menu option.</p>	
<b>Collapsing pages</b>	<p>To collapse a page to just show the heading (&lt;type&gt; elements, &lt;type&gt; Relationships or Common), click on the 'minus' box at the left of the page heading. To expand the page again, click on the heading. Alternatively, collapse the page by right-clicking on the page and</p>	

Topic	Detail	See Also
	selecting the Collapse context menu option.	

**How to:**

To tailor the Toolbox to list all pages you require at the same time, follow the steps below:

Step	Instruction	See Also
1	Click on the <b>Set Toolbox Visibility</b> context menu option The Visible Toolbox Pages dialog displays	
2	By default, the dialog lists the element pages only, in the order: UML pages, Extended pages, MDG Technology pages To include the corresponding relationship pages, select the <b>Show Relationship Pages</b> checkbox at the bottom of the dialog.	
3	For each page to display on the Toolbox, select the <b>Visible</b> checkbox Deselect the checkbox if you no longer require a page to be displayed	
4	When you have defined the list of pages to display, click on the <b>OK</b> button The pages you have selected are pinned to the Toolbox in a collapsed state, underneath the current diagram-type pages 	
5	To expand a page, click on the heading You can remove a page individually by expanding it, right-clicking on it and selecting the <b>Unpin from Toolbox</b> context menu option.	

**Notes:**

- On a Toolbox page for an MDG Technology or UML Profile, if you right-click directly on a profile element an additional option - Synchronize Stereotype - is available at the end of the context menu. This enables you to synchronize the Tagged Values and constraints for all elements created from the selected profile element
- MDG Technologies can impose their own Toolbox page visibility. For example, if ICONIX is the active technology, all six ICONIX pages are automatically exposed in the Toolbox. If the active Technology pages duplicate UML or Extended pages (as the ICONIX pages do) then the pinned Technology pages override and replace the pinned UML and Extended pages. For example, if ICONIX is active and you have pinned the Extended Analysis page, the Analysis page in the list is the ICONIX-defined page, not the Extended Analysis page

**Learn More:**

- [Synchronize Tags and Constraints](#) 

**5.5.5.2 Toolbox Shortcut Menu**

To add elements and connectors into a diagram, you can access the **Toolbox** shortcut menu instead of employing the full graphical Toolbox.

**Topics:**

Topic	Detail	See Also
Usage	<p>The menu provides options to select:</p> <ul style="list-style-type: none"> <li>• Elements specific to the current diagram type</li> <li>• Relationships specific to the current diagram type</li> <li>• Elements and relationships from any pages pinned in the Toolbox</li> <li>• Common elements and relationships</li> <li>• Elements and connectors for other diagram types</li> </ul> <p>The advantage of using the <b>Toolbox shortcut</b> menu is that it provides an increased amount of the workspace to be used for diagramming rather than to display fixed (instead of pop-up) menus</p>	

**To use the Toolbox shortcut menu, follow the steps below:**

Step	Action	See Also
1	Open a diagram	
2	<p>Either:</p> <ul style="list-style-type: none"> <li>• Click on the diagram background and press ( <b>Insert</b> ) or ( <b>Spacebar</b> )</li> <li>• Press and hold ( <b>Ctrl</b> ) and right-click on the diagram background</li> </ul> <p>The shortcut menu displays, listing the current diagram-type elements and connectors</p>	
3	If necessary, select the <b>Other</b> option or a pinned Toolbox page option to list elements and connectors for a different diagram type	
4	Select the element or connector to include in the diagram. The object is added to the diagram.	

Step	Action	See Also
	If you select the <b>Other</b> context menu option, the final menu in the sequence offers the <b>Activate &lt;Type&gt; Toolbox</b> option; this opens and activates the corresponding page in the <b>Toolbox</b> , if the <b>Toolbox</b> is visible	

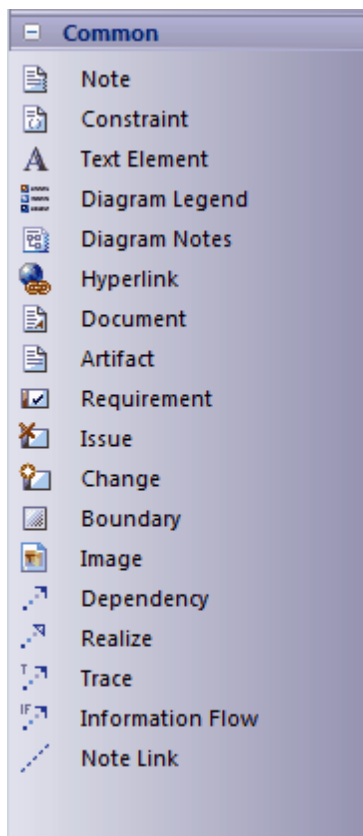

**Notes:**

- As with the Toolbox itself, if an MDG Technology:
  - Is active
  - Automatically pins Toolbox pages, and
  - Duplicates UML or Extended pages

The pinned Technology pages override and replace the pinned UML or Extended pages in the initial Toolbox shortcut menu

**5.5.5.3 Common Group**

The **Common** page of elements and relationships is displayed at the bottom of every other set of pages. It contains the elements and relationships that can be used on any diagram.

**Toolbox Elements and Connectors:**

Click on the elements and connectors below for information.

Common Elements	Common Connectors
 Note	 Dependency
 Constraint	 Realize

 Image	

### 5.5.5.4 Use Case Group

Use Case elements are used to build Use Case models. These describe the functionality of the system to be built, the requirements, the constraints and how the user interacts with the system.

Often, Sequence diagrams are associated with Use Cases to capture work flow and system behavior.

#### Topics:

Image	Topic	Detail	See Also
 Use Case  Actor  Use Case  Test Case  Collaboration  Collaboration Use  Boundary  Package  Use Case Relationships  Use  Associate  Generalize  Include  Extend  Realize  Invokes  Precedes	<b>Usage</b>	<p>The Use Case group is used to model the system functionality from the perspective of a system user; the user is called an Actor and is drawn as a stick figure, although the user could be another computer system or similar</p> <p>A Use Case is a discrete piece of functionality the system provides that enables the user to perform some piece of work or something of value using the system</p> <p>Examples of Use Cases are: login, open account, transfer funds, check balance and logout; each of these implies some purposeful and discrete functionality the system is to provide to a user</p> <p>A Test Case describes what must be set up in order to test a</p>	<a href="#">Test Case</a> <small>[1302]</small>

Image	Topic	Detail	See Also
		<p>particular feature</p> <p>The connectors available include: associate (an actor uses a Use Case), extend (one Use Case can extend another), include (one Use Case can include another) and realize (this Use Case might realize some business requirement)</p> <p>To add an element to the current diagram, click on the required icon and drag it into position on the diagram; set an element name and other properties as prompted</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element</p>	

**Notes:**

- Invokes and Precedes relationships are defined by the Open Modeling Language (OML). They are stereotyped Dependency relationships; *Invokes* indicates that Use Case A, at some point, causes Use Case B to happen, whilst *Precedes* indicates that Use Case C must complete before Use Case D can begin

**Learn More:**

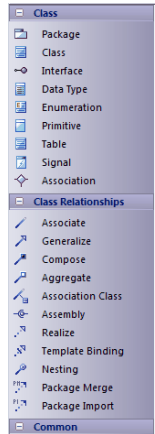

- [Use Case Models](#) <sup>815</sup>

**5.5.5.5 Class Group**

The **Class** group can be used for Package diagrams, Class diagrams and Object diagrams: those that usually display elements concerned with the logical structure of the system, such as Objects, Classes and Interfaces.

Logical models can include domain models (high level business driven object model) through to strict development Class models (define inheritance, attributes, operations).

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The Class group is used for creating Class models and database models. Class modeling is done using the Class and Interface elements, as well as occasional use of the Object element to model Class instances. You can add Association or Aggregation relationships. See the Class model template for an example of this.</p> <p>Use the Table element to insert a stereotyped Class for use in database modeling. See the Data Modeling topic for more details.</p> <p>To add an element to the current diagram, click on the required icon and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, click on the start element in the diagram and drag to the end element.</p>	<p><a href="#">Class</a> <sup>525</sup></p> <p><a href="#">Data Modeling</a> <sup>1279</sup></p>

**Learn More:**

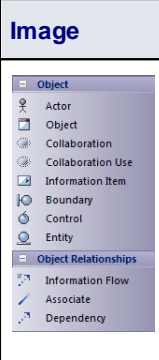

- [Package Diagrams](#)<sup>[79]</sup>
- [Class Diagrams](#)<sup>[80]</sup>
- [Object Diagrams](#)<sup>[80]</sup>

**5.5.5.6 Object Group**

The **Object** group is used to create Object diagrams.

Object diagrams reflect multiplicity and the roles instantiated Classes could serve. They are useful in creating different cases in which relationships and Classes are applied.

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The user is called an Actor and is drawn as a stick figure, although the user could be another computer system or similar.</p> <p>An Object is an instance of a Class.</p> <p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	<p><a href="#">Actor</a><sup>[87]</sup></p> <p><a href="#">Object</a><sup>[95]</sup></p>

**Learn More:**

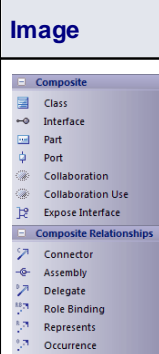

- [Object Diagrams](#)<sup>[80]</sup>

**5.5.5.7 Composite Group**

The **Composite** group is used for Composite Structure diagrams.

These reflect the internal collaboration of Classes, Interfaces or Components to describe a functionality or to express run-time architectures, usage patterns and the participating elements' relationships, which static diagrams might not show.

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram; set an element name and other properties as prompted</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element</p>	

**Learn More:**

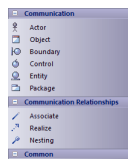

- [Composite Structure Diagrams](#)<sup>[803]</sup>

**5.5.5.8 Communication Group**

The **Communication group** is used to model dynamic interactions between elements at run-time.

The Actor element models a user of the system, while the other elements model things within the system, including standard elements (rectangular element), user interface component (circle with left positioned vertical bar), controller (circle with arrow head in top most position) and entity (circle with bar at bottom).

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>Communication diagrams are used to model work flow and sequential passing of messages between elements in real time. They are often placed beneath Use Case elements to further expand on Use Case behavior over time.</p> <p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	<a href="#">Communication Diagrams</a> <sup>[867]</sup>

**Notes:**

- Communication diagrams were known as Collaboration diagrams in UML 1.4

**5.5.5.9 Interaction Group**

The **Interaction group** is used for Interaction diagrams (Sequence, Timing, Communication or Interaction Overview), which are used to model work flow and sequential passing of messages between elements in real time.

Interaction diagrams are often placed beneath Use Case elements to further expand on Use Case behavior over time.

**Topics:**

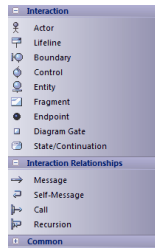

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The <b>Interaction group</b> is used to model dynamic interactions between elements at run-time</p> <p>The Actor element models a user of the system, while the other elements model things within the system, including standard elements (Lifeline), user interface component (Boundary), controller and Entity</p> <p>The meaning of the element symbols is discussed further in the Sequence diagram topic. The Message (sequence) relationship is used to model the flow of information and processing between elements.</p>	<a href="#">Sequence diagram</a> <sup>[857]</sup>

Image	Topic	Detail	See Also
		<p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	

**Notes:**

- Messages can be simple or recursive calls

**Learn More:**

- [Sequence](#) <sup>[851]</sup>
- [Timing](#) <sup>[832]</sup>
- [Communication](#) <sup>[861]</sup>
- [Interaction Overview](#) <sup>[863]</sup>

**5.5.5.10 Timing Group**

The **Timing** group is used solely for Timing diagrams, which use a time-scale to define the behavior of objects. The time-scale visualizes how the objects change state and interact over time.

Timing diagrams can be used for defining hardware-driven or embedded software components, and time-driven business processes.

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>A Lifeline is the path an object takes across a measure of time, indicated by the x-axis.</p> <p>A State Lifeline follows discrete transitions between states, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations.</p> <p>A Value Lifeline shows the lifeline's state across the diagram, within parallel lines indicating a steady state. A cross between the lines indicates a transition or change in state.</p> <p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	<p><a href="#">State Lifeline</a> <sup>[925]</sup></p> <p><a href="#">Value Lifeline</a> <sup>[940]</sup></p>

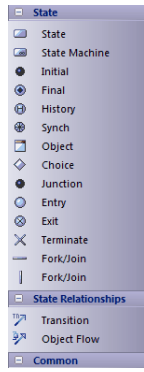

**Learn More:**

- [Timing Diagrams](#) <sup>[832]</sup>

### 5.5.5.11 State Group

The **State** group is used by State Machine diagrams to show the enableable states a Class or element might be in and the transitions from one state to another. These diagrams are often placed under a Class element in the Project Browser to illustrate how a particular element changes over time.

#### Topics:

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The State group provides elements common to State Machine diagrams; basically the State, start and end nodes and the Object Flow relation. State Machine diagrams are used to model the states or conditions that elements might be in at runtime, such as active, inactive, idle, accelerating or braking. States can have substates; for example, accelerate or brake might be substates of active.</p> <p>To add an element to the current diagram, click on the required icon and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	

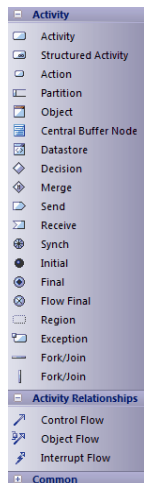

#### Learn More:

- [State Machine Diagrams](#) 

### 5.5.5.12 Activity Group

The **Activity** group is used to model system dynamics from a number of viewpoints in Activity diagrams and Interaction Overview diagrams.

#### Topics:

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>Activity elements enable you to describe the dynamics of the system from the point of view of activities and flows between them. Activities can be stereotyped as a process to display a business process icon. An Activity is some work that is carried out; it might overlap several Use Cases or form only a part of one Use Case.</p> <p>Send and Receive events are included as triggers.</p> <p>A Decision element marks a point where processing might split based on some outcome or value.</p> <p>The Flow relation models an active transition and synch points are used to split and rejoin periods of parallel processing.</p> <p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	

**Learn More:**

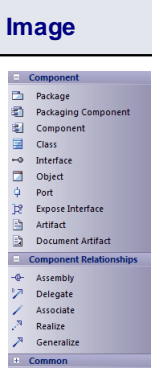

- [Activity Diagrams](#) <sup>[813]</sup>
- [Interaction Overview Diagrams](#) <sup>[863]</sup>

**5.5.5.13 Component Group**

The **Component** group enables you to model the physical components of your system in a Component diagram.

A component is a piece of hardware or software that makes up the system; for example, a DLL or Web Server are Components that might be deployed on a Windows 2000 Server (Node). See the Deployment Diagram topic for an example of this.

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The <b>Component</b> group contains elements related to the actual building of the system: the components that make up the system (such as ActiveX DLL's or Java beans), the Interfaces they expose and the dependencies between those elements.</p> <p>To add an element to the current diagram, click on the required icon and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	

**Learn More:**

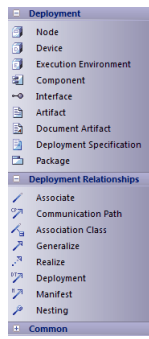

- [Component Diagram](#) <sup>[809]</sup>
- [Deployment Diagram](#) <sup>[806]</sup>

**5.5.5.14 Deployment Group**

The **Deployment** group enables you to model the physical components and deployment structure of your system in a Deployment diagram.

A Component is a piece of hardware or software that makes up the system, and a Node is a physical platform on which the component is to exist. For example, DLLs or Web Servers are Components that could be deployed on a Windows 2000 Server (Node). See the Deployment Diagram topic for an example of this.

**Topics:**

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The <b>Deployment</b> group contains elements related to the actual building of the system; the components that make up the system (such as ActiveX DLLs or Java beans) and the nodes those components run on, including the physical connections between nodes.</p> <p>To add an element to the current diagram, click on the required icon, and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, then click on the start element in the diagram and drag to the end element.</p>	

**Learn More:**

- [Deployment Diagram](#) 

**5.5.5.15 Profile Group**

The **Profile** group contains extended UML elements and connectors that can be used to create and modify Profiles, for rapidly creating stereotypes and Tagged Values that can be applied to structures such as elements, attributes, methods and connectors.

**Topics:**

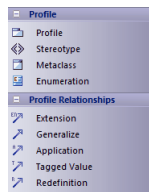

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>A <b>Profile</b> is used to provide a generic extension mechanism for building UML models in particular domains. They are based on additional Stereotypes and Tagged Values that are applied to structures such as elements, attributes, methods, connectors and connector ends.</p> <p>A <b>Stereotype</b> provides a mechanism for varying the behavior and type of a model element.</p> <p>A <b>Metaclass</b> is used to create a Class whose instances are Classes; a metaclass is typically used to construct metamodels.</p> <p>An <b>Enumeration</b> creates a Class stereotyped as enumeration, which is used to provide a list of named values as the range of a particular type.</p> <p>An <b>Extension</b> relationship shows that a stereotype extends one or more metaclasses. All stereotypes must extend either one or more Metaclasses, or another stereotype that extends a stereotype (that itself extends a stereotype, and so on).</p> <p>A <b>Generalize</b> relationship shows that one stereotype specializes a more general stereotype. The more general stereotype must still extend a metaclass.</p> <p>A <b>Tagged Value</b> relationship defines a reference-type (that is, RefGUID) Tagged Value owned by the source stereotype. The Tagged Value is named for the target role of this association, and is limited to referencing elements with the stereotype by the association target element.</p> <p>The <b>Application</b> and <b>Redefinition</b> relationships are deprecated.</p>

**5.5.5.17 Analysis Group**

Analysis-type elements are used early in modeling to capture business processes, activities and general domain information. They are generally used in Analysis diagrams.

Topics:

Image	Topic	Detail	See Also
	<b>Usage</b>	<p>The elements and relationships in the <b>Analysis</b> group are used for early modeling of business processes, activities and collaborations. You can use stereotyped activities to model business processes, or stereotyped elements to capture standard UML business process modeling extensions such as worker, case worker, entity, and controller.</p> <p>To add an element to the current diagram, click on the required icon and drag it into position on the diagram. Set an element name and other properties as prompted.</p> <p>To add a relationship, click on the required icon, click on the start element in the diagram and drag to the end element.</p>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Element permission to update or delete items on a diagram, and Manage Diagram permission to create, copy or delete diagrams

**Learn More:**

- [Permissions List](#) <sup>[206]</sup>

**5.5.6.1 Add New Diagrams**

This topic explains how to add a UML diagram, Extended diagram or MDG Technology diagram to a model in Enterprise Architect.

**How to:**

Step	Action	See Also
1	In the Project Browser, select the appropriate package or element under which to place the diagram	
2	Do one of the following: <ul style="list-style-type: none"> <li>• In the Project Browser toolbar click on the <b>New Diagram</b> icon</li> <li>• Right-click to open the context menu and select the <b>Add   Add Diagram</b> or <b>Add   Add &lt;type&gt; Diagram</b> menu option</li> <li>• Press ( <b>Insert</b> ) and select the <b>Add   Add Diagram</b> or <b>Add   Add &lt;type&gt; Diagram</b> menu option, or</li> <li>• Select the <b>Project   New Diagram</b> menu option</li> </ul>	

Step	Action	See Also
	The New Diagram dialog displays	
3	The <b>Name</b> field defaults to the name of the selected package or element; if necessary, type a different name for the new diagram	
4	In the Select From panel, click on the appropriate diagram category for the diagram  The Diagram Types panel displays a list of the diagram types within the selected category	<a href="#">UML Diagrams</a> [79]
5	In the Diagram Types panel, click on the type of diagram to create	
6	Click on the <b>OK</b> button to create your new diagram  Enterprise Architect checks whether there is a template diagram for this diagram type in the Templates package and, if so, applies the display characteristics defined in that template	<a href="#">Set Element Templates Package</a> [645]

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Manage Diagrams permission to create new diagrams
- The diagram type determines the default toolbar associated with the diagram and whether it can be set as a child of another element in the Project Browser (for example, a Sequence diagram under a Use Case)

**Learn More:**

- [Manage Diagrams](#) [206]

**5.5.6.2 Diagram Properties**

You can set several properties of a diagram using the diagram **Properties** dialog. Some properties influence the display and some are logical attributes that appear in the documentation.

**Topics:**

Topic	Detail	See Also
<b>Usage</b>	There are several options for opening the diagram <b>Properties</b> dialog for a given diagram: <ul style="list-style-type: none"> <li>• Select the <b>Diagram   Properties</b> menu option to open the Properties dialog for the currently active diagram</li> <li>• Right-click on the required diagram in the <b>Project Browser</b> and select the <b>Properties</b> context menu option</li> </ul>	

Topic	Detail	See Also
	<ul style="list-style-type: none"> <li>Right-click on the background of the open diagram and select the <b>Properties</b> context menu option</li> <li>Double-click in the background of the open diagram.</li> </ul> <p>In the Diagram Properties dialog you can set properties including name, author and version information, zoom factor, paper size and layout, diagram notes and various appearance attributes. Once you have made any necessary changes, click on the OK button to save and exit.</p>	

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Diagrams permission to change diagram properties
- You can also set the default diagram background color and the element fill color on the Standard Colors page of the Options dialog. You can set color gradients for both diagram background and element fill color on the Diagram Appearance page of the dialog

**Learn More:**

- [Update Diagrams](#) <sup>[206]</sup>
- [Standard Colors](#) <sup>[426]</sup>
- [Diagram Appearance](#) <sup>[429]</sup>
- [General Tab](#) <sup>[572]</sup>
- [Diagram Tab](#) <sup>[573]</sup>
- [Elements Tab](#) <sup>[575]</sup>
- [Features Tab](#) <sup>[576]</sup>
- [Connectors Tab](#) <sup>[578]</sup>

**5.5.6.2.1 General Tab**

The **General** tab of the diagram **Properties** dialog enables you to define characteristics of the overall diagram, such as its title, version and modification date.

**Access:** **Diagram | Properties > General**

**Use to:**

- Define characteristics of the overall diagram

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates the name of the diagram (defaults to the name of the parent package).	
<b>Author</b>	Specifies the name of the person who owns the diagram (defaults to the name of the person who created the diagram).	
<b>Version</b>	Indicates the version number of the diagram (defaults to 1.0).	

Field	Usage	See also
<b>Stereotype</b>	Indicates the name of the stereotype for the diagram. You can define stereotypes to select here using the <b>Settings   UML Types</b> menu option, selecting the Stereotypes <sup>[1978]</sup> tab and creating stereotypes with a <b>Base Class of Diagram</b> .	<a href="#">Stereotypes Tab</a> <sup>[1047]</sup>
<b>Created</b>	Automatically display the date the diagram was created.	
<b>Modified</b>	Indicates the date and time on which the diagram was last modified (defaults to the current date and time).	
<b>Notes</b>	Indicates any additional notes about the diagram. You can format the notes using the Notes toolbar at the top of the field.	<a href="#">Notes Toolbar</a> <sup>[772]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Diagrams permission to update diagram properties

**Learn More:**

- [Permissions List](#) <sup>[206]</sup>

**5.5.6.2.2 Diagram Tab**

The Diagram tab of the diagram Properties dialog enables you to define the representation of the diagram.

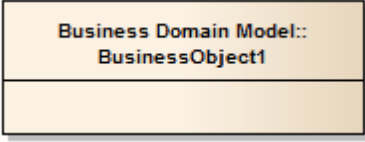

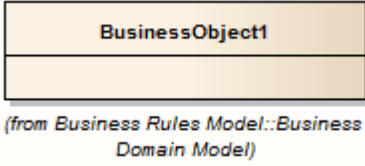

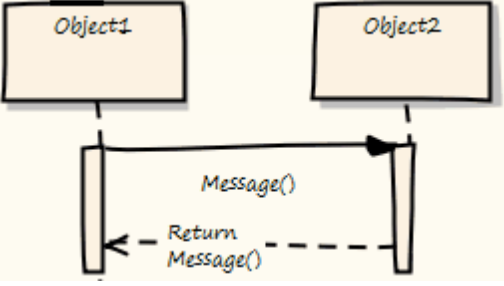

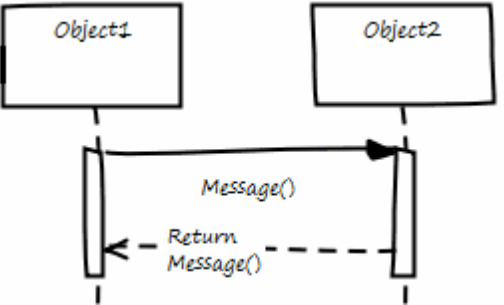

**Access:** **Diagram | Properties > Diagram**

**Use to:**

- Define the representation of a diagram

**Reference:**

Field	Usage	See also
<b>Use Alias if Available</b>	Display the element alias as the name if the alias is specified	
<b>Show Additional Parents</b>	Show the name of all parents not in the current diagram for all Classes and interfaces	
<b>Show Page Border</b>	Show a page border to align elements with	
<b>Show Diagram Details</b>	Show diagram details in a note in the top left corner of the diagram Deselect to hide the diagram details	
<b>Show Sequence Notes</b>	Show the Sequence Notes on the current diagram	
<b>Show</b>	Show the namespace of each element on the diagram, as part	

Field	Usage	See also
Namespace	of the element name; for example: 	
Fully Qualified Namespace	(If <b>Show Namespace</b> is selected) show the fully qualified namespace of each element on the diagram, under the element; for example: 	
Hand Drawn	Display the diagram contents as if they had been roughly drawn by hand; for example: 	
Whiteboard Mode	Displays the diagram as if it had been drawn on a whiteboard, with white fill and background; for example: 	
Disable fully scoped object names	Prevent the display of fully-qualified object names on the diagram	
Page Setup	Adjust the scaling of the image according to the size of the page it is to be printed on	<a href="#">Scale Image to Page Size</a> <sup>[604]</sup>
Print Page Header and Page Footer	Add page headers and footers to a print-out of the diagram; the headers and footers are generated from the diagram characteristics, such as the name of the creator and the date of modification	
Always Open as	Always display the diagram contents as a Diagram List rather	<a href="#">Diagram List</a> <sup>[464]</sup>

Field	Usage	See also
<b>Element List</b>	than as a diagram	
<b>Always Open as Gantt</b>	Always display the diagram contents as a GANTT chart	
<b>Set Layout Style</b>	Define the layout of the diagram, to be applied automatically when you select the Layout Diagram options	<a href="#">Layout Diagram</a> <sup>[62]</sup>
<b>RTF Document Options</b>	Options for generating RTF reports for a particular diagram	<a href="#">Document Options</a> <sup>[174]</sup>
<b>Exclude image from RTF documents</b>	Exclude this diagram image from any RTF document generated on the parent package or element	
<b>Document each contained element in RTF</b>	Include documentation on each element in this diagram, in any RTF document generated on the parent package or element	<a href="#">Generate RTF Documentation</a> <sup>[174]</sup>
<b>Divide Diagram into Multiple Pages</b>	Divide each large diagram into separate pages in the RTF document	<a href="#">Scaled to page</a> <sup>[60]</sup>
<b>Rotate Images</b>	Rotate each diagram image by 90 degrees in the RTF document	

**Notes:**

- The **Divide Diagrams into Multiple Pages** option is only effective when the **Scaled Printing** option is set to **None** on the Print Advanced dialog
- **Rotate Images** is only available for bitmap (.bmp) images

**5.5.6.2.3 Elements Tab**

The Elements tab of the diagram Properties dialog enables you to define what components of the elements should be displayed on the diagram.

**Access:** **Diagram | Properties > Elements**

**Use to:**

- Define what components of elements should be displayed

**Reference:**

Field	Usage	See also
<b>Use Stereotype Icons</b>	<p>For elements that have whole shapes drawn by Enterprise Architect (such as Analysis stereotypes), draw the alternative shape (if defined)</p> <p>For elements that have an icon displayed in the top right corner, (such as an Artifact element) if <b>Show Element Stereotypes</b> is selected, display the stereotype icon instead of the stereotype text</p>	<a href="#">Analysis stereotypes</a> <sup>[118]</sup> <a href="#">Artifact</a> <sup>[94]</sup>

Field	Usage	See also
<b>Show Element Stereotypes</b>	For elements that have whole shapes drawn by Enterprise Architect, if <b>Use Stereotype Icons</b> is deselected, display any stereotype on the element  For elements that have an icon displayed in the top right corner, indicate that a stereotype is present (icon if <b>Use Stereotype Icons</b> is selected, text if not)	
<b>Show Table Owner</b>	Display the Table Owner	<a href="#">Set Table Owner</a> [1355]
<b>Show Element Property String</b>	Show the advanced property string for all elements; for example, {leaf}	
<b>Show Compartments</b>	Enable the following compartments to be shown or hidden for any element using rectangle notation: <ul style="list-style-type: none"> <li>• Attributes</li> <li>• Operations</li> <li>• Tags (Tagged Values)</li> <li>• Requirements</li> <li>• Constraints</li> <li>• Testing (Testing Scripts)</li> <li>• Maintenance (Maintenance Scripts)</li> <li>• Package Contents</li> <li>• Notes</li> </ul>	<a href="#">Show Test Scripts Compartment</a> [1719]  <a href="#">Show Maintenance Script in Diagram</a> [1729]

#### 5.5.6.2.4 Features Tab

The Features tab of the diagram Properties dialog enables you to define how features (attributes and operations) are displayed on the diagram.

**Access:** **Diagram | Properties > Features**

**Use to:**

- Define how features (attributes and operations) are displayed on a diagram

**Reference:**

Field	Usage	See also
<b>Show Qualifiers and Visibility Indicators</b>	Show or hide the qualifiers and visibility indicators on the diagram  <i>Qualifiers</i> include such things as the 'derived' symbol ( <i>l</i> ) and the public key symbol ( <b>PK</b> )  Visibility indicators [1466] include such things as +, -, # and ~, which indicate the scope of access of the item (such as an attribute, operation or role)	<a href="#">Visibility indicators</a> [1466]
<b>Show Stereotypes</b>	Show the stereotypes on all features	
<b>Show Property</b>	Show the advanced property string for all element features, for	

Field	Usage	See also
String	example, {readOnly}	
Show Operation Return Type	Display the return data type of operations	
Suppress Brackets for Operations Without Parameters	Suppress brackets on operations that have no parameters; that is, <b>Opn</b> ; rather than <b>Opn()</b> ;	
Always Show Linked Features	Force display of linked <a href="#">[736]</a> attributes and operations, regardless of the setting of any other option that might hide them	<a href="#">Linked Attributes and Operations</a> <a href="#">[744]</a>
Visible Class Members	Hide Class members according to their scope and methods that specify properties	<a href="#">Visible Class Members</a> <a href="#">[577]</a>
Show Attribute Detail	Select whether to show both the attribute name and type, or the attribute name only	
Show Parameter Detail	Control the display of method parameters	<a href="#">Visible Class Members</a> <a href="#">[577]</a>

#### 5.5.6.2.4.1 Visible Class Members

On the Features tab of the diagram Properties dialog, the Visible Class Members panel enables you to hide Class members by their scope and methods that specify properties. Use the check boxes to define the visibility of Class members.

**Access:** **Diagram | Properties > Features : Visible Class Members**

#### Use to:

- Define visibility of class members

#### Show Parameter Detail:

The **Show Parameter Detail** field enables you to control the display of method parameters with the following options:

Option	Effect
None	No details shown
Type Only	Shows the type of parameter only
Full Details	Shows all of the details for parameters
Name Only	Shows the name of the parameter only

### 5.5.6.2.5 Connectors Tab

The Connectors tab of the diagram Properties dialog enables you to define the appearance of the connectors on the diagram.

**Access:** **Diagram | Properties > Connectors**

**Use to:**

- Define the appearance of connectors on a diagram

**Reference:**

Field	Action	See also
Show Relationships	Show relationships in the current diagram	
Show Collaboration Numbers	Show numbering in Communication diagrams	
Show Non-Navigable Ends	Indicate when an Association end is not navigable; a cross is presented at the Association connector	
Show Connector Property String	Show the property string for connectors	
Suppress All Connector Labels	Hide all connector labels	
Show Stereotype Labels	Show (selected) or hide (deselected) any stereotype labels on the connectors on the diagram	
Connector Notation	Display the required connector notation: <ul style="list-style-type: none"> <li>• <b>UML 2.1</b> - use the standard UML 2.1 notation for connectors</li> <li>• <b>Information Engineering</b> - use the Information Engineering (IE) connection style</li> <li>• <b>IDEX1</b> - use the Integrated Definition Methods IDEX1 connection style</li> </ul>	<a href="http://www.agiledata.org/essays/dataModeling101">http://www.agiledata.org/essays/dataModeling101</a> <a href="http://www.idef.com/IDEF1X.html">http://www.idef.com/IDEF1X.html</a>

### 5.5.6.3 Paste from Project Browser

As well as creating new elements in a diagram, you can drag existing elements from the Project Browser into the current diagram.

When you drag an existing element into the diagram, the Paste Element dialog displays to prompt you to select the type of paste action to carry out. (If the dialog does not display, press and hold (**Ctrl**) while dragging the element onto the diagram.)

**Topics:**

Topic	Detail	See also
<b>Pasting Options</b>	<p>Three paste options are available:</p> <ul style="list-style-type: none"> <li>• Paste the element as a simple link: in this case the original element exists both in the current diagram and in the original source diagram; changes to the element are reflected in all diagrams in which it is shown</li> <li>• Paste as an instance of the element: if the element can have instances such as an Object, Sequence instance or Node instance, you can drop the element in as an instance of the source element, with the classifier pre-set to the original source; this is useful when creating multiple instances of a Class in a Sequence diagram or Communication diagram</li> </ul> <p>If you select this option, the <b>Copy connectors</b> checkbox is enabled; if you select this checkbox, any connectors between the original element and any other elements that have also been pasted to this diagram are reproduced as connectors between the instances</p> <ul style="list-style-type: none"> <li>• Create as a child of the source element: this automatically creates a new Class (which you are prompted to name) with a Generalization connector back to the source; this is very useful when you have a Class library or framework from which you inherit new forms - for example, you can paste a Hashtable as "MyHashtable" which automatically becomes a child of the original Hashtable</li> </ul> <p>Used with the Override parent operations feature, this is a quick way to create new structures based on frameworks such as the Java SDK and the .NET SDK.</p> <p>You can make your selection on this dialog the default for:</p> <ul style="list-style-type: none"> <li>• all drag and drop operations, or</li> <li>• only those where you display this Paste Element dialog</li> </ul> <p>If you select the <b>This Dialog</b> checkbox, you should then select the <b>Only show this dialog when ( Ctrl ) +Mouse drag is used</b> checkbox and, on the Diagram Behavior page of the Options dialog, the <b>Auto Instance</b> checkbox</p> <p>The effect of these selections is to give you two default paste options:</p> <ul style="list-style-type: none"> <li>• Just drag the element onto the diagram and automatically create an instance</li> <li>• Press ( <b>Ctrl</b> ) while you drag the element from the Project Browser, displaying the Paste Element dialog, and click on the <b>OK</b> button to automatically paste the element according to whatever option you last selected from the dialog</li> </ul> <p>If you select the <b>All Drag and Drop</b> checkbox on the Paste Element dialog, this deselects the <b>Auto Instance</b> checkbox on the Options dialog and enables you to add existing elements to the diagram according to the paste option you selected, without pressing ( <b>Ctrl</b> ) and without displaying a dialog (if you want to change the default paste option, press ( <b>Ctrl</b> ) as you drag to display the dialog again and make your changes)</p>	<a href="#">Object Classifiers</a> <a href="#">Override Parent Operations</a> <a href="#">Diagram Behavior</a>

**Notes:**

- When an element dragged from the Project Browser is pasted into the diagram, its default style and size is applied rather than any alternative styles and sizes used for instances of the element in other

diagrams

**Learn More:**

- [Create Object From Attribute](#)<sup>[706]</sup>
- [Make Linked Element A Local Copy](#)<sup>[646]</sup>

### 5.5.6.3.1 Paste Multiple Items

You can paste multiple elements from the **Project Browser** into the current diagram.

**Topics:**

Topic	Detail	See also
<b>Pasting Multiple Elements</b>	<p>To select multiple elements, click on the selected items from the Project Browser while pressing and holding:</p> <ul style="list-style-type: none"> <li>• ( <b>Ctrl</b> ) to add single items to the selection of multiple elements, or</li> <li>• ( <b>Shift</b> ) to select all the elements between the first and last selected items in the Project Browser.</li> </ul> <p>You can then drag the selected elements from the Project Browser onto the current diagram, pressing and holding ( <b>Ctrl</b> ) ; for each element you have selected, the Paste Element dialog displays, prompting you to select the type of paste action to carry out.</p>	<a href="#">Pasting Options</a> <sup>[578]</sup>

### 5.5.6.3.2 Paste Composite Elements

When you drag a Composite element from the **Project Browser** onto the current diagram, Enterprise Architect prompts you to select the type of paste action to carry out with the Composite element.

(If the dialog does not display, press and hold ( **Ctrl** ) while dragging the element onto the diagram.)

**Topics:**

Topic	Detail	See also
<b>Pasting composite elements</b>	<p>Two advanced options are available for pasting Composite elements; these require the include Embedded Elements checkbox to be selected:</p> <ol style="list-style-type: none"> <li>1. The <b>All Embedded Elements</b> option, which pastes all of the Composite element's embedded elements.</li> <li>2. The Based on <b>instance</b> option, which pastes only the elements contained in a specific instance of the Composite element, maintaining the layout of the embedded elements.</li> </ol> <p>Click on the drop-down arrow and select the appropriate instance.</p> <p>For details of the other options on this dialog, see the Paste from Project Browser topic.</p>	<a href="#">Paste from Project Browser</a> <sup>[578]</sup>

### 5.5.6.3 Paste Activities

You can paste an Activity from the **Project Browser** into the current diagram.

**Topics:**

Topic	Detail	See also
<b>Pasting Activities</b>	<p>When you drag an Activity from the Project Browser onto the current diagram, The Paste Element dialog displays, prompting you to select the type of paste action to carry out. (If the dialog does not display, press and hold ( <b>Ctrl</b> ) while dragging the element onto the diagram.)</p> <p>Two options are available:</p> <ul style="list-style-type: none"> <li>• Paste the Activity as a <b>link</b>: in this case the Activity appears in the current diagram as a simple reference to the original source Activity. Changes to the Activity in the diagram affect all other links to this Activity</li> <li>• Paste as an invocation of the Activity; if you select this option, the <b>Copy connectors</b> checkbox is enabled. If you select this checkbox, any connectors between the original Activity and any other elements that have also been pasted to this diagram are reproduced as connectors between the instances</li> </ul> <p>For details of the other options on this dialog, see the Paste from Project Browser topic.</p>	<p><a href="#">Paste from Project Browser</a> 578</p>

**Learn More:**

- [Activity](#) 875

### 5.5.6.4 Copy And Paste Diagram Element

**How to:**

To copy a diagram element, follow the steps below:

Step	Instruction	See Also
1	Select the element(s) to copy.	
2	For multiple elements, right-click to open the context menu and select the <b>Copy</b> menu option. Alternatively, press ( <b>Ctrl+C</b> ) .	
3	For single elements, select the <b>Edit   Copy</b> menu option or alternatively press ( <b>Ctrl+C</b> ) .	

To paste diagram elements, follow the steps below:

Step	Instruction	See Also
1	Open the diagram to paste into.	
2	Right-click on the diagram background to open the <b>diagram</b> context menu.	

Step	Instruction	See Also
3	Select either the <b>Paste Object(s)</b> as New menu option (completely new element) or the <b>Paste Object(s)</b> as Link menu option (reference to the existing element).	

**Notes:**

- The Date Created and Time Created parameters of a pasted-as-new element are set to the current date and time; the parameters for a linked element remain the same as the copied element

**5.5.6.5 Place Related Elements on Diagram**

To find and place related elements on the current diagram, use the Relationships window.

**Access:** [View | Relationships](#)

**Topics:**

Topic	Detail	See Also
Usage	<p>Right-click on any <b>connector</b> in the list to open the context menu.</p> <p>If an element is not present in the current diagram, the context menu contains the <b>Place Target Element in Diagram</b> option. This is useful when you are building up a picture of what an element interacts with, especially when reverse engineering an existing code base.</p> <p>Select the <b>Place Target Element in Diagram</b> option. Move the cursor to the required position in the diagram and click to place the element. Alternatively, press ( <b>Esc</b> ) to cancel the action.</p>	

**5.5.6.6 Delete Diagram****How to:**

To delete a diagram from your model, follow the steps below

Step	Action	See Also
1	In the Project Browser, right-click on the diagram to delete The context menu displays	
2	Select the <b>Delete '&lt;diagram name&gt;'</b> menu option. A confirmation prompt displays.	
3	Click on the <b>OK</b> button to confirm the delete.	

**Notes:**

- In Enterprise Architect there is no Undo feature for deleting diagrams, so be certain that you want to delete a diagram before you do so
- When you delete a diagram, you do not delete the elements in the diagram from the model
- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to create new

diagrams

- You can also delete multiple diagrams from the Project Browser, by holding ( **Ctrl** ) or ( **Shift** ) while you select them, then right-clicking on one of them and selecting the Delete selected items context menu option

**Learn More:**

- [Permissions List](#)<sup>[206]</sup>

### 5.5.6.7 Rename Diagram

To rename a diagram, follow the steps below

**How to:**

Step	Action	See Also
1	Open the <b>Diagram Properties</b> dialog by double-clicking on the diagram background, or by selecting the <b>Diagram   Properties</b> menu option.	
2	In the <b>Name</b> field on the <b>General</b> tab, type the new name for your diagram.	
3	Click on the <b>OK</b> button to save changes.	

### 5.5.6.8 Change Diagram Type

If necessary, you can change one type of diagram to another type. This is useful if you have either made a mistake in selecting the diagram type to begin with, or if the purpose and nature of a diagram changes during analysis.

**Access:** **Diagram | Advanced | Change Type**

**How to:**

To change a diagram type, follow the steps below:

Step	Action	See Also
1	Open the diagram to change.	
2	Select the <b>Change Type</b> menu option The <b>Change Diagram Type</b> dialog displays	
3	Select the required diagram type	
4	Click on the <b>OK</b> button to save changes	

**Notes:**

- Some diagram types do not transfer to others; for example you cannot change a Class diagram into a Sequence diagram

### 5.5.6.9 Diagram Navigation Hotkeys

The diagram hotkeys enable you to quickly navigate to and select elements within a diagram. The following table details the key combinations and their functionality.

Hotkey Command	Action
<b>Shift + Arrow</b> , Element(s) selected	Move the selected element(s) by increments.
<b>Arrow</b> , No element selected	Scroll around the diagram.
<b>Esc</b>	Clear the current selection.
<b>Tab</b>	Select the first element in the diagram if none currently selected.
<b>Shift + click</b>	Add the clicked element to the current selection.
<b>Ctrl + click</b>	Add the clicked element to the current selection.
<b>Ctrl + Shift + drag</b>	Pan the diagram.
<b>Alt + G</b>	Select the item in the <b>Project Browser</b> and give it focus.

### 5.5.6.10 Copy Image to Disk

You can copy a diagram image to a disk file in the following formats:

- Windows bitmap (256 color bitmap)
- GIF image
- Windows Enhanced Metafile (standard metafile)
- Windows Placeable Metafile (older style metafile)
- PNG format
- JPG
- TGA

#### How to:

To copy a diagram image to file, follow the steps below:

Step	Action	See Also
1	Open the diagram to save.	
2	Select the <b>Diagram   Save as Image</b> menu option, or press ( <b>Ctrl+T</b> ) .	
3	When prompted, enter a name for the file and select an image format.	
4	Click on the <b>OK</b> button.	

#### Notes:

- Enterprise Architect clips the image size to the smallest bounding rectangle that encompasses all diagram elements

### 5.5.6.11 Copy Image to Clipboard

You can copy diagram images onto the MS Windows clipboard and paste them directly into MS Word or other applications.

To copy an image to the clipboard, follow the steps below

#### How to:

Step	Action	See Also
1	Open the diagram to copy.	
2	Select the <b>Diagram   Copy Image to Clipboard</b> menu option, or press ( <b>Ctrl+B</b> )	
3	Click on the <b>OK</b> button.  The diagram has been copied to the clipboard and can now be pasted into compatible applications or into another diagram. You can set the clipboard format on the Options dialog ( <b>Tools   Options</b> menu option, <b>General</b> page). Enterprise Architect supports bitmap or metafile format.	<a href="#">General Settings</a> <sup>[424]</sup>

### 5.5.6.12 Copy (Duplicate) Diagram

Enterprise Architect makes it easy to duplicate a complete diagram, with either :

- links back to the original diagram elements (*shallow mode*) or
- complete copies of all elements in the diagram (*deep mode*) or
- complete copies of all elements in the diagram that have the same parent as that of the diagram and links back to the original diagram elements for all other elements on the diagram (*smart mode*)

To duplicate a diagram, follow the steps below

#### How to:

Step	Action	See Also
1	In the <b>Project Browser</b> , select the diagram to copy.	
2	Right-click to display the context menu and select the <b>Copy Diagram</b> menu option.	
3	Navigate to the package to host the new diagram, and right-click to open the context menu.	
4	Select the <b>Paste Diagram</b> menu option. The <b>Copy Diagram</b> dialog displays.	
5	In the <b>Name</b> field, type the name for the new diagram.	
6	In the <b>Type of copy</b> panel, click on the radio button for the type of copy you require; either linked elements ( <i>shallow mode</i> ) or complete copies of the original elements shown on the diagram ( <i>deep mode</i> ) or complete copies of the original elements shown on the diagram that have the same parent as that of the diagram and linked elements of all other elements on the diagram ( <i>smart mode</i> ) .	
7	Click on the <b>OK</b> button.  Enterprise Architect automatically creates the new diagram, links or creates new	

Step	Action	See Also
	elements and arranges them as in the original diagram. All links are also copied between diagram elements where appropriate.	

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Manage Diagrams permission to copy diagrams.
- You can also paste a copied diagram as a child of a composite element.
- For a diagram copied in *shallow mode*, any changes to the properties of the original elements are reflected in the elements in the pasted diagram.
- For a diagram copied in *deep mode*, any changes to the properties of the original elements are not reflected in the elements in the pasted diagram.
- For a diagram copied in *smart mode*, any changes to the properties of the original elements are reflected only in those elements that are copied as simple links in the pasted diagram.
- Element position and size will be independent in all copy modes.

**Learn More:**

- [Permissions List](#)<sup>[206]</sup>
- [Composite Elements](#)<sup>[649]</sup>

**5.5.6.13 Z Order Elements**

Z Order refers to an element's depth in the diagram perspective, and thus influences which elements appear in front of others and which appear behind.

**How to:**

To set the Z Order of an element, follow the steps below:

Step	Action	See Also
1	Right-click on the element in the diagram	
2	Select the <b>Z-Order</b> menu option	
3	The displayed commands enable you to move the selected element(s) back, forward, to the front of all other elements or behind all other elements	

**Notes:**

- This option enables you to change the Z-order of a single element approximately in relation to the rest of the diagram; you can also select the **Modify Z-Order** option from the *diagram* context menu, to review and adjust the Z-Order of each element on the diagram precisely relative to each other element

**Learn More:**

- [Diagram Context Menu](#)<sup>[540]</sup>

### 5.5.6.14 Set the Default Diagram

A project might have a default diagram. If set, this diagram loads when Enterprise Architect first opens the model. It is often convenient to place hyperlinks to other diagrams and resources on the default diagram, thus creating a Home Page for your model.

**Access:** [Diagram](#) | [Advanced](#) | [Make Model Default](#)

**Notes:**

- Once you have specified a default diagram, the **Home** icon on the **Diagram** toolbar takes you back to that diagram from your current location in the model

### 5.5.6.15 Open Package From Diagram

**How to:**

To open a package from within a diagram follow the steps below:

Step	Action	See Also
1	Open a diagram that shows the package to open.	
2	Right-click on the package element to open the context menu.	
3	Select the <b>Open Package</b> option. Alternatively, press ( <b>Ctrl+K</b> ) .	

**Notes:**

- Enterprise Architect finds the package default diagram and opens it for you. This is the first available diagram in the package, selected in alphabetical order; for example, a diagram called Alpha in a child package or element several levels down opens before a diagram called Beta immediately under the selected package

### 5.5.6.16 Feature Visibility

Enterprise Architect enables you to set the visibility of attributes and operations - where shown - for selected elements on a specific diagram only. You can hide or show attributes and operations by scope, or you can hide attributes and operations individually. The visibility you set applies only to the current diagram, so a Class can appear in one diagram with all features displayed, and in another with features hidden. For example, you can hide all protected attributes, all private operations or any other combination of attributes and operations.

It is possible to show inherited attributes, operations, requirements, constraints and Tagged Values for elements that support those features. When Enterprise Architect displays inherited features, it creates a merged list from all generalized parents and from all realized interfaces. If a child Class redefines something found in a parent, the parent feature is omitted from the Merge List.

**How to:**

To customize feature visibility, follow the steps below:

Step	Action	See Also
1	Either: <ul style="list-style-type: none"> <li>• Click on the element in the diagram and either click on the <b>Element   Feature Visibility</b> menu option or press ( <b>Ctrl+Shift+Y</b> ), or</li> </ul>	

Step	Action	See Also
	<ul style="list-style-type: none"> <li>Right-click on the element in the diagram to display the context menu and click on the <b>Feature Visibility</b> option.</li> </ul> <p>The Feature Visibility dialog displays.</p>	
2	To filter display of attributes or operations by scope, select the checkbox against each scope that should be visible and clear the checkbox against each scope that should not.	
3	<p>In the <b>Show Element Compartments</b> panel, select the compartments to display for the element on the diagram.</p> <p>The <b>Fully Qualified Tags checkbox</b> enables you to display the full provenance of a Tagged Value, where the same Tagged Value can be used several times in different contexts with different values. The description in the Tagged Value compartment reads:</p> <p>&lt;Profile&gt;::&lt;Stereotype&gt;::&lt;Tagged Value name&gt;=&lt;Value&gt;      for example: BPMN::Activity::Activity Type = Task.</p> <p>(Only for Tagged Values created in Enterprise Architect release 7.1 or later.)</p> <p>If you select the <b>Notes</b> checkbox, the Notes compartment on the element in the diagram displays the text that has been typed into the <b>Notes</b> field of the <b>Element Properties</b> dialog. This checkbox also enables the <b>maximum chars</b> field, which defaults to 1000 as the number of characters of notes text displayed. Overtyping this value to display less text or more text.</p> <p>The change only applies to the selected elements on the diagram, so you can display full notes for a selected element whilst the other elements on the diagram have no notes text.</p>	
4	<p>In the <b>When Resizing Elements</b> panel, select the appropriate option for resizing the Class, object or table to prevent very wide diagram objects.</p> <p>The selected option defaults to <b>Resize to longest Feature</b>, so that the minimum width for a diagram object is determined by its longest displayed attribute, method or other compartment value. If necessary, you can change the option to <b>Wrap Features</b> (so that any longer features are wrapped onto multiple lines) or <b>Truncate Features</b> (so that longer features are not displayed in full).</p>	
5	If required, in the <b>Inherited Features</b> panel, select one or both checkboxes to set whether Enterprise Architect should display inherited features as well as directly owned ones.	
6	Click on the <b>OK</b> button to save changes. Enterprise Architect redraws the diagram with the appropriate level of feature visibility.	

#### Topics:

Topic	Detail	See also
<b>Suppress or Show Specific Features</b>	<p>The <b>Custom</b> button in the <b>Attribute Visibility</b> and <b>Operation Visibility</b> panels enables you to show or hide specific operations and attributes. If you select the <b>Show</b> checkbox, the Custom button displays the <b>Show Features in Diagram</b> dialog; if you deselect the checkbox, the button displays the Suppress Features in Diagram dialog.</p> <p>The two dialogs are identical, but in the first you select the checkboxes of specific features to show, and in the second you select the</p>	

Topic	Detail	See also
	checkboxes of specific features to hide.  You can also use the <b>Filter by Scope</b> button in this dialog to, for example, list only operations that are Protected and select, say, two of them to hide, so that on the diagram the element displays all but two of the Protected operations and all operations of other scopes.	

**Notes:**

- To show features for element types that do not have visible compartments, such as Use Cases and Actors, right-click on the diagram object to display the context menu and select the **Advanced Settings | Use Rectangle Notation** option
- The **Show** checkbox, if selected, overrides these selections to display all attributes or operations in the element, except those specifically deselected in the Show Features in Diagram dialog
- If you have selected the **Notes** checkbox, you can select the **Render Formatted Notes** checkbox to display the text on the diagram, formatted using the Notes toolbar

**Learn More:**

- [Notes](#)<sup>[77]</sup>

**5.5.6.17 Insert Diagram Properties Note**

Properties of a diagram can be displayed on screen within a custom text box. You can move this text box around and change its appearance. You cannot change what the text box says.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	To create the note, drag the <b>Diagram Notes</b> element from the Common page of the Toolbox onto the diagram.  Alternatively, select the <b>Diagram   Property Note</b> menu option, or click on the <b>Diagram Properties Note</b> button on the UML Elements toolbar and click on the diagram  	

**Notes:**

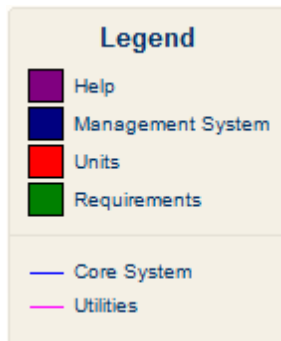

- This is not the same as the diagram details note, which displays in the top left corner of the diagram if the Show Diagram Details checkbox is selected on the Diagram Properties dialog. You cannot move the diagram details, nor change the appearance. To hide the diagram details, deselect the checkbox

**Learn More:**

- [Configure Default Appearance](#)<sup>[64]</sup>
- [Diagram Properties](#)<sup>[57]</sup>

### 5.5.6.18 Create Legends

A *Legend* shape identifies colors and styles you have used to group other elements on the diagram. You can use the Legend to assist in distinguishing different elements, connectors or systems on the diagram. For example, the Legend could show that all elements concerned with the management system are shaded in blue, and all outcomes connectors are shown in red. The Legend displays as a key to the diagram, with the filled shape styles first and the lines and connector styles underneath.

You add a Legend to the diagram, then edit it to add Legend elements, which define the colors and styles used in the diagram.

To add a Legend to a diagram, drag the *Diagram Legend* element from the **Common** page of the **Toolbox** onto the diagram (or click on the **New Diagram Legend** icon (  ) on the **UML Elements** toolbar, and click on the diagram).

To edit the Legend either double-click on the Legend or Right-click on the Legend and select the **Properties** context menu option.

#### 5.5.6.18.1 Legend Properties

**Access:** drag the Diagram Legend element from the Common page of the Toolbox onto the diagram

**Use to:**

- Add a Legend to a diagram

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates a name for an element displayed within a legend.	
<b>Fill Color</b>	Indicates a fill color for an element within a legend.	
<b>Line Color</b>	Indicates a line color for an element within a legend.	
<b>Line Thickness</b>	Denotes the line thickness of an element within a legend.	
<b>Style Options</b>	Allows further alteration options to the legend appearance.	<a href="#">Style Options</a> <sup>[59]</sup>
<b>Fill</b>	Indicates that a fill element is to be created/modified.	
<b>Line</b>	Indicates that a line element is to be created/modified.	

<b>Hand (Up)</b>	If more than one element is present within a legend, this button moves a highlighted element up one entry within the description list.	
<b>Hand (Down)</b>	If more than one element is present within a legend, this button moves the highlighted element down one entry within the description list.	
<b>New</b>	Add a new element to the legend.	
<b>Save</b>	Saves an element and adds it to the description list.	
<b>Delete</b>	Deletes an element from the description list.	
<b>Description List</b>	Specifies the current elements created within the legend.	

**Notes:**

- The Legend dialog enables you to add, delete, modify or re-sequence Legend elements. Use the **Fill** tab to define the Legend elements for shapes, then click on the **Line** tab to define Legend elements for lines and connectors

**5.5.6.18.2 Style Options**

Click on the **Style Options** button ( ... ) to display the Style Options dialog, on which you can modify a Legend title, font size, background color and border color. If you choose default options for the colors, the Legend automatically assumes colors based on the diagram background color.

**Access:** Legend dialog > (...)

**Use to:**

- Modify appearance options for a Legend

**Reference:**

Field	Usage	See also
<b>Legend Title</b>	Indicates the title of the Legend	
<b>Heading Size</b>	Indicates the size of the font for a Legend	
<b>Font Color</b>	Indicates the font color the Legend is to use	
<b>Background</b>	Indicates the background color the Legend is to use	
<b>Border Color</b>	Indicates the border color the Legend is to use	

**5.5.6.19 Autosize Elements**

You can autosize an element or group of elements in a diagram to the default size for the element type (for a Class, 90 x 70 pixels at 100% zoom). However, if the element contains more information than the default size can show (such as a long name, long attributes or additional compartments) the autosize option resizes the element to the minimum size for revealing the information.

The size change effectively operates around the mid point of each element, so the layout and size of the diagram do not change. Automatically changing the layout of a diagram is a different process.

**How to:**

To autosize elements, follow the steps below:

Step	Action	See Also
1	Select the elements to resize (press ( <b>Ctrl+A</b> ) to select all).	
2	Either: <ul style="list-style-type: none"> <li>• Right-click on any of the elements and, on the context menu, select the <b>Autosize</b> menu option, or</li> <li>• Press ( <b>Alt+Z</b> ) .</li> </ul>	

**Notes:**

- Not all elements resize: elements such as Events remain the same; Timing and Sequence diagrams (where position is crucial) are unchanged; and elements added from a profile or Shape Script maintain any size definitions imposed by the profile
- With an element image created with a Shape Script that contains a defSize command, **Autosize** returns the element to the defSize value and not the element default size

**Learn More:**

- [Lay Out a Diagram Automatically](#)<sup>[62]</sup>
- [defSize command](#)<sup>[1095]</sup>

**5.5.6.20 Swimlanes**

Enterprise Architect diagrams support *Swimlanes* for all diagram types. Swimlanes are vertical or horizontal bands in a diagram that divide the diagram into logical areas or partitions. In the example below the activities relating to particular entities within the model (such as the User, or the back end Repository) are placed within a containing swim lane to indicate their association.

**Access:** **Diagram | Swimlanes and Matrix > Swimlanes**

**Use to:**

- Add Swimlanes to a diagram

**Reference:**

Field	Usage	See also
<b>Active</b>	Indicates that the Swimlane dialog is active, as opposed to the Matrix dialog	<a href="#">Swimlanes Matrix</a> <sup>[594]</sup>
<b>Orientation</b>	Specifies the orientation of the swimlane, either vertical or horizontal	
<b>Line Color</b>	Indicates the line color for the swimlane	
<b>Font Color</b>	Indicates the font color for the swimlane	

<b>Line Width</b>	Indicates the line width of the swimlane	
<b>Locked</b>	Indicates that the swimlane can not be moved on the diagram	
<b>Bold Font</b>	Indicates that the name given to the swimlane is set to bold	
<b>Hide Classifier</b>	Indicates that the classifier name is not shown on the diagram	
<b>Hide Names</b>	Indicates that the names set for swimlanes do not appear on the dialog	
<b>Show Names in Title Bar</b>	Specifies that the name given to a swimlane appear in the title bar	
<b>Hand (Up)</b>	If more than one element is present within a swimlane, this button moves a highlighted element up one entry within the Swimlanes list	
<b>Hand (Down)</b>	If more than one element is present within a swimlane, this button moves a highlighted element down one entry within the Swimlanes list	
<b>New</b>	Opens the Swimlane Details dialog, allowing specification of the Name, Classifier and Background Color	<a href="#">Swimlane Details</a> <sup>[593]</sup>
<b>Modify</b>	Opens the Swimlane Details dialog, allowing modification of the Name, Classifier and Background Color	<a href="#">Swimlane Details</a> <sup>[593]</sup>
<b>Delete</b>	Deletes a Swimlane from the Swimlanes List	
<b>Swimlanes List</b>	The list of the currently defined Swimlanes	

**Notes:**

- If you set a background color for a swimlane, it takes on the same shading profile as the main diagram background

**5.5.6.20.1 Swimlane Details**

The Swimlane Details dialog opens if the **New** or **Modify** buttons are clicked from the Swimlanes dialog.

**Access:** **Diagram | Swimlanes and Matrix > Swimlanes : New/Modify**

**Use to:**

- Specify details about a swimlane

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates a name for the swimlane.	
<b>Classifier</b>	Indicates the classifier name for the swimlane, the (...) button allows specification of a classifier.	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>
<b>Back Color</b>	Specifies a background color for a swimlane.	

### 5.5.6.21 Swimlanes Matrix

Enterprise Architect diagrams support a *Swimlanes Matrix* for all diagram types, based on the Zachman Framework.

The Swimlanes Matrix divides the diagram into cells of vertical columns and horizontal rows. The cell in the top left corner of the Swimlanes Matrix contains the heading of the matrix. The first cell at the top of each column contains the column title text. The first cell at the left of each row contains the row title text.

**Access:** [Diagram | Swimlanes and Matrix > Matrix](#)

**Use to:**

- Add a Matrix to a diagram

**Reference:**

Field	Usage	See also
<b>Active</b>	Indicates that the Matrix dialog is active, as opposed to the Swimlanes dialog.	<a href="#">Swimlanes</a> <sup>[592]</sup>
<b>Title #</b>	Indicates a title name, up to 3 title names can be specified.	
<b>Color</b>	Indicates a font color for a title.	
<b>Font</b>	Opens the font dialog, font styles can be specified here.	<a href="#">Set Element Font</a> <sup>[659]</sup>
<b>Hidden</b>	Indicates if a title is hidden.	
<b>Type</b>	Indicates what type of matrix heading is created.	
<b>Back Color</b>	Indicates what background color the matrix item has.	
<b>Hide Item</b>	Indicates that the matrix item is hidden.	
<b>Model Profiles</b>	Indicates what profile is used during creation of the Matrix.	
<b>Model Profiles : Save</b>	Saves a profile to the Model Profiles list Prompts for a profile name.	
<b>Model Profiles : Delete</b>	Deletes a profile from the Model Profiles list.	
<b>Lock</b>	Indicates that the matrix item can not be moved or resized on a diagram.	
<b>Line Widths</b>	Indicates the width on lines surrounding a matrix.	
<b>Hand (Up)</b>	If more than one item is present within a matrix, this button moves a highlighted element up one entry within the Matrix List.	
<b>Hand (Down)</b>	If more than one element is present within a matrix, this button moves a highlighted element down one entry within the Matrix List.	

<b>New</b>	Allows for the creation of a new matrix item.	
<b>Copy</b>	Copies the highlighted matrix item.	
<b>Delete</b>	Deletes a matrix item from the Matrix List.	
<b>Matrix List</b>	A list of currently defined matrix items.	

**Notes:**

- The heading is the first item in the list; you create only one heading
- When you define columns and rows, you define the header or title cells. The properties of these cells do not reflect on the matrix cells themselves. For example, the intersection cell of a column and row has a transparent background and therefore takes the color and shading effect of the diagram background
- You can also transport all the matrix profiles between models (as Diagram Matrix Profiles), using the Export Reference Data and Import Reference Data options
- By applying a Model Profile, you replace the current profile. Save the current profile to avoid losing it
- To size the rows and columns, drag the row and column borders on the diagram. Elements placed inside each cell are shifted when sizing. To prevent the elements shifting, press and hold ( **Ctrl** ) while sizing

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**5.5.6.22 Using the Image Manager**

The **Image Manager** dialog enables you to insert alternative images in diagrams, rather than inserting standard UML elements. For example, you might want to place a **custom background** image on a diagram, or display a custom image such as a Router or PC on a UML element.

**Access:** **Right-click on an element within a diagram | Appearance | Select Alternate Image (Shortcut - Ctrl + Shift + W)**

To locate and display an image, click on individual image filenames, or press ( **↑** ) and ( **↓** ) to scroll through the list of images. As you highlight each image filename, the Preview panel changes to reflect the image. Double-click on the required image filename to display the image in full size.

On the Image Manager dialog, the following buttons are available:

**Reference:**

Action	Usage	Shortcut	See also
<b>View</b>	Display the selected image in full size.	<b>Alt + V</b>	
<b>Usage</b>	Display the Element Usage <sup>[658]</sup> dialog, which lists the diagrams in which the selected image is used.		<a href="#">Element Usage</a> <sup>[632]</sup>
<b>Rename</b>	Change the filename of the selected image.  The option first warns you that the change would impact the other elements that use this image, and prompts you to confirm that you want to go ahead with the name change.		

Action	Usage	Shortcut	See also
	If you continue, a prompt displays for you to enter the new filename.		
<b>Add New</b>	Browse appropriate directories to search for and import new images.  You can import images in .BMP, .PNG, .EMF, .WMF, .TGA, .PCX or .JPG format. Internally, Enterprise Architect stores the images in .PNG or metafile format to conserve space.	<b>Alt + A</b>	
<b>Update Selected</b>	Refresh the selected image; for example, after it has been modified.	<b>Alt + U</b>	
<b>Delete</b>	(Not available for an image from a deployed MDG technology.)  Delete the selected image.  A message displays to indicate how many elements use the image. Click on the Continue button to delete information about the image from those elements, which then revert to their previous appearance.	<b>Alt + D</b>	
<b>Cancel</b>	Close the Image Manager dialog.		
<b>OK</b>	Confirm selection of the alternative image for the element selected in the diagram.	<b>Alt + O</b>	

**Notes:**

- For elements with lifelines, such as those used on Sequence diagrams, the Lifeline must remain intact to enable messages to be created between the elements. Therefore such elements cannot have alternative images.
- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Configure Images permission to configure alternative element images
- There are two categories of image available through the Image Manager: those images that have been imported into the model, which are stored in the model; and those images that are incorporated into a deployed MDG technology, which are not copied into the current model but are held in memory. The technology images are identified by the technology name followed by the image file name; for example: MDGFrame::ovalshape.emf
- If you are creating many elements of the same type that have a particular image, you should use a custom stereotype with an associated metafile
- You can transport image files between models, using the Export Reference Data and Import Reference Data options

**Learn More:**

- [Custom background image](#) <sup>[597]</sup>
- [Permission List](#) <sup>[206]</sup>
- [Adding Images in MDG Technology](#) <sup>[1073]</sup>
- [Custom Stereotype](#) <sup>[1018]</sup>
- [Export Reference Data](#) <sup>[233]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

### 5.5.6.22.1 Create Custom Diagram Background

Enterprise Architect diagrams have a single-color 'wash' background that you can set to a solid color or a fade gradient down the screen. You set the color on the Standard Colors page of the Options dialog, and whether to have a fade gradient on the Diagram Appearance page.

Alternatively, using the Image Manager dialog, you can create a non-tiled background for diagrams.

#### How to:

To create a non-tiled background follow the steps below:

Step	Action	See Also
1	Create a Boundary object from the <b>Use Case Elements</b> page of the Toolbox; do not use the Boundary element from any other section of the Toolbox	<a href="#">System Boundary</a> <sup>[933]</sup> <a href="#">Toolbox</a> <sup>[548]</sup>
2	Stretch the Boundary to a size that can contain all of the elements you intend to place on the diagram, and drag it to the edges of the diagram workspace	
3	Right-click on the Boundary element The context menu displays	
4	Select the <b>Z-Order   Send to Bottom</b> menu option; this ensures that the Boundary is not displayed in front of any other element in the diagram	
5	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+Shift+W</b> ), or</li> <li>• Right-click on the Boundary to display the context menu, and select the <b>Appearance   Alternate Image</b> menu option</li> </ul>	
6	On the Image Manager dialog, select an appropriate image as the diagram background and ensure that the image size is large enough to span the required size of the diagram background	<a href="#">Image Manager</a> <sup>[595]</sup>
7	When you have selected the required image, click on the <b>OK</b> button  Alternatively, you can copy an image from another source onto the Windows clipboard, right-click on the Boundary element in the Enterprise Architect diagram, and select the <b>Appearance   Apply Image From Clipboard</b> context menu option	

#### Learn More:

- [Standard Colors](#)<sup>[426]</sup>
- [Diagram Appearance](#)<sup>[429]</sup>

### 5.5.6.22.2 Import Image Library

Using the Image Library enables you to create attractive diagrams with custom images. A bundled clip art collection of UML-based images is available as an Imported Image Library, from the Sparx Systems website. Image libraries enable you to import a collection of images into the Image Manager in one process.

#### How to:

To import the Image Library, follow the steps below (before starting, you must have a suitable Image Library file):

Step	Action	See Also
1	Download the Image Library from the Sparx Systems website.	<a href="http://www.sparxsystems.com/resources/image_library.html">www.sparxsystems.com/resources/image_library.html</a>
2	Select the <b>Project   Model Import/Export   Import Reference Data</b> menu option. The Import Reference Data dialog displays.	
3	Locate the XML Image Library file to import using the <b>Select File</b> button. The file name is ImageLibrary.xml in the directory in which you saved the file.	
4	Select the data set containing the Image Library. Then click on the <b>Import</b> button.	

To use the images contained within the Image Library, follow the steps below

Step	Action	See Also
1	Create a diagram to associate with the images contained in the Image Library.	
2	Select the element to change from the default appearance to one of the images contained within the library.	
3	Press ( <b>Ctrl+Shift+W</b> ), or right-click on the selected element to display its context menu and then select the <b>Appearance   Select Alternate</b> Image option.	
4	On the <b>Image Manager</b> dialog, in the <b>Name</b> field highlight the appropriate image name and then click on the <b>OK</b> button.	

**Notes:**

- Images contained within the Image Library are copyright of Sparx Systems, are only available for use in conjunction with Enterprise Architect, and are supplied on the understanding that they are not used under any other circumstance

### 5.5.6.23 Show Realized Interfaces of Class

You can display each interface directly realized by a Class as a 'lollipop' style interface node, which protrudes from the left-hand side of the Class. Connectors can be directly attached to the node, indicating usage of the interface part of the Class or component. See the example below:

**Topics:**

Topic	Detail	See also
<b>Explanation</b>	<p>In this example, Class2 realizes Interface1 and Interface2 as represented by the interface nodes protruding from the Class. Class1 is dependent on these two interfaces, which is shown by the Dependency connectors linking to the nodes.</p> <p>To show nodes for the interfaces a Class realizes, as in the above diagram, right-click on the Class and select the <b>Embedded Elements   Show Realized Interfaces</b> context menu option. This setting only applies to the selected Class, and can be changed at any time.</p>	

### 5.5.6.24 Label Menu Section

You can add labels to both connectors and elements, using the element or connector context menu as follows:

- Element:
  - Select the Embedded Elements menu option and either the **Add <element>** option or the **Embedded Elements** option; the label is the embedded element name
  - Apply an alternative image to an element (that might also have a run state; the run state, attributes and operations of the element are then displayed as a label of the element
  - Connector - Select the Properties option and define the connector name, stereotype, constraints and/or source and target roles

Once you have these labels, you can edit and format them using the **Labels** context menu.

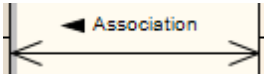

**Access:** Right-click on a label

**Reference:**

The **Labels** context menu associated with embedded elements provides the following options:

Action	Usage	Shortcut	See also
<b>Set Label Color</b>	Specify a color for the label.		
<b>Hide Label</b>	Hide the label; to unhide the label, right-click on the element and select the <b>Appearance   Show labels</b>  context menu option.		<a href="#">Appearance Menu section</a> 
<b>Bold</b>	Set the label font to bold.		
<b>Text Alignment</b>	Align the text within the label text area. The options available from the submenu enable you to specify left, center and right alignment.		
<b>Label Rotation</b>	Orient the label in the horizontal or vertical planes, with the vertical plane offering the option of clockwise or anti-clockwise position.		
<b>Default Position</b>	Move the label to the initial default location.		
<b>Default Color</b>	Set the label color to the default color.		

The **Labels** menu associated with connectors provides the following options:

Action	Usage	Shortcut	See also
<b>Set Label Color</b>	Specify a color for the label.		
<b>Hide Label</b>	Hide the label; to unhide the label use the <b>Visibility   Set Label Visibility</b>  option on the connector context menu.		<a href="#">Set Label Visibility</a> 
<b>Bold</b>	Set the label font to bold.		
<b>Text Alignment</b>	Align the text within the label text area. The options available from the submenu enable you to specify left, center and right alignment.		
<b>Label Rotation</b>	Orientate the label horizontally or vertically and, if vertically, in a clockwise or anti-clockwise position.		
<b>Direction</b>	Set a small arrow at the end of the label pointing to either the label source or the destination dependent upon selection from the available options.  This is part of the label, so if there is no label there is no direction indicator.		
<b>Default Position</b>	Move the label to the default location.		
<b>Default Color</b>	Set the label color to the initial default color.		

**Notes:**

- As labels can be concentrated on and around the element or connector, make sure that you click on a section of the required label that is clear of any other label or structure

**Learn More:**

- [Embedded Elements](#) <sup>[655]</sup>
- [Using the Image Manager](#) <sup>[595]</sup>
- [Run-time State](#) <sup>[960]</sup>
- [Connector Properties](#) <sup>[758]</sup>

**5.5.6.25 Pan and Zoom a Diagram**

**Topics:**

Topic	Detail	See also
Pan	<p>Pan the <b>Diagram View</b> in the following ways:</p> <ul style="list-style-type: none"> <li>• Use ( ← ), ( → ), ( ↑ ), ( ↓ ), ( <b>Page Up</b> ), ( <b>Page Down</b> ), ( <b>Home</b> ) and ( <b>End</b> ) when the Diagram View is selected</li> <li>• Use the scrollbars</li> <li>• Use the middle mouse button</li> <li>• Use the <b>Pan &amp; Zoom</b> window</li> </ul>	<p><a href="#">Pan &amp; Zoom Window</a> <sup>[475]</sup></p>
Zoom	<p>You can zoom into and out from a diagram using the zoom buttons on the diagram toolbar, or by using the <b>Diagram   Zoom</b> submenu.</p>  <p>Change the zoom level by 10% by clicking on either the <b>Zoom In (+)</b> or <b>Zoom Out (-)</b> buttons. Alternatively, select the <b>Zoom In</b> or <b>Zoom Out</b> options from the <b>Diagram   Zoom</b> submenu.</p> <p>There are three ways to return the diagram to 100%:</p> <ul style="list-style-type: none"> <li>• Click on the  button</li> <li>• Select <b>Zoom to 100%</b> from the <b>Diagram   Zoom</b> submenu</li> <li>• ( <b>Ctrl</b> ) +middle-click the mouse</li> </ul>	

**Notes:**

- You can zoom in and out of the main window dynamically by holding ( **Ctrl** ) and rolling the mouse wheel
- Changes in diagram magnification through the zoom options can be saved as permanent changes to the diagram
- At high levels of zoom, element features cease to display. This is because of the difficulty the Windows font mapper has in choosing a font for extreme conditions, and the result can look odd

### 5.5.6.26 Move Elements In Diagram Sections

As you build up a diagram, you might find that you have to move part of the diagram up, down or to one side. You can do this in one of two ways:

#### Topics:

Topic	Detail	See also
<b>Moving Elements</b>	<ul style="list-style-type: none"> <li>• Hold the left mouse button down and drag over a group of elements to move (creating an outline around the elements), then click on an element in the outline and move the group as required</li> <li>• Press ( <b>Alt</b> ) and click on the diagram, then drag the cursor to move everything beyond the cursor in the direction of the movement.</li> </ul> <p>The first method enables you to reposition groups of elements within the larger diagram. The second method enables you to create space within the diagram without pushing some elements into others, as might happen if you cannot see the whole diagram on one screen.</p> <p>When you press ( <b>Alt</b> ) and click on the diagram, as you move the cursor a line displays on the diagram just behind the cursor. If you are moving the cursor left, everything to the left of the line moves with the cursor. If you move the cursor up, everything above the line moves up.</p> <p>However, if you move the cursor diagonally, two lines display to create a quadrant, and everything within the quadrant moves. For example, if you move the cursor left and down, everything below and left of the cursor moves.</p>	
<b>Fine Movement</b>	To adjust (or 'nudge') the position of a single element or a selected group of elements, press ( <b>Shift</b> ) + ( <b>→</b> ), ( <b>←</b> ), ( <b>↑</b> ) or ( <b>↓</b> ).	

### 5.5.6.27 View Last and Next Diagram

Enterprise Architect enables you to step backwards and forwards through the currently-open diagrams, including the **Start Page**.

#### Topics:

Topic	Detail	See also
<b>Usage</b>	 <p>To view the previous or next diagram use the <b>Previous</b> or <b>Next</b> buttons on the <b>Diagram</b> toolbar.</p> <p>Use the <b>Home</b> button to display the <b>default project diagram</b> (if one has been specified).</p>	<a href="#">Default Project Diagram</a> <sup>[587]</sup>

### 5.5.6.28 Set Diagram Page Size

You can change the size of the diagram area (or scrollable/printable area) using the Diagram Properties dialog.

#### How to:

To set the page size, follow the steps below:

Step	Action	See Also
1	Load a diagram.	
2	Double-click on the background to open the <b>Diagram Properties</b> dialog.	
3	Click on the <b>Diagram</b> tab and, in the <b>Appearance</b> panel ensure that the <b>Show Page Border</b> checkbox is selected.	
4	On the <b>Page Setup</b> panel, click on the <b>Advanced</b> button. The <b>Print Advanced</b> dialog displays.	
5	Click on the <b>Page Setup</b> button. The Page Setup dialog displays.  As you adjust the settings on this dialog, the page icon at the top illustrates the effects of your changes.	
6	In the <b>Size</b> field, click on the drop-down arrow and select an appropriate page size.	
7	In the <b>Orientation</b> panel click on the radio button for the orientation of the page to print.	
8	In the <b>Margins</b> panel, type the required left, right, top and bottom page margins for the diagram, in inches.	
9	Click on the <b>OK</b> button on the <b>Page Setup</b> dialog, the <b>Print Advanced</b> dialog, and the <b>Diagram Properties</b> dialog.  The area within the page boundary lines on your diagram is expanded or reduced accordingly. When you print or print preview, the output is cropped to these boundary lines and the diagram divided between the necessary number of pages.	

**Topics:**

Topic	Detail	See also
<b>Setting the Default Paper Size for New Diagrams</b>	You can set the default paper size for new diagrams on the <b>Diagram</b> page of the <b>Options</b> dialog (select the <b>Tools   Options   Diagram</b> menu option). Once the paper size is set there, all new diagrams have that as the default size.	<a href="#">Configure Local Options - Diagram</a> <sup>428</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Update Diagrams permission to change diagram page setup

**Learn More:**

- [Permissions List](#)<sup>206</sup>

### 5.5.6.29 Scale Image to Page Size

When you print a diagram, the default setting is to scale the image to fit the size of the printer paper you have defined in the page set-up. The image is not scaled up to fill the page, but it is scaled down if it exceeds the current page boundary. The image retains its current proportions; that is, it is scaled down equally in the X and Y dimensions. For a large diagram, this can mean that the components of the diagram are small and hard to read.

Alternatively, you can print a multi-page image; that is:

- allow the diagram image to print on as many printer pages as it naturally occupies, (no scaling), or
- scale the diagram image to exactly fit a specified number of pages

In all three cases you also define the paper size and orientation.

#### How to:

To turn off or customize image scaling options, follow the steps below:

Step	Action	See Also
1	Select the diagram to scale	
2	Either: <ul style="list-style-type: none"> <li>• Double-click on the diagram background, or</li> <li>• Right-click on the background and select the <b>Properties</b> context menu option</li> </ul> The <type> Diagram: <name> dialog displays	
3	Click on the Diagram tab and, in the Page Setup panel click on the <b>Advanced</b> button The Print Advanced dialog displays	<a href="#">Page size and Alignment</a> <sup>[602]</sup>
4	Select from the following options as required: <ul style="list-style-type: none"> <li>• <b>None</b>: select to print on as many pages as the diagram image covers</li> <li>• <b>Scale to 1 page</b>: select to scale the diagram image to fit on the currently selected page</li> <li>• <b>Custom</b>: select to specify the width and height of the diagram images across a specified number of pages</li> <li>• <b>Page Setup</b>: click to select the page size and alignment</li> </ul>	

#### Notes:

- Before printing, make sure you have selected the required page layout using the **Page Setup** button

#### Learn More:

- [File Menu](#)<sup>[74]</sup>

### 5.5.6.30 Lock Diagram

You can lock a diagram against inadvertent changes, such as moving or sizing elements.

#### How to:

To lock a diagram, follow the steps below:

Step	Action	See Also
1	Open the diagram to lock	
2	Right-click on the background to open the diagram context menu	
3	Click on the <b>Lock Diagram</b> option to prevent further changes	
4	Click on the <b>OK</b> button If a user selects an item on a locked diagram, the object border or outline displays in red	

**Notes:**

- This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions if security is enabled. In that case, see the Lock Model Elements topic

**Learn More:**

- [Lock Model Elements](#) <sup>[21]</sup>

### 5.5.6.31 Undo Last Action

When editing diagrams, Enterprise Architect supports multiple undo levels for moving, re-sizing and deleting elements, and for deleting connectors.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	There are three ways to undo the last action: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+Z</b> )</li> <li>• Select the <b>Edit   Undo</b> menu option</li> <li>• Click on the <b>Undo</b> button in the <b>Default Tools</b> toolbar - </li> </ul>	

**Notes:**

- Currently you cannot undo element additions or connector moves

### 5.5.6.32 Redo Last Action

When editing diagrams, Enterprise Architect supports multiple undo levels for moving, re-sizing and deleting elements, and for deleting connectors. If an Undo action is in error, you can redo the action to reverse the Undo.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	There are three ways to redo the last action: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+Y</b> )</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Select the <b>Edit   Redo</b> menu option</li> <li>Click on the <b>Redo</b> button in the <b>Default Tools</b> toolbar - </li> </ul>	

### 5.5.7 Layout Diagrams

Enterprise Architect provides a Layout Tools window to enable you to lay out the elements in a diagram. Unless the diagram is very simple, this facility does not lay out the entire diagram; it consists of a set of tools to set out different areas or sets of elements in the diagram.

#### How to:

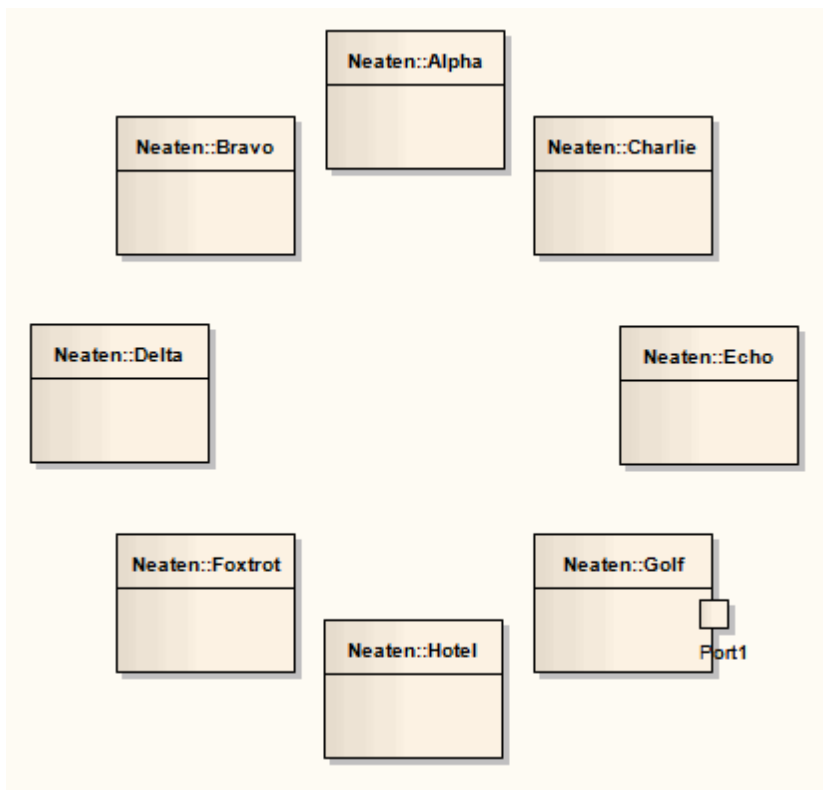

To start to lay out a diagram, follow the steps below:

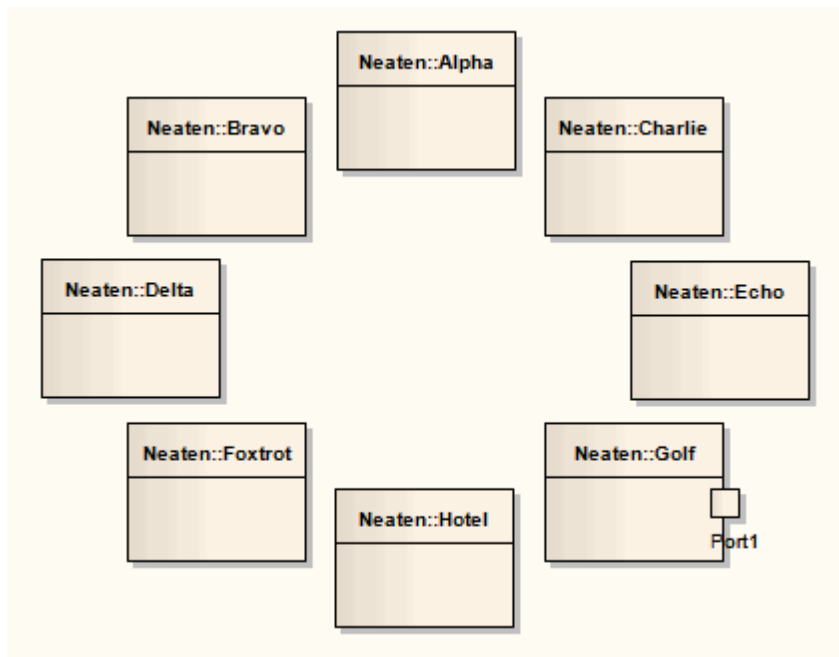

Step	Action	See Also
1	Open the Layout Tools window; either: <ul style="list-style-type: none"> <li>Select the <b>View   Diagram Layout</b> menu option, or</li> <li>Right-click on the main toolbar and select the <b>Layout Tools</b> context menu option</li> </ul>	
2	Select the elements to lay out on the currently-active diagram - hold ( <b>Shift</b> ) or ( <b>Control</b> ) while you click on each required element, or hold the mouse button down while you sweep over the area containing the required elements  If no elements are selected on the active diagram, then all elements on the diagram are laid out (except where otherwise documented)	
3	Click on the drop-down arrow on the top left field of the Layout Tools window, and select the required layout type	
4	The layout type determines the fields presented in the window, therefore the appropriate fields are described in the topic for each layout type <ul style="list-style-type: none"> <li>Circle/Ellipse</li> <li>Box</li> <li>Per Page</li> <li>Digraph</li> <li>Spring</li> <li>Neaten</li> <li>Converge/Diverge</li> <li>Fan Relations</li> <li>Auto Route</li> </ul>	<a href="#">Circle/Ellipse</a> <sup>607</sup> <a href="#">Box</a> <sup>611</sup> <a href="#">Per Page</a> <sup>613</sup> <a href="#">Digraph</a> <sup>614</sup> <a href="#">Spring</a> <sup>615</sup> <a href="#">Neaten</a> <sup>616</sup> <a href="#">Converge/Diverge</a> <sup>617</sup> <a href="#">Fan Relations</a> <sup>619</sup> <a href="#">Auto Route</a> <sup>620</sup>
5	When you have completed the fields, click on the  button  Enterprise Architect sets out the selected elements according to the options you have selected	
6	If you do not want to work with the new layout, click on the <b>Undo</b> button in the toolbar  (  )	<a href="#">Automatically Laying out a Diagram</a> <sup>621</sup>

Step	Action	See Also
	Enterprise Architect also provides a facility for automatically laying out a diagram; if necessary, you can manually adjust the final result of this automatic process	

### 5.5.7.1 Circular/Elliptical Layout

The *Circle* and *Ellipse* layouts arrange the selected elements in a circle or elliptical pattern, using the largest horizontal and vertical element edge in the set of elements when calculating the radius of the layout arc.

**How to:**

To invoke the Circular or Ellipse layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select either <b>Circle</b> or <b>Ellipse</b> as required	<a href="#">Layout Diagrams</a> 606
2	Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter: <ul style="list-style-type: none"> <li>• <b>None</b> - Elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - Elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - Elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - Elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	Under the <b>Placement</b> option, select either: <ul style="list-style-type: none"> <li>• <b>Top to Bottom</b> (the elements are positioned in the required order, zig-zagged across the perimeter of the circle or ellipse - see Diagram A, below)</li> <li>• <b>Circular</b> (the elements are placed in the required order, clockwise around the perimeter of the circle or ellipse - see Diagram B, below)</li> </ul>	
4	Select the <b>Center focused element</b> checkbox to put the last-selected element (the one with the hashed border) in the center of the circle or ellipse - see Diagram C, below	

Diagram A - Top To Bottom Layout

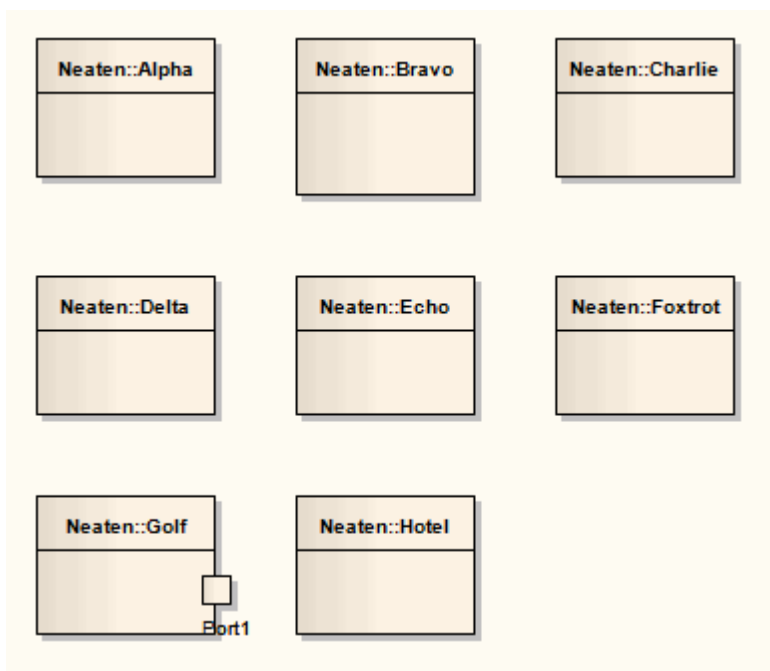

*Diagram B - Circular Layout*

Diagram C - Center Focused Element

### 5.5.7.2 Box Layout

The *Box* layout arranges the set of selected elements into a square grid.

The dimensions of the box are determined by the square root of the number of selected elements (for example, 16 elements create a 4x4 box).

**How to:**

To invoke the Box layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select <b>Box</b>	<a href="#">Layout Diagrams</a> 6061
2	Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter: <ul style="list-style-type: none"> <li>• <b>None</b> - Elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - Elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - Elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li>• <b>Element Type</b> - Elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	In the <b>Padding (px)</b> field, type the vertical and horizontal distance between elements, in pixels	
4	Select the appropriate element distribution option: <ul style="list-style-type: none"> <li>• <b>Automatically distribute:</b> Automatically calculate the dimensions of the box (the square root of the number of selected elements; for example, 16 elements create a 4x4 box)</li> <li>• <b>Specify distribution:</b> Manually define the width of the box, in columns</li> </ul>	
5	If you selected <b>Specify Distribution</b> , in the <b>Columns</b> field type the required number of columns	

### 5.5.7.3 Per Page Layout

The *Per Page* layout divides each diagram page into a number of cells, which house the selected elements. The number of cells per page is determined by the page distribution parameter, as explained below.

#### How to:

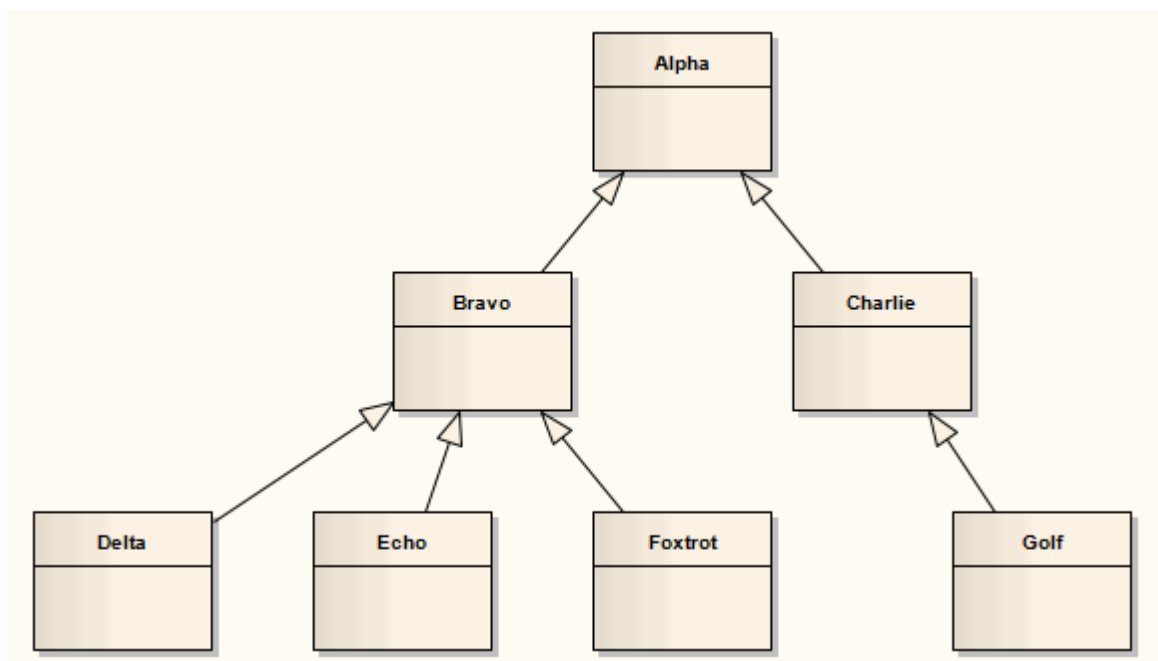

To invoke the *Per Page* layout, follow the steps below:

Step	Action	See Also
1	Follow the general <b>Layout Diagrams</b> procedure, and at step 3 select <b>Per Page</b>	<a href="#">Layout Diagrams</a> 
2	Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter: <ul style="list-style-type: none"> <li><b>None</b> - Elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li><b>Area (Ascending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li><b>Area (Descending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li><b>Name (Ascending)</b> - Elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li><b>Name (Descending)</b> - Elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> <li><b>Element Type</b> - Elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
3	In the <b>Padding (px)</b> field, type the vertical and horizontal distance between cells, in pixels	

Step	Action	See Also
4	Select the appropriate page distribution option: <ul style="list-style-type: none"> <li>• <b>Automatically distribute:</b> Automatically calculate the optimum number of cells, taking into consideration the largest horizontal and vertical element edges</li> <li>• <b>Specify distribution:</b> Manually enter the per page grid dimensions</li> </ul>	
5	If you selected <b>Specify Distribution</b> , in the <b>Rows</b> and <b>Columns</b> fields type the required number of rows and columns	
6	Select the <b>Center Elements</b> checkbox to place each element in the center of its cell; otherwise the element placement defaults to the top left corner of the cell	
7	In the <b>Start Page</b> field, type the number from which to start page numbering; pages begin at the top left and continue horizontally to the right	

#### 5.5.7.4 Digraph Layout

The *Digraph* layout arranges the selected elements into a directed graph (digraph for short). The Digraph attempts to highlight the hierarchy of the elements while keeping the direction of all connectors pointing to the same edge of the diagram.

The Digraph layout provides the same behaviour as the Automatic Diagram layout.

#### Learn More:

- [Layout Diagrams](#)<sup>[606]</sup>
- [Lay out a Diagram Automatically](#)<sup>[621]</sup>

### 5.5.7.5 Spring Layout

The *Spring* layout uses a force-directed approach to arrange the selected elements organically.

The Spring layout employs a physical analogy to lay out elements. Each element is treated as a particle with a like electrical charge that repels other elements. Connectors act as springs (hence the term Spring layout) that draw connected elements back together. The layout is good for highlighting clusters of related objects and identifying symmetry in the graph.

**How to:**

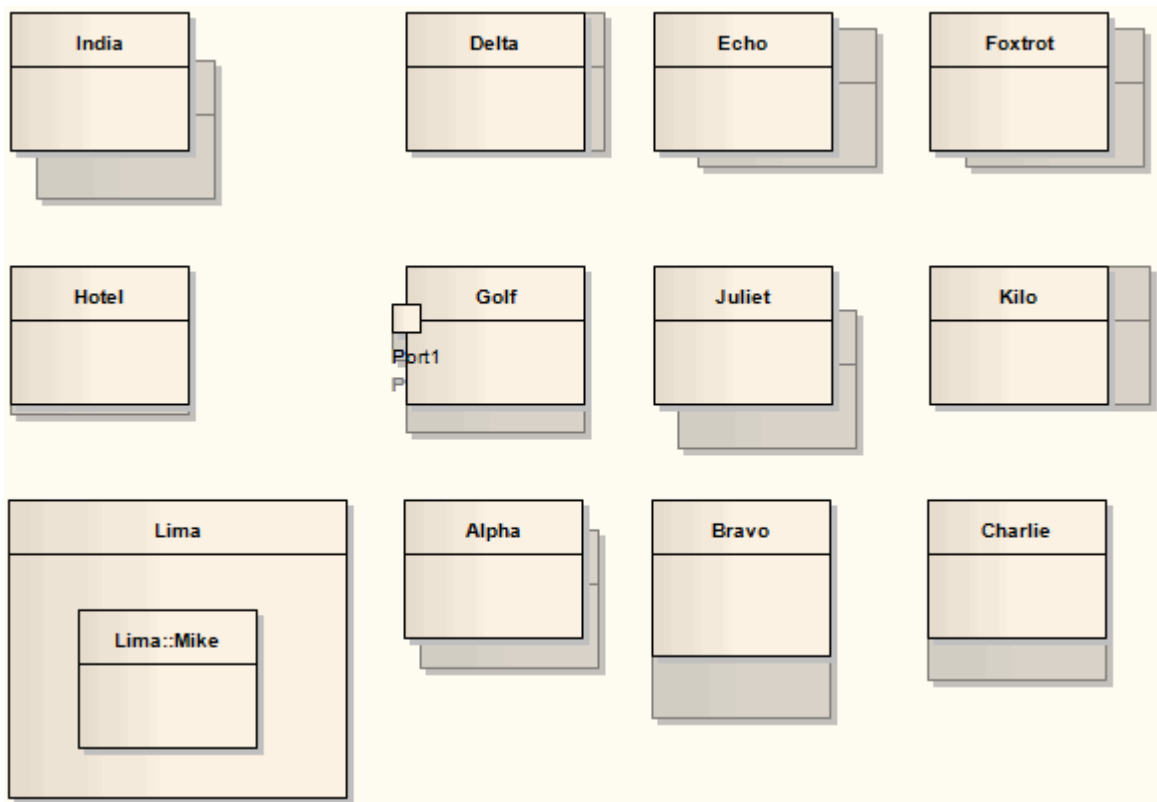

To invoke the Spring layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select <b>Spring</b>	<a href="#">Layout Diagrams</a> 
2	In the <b>Iterations</b> field, type the number of iterations, or rounds, to perform to reach the final layout  The layout is developed over several iterations; depending on the complexity of the graph, increasing the number of iterations produces a better result but takes longer to calculate	

Step	Action	See Also
3	If the diagram contains elements that significantly vary in size, and that might overlap in the final layout, select the <b>Scale to prevent overlap</b> checkbox to scale up the positions of the selected elements (preserving size) until no elements overlap	

### 5.5.7.6 Neaten Layout

The *Neaten* layout attempts to arrange the selected elements into a grid based on their horizontal and vertical proximity to each other. Elements that share the same row or column are aligned based on the **Column** and **Row Snap** parameters.

#### How to:

To invoke the Neaten layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select <b>Neaten</b>	<a href="#">Layout Diagrams</a> <sup>606</sup>
2	In the <b>Threshold (px)</b> field, type the height or width distance, in pixels, at which elements should be considered to be in the same row or column; a lower threshold value produces a tighter result, with only elements that are extremely similar - vertically or horizontally - considered to be in the same row or column	
3	In the <b>Column Snap</b> field, click on the drop-down arrow and select the appropriate alignment for elements in the same column:	

Step	Action	See Also
	<ul style="list-style-type: none"> <li>• <b>Left</b> - elements are aligned with the left edge of the left-most element in the column</li> <li>• <b>Center</b> - elements are aligned with the vertical center of the center-most element in the column</li> <li>• <b>Right</b> - elements are aligned with the right edge of the right-most element in the column</li> </ul>	
4	<p>In the <b>Row Snap</b> field, click on the drop-down arrow and select the appropriate alignment for elements in the same row:</p> <ul style="list-style-type: none"> <li>• <b>Top</b> - elements are aligned with the top edge of the highest element in the row</li> <li>• <b>Center</b> - elements are aligned with the horizontal center of the center-most element in the row</li> <li>• <b>Bottom</b> - elements are aligned with the bottom edge of the lowest element in the column</li> </ul>	

#### 5.5.7.7 Converge/Diverge Layout

The *Converge* layout attracts the set of selected elements towards the center of their bounding rectangle. Conversely, the *Diverge* layout repels the set of selected elements away from the center of their bounding rectangle. The Converge/Diverge layout also tries to maintain connector angles if an element in the set contains a connector with waypoints.

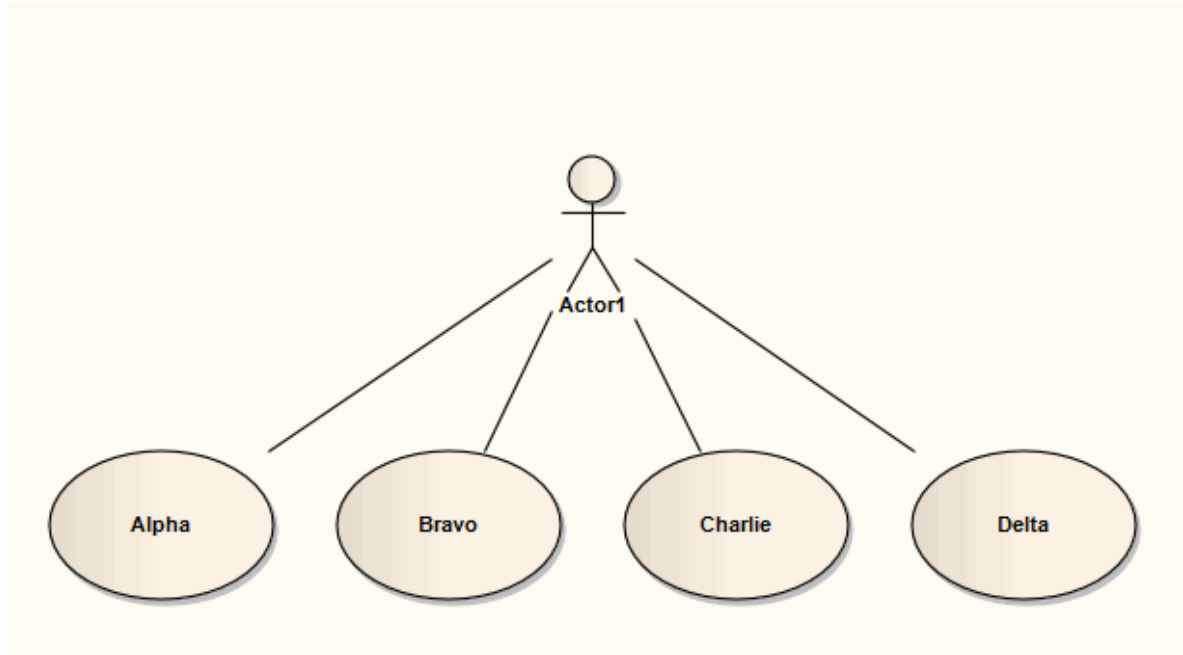

**How to:**

To invoke the Converge/Diverge layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select <b>Converge/Diverge</b>	<a href="#">Layout Diagrams</a> <sup>606</sup>
2	For <b>Direction</b> , select the required layout: <ul style="list-style-type: none"> <li>• <b>Converge</b> - attracts the set of selected elements to the center point</li> <li>• <b>Diverge</b> - repels the set of selected elements from the center point</li> </ul>	
3	The <b>Amount (%)</b> slider determines how far the elements are moved towards or away from the center point; the movement is the element's current distance from the center point multiplied by the percentage value set on the slider  In the Converge layout, the element moves towards the center point; in the Diverge layout the element moves further away from the center point  Set the slider to the required percentage	

### 5.5.7.8 Fan Relations Layout

The *Fan Relations* layout arranges the immediate relations of an element around a specified edge. This layout requires a single element to be selected on the diagram, to be used as the context for the layout.

#### How to:

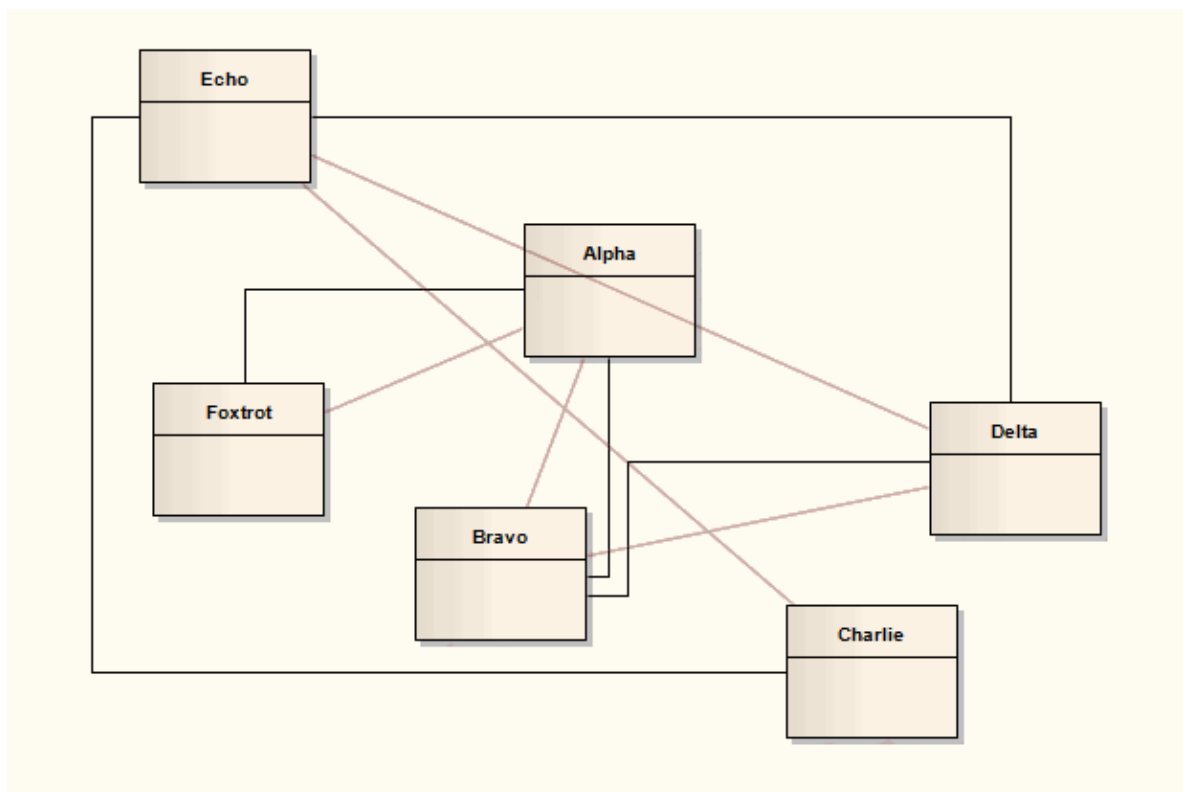

To invoke the Fan Relations layout, follow the steps below:

Step	Action	See Also
1	Open the Layout Tools window; either: <ul style="list-style-type: none"> <li>• Select the <b>View   Diagram Layout</b> menu option, or</li> <li>• Right-click on the main toolbar and select the <b>Layout Tools</b> context menu option</li> </ul>	<a href="#">Layout Diagrams</a> 606
2	Select the single element around which to lay out related elements on the currently-active diagram	
3	Click on the drop-down arrow on the top left button of the Layout Tools window, and select <b>Fan Relations</b>	
4	Click on the drop-down arrow in the <b>Sort By:</b> field and select the required sort parameter The options are: <ul style="list-style-type: none"> <li>• <b>None</b> - Elements are passed to the specified layout in the order in which they appear on the original diagram (left to right, top to bottom)</li> <li>• <b>Area (Ascending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, smallest to largest</li> <li>• <b>Area (Descending)</b> - Elements are passed to the specified layout in order of the screen space they occupy, largest to smallest</li> <li>• <b>Name (Ascending)</b> - Elements are passed to the specified layout in alphanumeric order, based on the element name</li> <li>• <b>Name (Descending)</b> - Elements are passed to the specified layout in reverse alphanumeric order, based on the element name</li> </ul>	

Step	Action	See Also
	<ul style="list-style-type: none"> <li>• <b>Element Type</b> - Elements are grouped by type (for example, Class, Use Case) and in alphanumeric order within the group by name</li> </ul>	
5	In the <b>Padding (px)</b> field, type the separation required between the selected element and its related elements, in pixels	
6	Select the connector direction to use in determining the related elements to lay out; either: <ul style="list-style-type: none"> <li>• <b>Incoming Nodes</b> - to lay out related elements that have the selected element as the target</li> <li>• <b>Outgoing Nodes</b> - to lay out related elements that have the selected element as the source</li> </ul>	
7	In the <b>Fan Edge</b> field, click on the drop-down arrow and specify the edge of the selected element from which to lay out the related elements <ul style="list-style-type: none"> <li>• <b>Left</b> - to arrange related elements to the left of the selected element</li> <li>• <b>Right</b> - to arrange related elements to the right of the selected element</li> <li>• <b>Top</b> - to arrange related elements from the top of the selected element</li> <li>• <b>Bottom</b> - to arrange related elements from the bottom of the selected element</li> </ul>	

### 5.5.7.9 Auto Route Layout

The *Auto Route* layout orthogonally routes connectors between the selected elements. The layout attempts to find the shortest path between the two connected elements while minimizing crossings. In the following layout, the original connectors are shown in red.

How to:

To invoke the Autoroute layout, follow the steps below:

Step	Action	See Also
1	Follow the general Layout Diagrams procedure, and at step 3 select <b>Auto Route</b>	<a href="#">Layout Diagrams</a> 
2	When calculating connector routes, the algorithm divides the diagram into cells of a size determined by the Cell Size value; a smaller cell size results in connectors being placed closer together  In this <b>Cell Size (px)</b> field, type the value in pixels	
3	In the <b>Element Margin</b> field, type the preferred separation between connector segments and element borders, in pixels	

### 5.5.7.10 Lay Out a Diagram Automatically

Enterprise Architect provides the facility to layout diagrams automatically. This creates a tree-based structure from the diagram elements and relationships in a diagram. Owing to the complexity of many diagrams, you might then have to do some manual 'tweaking'.

#### How to:

To layout a diagram, follow the steps below:

Step	Action	See Also
1	Select a diagram.	
2	Click on either: <ul style="list-style-type: none"> <li>The <b>Diagram   Layout Diagram</b> option, or</li> <li>The <b>Auto Layout</b> button on the diagram toolbar</li> </ul>	<a href="#">Layout Diagrams</a> 

#### Notes:

- This facility is available for Structural diagrams and Extended diagrams, but not for Behavioral diagrams (see the *UML Diagrams* topic for a description of the diagram types); however, the facility is also available for Sequence diagrams generated by the Enterprise Architect Debugger
- Dynamic and Analysis diagrams are **NOT** suited to this form of layout - please ensure first that the diagram type you are laying out benefits from the action
- If you dislike the autolayout, you can reverse it before saving the diagram; click ( **Ctrl+Z** )

For a fine degree of control of the elements in your diagram, you can use the Diagram Layout Options dialog. Generally the default layout parameters provide adequate layouts for a wide range of diagrams, but there are times when more specific settings are required.

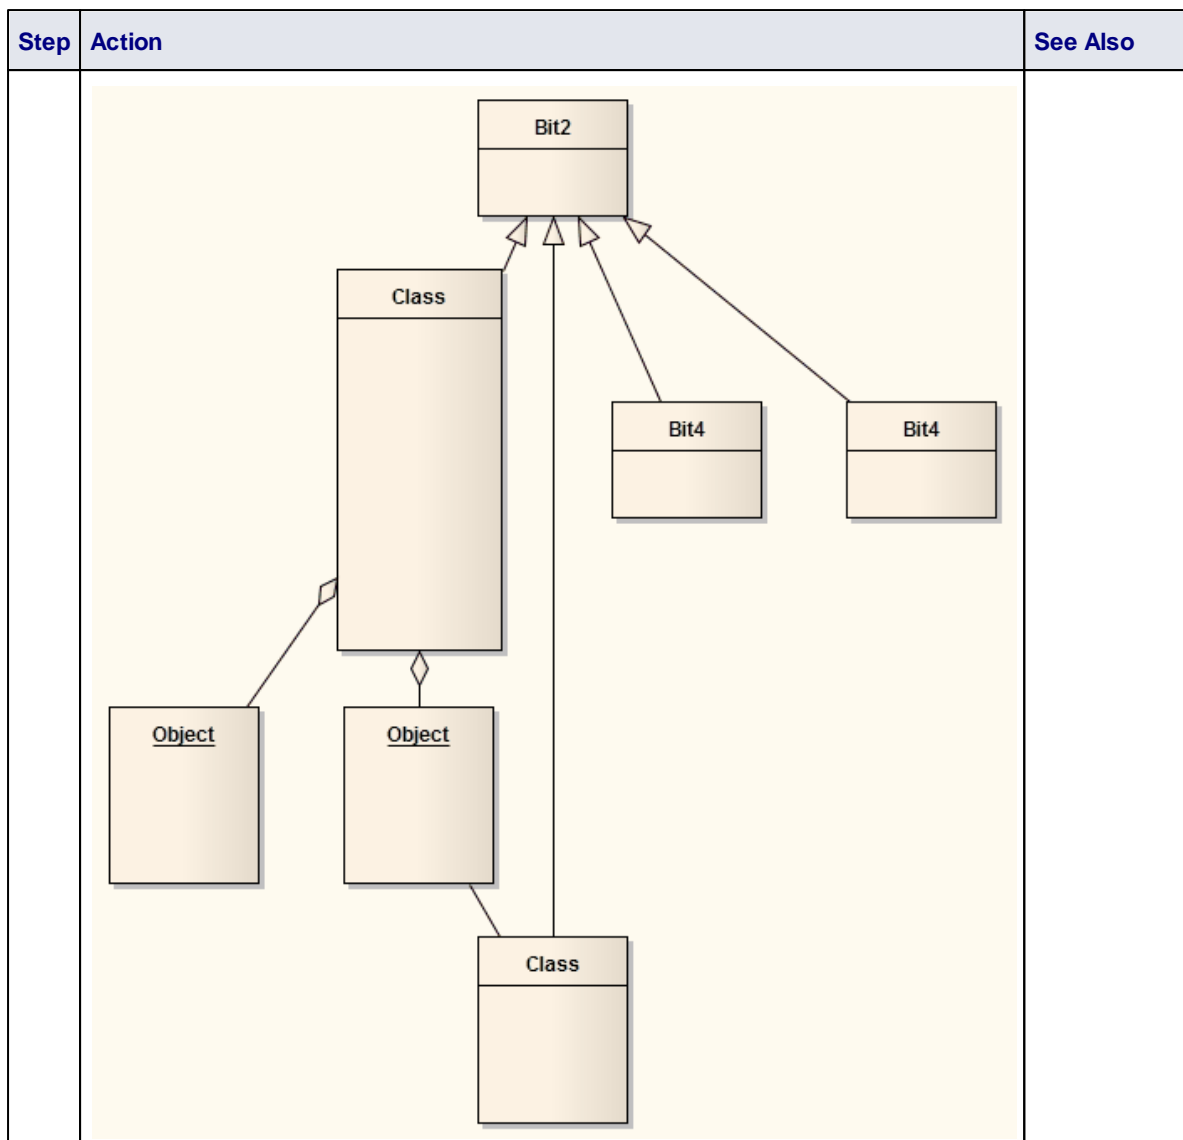

#### How to:

To access the Diagram Layout Options dialog, follow the steps below:

Step	Action	See Also
1	Double-click on the background of the diagram	

Step	Action	See Also
	The Diagram Properties dialog displays	
2	Click on the Diagram tab, then click on the <b>Set Layout Style</b> button The Diagram Layout Options dialog displays	
3	<p>When you have made the required changes, click on the <b>OK</b> button to save the changes</p> <p>You can alter any of the following settings on the Diagram Layout Options dialog to refine your layout:</p> <ul style="list-style-type: none"> <li>• Cycle Remove Options panel - these settings remove cycles in the element organization (where element X is the source of a path but also becomes the target of a branch of the path), by reversing the connectors that impose the cycling and then reorganizing the diagram and reinstating the reversed relationships; this identifies the primary source element in the diagram <ul style="list-style-type: none"> <li>• <b>Greedy</b> - Select to use the Greedy Cycle Removal algorithm, which minimizes the number of connectors reversed</li> <li>• <b>Depth First Search</b> - Select to use the Depth First Search Cycle Removal algorithm, which establishes the longest linear sequence possible, before establishing parallel sequences and branches; this algorithm is less effective in large and/or complex diagrams, but produces a more natural layout than the Greedy algorithm</li> </ul> </li> <li>• Crossing Reduction Options panel - these options determine how long the routine should look for ways of reorganizing the layout to avoid crossed relationships: <ul style="list-style-type: none"> <li>• <b>Iterations</b> - Type the number of iterations to be used during cycle removal (more than 8 does not usually provide any improvement)</li> <li>• <b>Aggressive</b> - Select to use an aggressive (detailed and time-consuming) crossing reduction step</li> </ul> </li> <li>• Layering Options panel - these settings determine how elements are organized in layers during layout: <ul style="list-style-type: none"> <li>• <b>Longest Path Sink</b> - Select to use the Longest Path Sink Layering algorithm, where the final target elements (sinks, which have no relationships issuing from them) are arranged in a layer at the top of the diagram, and the relationship paths built downwards from there in as many layers as there are nodes in the longest path</li> <li>• <b>Longest Path Source</b> - Select to use the Longest Path Source Layering algorithm, where the original source elements (those with no relationships entering them) are arranged in a layer at the bottom of the diagram and the relationship paths built up from there in as many layers as there are nodes in the longest path</li> <li>• <b>Optimal Link Length</b> - Select to use the Optimal Link Length Layering algorithm, which organizes the elements into whichever layers minimize the total source-to-sink relationship chain; in this layout you can have both source elements and sink elements at various levels of the diagram</li> </ul> </li> <li>• Layout Options panel: <ul style="list-style-type: none"> <li>• <b>Layer Spacing</b> - Type the default number of logical units between layers of elements (vertical spacing)</li> <li>• <b>Column Spacing</b> - Type the default number of logical units between elements within a layer (horizontal spacing)</li> </ul> </li> <li>• Direction panel: <ul style="list-style-type: none"> <li>• <b>Up, Down, Left, Right</b> - Select the direction in which directed connectors should point, to set the position of the primary source element and the overall flow of the diagram</li> </ul> </li> <li>• <b>Initialize Options panel</b> - the autolayout routine inserts line waypoints and</li> </ul>	

Step	Action	See Also
	<p>connectors into relationship paths to help plot the direction of relationships; the routine then assigns an index number to every node, such that nodes in the same layer are numbered left to right</p> <p>The settings in this panel determine how those index numbers are assigned</p> <ul style="list-style-type: none"> <li>• <b>Naive</b> - Select to use the Naive Initialize Indices algorithm, which assigns index numbers to nodes as they are encountered in a sweep and tends to place all waypoints to the right of real nodes (and therefore long relationships between a small number of elements to the right of chains of short relationships between several elements)</li> <li>• <b>Depth First Search Outward</b> - Select to use the Depth First Out Initialize Indices algorithm, which assigns index numbers to nodes as they are encountered in a depth first search from source nodes outwards (and would therefore place longer relationship chains to the left of shorter chains, with the primary source node at the start of the diagram flow)</li> <li>• <b>Depth First Search Inward</b> - Select to use the Depth First In Initialize Indices algorithm, which also assigns index numbers to nodes as they are encountered in a depth first search, but from sink nodes inwards (and would therefore place longer relationship chains to the left of shorter chains, with the ultimate target node at the end of the diagram flow)</li> </ul> <ul style="list-style-type: none"> <li>• Set as <b>Project Default</b> checkbox - select this checkbox to apply the diagram layout settings to all diagrams in the project; if you later check this box and click on the <b>OK</b> button for a different diagram, the new settings override the settings saved earlier</li> </ul> <p>The following is an example of an automatically laid out diagram, with the following options set:</p> <ul style="list-style-type: none"> <li>• <b>Depth First Search</b></li> <li>• <b>Optimal Link Length</b></li> <li>• <b>Depth First Search Outward</b></li> <li>• <b>Direction - Up</b></li> </ul>

**5.5.8 The Quick Linker**

The *Quick Linker* provides a simple and fast way to create new elements and connectors on a diagram. When an element is selected in a diagram, the **Quick Linker** arrow is displayed at the upper right corner of the element, as shown below:

**Topics:**

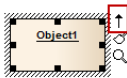

Image	Topic	Detail	See also
	<b>Usage</b>	Simply clicking and dragging the icon enables you to create new connectors and elements on a diagram, as explained in the following topics: <ul style="list-style-type: none"> <li>• Create New Elements</li> </ul>	<a href="#">Create New Elements</a> <sup>[625]</sup> <a href="#">Create Connectors</a> <sup>[626]</sup>

Image	Topic	Detail	See also
		<ul style="list-style-type: none"> <li>• Create Connectors</li> </ul> <p>The connectors and elements suggested by the Quick Linker are the commonest objects appropriate to the context. You can select others from the <b>Toolbox</b> pages. Also, a Technology Developer can edit the lists of elements and connectors, and create new combinations.</p>	

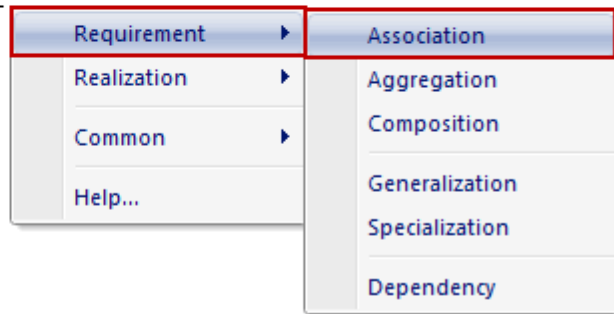

### 5.5.8.1 Create New Elements

*Click, drag and release*

*Choose element and connector type*

**Topics:**

Topic	Detail	See also
Usage	<ul style="list-style-type: none"> <li>• Press and hold ( <b>Shift</b> ) while selecting the type of connector to select an existing classifier as the target.</li> <li>• For rapid modeling, you can suppress the <b>Properties</b> dialog when creating new elements. See the option <b>Tools   Options   Objects   Edit Object on New</b>.</li> </ul> <p>The available Quick Linker options depend on the type of element selected. For example, the Quick Linker options for a Class (above) differ from those of an Actor (below). These are the most appropriate, commonly used elements and connectors for the source element; you can create other target elements and connectors by selecting them from the appropriate <b>Toolbox</b> page.</p>	

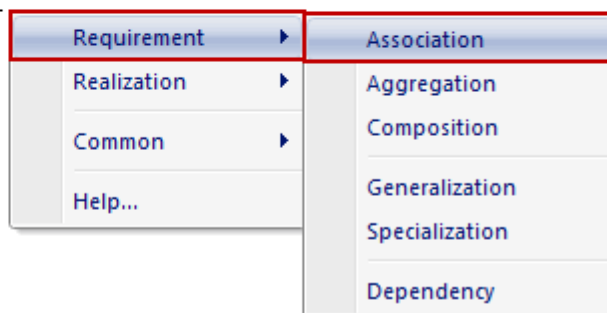

### 5.5.8.2 Create Connectors

*Click, drag and release*

*Choose element and connector type*

#### Topics:

Topic	Detail	See also
Usage	<p>The list of connectors provides the most appropriate, commonly-used connectors for the source and target element types. If you want to use a different connector, select the appropriate Toolbox page, click on the required connector and then on the source element, and drag across to the target element.</p> <p>The connector does not actually establish until you release the mouse button over the target element. However, a dotted line shows where the connector would be at any point, and the solid outline of the nearest element or extension changes to a hatched outline as you move the cursor onto it; this helps you identify where the connector should connect to, if there are many closely-arranged elements, Parts, Ports and other extensions.</p> <p>You can also bend the connector, pressing ( <b>Shift</b> ) as you drag the cursor in a new direction.</p> <p>You can create a <b>Notelink</b> to attach a Note or Constraint to a connector, simply by dragging the Quick Linker arrow on the Note to the connector.</p>	

## 5.6 Elements

Models are constructed from elements, each of which has its own meaning, rules and notation. Elements can be used at different stages of the design process for different purposes.

The properties and features of an element can be defined and displayed through a set of windows and dialogs.

- [Set Element Templates Package](#)<sup>[645]</sup>
- [Behavioral Diagram Elements](#)<sup>[866]</sup>
- [Structural Diagram Elements](#)<sup>[942]</sup>

**5.6.1.2 Add Elements Directly To Packages**

You can quickly add new elements to a package without the necessity of adding a diagram element at the same time. This is particularly useful in defining a group of Requirements, Changes, Issues, base Classes or other element types that might not require diagrammatic representation in the model.

**How to:**

To add a new element to a package, follow the steps below:

Step	Action	See Also
1	In the <b>Project Browser</b> , right-click on the appropriate package. The context menu displays.	
2	Select the <b>Add   Add Element</b> menu option. The <b>New Element</b> dialog displays.	
3	In the <b>Name</b> field, type the name of the element.	
4	In the <b>Type</b> field, click on the drop-down arrow and select the element type.	
5	If required, in the <b>Stereotype</b> field either type the stereotype name or click on the drop-down arrow and select the stereotype.	
6	Select the <b>Open Properties Dialog on Creation</b> checkbox if the <b>Properties</b> dialog is to open immediately after the element is created.	
7	Deselect the <b>Close Dialog on OK</b> checkbox to add multiple elements in one session.	
8	Click on the <b>OK</b> button to create the element.	

**Notes:**

- The drop-down list is populated from one of the **Toolbox** page groups (including profile, Add-In and MDG Technology groups). If the list does not represent the group containing the element you require, click on the **Select Group** button and, from the list, select the appropriate **Toolbox** page group. The drop-down list then shows the elements from that group
- The <default> group in the list contains a basic set of elements drawn from across the UML Behavioral and Structural groups, and the Enterprise Architect Extended groups
- If you have a diagram open, the **Add to Current Diagram** checkbox is available and defaulted to selected to add the new element to the diagram. If you do not want the element in that diagram, deselect the checkbox

**5.6.1.3 Use Auto Naming and Auto Counters**

The Auto Element Naming dialog enables you to configure automatic naming for any element type. Each element can have separately configured automatic names and aliases.

**How to:**

To set up auto naming, follow the steps below:

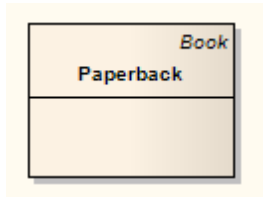

Step	Action	See Also
1	<p>In the Name panel:</p> <ul style="list-style-type: none"> <li>• In the <b>Prefix</b> field, type a prefix for the new name (optional)</li> <li>• In <b>Counter</b> field, type the counter value; use as many 0's as required to pad the name</li> <li>• In the <b>Suffix</b> field, type a suffix for the new name (optional)</li> <li>• If required, click on the <b>Active</b> checkbox to turn auto naming on for this element type</li> </ul>	
2	<p>In the Alias panel:</p> <ul style="list-style-type: none"> <li>• In the <b>Prefix</b> field, type a prefix for the new alias (optional)</li> <li>• In <b>Counter</b> field, type the counter value; use as many 0's as required to pad the alias</li> <li>• In the <b>Suffix</b> field, type a suffix for the new alias (optional)</li> <li>• If required, click on the <b>Active</b> checkbox to turn alias auto naming on for this element type</li> </ul>	
3	<p>Click on the <b>Save</b> button.</p> <p>New elements of this type now have an automatically-generated name and/or alias with an incrementing counter value.</p> <p>If an Alias is active then auto naming applies; however, to view the Alias in a diagram requires that the option <b>Use Alias if Available</b> is selected in Diagram Properties.</p>	<a href="#">Diagram Properties</a> 

**5.6.1.4 Set Element Parent**

You can manually set an element's parent or parents, or an interface it realizes (implements), using the **Set Parents and Interfaces** dialog.

**How to:**

To set an element parent, follow the steps below:

Step	Action	See Also
1	Select a generalizable element in a diagram.	
2	Select the <b>Element   Advanced   Set Parents and Interfaces</b> menu option. Alternatively: <ul style="list-style-type: none"> <li>• Press (<b>Ctrl+I</b>) or</li> <li>• Right-click and select the <b>Advanced   Parent</b> context menu option.</li> </ul> The <b>Set Parents and Interfaces</b> dialog displays.	
3	You can elect to enter a parent or interface name by either manually typing it in, or clicking on the <b>Choose</b> button to locate the element within the current model.	
4	Set the <b>Type</b> of relationship ( <b>Implements</b> or <b>Generalizes</b> ) from the drop-down list.	
5	Click on the <b>Add</b> button to add the relationship to the <b>Type Details</b> list, and to the selected child element. <div style="text-align: center; margin: 10px 0;">  </div>	
6	Repeat this process to add further parent elements, or click on the <b>Delete Selected</b> button to remove a selected relationship.	

If the parent name is shown in the element on the diagram, you can select it and perform further operations, as follows:

Step	Action	See Also
1	Click on the element	
2	Click on the parent name to highlight it	
3	Right-click to display the context menu, which provides options enabling you to: <ul style="list-style-type: none"> <li>• Redisplay the Set Parents and Interfaces dialog to, for example, delete the parent or add further parents</li> <li>• Display the parent element Properties dialog</li> <li>• Find the parent element in the Project Browser</li> </ul> Find the parent element in the diagram  If the parent element does not currently exist in the model, and is listed on the element in the diagram, you can highlight it and click on it to redisplay the Set Parents and Interfaces dialog to, for example, delete it or add further parents	

**Notes:**

- You can specify parent elements that exist in the model, or that you intend to create later. If the parent element does not currently exist in the model, select the **Accept classifier even if not in model** checkbox to ensure that the reference to a non-existent element is accepted
- If Parents are not in the same diagram as their corresponding related element, the parentage is

shown in the top right corner of the child element

### 5.6.1.5 Show Element Use

You can display the use of an element using the **Element Usage** dialog. This lists all occurrences of the element throughout the model, and enables you to easily navigate to any occurrence.

#### How To:

To show element usage, follow the steps below:

Step	Action	See Also
1	Select an element in a diagram	
2	Select the <b>Element   Find in Diagrams</b> menu option (or, for a Package element, the <b>Find in all Diagrams</b> option)  Alternatively, press ( <b>Ctrl+U</b> )  If the element exists in other diagrams, the <b>Element Usage</b> dialog displays, listing all occurrences of the current element in diagrams in the model	
3	If you want to display the usage information in a more readable layout, you can resize the dialog and its columns  Either: <ul style="list-style-type: none"> <li>• Double-click on a line item to open the relevant diagram and display the selected element (the Element Usage dialog remains open), or</li> <li>• Click on the <b>Open</b> button to display the selected diagram and close the Element Usage dialog</li> </ul>	

#### Notes:

- You can also access this feature from the Project Browser; select an element in the tree and select the **Element | Find in Diagrams** menu option

If there is only one instance of the element in any diagram, that diagram displays instead

### 5.6.1.6 Set Up Cross References

It is possible to set up a cross reference (or Custom Reference) from one element in Enterprise Architect to another. You can also view existing cross references on an element, using the Context References tab on the element's Properties dialog, or the Traceability window.

#### How to:

To set up a cross reference, follow the steps below:

Step	Action	See Also
1	In the <b>Project Browser</b> , locate the target element or diagram (that is, the object of the cross reference).	
2	Open a diagram that contains the elements that are to have the currently selected element as a reference.	
3	Right-click on the element in the <b>Project Browser</b> . The context menu displays.	

Step	Action	See Also
4	Select the <b>Add custom reference</b> menu option.	
5	In the <b>Set up references</b> dialog, select the checkbox against each element to that is to have the target element as a reference.	
6	Optionally, in the <b>Comment</b> field, type some text to describe the purpose of the reference.	
7	Click on the <b>OK</b> button.	

To use the cross reference, follow the steps below:

Step	Action	See Also
1	Select an element in a diagram.	
2	Select the <b>Element   Advanced   Custom References</b> menu option Alternatively, either press ( <b>Ctrl+J</b> ) , or right-click on the element and select the <b>Find   Custom References</b> context menu option.	
3	The <b>Custom References</b> dialog displays, showing a list of elements that have been set as cross references for the selected element.	
4	You can open the <b>Properties</b> dialog for an element by highlighting it and clicking on the <b>Open</b> button.	
5	If you have a diagram cross reference, you can open that diagram.	
6	If you have a string of diagram links, click on the <b>Home</b> button to return to the original diagram.	

**Notes:**

- You can delete a cross reference by selecting it on the Custom References dialog and clicking on the **Delete** button; cross references are also automatically deleted if the source or target element in the reference is deleted

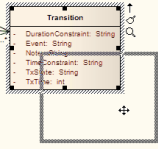

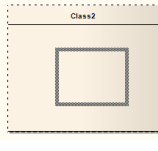

**Learn More:**

- [Context References Tab](#)<sup>688</sup>
- [The Traceability Window](#)<sup>497</sup>

### 5.6.1.7 Move Elements Within Diagrams

Any one of the following options enables you to move an element within a diagram.

#### Topics:

Image	Topic	Detail	See also
	<b>Usage</b>	<p>Select an element or group of elements in the diagram view, then:</p> <ul style="list-style-type: none"> <li>• Use the mouse to drag the element to the required position (the cursor switches to the four-arrow icon as shown)</li> <li>• Hold down ( <b>Shift</b> ) and use the arrow keys to move the element by increments to the required position</li> <li>• Use the <b>Left, Right, Up and Down</b> options in the <b>Element   Move</b> submenu</li> <li>• Align multiple elements using the <b>Element   Alignment</b> submenu, the <b>Alignment</b> options in the right-click context menu, or the <b>Alignment</b> buttons on the <b>Diagram</b> toolbar.</li> </ul> 	
	<b>Confirm Possible Parent Elements</b>	<p>As you organize the elements within a diagram, you can drag any element over another and, provided the dragged element is within and on top of the possible parent, it is always encapsulated by the lower element and moved within the lower element. However, the lower element might not be a valid parent.</p> <p>You can confirm that a possible parent element is able to accept a selected child element. When you drag the child element over the potential parent, the target element border changes to a dashed line if it can accept the selected element as a child. If the border does not change, the selected element cannot be a child to the target element.</p>	

#### Notes:

- The **Support for Composite Objects** checkbox must be selected on the Objects page of the Options dialog (select the **Tools | Options | Objects** option). If this option is not selected, the dashed border does not show and the child element cannot be embedded on the parent in the diagram
- Both elements must already exist on the diagram; an element border does not change if you drag a potential child element over it from the Toolbox or Project Browser
- The child element must have equal or higher Z-order placement than the parent; that is, the parent element must be level with or behind the child
- The child element borders must be completely within the parent element borders
- For example, if you drag a Signal over a Class, the Class border changes; a Class element can be a parent to a Signal. If you drag a Class element over a Signal element, the Signal border does not change. A Signal cannot be a parent to a Class
- When you embed a child element on its parent, the child element becomes part of the parent element hierarchy in the Project Browser. Similarly, if you drag the child element out of the parent, the child element becomes independent and is no longer embedded in the parent element hierarchy

#### Learn More:

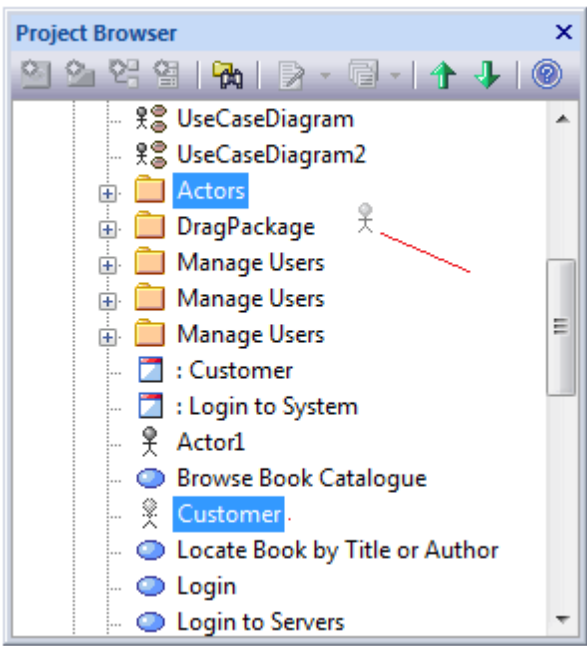

- [Objects](#)<sup>[434]</sup>
- [Diagram Context Menu](#)<sup>[540]</sup>

### 5.6.1.8 Move Elements Between Packages

Elements and packages can be moved from one package to another by dragging and dropping the element to the target destination in the **Project Browser**. Note that if you move a package, ALL the child packages and their contents are moved to the new location also.

**How To:**

To move an element between packages, follow the steps below:

Step	Action	See Also
1	Click on the element in the Project Browser. (See <b>Customer</b> in the diagram below.)	
2	<p>Drag the element so that the cursor is over the target package icon. The element symbol (and, in some operating systems, the element name) displays at the moving cursor position.)</p> 	
3	Release the mouse button. The element is moved into the target package.	

**Notes:**

- You can also drag the element under a host element in the new package; for example, drag an element under a Class
- Moving an element has no effect on any relationships that the element might have
- Moving an element in the **Project Browser** has no effect on the use of that element in any diagram
- Moving a diagram generally does not affect the location of elements in packages. If you move a diagram out of one package into another, all the elements in the diagram remain in the original package. However, certain elements (such as Decision, Initial and Final elements) are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram. Therefore, if you move a diagram containing these elements, they **are** moved to the new parent package with the diagram

- In a multi-user environment, if one person moves or updates the **Project Browser** structure, other users must reload their project to see the latest changes in the **Project Browser**. Although this is true of any addition or modification to the tree, it is most important when big changes are made, such as dragging a package to a different location

**Learn More:**

- [Refresh View of Shared Project](#)<sup>[188]</sup>

### 5.6.1.9 Copy Elements Between Packages

Enterprise Architect enables you to quickly and easily duplicate one or more elements, including their child elements and diagrams. You can insert a copy of an element under one or more other packages, in the same .eap file or any other .eap file.

**Topics:**

Topic	Detail	See also
<b>Copying Elements</b>	<p>In the Project Browser, select each required element, right-click on one of them and select the <b>Copy Element(s) to Clipboard</b> context menu option (or click on a selected element and press ( <b>Ctrl+C</b> ) )</p> <p>The Copy Element(s) to Clipboard dialog briefly displays until the copy operation completes</p>	
<b>Pasting Elements</b>	<p>In the Project Browser, right-click on the package into which to paste the copied elements, and select the <b>Paste Element(s) from Clipboard</b> context menu option (or click on the package and press ( <b>Ctrl+V</b> ) )</p> <p>The Paste Element(s) from Clipboard dialog briefly displays until the paste operation completes.</p> <p>The target package is expanded and the pasted elements are exposed in the Project Browser. If you are pasting the elements within the same model as the copied source, the source parent package is also collapsed.</p> <p>If the target package already contains:</p> <ul style="list-style-type: none"> <li>• an element of the same type with the same name as a pasted element, the pasted element name has the suffix - Copy</li> <li>• an element with the same name as the pasted element including the - Copy suffix, the suffix becomes - Copy1 (or - Copy 2, - Copy3 and so on, as copies of the element accumulate in the target package)</li> </ul> <p>You can keep the same element names as the source, or you can rename each element either by clicking twice on it and editing the name in the Project Browser, or by double-clicking on it and editing the name in the Properties dialog</p>	

**Notes:**

- A copy of an element does not have the external cross references of the source element; that is:
- if one element is copied it has no connectors
- if more than one element is copied, only the connectors between the copied elements are retained
- however, if those elements come from a Sequence or Communication diagram and the diagram itself

is not copied, the message connectors between the copied elements are not retained

- You cannot paste an element into a package that is locked by another user or that is checked in. The **Paste...** option is grayed out in the context menu

**Learn More:**

- [Locking Packages](#)<sup>[213]</sup>
- [Checking In/Checking Out Packages](#)<sup>[276]</sup>

### 5.6.1.10 Change Element Type

**Access:** **Element | Advanced | Change Type**

Select the new element type from the list and click on the **OK** button.

The target element is transformed into the required type.

### 5.6.1.11 Align Elements

To align multiple elements, follow the steps below

**How To:**

Step	Action	See Also
1	Select a group of elements by drawing a selection box around them all (or select them one by one by holding down ( <b>Ctrl</b> ) and clicking on each element)	
2	Right-click on the element in the group to align others to The context menu displays	
3	Select the alignment function you require All selected elements are aligned to the one beneath the cursor	

**Notes:**

- You can also use the Diagram toolbar; the first four buttons are used to align elements, and are made available when more than one element is selected in a diagram
- You can also select the **Element | Alignment** menu option, to display one of the Position submenus

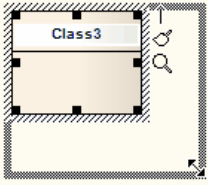

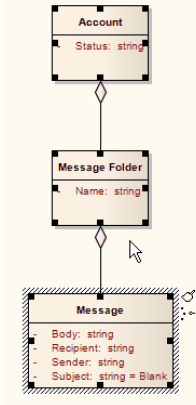

**Learn More:**

- [Diagram Toolbar](#)<sup>[112]</sup>
- [Position Submenus](#)<sup>[88]</sup>

### 5.6.1.12 Resize Elements

Any one of the following options enables you to resize an element.

#### Topics:

Images	Topic	Detail	See also
	<b>Resize handles</b>	<p>Select an element or group of elements in the diagram view, then:</p> <ul style="list-style-type: none"> <li>• Use the resize handles that appear at each corner and side to resize the element(s) by dragging with the mouse (the cursor switches to the double-ended arrow as shown in the image to the left)</li> <li>• Press and hold ( <b>Ctrl</b> ) and use the arrow keys to resize by increments as required</li> <li>• Use the Wider, Narrower, Taller and Shorter options in the Element   Move submenu</li> <li>• Autosize selected element(s) using the option in the Element   Appearance submenu, or by pressing ( <b>Alt+Z</b> ) . (With multiple elements selected, Autosize also appears in the right-click context menu)</li> <li>• Set multiple elements to the same height, width or both, using these options in the <b>Element   Make Same</b> submenu, or the options in the right-click context menu.</li> </ul>	
	<b>Resize a Set of Objects to a specific size</b>	<p>If you right-click a selected set of objects, you can resize them to the same dimensions (height, width or both) using the context menu. When you select multiple elements using ( <b>Ctrl</b> ) +click, then resize the dimensions, the dimensions of the selected hatched object are used to set the dimensions of the other selected objects.</p> <p>For example, in the diagram below, the Message Class height and width are used to set the height and width of the Account and Message Folder Classes. The aim is to make the Account and Message Folder elements the same height and width as the Message element.</p>	

#### How To:

To resize a set of objects to a specific size, follow the steps below:

Step	Action	See Also
1	Set one element to the required size (for example, Message as above)	
2	Select all other elements (for example, Account and Message Folder as above)	

Step	Action	See Also
3	Right-click on the pre-sized element (for example, Message)	
4	Select your resizing option (such as same height, width) from the context menu	

Learn More:

- [Highlight Context Elements](#) <sup>[647]</sup>

### 5.6.1.13 Delete Elements

How To:

To delete an element from a diagram, follow the steps below:

Step	Action	See Also
1	In the active diagram, click on the element to delete	
2	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Delete</b> ) or</li> <li>• Right-click to display the context menu and select the <b>Delete &lt;element name&gt;</b> option</li> </ul> This does not delete the element from the model, only from the current diagram	

To delete an element from the model, follow the steps below:

Step	Action	See Also
1	In the Project Browser, right-click on the element to delete The context menu displays	
2	Select the <b>Delete &lt;element name&gt;</b> option A confirmation prompt displays	
3	Click on the <b>Yes</b> button	

Alternatively, click on the element in the Project Browser and press ( **Ctrl+Delete** ). The element is completely removed from the **model**.

To delete multiple elements from a diagram, follow the steps below:

Step	Action	See Also
1	In the active diagram, ( <b>Ctrl</b> ) <b>+click</b> on each element to delete	

Step	Action	See Also
2	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Delete</b> ), or</li> <li>• Right-click to display the context menu and select the <b>Delete selected elements</b> option</li> </ul>	

To delete multiple elements from a diagram and model, follow the steps below:

Step	Action	See Also
1	Open the diagram containing the elements to remove from the model	
2	Press ( <b>Ctrl+A</b> ) to select all of the elements in the diagram, or use ( <b>Ctrl</b> ) + <b>click</b> to select specific elements	
3	Press ( <b>Ctrl+Delete</b> ) to completely remove the elements from the model	

To delete multiple elements from the Project Browser and model, follow the steps below:

Step	Action	See Also
1	In the Project Browser, press and hold either ( <b>Shift</b> ) or ( <b>Ctrl</b> ) and click on the required items	
2	To completely remove the elements from the model, either: <ul style="list-style-type: none"> <li>• Press ( <b>Ctrl+Delete</b> ), or</li> <li>• Right-click on the selected items and select the <b>Delete selected item(s)</b> context menu option</li> </ul> If you delete an element in this way, you delete all its properties and connectors as well	

#### 5.6.1.14 Customize Visibility of Elements

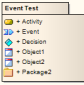

Some elements are hidden from view in packages and in RTF documents by default. These include Events, Decisions, Sequence elements and Associations. You have the option of turning these elements back on.

For example, some Events and Decisions contained in a package do not appear in the package view, as in the example below.

**How To:**

Images	Step	Action	See Also
	1	Select the <b>Tools   Options   Objects</b> menu option The Objects page of the Options dialog displays	
	2	Click on the <b>Advanced</b> button The Advanced Settings dialog displays	
	3	Select the checkbox for each type of element to show in packages and in RTF documents	
	4	Click on the <b>Close</b> button on each dialog	
	5	<b>Reload</b> the current diagram if required The package from the example shows the Event and Decision elements it now contains (see left image)	<a href="#">Refreshing the view of a shared project</a> <sup>[188]</sup>

**5.6.1.15 Create Notes and Text**

You can create both notes and text on a diagram; the two are slightly different.

**How To:**

To create a Note, follow the steps below:

Step	Action	See Also
1	<p>Drag the Note icon from the Common page of the Toolbox onto the diagram.</p> <ul style="list-style-type: none"> <li>If you have the <b>Edit Object On New</b> checkbox deselected on the Objects page of the Options dialog, the Note element displays on your diagram; type your note text directly within the Note element</li> <li>If you have the checkbox selected, the Notes window displays; type your text in that window</li> </ul> <p>If you want to display the Notes information in a more readable layout, you can resize the dialog</p> <p>You can format the text if necessary, using the Notes toolbar at the top of the window. When you have completed the text, click on the <b>OK</b> button to save it</p>	<a href="#">Objects</a> <sup>[434]</sup> <a href="#">Notes</a> <sup>[77]</sup> <a href="#">Notes Toolbar</a> <sup>[772]</sup>

To create a Text element, follow the steps below:

Step	Action	See Also
1	<p>Drag the Text Element icon from the Common page of the Toolbox onto the diagram</p> <p>The Notes window displays</p>	<a href="#">Notes</a> <sup>[77]</sup>

Step	Action	See Also
2	<p>Type your text in the window</p> <p>If you want to display the Notes information in more readable layout, you can resize the dialog</p> <p>You can format the text if necessary, using the Notes toolbar at the top of the window; when you have completed the text, click on the <b>OK</b> button to save it</p>	<a href="#">Notes Toolbar</a> 

#### Notes:

- You can also create a note by clicking on the **New Note** icon (the text page) on the UML Elements toolbar and clicking on the diagram

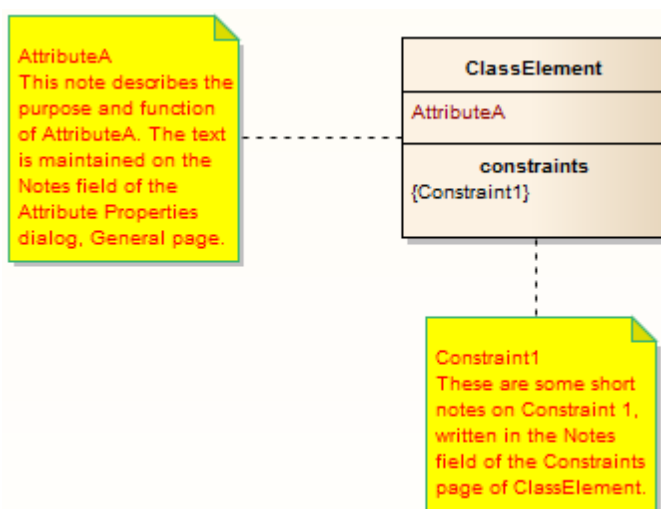

#### Learn More:

- [UML Elements Toolbar](#)

### 5.6.1.16 Link Note to Internal Documentation

It is possible to connect a *Note* element to another element's internal documentation. This enables you to externalize model documentation to the diagram level, and as Enterprise Architect keeps the note and the internal structure in synch, you do not have to worry about updating the note contents; this is done automatically.

In the example below, two notes are connected into an element's internal structures. One is connected to an attribute, and displays the attribute name and notes. The other is connected to a constraint, showing the constraint name and documentation.

#### How To:

To connect a Note element to another element's documentation, follow the steps below:

Step	Action	See Also
1	Click on the element and then click on the feature to link the Note to	
2	Select the <b>Element   Inline Features   Create Linked Note</b> context menu option. This creates a Note element linked to the selected feature, reflecting the content of that feature	

Alternatively:

Step	Action	See Also
1	Insert the target element into a diagram	
2	Drag the Note icon from the Common page of the Toolbox onto the diagram, next to the target element The Notes dialog displays	
3	Do not type any text, just click on the <b>OK</b> button	
4	Click on the <b>Note Link</b> icon from the Common page of the Toolbox	
5	Click on the Note, and drag across to the target element to create the connector	
6	Right-click on the Note Link to display the context menu	
7	Select the <b>Link this Note to an Element Feature</b> menu option The Link note to element feature dialog displays	
8	In the <b>Feature Type</b> field, click on the drop-down arrow and select the type of feature to link to	
9	In the <b>Feature</b> list, click on the specific feature to link to	
10	Click on the <b>OK</b> button The note now automatically derives its contents from the target element	

### 5.6.1.17 Set an Element's Default Appearance

To override the global appearance and define a default appearance for a specific element on all diagrams on which it is found, you use the Default Appearance dialog.

**Access:** **Double-click element | Appearance | Default Appearance**

**Use to:**

- Alter the background, border and font colors
- Change font styles, including font face and size
- Alter the border width for an element

**Reference:**

Field	Usage	See also
<b>Background Color</b>	Set the color of the background for an element	
<b>Border Color</b>	Set the color of the border for an element	
<b>Border Width</b>	Set the width of the border surrounding an element, the minimum setting being <b>1</b> , the maximum setting being <b>5</b>	
<b>Font Style (...)</b>	Set the typeface of element text  The current font typeface is displayed within the text field; click on the (...) button  The Font dialog displays, which enables you to select a different typeface, style, (such as bold/italic) and font size  You can also select from a limited number of font colors and effects on this dialog	<a href="#">Font Dialog</a> <small>[659]</small>
<b>Font Color</b>	Set the font color of the element text	
<b>Reset to defaults</b>	Reset all appearance settings to default values	
<b>Preview</b>	Review a representation of the colors, border width and font styles, which updates as you choose the new settings	

**Notes:**

- You can adjust several elements at the same time; select all of the required elements, right-click on one of them and select the **Default Appearance** context menu option, or use the Format toolbar
- If the **Show Project Custom Colors in Color Combo Boxes** checkbox is selected on the Options dialog, Standard Colors page, the last 16 color squares in the color selection palettes contain the project colors set on that dialog
- The **Font Color** field affects only the element name text; it does not override the feature text colors as defined on the Options dialog, Standard Colors page
- When it has been called directly on one or more selected elements (**Appearance | Set Font**), the Font dialog overrides the Default Appearance dialog
- When called from the Default Appearance dialog, the **Color** field on the Font dialog is overridden by the **Font Color** field on the Default Appearance dialog
- The **Font** and **Style** fields affect all text except for the Note compartment text
- The **Size** field affects all text

**Learn More:**

- [Standard Colors](#) [426]
- [Diagram Appearance](#) [429]
- [Format Toolbar](#) [543]

**5.6.1.18 Get/Set Project Custom Colors**

If more than one person is working on a project, you might want to share a set of custom colors with other team members, and possibly the whole project.

**Access:** **Settings | Colors | Set Project Custom Colors**  
**Settings | Colors | Get Project Custom Colors**

**Use to:**

- Capture the project colors you have defined, in the project file, or
- Retrieve a set of colors someone else has defined, from the project file

**How To:**

To set your project's custom colors in the project file, follow the steps below:

Step	Action	See Also
1	Define the project colors on the Standard Colors page of the Options dialog	<a href="#">Standard Colors</a> [426]
2	Select the <b>Set Project Custom Colors</b> option The following message displays: <i>Project Custom Colors export successful. 16 custom colors saved to the project file.</i>	
3	Click on the <b>OK</b> button	

To get your project's custom colors from the project file, follow the steps below:

Step	Action	See Also
1	Select the <b>Get Project Custom Colors</b> option The following message displays: <i>Project Custom Colors import successful. 16 custom colors imported from the project file.</i>	
2	The colors are now made available in the color pallet of the Default Appearance dialog	<a href="#">Set an Element's Default Appearance</a> [643]

**5.6.1.19 Set Element Templates Package**

**Topics:**

Topic	Detail	See also
<b>Overview</b>	<p>In building up a model, you might want to represent or emphasize certain characteristics of elements in the appearance of those elements, or select particular display options as standard</p> <p>For example, you could make new Interface elements a different default color to new Class elements, ensure all new Activity Partitions are vertical rather than horizontal, or set a specific group of display options for new diagrams; you could also define a set of characteristics to use for each development stage of a project</p> <p>To do all this, you create a diagram with all the characteristics you require, and store the diagram in an element Templates package; Enterprise Architect then checks this package:</p> <ul style="list-style-type: none"> <li>• Whenever you start to create an element in a diagram or</li> <li>• Whenever you create a new diagram</li> </ul>	

Topic	Detail	See also
	<p>If it finds a template for that diagram type, Enterprise Architect applies the settings in that template to the new element or to the display options of the diagram; for example, you could save a diagram under the name <i>ClassTemplate</i>, to apply a set of display characteristics to all new Class elements and all new Class or Logical diagrams</p> <p>You should create the Templates package in an administrative View of the project file rather than in any work area, to prevent the package from being changed or lost in any project development work</p>	
<p><b>Modifying the appearance of elements</b></p> 	<p>There are two other ways in which you can modify the appearance of elements in diagrams:</p> <ul style="list-style-type: none"> <li>You can define the default appearance of elements (and other structures) grouped in a diagram by using UML Profiles; these provide a means of extending the UML Language, which enables you to build UML models in particular domains</li> </ul> <p>Profiles are based on additional stereotypes and Tagged Values that are applied to elements, attributes, methods, connectors and connector ends</p> <ul style="list-style-type: none"> <li>You can modify the appearance of elements (and connectors) of a specific type using stereotypes, which take precedence over templates; if you drop an unsteretyped element - a Class, for example - onto a diagram, Enterprise Architect searches the Templates package for a Class diagram that defines an unsteretyped Class, and applies that definition to the new Class</li> </ul> <p>If you drop a stereotyped Class onto a diagram, the stereotype defines the Class appearance so the template is not accessed; stereotypes are much more flexible for defining the appearance of an element under different scenarios</p>	<p><a href="#">UML Profiles</a> <sup>[102B]</sup></p> <p><a href="#">UML Stereotypes</a> <sup>[101B]</sup></p>

### How To:

To set up the element Templates package, follow the steps below:

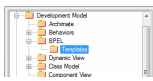

Image	Step	Action	See Also
	1	<p>Create a new package in the appropriate administration View</p> <p>You can give this package any name; <i>Templates</i> is an unambiguous option</p>	
	2	<p>Within the Templates package create new diagrams, one for each type of diagram to template</p> <p>Give them easily recognized names; for example <i>ClassTemplate</i> for the template for Class diagrams</p>	
	3	<p>Add new elements to the template diagrams from the Toolbox, and configure the size, appearance, notes, version and other properties</p>	
	4	<p>Select the <b>Settings   Project Template Package</b> menu option to set the templates as the default element templates</p> <p>The Browse Project window displays</p>	

Image	Step	Action	See Also
	5	<p>Locate and click on the Templates package, and click on the <b>OK</b> button to set the package as the default element template</p> <p>Now each new element or diagram you add to your project is created with the settings from the appropriate Template diagram</p>	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Reference Data - Update** permission to set up or access the element Templates package
- If you decide not to use the default element template, set the default element template to **<none>** in the Browse Project window; the **<none>** package is at the bottom of the hierarchy shown in the Browse Project window

**5.6.1.20 Highlight Context Element**

You can show a hatched border around a selected element by selecting the **Always Highlight Context Element** checkbox on the Diagram Behavior page of the Options dialog. If you have selected this checkbox, the selected element displays similarly to the following example:

If you have not selected the **Always Highlight Context Element** checkbox, the selected element does not have a hatched border around it.

**Topics:**

Images	Topic	Detail	See also
	<b>Multiple Selections</b>	<p>Whether you have selected the <b>Always Highlight Context Element</b> checkbox or not, if you select multiple elements one of the elements you select always has a hatched border</p> <p>If you align the elements, this element is the one used to align the other elements against</p> <p>For example, if the elements in the diagram are aligned, the top element aligns to the bottom element (the element showing a hatched border)</p>	
	<b>Change the Element to Align Against</b>	To change which element has a hatched border in a selected group (and thus the element that is aligned with) click on the element that the other elements are to align with	

### 5.6.1.21 Make Linked Element a Local Copy

#### How To:

To convert a linked element to a local copy, follow the steps below:

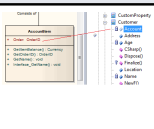

Step	Action	See Also
1	Open the diagram with the linked element	
2	Select the linked element and right-click on it to display its context menu	
3	Select the <b>Convert Linked Element to Local Copy</b> menu option The element changes to a local copy and is placed in the appropriate package	

### 5.6.1.22 Copy Features Between Elements

Using drag and drop, you can copy attributes and/or operations from an element in the Project Browser on to another element in a diagram.

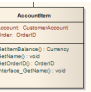

#### How To:

To copy an element feature, follow the steps below:

Images	Step	Action	See Also
	1	Open a diagram that contains the target element (in the example to the left, the AccountItem Class is the target and Customer element is the donor)	
	2	Click on the attribute or operation and drag it to the target element	
	3	Release the mouse button	

The image below shows *AccountItem* after the attribute *Account* has been dropped from the browser on to it.

To copy multiple element features, follow the steps below:

Images	Step	Action	See Also
	1	Open a diagram that contains the target element (in the example above, the AccountItem Class is the target and Customer element is the donor)	
	2	Hold down ( <b>Ctrl</b> ) (separate features) or ( <b>Shift</b> ) (select a range) and click on the attributes and/or operations to copy, then drag the selected features to the target element	
	3	Release the mouse button	

#### Learn More:

- [Attributes](#) <sup>697</sup>
- [Operations](#) <sup>709</sup>

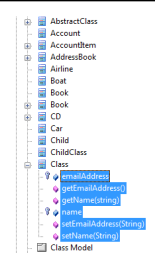

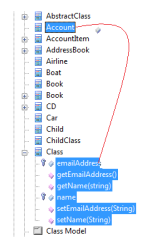

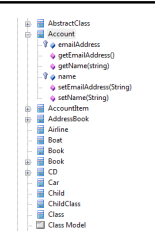

- [Move Features Between Elements](#) <sup>649</sup>

### 5.6.1.23 Move Features Between Elements

Using drag and drop, you can move attributes and/or operations from an element in the Project Browser on to another element within the Project Browser.

**How To:**

To move element features, follow the steps below:

Images	Step	Action	See Also
	1	In the Project Browser, locate the attributes and/or operations to move from the target element and select them while holding down: <ul style="list-style-type: none"> <li>• ( <b>Ctrl</b> ) (single item select) or</li> <li>• ( <b>Shift</b> ) (multiple item select)</li> </ul>	
	2	Holding down the mouse button, drag the attributes and/or operations to the target element  A single feature symbol (and, under some operating systems, the feature name) displays during the move; however all of the selected features are moved	
	3	Release the mouse button  The image to the left shows the final stage of the attribute and operations move between the Class element and the Account element	

**Learn More:**

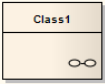

- [Attributes](#) <sup>697</sup>
- [Operations](#) <sup>709</sup>
- [Copy Features Between Elements](#) <sup>648</sup>

### 5.6.1.24 Composite Elements

Enterprise Architect supports *Composite elements* for Classes, Objects and Use Cases. A Composite element is a pointer to a child diagram.

**How To:**

Images	Step	Action	See Also
	1	Create the element to set as a Composite element	

Images	Step	Action	See Also
	2	<p>Right-click on the element in the diagram and select the <b>Advanced   Make Composite</b> context menu option</p> <p>The element displays (see Image on left)</p> <p>Note the small icon in the bottom right hand corner indicating that this is now a Composite element</p>	
	3	<p>Double-click on the Composite element to access the child diagram that it points to</p> <p>The Composite element and its child diagram are represented in the Project Browser as shown</p> <p>Note that <i>ClassX</i>, <i>ClassY</i> and <i>ClassZ</i> are elements in the child diagram</p>	

### Topics:

Topic	Detail	See also
<b>Alternative Notation</b>	<p>Composite elements can show their contents instead of their usual notation</p> <p>To enable this:</p> <ol style="list-style-type: none"> <li>1. Right-click on the element to open the context menu</li> <li>2. Select the <b>Advanced   Show Composite Diagram</b> option</li> </ol>	
<b>The Automation Interface</b>	<p>Automation support is available for Composite elements</p> <p>Element has an <i>Elements</i> collection and a <i>Diagrams</i> collection</p>	<a href="#">Using the Automation Interface</a> <sup>1837</sup>

### Notes:

- If the **Make Composite** option is not listed in the context menu, the option is not available for the type of element you have selected

## 5.6.2 Element Context Menu

Right-click on a single element in a diagram to open the element context menu. If two or more elements are selected, a different, multiple selection context menu is displayed.

The element context menu is split into a number of sections and sub-menus:

- **Properties**
- **Add**
- **Find**
- **Transform ( Ctrl+H )** - Transform the selected element from one domain to another
- **Embedded Elements**
- **Features**
- **Generate DDL** - Generate DDL for a table, procedure or view Class
- **Code Engineering**
- **Appearance**
- **UML Help** - display the Enterprise Architect Help topic for the UML element type
- **Delete ( Ctrl+D )** - delete the element

**Notes:**

- Context menus vary between element types; for example, the **Code Engineering** options won't display for a Use Case element

**Learn More:**

- [Properties](#) <sup>[651]</sup>
- [Add Sub-menu](#) <sup>[653]</sup>
- [Find Sub-menu](#) <sup>[655]</sup>
- [Transform Elements](#) <sup>[1311]</sup>
- [Embedded Elements](#) <sup>[655]</sup>
- [Features Menu](#) <sup>[656]</sup>
- [Generate DDL](#) <sup>[1385]</sup>
- [Code Engineering Menu](#) <sup>[657]</sup>
- [Appearance Menu](#) <sup>[657]</sup>
- [Multiple Selection Context Menu](#) <sup>[660]</sup>

**5.6.2.1 Properties Menu Section**

The **Properties** section of the element context menu can contain the following options:

Action	Usage	Shortcut	See also
<b>Properties</b>	Open the Properties dialog for the selected element  For State Lifeline and Value Lifeline elements, display the Configure Timeline dialog	<b>Ctrl + Enter</b>	<a href="#">Properties dialog</a> <sup>[662]</sup>
<b>Advanced</b>	Open the Advanced sub-menu		<a href="#">Advanced Submenu</a> <sup>[651]</sup>
<b>Rule Composer</b>	For a Rule Task element, invoke the Rule Composer tab in Business Rule Modeling		<a href="#">Compose Business Rules</a> <sup>[1214]</sup>
<b>Other Properties</b>	For State Lifeline and Value Lifeline elements, display the Properties dialog for the selected element		<a href="#">Properties dialog</a> <sup>[662]</sup>
<b>Create (or Edit) Linked Document</b>	(Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions) Create an RTF document linked to the element	<b>Ctrl + Alt + D</b>	<a href="#">Link Document to UML Element</a> <sup>[732]</sup>
<b>Delete Linked Document</b>	Delete an existing linked document for the element		

**5.6.2.1.1 Advanced Submenu**

The **Advanced** submenu on an element context menu can contain the options listed in the table below.

Action	Usage	Shortcut	See also
<b>Parent</b>	Set the element parent	<b>Ctrl + I</b>	<a href="#">Set Element Parent</a> <sup>[630]</sup>
<b>Instance</b>	Set the instance classifier for the element, on	<b>Ctrl + L</b>	<a href="#">Select &lt;Item&gt;</a>

Action	Usage	Shortcut	See also
<b>Classifier</b>	the Select <Item> dialog		<a href="#">Dialog</a> <sup>[692]</sup>
<b>Classifier Properties</b>	Open the Properties dialog for the <i>classifier</i> of the selected element	<b>Ctrl + Alt + Enter</b>	<a href="#">Properties Dialog</a> <sup>[662]</sup>
<b>Make Composite</b>	Set the element as a Composite element		<a href="#">Composite Elements</a> <sup>[649]</sup>
<b>Change to State (Value) Lifeline</b>	Switch one type of Lifeline element to the other		
<b>Show Composite Diagram</b>	Display a mini-picture of the contents of a composite element within that element		
<b>Multiplicity</b>	Define the multiplicity for the element, using the format defined on the Cardinality tab  This is the number of instances of the element that can exist in a set; the value displays on the element in a diagram, in the <i>Name</i> compartment		<a href="#">Cardinality</a> <sup>[778]</sup>
<b>Show Element Type</b>	(Ports and Parts only) Toggles between displaying and hiding the element type, as set on the Property page of the element's Properties dialog		<a href="#">Part</a> <sup>[962]</sup> <a href="#">Port</a> <sup>[964]</sup> <a href="#">The Property Page</a> <sup>[965]</sup>
<b>Edit Extension Points</b>	For an extended Use Case, display the Use Case Extension Points dialog, which you use to insert the point at which the behavior should be inserted		<a href="#">Use Case Extension Points</a> <sup>[939]</sup>
<b>Association Class</b>	Connect the Class to a new Association (if the element is a Class)		<a href="#">Connect New Class to Association</a> <sup>[977]</sup>
<b>Use Rectangle (Circle) Notation</b>	Use rectangle notation for the element		<a href="#">Rectangle Notation</a> <sup>[940]</sup>
<b>Partition Activity</b>	Define an Activity Partition		<a href="#">Activity Partition</a> <sup>[878]</sup>
<b>Set Run State</b>	Add a new instance variable to the element using the Define Run State dialog		<a href="#">Define A Run-Time Variable</a> <sup>[960]</sup>
<b>Set Property Value</b>	(Part elements) Set the property value for the Part, using the Set Property Values dialog		
<b>Override Attribute Initializers</b>	Pre-define initial values for attributes that can be used to override existing defaults	<b>Ctrl + Shift + R</b>	
<b>Convert to Instance (Property)</b>	Convert this classifier to an instance or a property, depending on the type of classifier selected (for example, SysML classifiers are always converted to properties)		
<b>Convert Linked Element To Local Copy</b>	Convert the occurrence of the element on this diagram from a link to the original element to a local copy of the element		
<b>Make Sender/</b>	Toggle the element from a sender to a receiver		

Action	Usage	Shortcut	See also
Receiver	and vice versa		
Accept Time Event	Change the notation for an Accept Event action to an Accept Time Event action		
Set Object State	Set the state of an object/instance based on the child states of its classifier	Ctrl + Shift + S	<a href="#">Object State</a> <sup>[96]</sup>
Define Concurrent Substates	Define a set of substates that can be held simultaneously within that composite State		<a href="#">Regions</a> <sup>[82]</sup>
Use State Label Notation	Display State Label Notation for a State object (the element name is displayed on a box on top of the element rather than inside it)		
Deep History	Change the type of a shallow History pseudo-state to a deep History  Applies only when right-clicking on a History pseudo-state.		<a href="#">History</a> <sup>[90]</sup>
Set Attached Links	Attach the selected Note element to a connector, or several connectors		<a href="#">Add A Note to A Connector</a> <sup>[74]</sup>
Link to Diagram Note	Display the diagram notes as the Note element text  The option simply deletes any current text and blocks the Note from being edited other than through the <b>Notes</b> field in the diagram Properties dialog		

**Notes:**

- Context menus vary between element types. Not all menu options shown here are present on all element context menus; for example, the Partition Activity option only displays for an Activity element
- If an element appearance is overridden by a Shape Script, several of the appearance options are disabled; for example, Use Rectangle (Circle) Notation

**Learn More:**

- [Shape Scripts](#) <sup>[109]</sup>

**5.6.2.2 Add Submenu**

The **Add** submenu enables you to add supporting elements and diagrams to the selected element.

Menu Option	Action	Shortcut	See Also
Tagged Value	Add a Tagged Value		<a href="#">Quick Add - Tagged Value To Elements</a> <sup>[76]</sup>
Related Elements	Open the Insert Related Elements dialog		<a href="#">Insert Related Elements</a> <sup>[65]</sup>
Note	Create and attach a blank Note element to the current element		<a href="#">Create Notes and Text</a> <sup>[64]</sup>

Menu Option	Action	Shortcut	See Also
<b>Constraint</b>	Create and attach a blank Constraint element to the current element		<a href="#">Note</a> <sup>[915]</sup>
<b>Activity</b>	Add an Activity element as a child of the current Classifier element, with either an Activity diagram or an Interaction Overview diagram.		<a href="#">Activity</a> <sup>[875]</sup> <a href="#">Object Classifiers</a> <sup>[707]</sup>
<b>Interaction</b>	Add an Interaction element as a child of the current Classifier element, with either a Sequence diagram, a Communication diagram or a Timing diagram		<a href="#">Interaction</a> <sup>[906]</sup>
<b>State Machine</b>	Add a State Machine element as a child of the current Classifier element, with a State Machine diagram		<a href="#">State Machine</a> <sup>[927]</sup>
<b>RuleFlow activity</b>	For a Class element, create a Rule Flow Activity element with a child Rule Flow diagram, as a behavior for the Class		<a href="#">Create a Rule Flow Model</a> <sup>[1209]</sup>
<b>Add Diagram</b>	Add a child diagram to the Classifier element, using the New Diagram dialog		<a href="#">Add New Diagrams</a> <sup>[570]</sup>

**Notes:**

- Context menus vary between element types, so not all menu options shown here are present on all element context menus; for example, the options relating to Classifiers are not available for Object elements

**5.6.2.2.1 Insert Related Elements**

The Insert Related Elements dialog can be accessed from the **Add | Related Elements** option on most element context menus. This dialog enables you to insert connected elements from elsewhere in the model into the current diagram.

You can specify the following details:

Field	Usage	See also
<b>Insert elements to: «x» levels</b>	Select the level down to which to insert connected elements, between levels <b>1</b> and <b>5</b>  You can select levels <b>4</b> or <b>5</b> to see how far the element/relationship hierarchy extends, but as this can produce a complicated and tangled diagram, it is better to use level <b>1</b> or <b>2</b> on selected elements in turn	
<b>For Link Type</b>	Select a type of connector to limit the inserted elements to those connected by that relationship type	
<b>With Link Direction</b>	Select whether the connectors are to be a single direction or bi-directional	
<b>Limit to Element Type</b>	Select a type of element to limit the inserted elements to those of that element type	
<b>Layout Diagram When Complete</b>	Select whether Enterprise Architect should layout the diagram after the elements have been inserted; the layout applied is the Digraph	<a href="#">Digraph Layout</a> <sup>[614]</sup>

Field	Usage	See also
	layout If no elements have been added, this option has no effect; elements have to be added for Enterprise Architect to adjust the layout	
Limit to this Namespace	Select a specific namespace from which the inserted elements are to come	

### 5.6.2.3 Find Submenu

The **Find** submenu on the element context menu can contain the following options:

Action	Usage	Shortcut	See also
In Project Browser	Highlight the currently selected element in the Project Browser	Alt + G	
Locate Classifier In Project Browser	Highlight the classifier for the currently-selected object, in the Project Browser	Ctrl + Alt + G	
Locate Operation in Project Browser	Highlight the call operation for the currently-selected Activity, in the Project Browser	Ctrl + Alt + G	<a href="#">Class Operations in Activity Diagrams</a> [874]
In Diagrams	Open the Element Usage dialog	Ctrl + U	<a href="#">Show Element Use</a> [632]
Custom References	Set up cross references	Ctrl + J	<a href="#">Set Up Cross References</a> [632]
Add to Favorites	Add the element to the Favorites folder in the Resources window		<a href="#">Favorites</a> [792]

### 5.6.2.4 Embedded Elements Submenu

The **Embedded Elements** submenu on the element context menu can contain the following options:

Menu Option	Action	Shortcut	See also
Add Port	Add an embedded Port to the element		
Add Required Interface	Add an embedded Required Interface to the element		
Add Provided Interface	Add an embedded Provided Interface to the element		
Add Action Pin	Add an embedded Action Pin to the element		
Add Expansion Node	Add an embedded Expansion Node to the element		
Add Object Node	Add an embedded Object Node to the element		
Add Activity Parameter	Add an embedded Activity Parameter to the element		

<b>Add Entry Point</b>	Add an embedded Entry Point to the element		
<b>Add Exit Point</b>	Add an embedded Exit Point to the element		
<b>Embedded Elements</b>	Open the Embedded Elements window		<a href="#">Embedded Elements Window</a> <sup>[656]</sup>
<b>Show Realized Interfaces</b>	Display each interface directly realized by a Class		<a href="#">Show Realized interfaces of Class</a> <sup>[599]</sup>
<b>Show Dependent Interfaces</b>	Display each dependency relationship for that model element as a lollipop style node attached to its left-hand side		

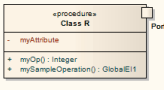

**Notes:**

- Context menus vary slightly between element types, and not all menu options shown here are present on all element context menus; for example, of the **Add** options, only **Add Port** displays for a Class element

**5.6.2.4.1 Embedded Elements Window**

The **Embedded Elements** dialog enables you to embed particular elements into other elements. For example, a Port can be embedded into a Class. The **Embedded Elements** option is available on the context menu of some elements.

**Topics:**

Image	Topic	Detail	See also
	<b>Usage</b>	<p>In the Embedded Elements dialog, click on the <b>New</b> button to create a new embedded element</p> <p>Enter details such as type, name and stereotype, and click on the <b>OK</b> button</p> <p>The embedded element now shows on the primary element as shown</p> <p>You can add as many embedded elements as necessary; modify or delete embedded elements using the Embedded Elements dialog</p> <p>To incorporate inherited or owner properties, select the <b>Show Owned/Inherited</b> checkbox</p> <p>The name of the embedded element is a label, which you can edit using the <b>Labels</b> context menu</p>	<a href="#">Label Menu Section</a> <sup>[599]</sup>

**5.6.2.5 Features Menu Section**

The **Features** section of the element context menu can contain the following options:

Action	Usage	Shortcut	See also
<b>Attributes</b>	Open the Attributes <sup>[697]</sup> dialog		<a href="#">Attributes</a> <sup>[697]</sup>

Action	Usage	Shortcut	See also
<b>Operations</b>	Open the Operations <a href="#">[709]</a> dialog		<a href="#">Operations Dialog - General</a> <a href="#">[710]</a>
<b>Feature Visibility</b>	Open the Feature Visibility <a href="#">[497]</a> dialog	<b>Ctrl + Shift + Y</b>	<a href="#">Feature Visibility</a> <a href="#">[587]</a>

**Notes:**

- Context menus vary slightly between element types, and not all menu options shown here are present on all element context menus; for example, the **Attributes** and **Operations** options won't display for an Action element

### 5.6.2.6 Code Engineering Menu Section

The **Code Engineering** submenu on the element context menu can contain the following options:

Action	Usage	Shortcut	See also
<b>Generate Code</b>	Generate source code <a href="#">[1500]</a> for the selected element (forward engineer)	<b>F11</b>	<a href="#">Generate a Single Class</a> <a href="#">[1500]</a>
<b>Synchronize With Code</b>	Reverse engineer source code <a href="#">[1517]</a> for the selected element	<b>F7</b>	<a href="#">Importing Source Code</a> <a href="#">[1517]</a>
<b>View Source Code</b>	Open the source editor <a href="#">[1417]</a> if a file exists for that selected element	<b>F12</b>	<a href="#">The Source Code Viewer</a> <a href="#">[1417]</a>
<b>Create Workbench Instance</b>	Create a workbench instance for the Debug Workbench (if a debug command <a href="#">[1676]</a> has been configured for the parent package)	<b>Ctrl + Shift + J</b>	<a href="#">Create Workbench Variables</a> <a href="#">[1676]</a>

**Notes:**

- Context menus vary slightly between element types, and not all menu options shown here are present on all element context menus; for example, Code Engineering options won't appear for a Use Case element

### 5.6.2.7 Appearance Menu Section

The **Appearance** section of the element context menu can contain the following options:

**Reference:**

Menu Option	Action	Shortcut	See also
<b>Lock Element</b>	<p>Lock the element so it can't be edited; to unlock the element, select <b>Lock Element</b> again</p> <p>This does not apply in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions when security is enabled; in that situation, use the <b>Lock</b> option for model elements</p>		<a href="#">Lock model elements</a> <a href="#">[211]</a>

Menu Option	Action	Shortcut	See also
<b>Selectable</b>	<p>Toggle whether the element is selectable or not</p> <ul style="list-style-type: none"> <li>If an element is selectable, you can move it around the diagram and perform right-click context menu operations</li> <li>If an element is unselectable, you cannot move it around the diagram and the only right-click operation available is to make the element selectable</li> </ul> <p>This option has no effect on double-click operations on the element, such as displaying child diagrams or Properties dialogs</p> <p>An element on a locked diagram is also unselectable - if you click on it, the element outline displays in red</p> <p>In a diagram, you can filter the display to show selectable or non-selectable elements only</p>		<a href="#">Diagram Filters</a> <sup>[49]</sup>
<b>Dockable</b>	<p>Align and join two elements either vertically or horizontally, on the current diagram only</p> <p>Both elements must have the <b>Dockable</b> option selected, and must have the joining edges parallel</p> <p>As the distance between the elements narrows, the moving element snaps to the edge of the other element</p> <p>For Activity Partitions, the option is selected by default.</p> <p>Deselecting the <b>Dockable</b> option does not separate the elements; if necessary, you can simply move the elements apart again</p>		<a href="#">Partition</a> <sup>[91]</sup>
<b>Appearance</b>	Display the <b>Appearance</b> submenu; see the table below		
<b>Z-Order</b>	Set the Z-Order of the element		<a href="#">Z-Order Elements</a> <sup>[58]</sup>

#### Appearance Sub-Menu

Action	Usage	Shortcut	See also
<b>Default Appearance</b>	<p>Override the <i>global</i> default appearance of all elements (which you set on the Options dialog, Standard Colors page and Diagram Appearance page) with a different default for just the selected element on all diagrams in which it is found</p> <p>To change the appearance of the selected element on the <i>current diagram only</i>, use the Format toolbar</p>	<b>F4</b>	<a href="#">Standard Colors</a> <sup>[42]</sup> <a href="#">Appearance</a> <sup>[42]</sup> <a href="#">Set an Element's Default Appearance</a> <sup>[64]</sup> <a href="#">Format toolbar</a> <sup>[54]</sup>
<b>Apply Image From</b>	Paste the image held on the clipboard onto the		

Action	Usage	Shortcut	See also
Clipboard	selected element		
Select Alternate Image	Select an alternative image using the Image Manager	Ctrl + Shift + W	<a href="#">Using the Image Manager</a> [595]
Hide/Show Name Under Image	Hide or redisplay the name label under an element with an alternative image		
Set Font	Change the font type, size, color and effects for the text in an element		<a href="#">Set Element Font</a> [659]
Show Labels	Reveal any hidden labels on the element		
Copy Appearance to Painter	Copy the default element appearance (set using the <b>Default Appearance</b> option, above) to the painter  You then paste the default appearance using the <b>Paste Appearance</b> option on the Diagram toolbar		<a href="#">Diagram toolbar</a> [112]
Copy Image to Clipboard	Copy the element image to the clipboard		

**Notes:**

- You can also change the appearance (and other aspects) of several selected elements at once
- Context menus vary slightly between element types, and not all menu options shown here are present on all element context menus; for example, the **Alternate Image** option won't display for a Lifeline element

**Learn More:**

- [Element Multiple Selection Menu](#) [660]

**5.6.2.7.1 Set Element Font**

**Topics:**

Topic	Detail	See also
Usage	<p>You can change the appearance of the text within an element, for one or more selected elements</p> <ul style="list-style-type: none"> <li>• Selecting the <b>Appearance   Set Font</b> context menu option</li> <li>• Selecting the <b>Font</b> icon on the Format toolbar, or</li> <li>• Selecting the <b>Font Style</b> option on the element Default Appearance dialog (for the selected element, overridden by the two options above).</li> </ul> <p>The <b>Font</b> dialog displays</p> <p>Select the font, style, size, color and effects, and (if necessary) the script type. Click on the <b>OK</b> button to save your changes</p>	<a href="#">Format Toolbar</a> [543] <a href="#">Default Appearance</a> [643]

### 5.6.2.8 Element Multiple Selection Menu

You can perform operations on two or more elements on a diagram at once. To select the required elements, either click and drag the cursor over the group to highlight them, or press ( **Shift** ) and click on each element.

#### Topics:

Topic	Detail	See also
Usage	<p>Right-click on an element to display a context menu that enables you to:</p> <ul style="list-style-type: none"> <li>Align elements (by left edge, right edge, top, bottom, center in a column or center in a row)</li> <li>Space elements evenly (across or down)</li> <li>Standardize the dimensions of the selected elements</li> <li>Specify the visibility of features for all selected elements</li> <li>Add the same Tagged Value to all selected elements</li> <li>Automatically resize elements to match (element content permitting)</li> <li>Turn the <b>Dockable</b> option on or off for all selected elements on a diagram</li> <li>Set the default appearance and font for multiple elements at once</li> <li>Make the selected elements on the diagram non-selectable; to make them selectable again, right-click on the diagram and select the <b>Make All Elements Selectable</b> context menu option</li> <li>Generate code for all selected elements at once, or synchronize the code against the selected elements</li> <li>Transform the selected elements</li> <li>Copy all selected elements to the clipboard</li> <li>Automatically adjust the layout of the selected elements on the diagram</li> <li>Delete all selected elements</li> </ul>	<p><a href="#">Feature Visibility</a> <sup>[58]</sup></p> <p><a href="#">Assign a Tagged Value to an Item</a> <sup>[76]</sup></p> <p><a href="#">Appearance Menu Section</a> <sup>[65]</sup></p> <p><a href="#">Set an Element's Default Appearance</a> <sup>[64]</sup></p> <p><a href="#">Set Element Font</a> <sup>[65]</sup></p> <p><a href="#">Transform Elements</a> <sup>[131]</sup></p>

#### Notes:

- Where elements are made the same, they are matched to the element you right-clicked on
- It is much faster to assign an appearance or characteristic to a group of elements than to one element at a time

### 5.6.3 Visual Representation

Each UML element has a default representation. However, you can:

- Change the appearance, features, position and - for some elements - orientation through a number of toolbars
- Display or hide various types of information held in the element, in compartments

#### Learn more:

- [Element Icons](#) <sup>[66]</sup>
- [Compartments](#) <sup>[66]</sup>

### 5.6.3.1 Element Icons

When you add an element to a diagram, or select an existing element, a number of small icons display off the right hand side of the element, underneath the Quicklinker arrow. For example:

These icons display small versions of the diagram toolbars or perform specific actions, to enable you to quickly edit the element you have highlighted.

**Reference:**

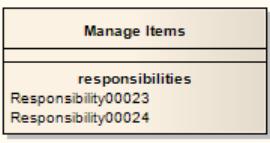

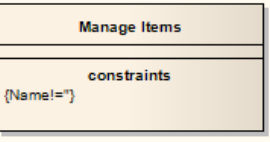

Icon	Description	See Also
	Rotates a Fork/Join element from vertical to horizontal and vice-versa	
	Displays the Format toolbar, for changing element appearance	<a href="#">Format Toolbar</a> [543]
	Displays the Current Element toolbar, to edit the element's properties and features	<a href="#">Current Element Toolbar</a> [113]
	When multiple elements are selected, displays the Diagram Toolbar for changing or aligning the elements together	<a href="#">Diagram Toolbar</a> [112]
	Toggles an Activity Partition between vertical and horizontal	<a href="#">Activity Partition</a> [878]

### 5.6.3.2 Compartments

In addition to the attributes and operations compartments shown in a Class element, Enterprise Architect enables you to display or hide other compartments.

**Topics:**

Images	Topic	Detail	See also
<ul style="list-style-type: none"> <li>Or, fully qualified, expanded format:</li> </ul>	<p><b>Tags Compartment</b></p>	<p>The <i>tags</i> compartment lists all Tagged Values for an element as entered in the Tagged Values window</p> <p>The <b>fully-qualified</b> option operates only on those Tagged Values that were created in Enterprise Architect release 7.1 or later; it does not expand Tagged Values created in earlier releases</p>	<p><a href="#">Tagged Values</a> [764]</p>

Images	Topic	Detail	See also
	<b>Responsibilities Compartment</b>	The <i>responsibilities</i> compartment shows a list of responsibilities as entered on the Requirements page of the element Properties dialog	<a href="#">Requirements</a> <sup>[666]</sup>
	<b>Constraints Compartment</b>	The <i>constraints</i> compartment shows a list of element constraints as entered in the Constraints page of the element Properties dialog	<a href="#">Constraints</a> <sup>[668]</sup>
	<b>Testing Compartment</b>	The <i>testing</i> compartment lists all of the tests associated with an element as listed in the Testing window	<a href="#">The Testing Workspace</a> <sup>[1707]</sup>
	<b>Maintenance Compartment</b>	The <i>maintenance</i> compartment lists all of the defects, changes, issues and tasks associated with an element, as listed in the Maintenance window	<a href="#">The Maintenance Workspace</a> <sup>[1725]</sup>

**Notes:**

- To set the visibility of the various compartments, see *Feature Visibility*

**Learn More:**

- [Feature Visibility](#) <sup>[587]</sup>

## 5.6.4 Element Property Displays

To define, assign and review the properties and features of elements, you can use the following:

Topic	Link
Properties Dialog	<a href="#">Properties Dialog</a> <sup>[662]</sup>
Properties Docked Window	<a href="#">Properties Window</a> <sup>[691]</sup>
Element Browser	<a href="#">The Element Browser</a> <sup>[689]</sup>
Scenarios & Requirements Window	<a href="#">The Scenarios &amp; Requirements Window</a> <sup>[691]</sup>
Select <Item> Dialog	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>

### 5.6.4.1 Properties Dialog

This topic area covers element properties and their settings, responsibilities, constraints, connectors, scenarios, Tagged Values, associated files, object files and classifiers, and boundary element settings.

**Topics:**

Topic	Detail	See also
<b>Displaying the Properties dialog</b>	<p>To display the element Properties dialog, use any of the following methods:</p> <ul style="list-style-type: none"> <li>• Select an element in the Diagram View and select the <b>Element   Properties</b> menu option</li> <li>• Right-click on an element in the Diagram View, and select the <b>Properties</b> context menu option</li> <li>• Select an element in the Diagram View, and press ( <b>Alt+Enter</b> )</li> <li>• Double-click on an element in the Diagram View</li> <li>• Right-click on an element in the Project Browser, and select the <b>Properties</b> context menu option</li> </ul> <p>To suppress display of the Properties dialogue when placing a new element, uncheck the <b>Edit Object on New</b> option on the Objects page of the Options dialog</p>	<a href="#">Objects</a> <sup>[434]</sup>
<b>Properties dialog pages</b>	<p>The Class Properties dialog consists of the following pages:</p> <ul style="list-style-type: none"> <li>• General</li> <li>• Details</li> <li>• Advanced Properties</li> <li>• Templates</li> <li>• Tagged Values</li> <li>• Requirements</li> <li>• Constraints</li> <li>• Scenarios</li> <li>• Files</li> <li>• Links</li> </ul> <p>Properties also include Object files and Classifiers, and the Boundary element appearance</p>	<a href="#">General Settings</a> <sup>[664]</sup> <a href="#">Details</a> <sup>[665]</sup> <a href="#">Advanced Properties</a> <sup>[666]</sup> <a href="#">Templates</a> <sup>[666]</sup> <a href="#">Tagged Values</a> <sup>[764]</sup> <a href="#">Requirements</a> <sup>[666]</sup> <a href="#">Constraints</a> <sup>[668]</sup> <a href="#">Scenarios</a> <sup>[669]</sup> <a href="#">Associated Files</a> <sup>[689]</sup> <a href="#">Links</a> <sup>[668]</sup> <a href="#">Object Classifiers</a> <sup>[707]</sup> <a href="#">Boundary Element Settings</a> <sup>[934]</sup>

**Notes:**

- There are several variations of the Properties dialog:
  - The dialog for a Table or Stored Procedure element has slight differences on the General page, and a Table (Stored Procedure) Details page instead of a Details page
  - The dialog for a Class element of a stereotype other than Table is as shown in General Settings
  - The dialog for an element of any other type does not have a Details page
  - Port and Part elements have a Property page
  - Activity elements have a Behavior page, and Action and Invocation elements (depending on their type) have other pages such as Effect, Trigger and Call pages
  - Action Pins have a Pin page
- In all cases, the Properties dialog is an expandable window, which you can stretch to enable longer entry and clearer inspection of the text field values
- The Tagged Values page of the element Properties dialog simply provides the Tagged Values window within the frame of the Properties dialog.

**Learn More:**

- [Working With Table Properties](#) <sup>[1354]</sup>

- [Trigger](#)<sup>[936]</sup>
- [Behaviour Calls](#)<sup>[717]</sup>
- [Action Pin](#)<sup>[877]</sup>

#### 5.6.4.1.1 General Settings

The General page of the element Properties dialog contains the following fields:

Field	Usage	See also
<b>Name</b>	Change the element's name	
<b>Stereotype</b>	(Optional) Type the name of a stereotype for the element, or click on the drop-down arrow and select one	
<b>Role</b>	Type the role played by the object represented by the element	
<b>Alias</b>	Type an alias (alternative display name) for the object	
<b>Keywords</b>	Enter free-text items such as keywords or context information; this can be filtered in Use Case Metrics and Search dialogs	
<b>Author</b>	Enter or select the name of the original author	
<b>Language</b>	Select the programming language for the object	
<b>Status</b>	Indicate the current status of the element (such as Approved or Proposed)	
<b>Complexity</b>	Indicate the complexity of the element (used for project estimation), such as Easy, Medium or Hard	
<b>Version</b>	Enter the version of the current element	
<b>Phase</b>	Indicate the phase this element is to be implemented in (for example, 1, 1.1, 2.0 ...)	
<b>Notes</b>	Enter any notes text associated with the element, as described for the Notes window  You can format the notes text using the Notes toolbar at the top of the field	<a href="#">Notes</a> <sup>[777]</sup>  <a href="#">Notes Toolbar</a> <sup>[772]</sup>

Further facilities are made available by clicking on the Advanced page.

#### Learn More:

- [Advanced Settings](#)<sup>[666]</sup>

### 5.6.4.1.2 Details

The **Details** page of the element **Properties** dialog enables you to define the structural and processing details for the selected Class element.

#### Reference:

Field/Button	Usage	See also
<b>Scope</b>	Click on the drop-down arrow and select the element's scope (public, private, protected, package)	
<b>Persistence</b>	Click on the drop-down arrow and select the appropriate value (blank, persistent or transient)	
<b>Cardinality</b>	The number of instances of the element that can exist - the value displays on the element in a diagram, in the <i>Name</i> compartment  Use the format defined in the Cardinality tab	<a href="#">Cardinality</a> [778]
<b>Abstract</b>	Select if the element is abstract	
<b>Is Root</b>	Select if the element is a root element and cannot be descended from another	
<b>Is Leaf</b>	Select if the element is final and cannot be a parent for other elements	
<b>Is Specification</b>	Select if the element is a specification	
<b>Is Active</b>	Select if the element is active; for example, an Active Class	<a href="#">Active Classes</a> [945]
<b>Attributes</b>	Define attributes for the Class  The Attributes Properties dialog displays	<a href="#">Attributes</a> [697]
<b>Operations</b>	Define operations for the Class  The Operations Properties dialog displays	<a href="#">Operations Dialog - General</a> [710]
<b>Concurrency</b>	Specify how concurrent activities should be processed	
<b>Collection Classes</b>	Define Collection Classes (for generating code from Association connectors) that apply to this Class  The Collection Classes for Association Roles dialog displays	<a href="#">Set Collection Classes</a> [1535]
<b>Template Parameters</b>	List the <i>Parameterized Class</i> template parameters  Click on the <b>Edit</b> button to edit a selected parameter, or click on the <b>Add</b> button to add a new parameter	<a href="#">Parameterized Classes</a> [945]
<b>Binding(s)</b>	List the binding expressions on a <i>binding</i> Class  Click on the <b>Edit</b> button to edit a selected binding expression, or click on the <b>Add</b> button to add a new binding expression	<a href="#">Template Binding</a> [1012]

#### Notes:

- When launched from MDG Integration, the **Attributes** and **Operations** buttons are not available

### 5.6.4.1.3 Advanced Properties

The Advanced page displays the advanced properties of the element (where they exist) and enables you to reset the values of these properties.

#### How to:

To set a value for an advanced (or custom) property, follow the steps below:

Step	Action	See also
1	Click on the data field to the right of the property name	
2	Depending on the property, either: <ul style="list-style-type: none"> <li>• Type the value in free text</li> <li>• Click on the drop-down arrow and select the value from the list</li> <li>• Click on the ( ... ) Browse button and search for the required value</li> </ul>	
3	Click on the <b>Apply</b> button	

### 5.6.4.1.4 Templates

Use the Templates page to define

- Parameterized Class template parameters
- Binding expressions on a binding Class

In the Template Parameter(s) panel, click on the **Add** button to add a new parameter, or click on the **Edit** button to edit a selected existing parameter; in either case, the Template Parameter dialog displays.

In the Binding(s) panel, click on the **Add** button to add a new binding expression or click on the **Edit** button to edit a selected binding expression. When you click on the **Add** button, a short context menu displays from which you select the type of relationship to generate, and then you define the binding expressions.

If either a template parameter or a binding expression is no longer required, click on it and then click on the corresponding **Delete** button.

#### Learn More:

- [Parameterized Classes \(Templates\)](#)<sup>[945]</sup>
- [Template Binding](#)<sup>[1012]</sup>

### 5.6.4.1.5 Requirements

You use the Requirements page of the element Properties dialog to create requirements that this element is designed to meet.

Requirements are of two types:

- Internal requirements (responsibilities) and
- External requirements (system requirements, elements connected to the element by a Realize connector)

Enterprise Architect shows both types, but you can only edit the internal type from the Requirements page.

You can show the requirements for an element on the diagram directly, using the Feature Visibility function; it is also possible to show inherited requirements in this way.

Field/Button	Usage	See Also
<b>Requirement</b>	Enter the name and high level detail of the requirement	
<b>Type</b>	Specify the type; for example, Functional or Non-functional: <ul style="list-style-type: none"> <li>Functional requirements are things that the system must do, such as identify franked, unfranked and total credit for a dividend</li> <li>Non-functional requirements are things that the system must be, such as reliable or cost effective</li> </ul>	
<b>Last update</b>	Specify the date of the last requirement update	
<b>Status</b>	Specify the current status of the requirement	
<b>Difficulty</b>	Identify the difficulty of implementing the current requirement	
<b>Priority</b>	Specify how urgent the requirement is	
<b>Stability</b>	Specify the estimated stability of the requirement  This is an indication of the probability of the requirement - or understanding of the requirement - changing; high stability indicates a low probability of the requirement changing	
<b>Notes</b>	Record details of the requirement  You can format the notes text using the Notes toolbar at the top of the field	<a href="#">Notes Toolbar</a> <sup>[772]</sup>
<b>Move External</b>	Make an internal responsibility into an external requirement	<a href="#">Make Internal Requirement External</a> <sup>[1170]</sup>
<b>New</b>	Create a new requirement	
<b>Save</b>	Save changes to requirements	
<b>Delete</b>	Delete a selected requirement	
<b>Defined</b>	List the defined requirements associated with this element	

**Learn More:**

- [Internal Requirements](#)<sup>[1170]</sup>
- [External Requirements](#)<sup>[667]</sup>
- [Feature Visibility](#)<sup>[587]</sup>

**5.6.4.1.5.1 External Requirements**

External requirements are those Requirement elements that have been connected to the current element using a *Realization* connector. By creating the connector from the element to the requirement, you create an expectation that the element must implement the requirement as part of the system solution.

In Enterprise Architect, linked requirements are shown in the Requirements page of the element Properties dialog, but they are marked external and cannot be directly edited (on selection, the page fields are grayed out).

Double-click an external requirement in the list to activate the Properties dialog for the associated requirement, where you can view and modify the requirement details and check the requirement hierarchy details.

**Learn More:**

- [Create Requirements](#) <sup>[1159]</sup>
- [Requirement Properties](#) <sup>[1160]</sup>
- [Make Internal Requirement External](#) <sup>[1170]</sup>

**5.6.4.1.6 Constraints**

Elements can have associated constraints placed on them. Constraints are used in conjunction with responsibilities to define the conditions and rules under which an element operates and exists.

Typical constraints are pre- and post- conditions, which indicate things that must be true before the element is created or accessed and things that must be true after the element is destroyed or its action complete.

Use the Feature Visibility function to show constraints for an element on the diagram directly; it is also possible to show inherited constraints in this way.

**How To:**

To add constraints to a model element, follow the steps below:

Step	Action	See Also
1	Open the element Properties dialog	
2	Select the Constraints page	
3	In the <b>Constraint</b> field, type the name of the constraint	
4	In the <b>Type</b> and <b>Status</b> fields, click on the drop-down arrow and select the constraint type ( <b>Pre-condition</b> , <b>Post-condition</b> or <b>Invariant</b> ) and status	
5	In the larger text field, type any additional notes required	
6	Click on the <b>Save</b> button	

**Learn More:**

- [Feature Visibility](#) <sup>[587]</sup>
- [Requirements](#) <sup>[666]</sup>

**5.6.4.1.7 Links**

The Links page of the element Properties dialog displays a list of all relationships active for the current element.

**Topics:**

Topic	Detail	See also
<b>Relationships Panel</b>	The Relationships panel lists the relationships this element has, including: <ul style="list-style-type: none"> <li>• <b>Elements</b> this element is related to</li> <li>• <b>Element Stereotype</b> (if any) of the element</li> <li>• <b>Type</b> of the related element</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Connection</b> or relationship type</li> <li>• <b>Stereotype</b> (if any) of the relationship</li> </ul>	
<b>Links Page</b>	<p>From the Links page you can perform operations on a relationship, by right-clicking on the relationship to display the context menu</p> <p>To:</p> <ul style="list-style-type: none"> <li>• Hide the relationship on the diagram, click on the <b>Hide Relation</b> menu option; the option then changes to <b>Show Relation</b>, which you select to redisplay the relationship on the diagram</li> <li>• Display the relationship Properties dialog, click on the <b>Relationship Properties</b> menu option</li> <li>• Highlight the related element in the Project Browser, click on the <b>Locate Related Object</b> menu option</li> <li>• Delete the relationship from the model and all diagrams, click on the <b>Delete Relationship</b> menu option; the system prompts you to confirm the deletion</li> </ul>	<a href="#">Connector Properties</a> <small>[758]</small>

#### 5.6.4.1.8 Scenarios

A scenario is a real-world sequence of operations that describes how an element works in real-time.

##### Topics:

Topic	Detail	See also
<b>Where you can generate Scenarios</b>	<p>You can apply scenarios to any element - generally Use Cases - to describe functional behavior, business work flows and end-to-end business processes</p> <p>You create scenarios through the Scenario page of the element Properties dialog; this page has two internal tabs, as described below.</p> <ul style="list-style-type: none"> <li>• The Description tab enables you to create scenarios and provide a simple text description of each scenario, or of the structure of each scenario</li> <li>• The Structured Specification tab (the default) enables you to create scenarios or select those you have created elsewhere and, for each scenario: <ul style="list-style-type: none"> <li>• Create a series of steps for each part of the scenario</li> <li>• Structure the scenario to show how the basic path diverges into the alternate paths and exception paths</li> <li>• Generate a number of types of diagram from the structure</li> <li>• Generate a structured scenario from an Activity diagram</li> <li>• Generate a structured scenario from text on the clipboard; this option has a variation in the Description tab that enables you to translate scenario descriptions created prior to release 8.0 of Enterprise Architect, into structured scenarios in the latest release</li> </ul> </li> </ul>	<a href="#">Structured Specification Tab</a> <small>[671]</small> <a href="#">Generate Diagrams</a> <small>[678]</small> <a href="#">Generate Scenario from Activity diagram</a> <small>[686]</small> <a href="#">Structured Specification Item Context Menu</a> <small>[674]</small> <a href="#">Scenarios</a> <small>[670]</small>
<b>Description Tab</b>	On the Scenarios page, click on the Description tab; the	

Topic	Detail	See also
	<p><b>Scenario</b> (name) field and the <b>Type</b> field both default to <b>Basic Path</b>, to enable you to define the basic path first; you can overtype the scenario name with more appropriate text if required</p> <p>As you go on to create other scenarios, you set the type to <b>Alternate</b> or <b>Exception</b> as appropriate</p> <p>Complete the fields as described in the table below</p>	

Reference:

Field	Usage	See also
<b>Scenario</b>	Type in the name of the scenario (or, for existing scenarios, click on the drop-down arrow and select one from the list)	
<b>Type</b>	Specify the type of scenario; the options are: <ul style="list-style-type: none"> <li>• <b>Basic Path</b> - the direct set of steps for the scenario</li> <li>• <b>Alternate</b> - an alternative set of steps, in parallel with part of the basic path</li> <li>• <b>Exception</b> - the path the scenario follows if a step of the basic path does not produce an appropriate result</li> </ul>	
<b>Description</b>	<p>Record a textual description of how the user uses the current element</p> <p>As for the Notes window, you can format the notes text using the Notes toolbar at the top of the field</p> <p>As well as the Notes window facilities, you can also generate a structured specification from the text in this field; highlight the text, right-click on it and select the <b>Create Structure from Notes</b> context menu option</p> <p>The text is copied to the Structured Specification tab for the current scenario, either as a new specification or as the continuation of an existing specification, with a new step created at each carriage return</p> <p>Subsequent changes to the text on the Structured Specification tab are not reflected on the Description tab</p>	<p><a href="#">Note Tab</a><sup>[77]</sup></p> <p><a href="#">Notes Toolbar</a><sup>[77]</sup></p> <p><a href="#">Structured Specification Tab</a><sup>[67]</sup></p>
<b>New</b>	Clear the data fields so that you can enter data in them to create a new scenario	
<b>Save</b>	Save a new scenario, or changes to an existing scenario	
<b>Delete</b>	Delete a scenario selected from the Scenarios panel, below	
<b>Scenarios</b>	<p>Display a list of defined scenarios for this element</p> <p>You can change the order in which the scenarios are listed, using the  and  buttons</p>	

Notes:

- The Scenario page does not prevent you from creating more than one basic path, but it would be

unusual to define more than one

- All the functions available on the Scenario page are also available through the Scenarios & Requirements window/view; use the **Browse Element** icon in the window toolbar to list and select the scenarios for the element

#### Learn More:

- [Scenarios & Requirements](#)<sup>[69]</sup>

#### **5.6.4.1.8.1 Structured Specification Tab**

The Structured Specification tab offers a wide range of facilities for generating and modifying scenario specifications, enabling you to define the structure, actions and interactions of the scenarios defined for an element such as a Use Case. These scenarios can be the main (basic) path, alternate paths or exception paths.

When you open the Structured Specification tab it defaults to the basic path so that if it does not already exist, you can create it. You can create alternate paths and exception paths as part of the process of adding them to steps of the basic path.

You can also create all three types of scenario paths on the Description tab, or in the Scenarios & Requirements window.

#### Learn More:

- [Scenarios](#)<sup>[66]</sup>
- [Scenarios & Requirements](#)<sup>[69]</sup>
- [Structured Specification Toolbar](#)<sup>[67]</sup>
- [Item context menu](#)<sup>[67]</sup>
- [Selected Text context menu](#)<sup>[67]</sup>
- [Entry Points context menu](#)<sup>[67]</sup>
- [Floating Toolbar](#)<sup>[67]</sup>

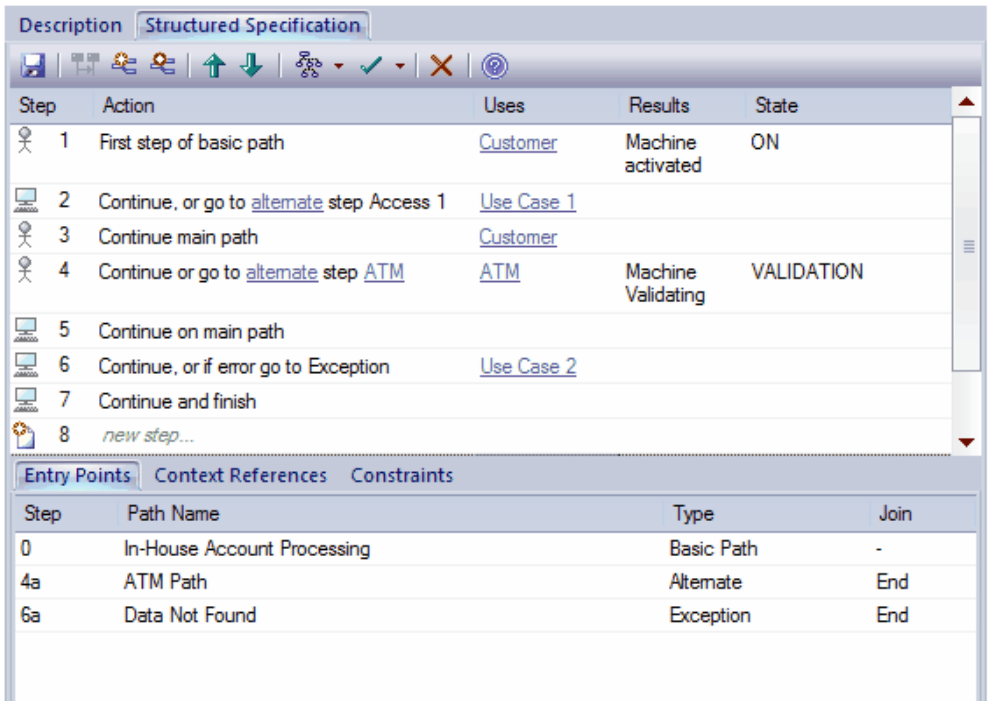

You can create a specification for a scenario in one of several ways:

- Enter the specification yourself, as described below
- Generate a specification from an Activity diagram created under a Use Case element
- Generate a specification from the notes text of the scenario in the Description tab
- Generate a specification from text held on the clipboard

#### How To:

To enter the specification yourself, starting with the basic path, follow the steps below:

Step	Action	See Also
1	In the <b>Scenario</b> field, click on the drop-down arrow and select the <i>Basic Path</i> scenario	
2	In the <i>new step</i> field in the <b>Action</b> column, type the text of the first step or action	
3	Tab to the <b>Uses</b> column and, if necessary, type the name of each element used in this step; any elements that are listed in the Context References tab are highlighted in blue and underlined  You can also manage the list of elements as context references, and add to the list directly; see the Notes below	

Step	Action	See Also																																																													
4	Tab to the <b>Results</b> column and, if necessary, type the outcome of completing this step																																																														
5	Tab to the <b>State</b> column and, if necessary, type the name of the state into which the step moves the action																																																														
6	<p>When you move out of the <b>Action</b> column, the next <i>new step</i> field displays underneath</p> <p>Repeat steps 2 to 5 as many times as is necessary.</p> <p>The Structured Specification tab should now resemble the following illustration:</p>  <p>The screenshot shows the 'Structured Specification' tab with a table of steps and an 'Entry Points' sub-tab. The main table has columns: Step, Action, Uses, Results, and State. The 'Entry Points' sub-tab has columns: Step, Path Name, Type, and Join.</p> <table border="1" data-bbox="323 734 1316 1097"> <thead> <tr> <th>Step</th> <th>Action</th> <th>Uses</th> <th>Results</th> <th>State</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>First step of basic path</td> <td>Customer</td> <td>Machine activated</td> <td>ON</td> </tr> <tr> <td>2</td> <td>Continue, or go to <a href="#">alternate step Access 1</a></td> <td><a href="#">Use Case 1</a></td> <td></td> <td></td> </tr> <tr> <td>3</td> <td>Continue main path</td> <td>Customer</td> <td></td> <td></td> </tr> <tr> <td>4</td> <td>Continue or go to <a href="#">alternate step ATM</a></td> <td>ATM</td> <td>Machine Validating</td> <td>VALIDATION</td> </tr> <tr> <td>5</td> <td>Continue on main path</td> <td></td> <td></td> <td></td> </tr> <tr> <td>6</td> <td>Continue, or if error go to Exception</td> <td><a href="#">Use Case 2</a></td> <td></td> <td></td> </tr> <tr> <td>7</td> <td>Continue and finish</td> <td></td> <td></td> <td></td> </tr> <tr> <td>8</td> <td><i>new step...</i></td> <td></td> <td></td> <td></td> </tr> </tbody> </table> <table border="1" data-bbox="323 1108 1316 1288"> <thead> <tr> <th>Step</th> <th>Path Name</th> <th>Type</th> <th>Join</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>In-House Account Processing</td> <td>Basic Path</td> <td>-</td> </tr> <tr> <td>4a</td> <td>ATM Path</td> <td>Alternate</td> <td>End</td> </tr> <tr> <td>6a</td> <td>Data Not Found</td> <td>Exception</td> <td>End</td> </tr> </tbody> </table>	Step	Action	Uses	Results	State	1	First step of basic path	Customer	Machine activated	ON	2	Continue, or go to <a href="#">alternate step Access 1</a>	<a href="#">Use Case 1</a>			3	Continue main path	Customer			4	Continue or go to <a href="#">alternate step ATM</a>	ATM	Machine Validating	VALIDATION	5	Continue on main path				6	Continue, or if error go to Exception	<a href="#">Use Case 2</a>			7	Continue and finish				8	<i>new step...</i>				Step	Path Name	Type	Join	0	In-House Account Processing	Basic Path	-	4a	ATM Path	Alternate	End	6a	Data Not Found	Exception	End	
Step	Action	Uses	Results	State

8	<i>new step...</i>																																																														
Step	Path Name	Type	Join																																																												
0	In-House Account Processing	Basic Path	-																																																												
4a	ATM Path	Alternate	End																																																												
6a	Data Not Found	Exception	End																																																												

**Notes:**

- By default, the steps begin with a user step (indicated by an actor icon) and alternate between user and system (indicated by a screen icon) steps. However, you can control the responsible entity assigned to a step by typing a keyword within the first 15 characters of the text in the Action column; either 'User' or 'Actor' for a user step, or 'System' for a system step. Once a step has been saved, you can change the responsible entity by either double-clicking on the icon or right-clicking on the step, and selecting the **Set Step as 'System'** or **Set Step as 'User'** context menu option as required
- An entry for the basic path displays in the Entry Points tab, as **Step 0** with no value in the **Join** column (the basic path does not rejoin itself)
- The values in the **Uses**, **Results** and **State** columns, whilst optional, are significant if you want to generate a diagram from the specification; if you type the name of an element linked to the current element (and listed in the Context References tab), the element name is highlighted and underlined
- In the **Uses** column, in edit mode, the **Manage Uses Context List** context menu option enables you to enable and disable **Uses** cells as linked element lists as well as text fields, across the whole model; when the feature is enabled, the column shows both context-linked elements and manually-entered text, and when disabled only text entries are listed (the context-linked entries are hidden and deactivated, but not deleted - they are re-activated when the feature is enabled)
- As you develop the scenario, you can move steps to different positions in the scenario, and insert new step lines within the body of the scenario
- You can also create constraints on the element that have an impact on the scenarios

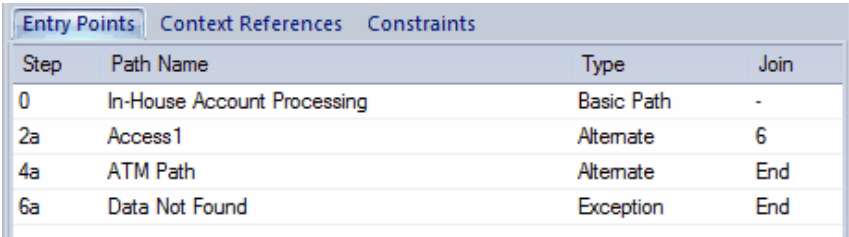

- Repeat the **Scenario Steps** procedure for each scenario you have created; you can now adapt, enhance and interrelate the scenario specifications using the facilities of the Structured Specification tab:
  - Structured Specification Toolbar
  - Item context menu
  - Selected Text context menu
  - Entry Points context menu
  - Floating Toolbar

**Learn More:**

	displays the definition when you move the cursor over it. If you highlighted part of the original text, the term overwrites that text.		
<b>Manage Uses Context List</b>	<p>(On highlighted text or a specific cursor position in the Uses column)</p> <p>Display the Manage Uses Context List dialog, which enables you to:</p> <ul style="list-style-type: none"> <li>• Browse to or type in a context reference item</li> <li>• Re-sort the list with up and down arrow keys</li> <li>• Remove an entry from the list</li> <li>• Enable or disable the Uses Context List facility across the model</li> </ul> <p>You can resize the dialog to show the full details of context reference items</p> <p>If you enable the Uses Context List facility, you do not necessarily have to use the dialog to add context list items; you can type or insert an element name from the Context References tab in the Uses column, and that name is added to the Uses Context List</p> <p>If you disable the Uses Context List facility, the context list items in the Uses column are hidden</p>		<a href="#">Context References Tab</a> <sup>[688]</sup>
<b>Split Step</b>	<p>Splits the selected step into two consecutive steps.</p> <p>The option is available only if you highlight a <i>portion</i> of the text in the selected field. The new step takes the highlighted text as its <b>Action</b> text.</p>		
<b>Search for &lt;text&gt;</b>	Displays a sub-menu of options for locating the selected text in a number of locations.		<a href="#">Code editor context menu</a> <sup>[1412]</sup>
<b>Undo</b>	Undo any unsaved changes you have just made in the step.		
<b>Cut</b>	Perform simple editing operations on the highlighted text.		
<b>Copy</b>			
<b>Paste</b>			
<b>Delete</b>			
<b>Select All</b>			

The Entry Points tab shows how the basic path, alternate path and exception path scenarios for the element are organized and interrelated. If an alternate path or exception path has been defined but has not yet been added to the basic path, it is not listed on this tab.

You can switch focus between the Entry Points tab and the Structured Specification tab by pressing ( **Alt+Q** ) .

To display the context menu for this tab, highlight an entry and right-click on it. The following options are available:

Option	Action	Shortcut	See also
<b>Edit Path</b>	Display the steps of the scenario in the Structured Specification tab, with the first step highlighted		
<b>Join with Step</b>	(Available only if the basic path scenario is displayed in the Structured Specification tab. Not available to edit the basic path scenario.)  Highlight the <b>Join</b> field and its drop-down arrow. Click on the drop-down to define or change the step number at which the alternate or exception path rejoins the basic path. Select <b>End</b> if the path does not rejoin the basic path steps.		
<b>Remove Entry Point</b>	(Available only if the basic path scenario is displayed in the Structured Specification tab. Not available to delete the basic path.)  Delete the relationship between the selected path and the basic path, and remove the entry from the Entry Points tab.		

Wherever a reference to another element exists on the Scenario tab (that is, where the text is highlighted and underlined), if you hover the cursor over the element name a short floating toolbar displays.

#### Use To:

- Display the element Properties dialog
- Locate the element in its parent diagram
- Locate the element in the Project Browser

#### 5.6.4.1.8.2 Generate Diagrams

If you have created a structured scenario, you can generate any of the following diagrams from that scenario:

- Activity
  - With ActivityParameter
  - With Action
  - With Action Pin
- Rule Flow
- State Machine
- Sequence
- Robustness

#### How To:

To generate the required diagram, follow the steps below:

Icon	Step	Action	See Also
	1	Create the scenario structure on the Structured Specification tab	<a href="#">Structured Specification Tab</a> <sup>[67]</sup>
	2	Click on the Generate Diagram icon in the toolbar on the tab	
	3	Click on the type of diagram to generate  Enterprise Architect generates the diagram and notifies you that	

Icon	Step	Action	See Also
		<p>generation is complete. Close the Properties dialog to review the diagram</p> <p>If the diagram being generated already exists under the selected element, a prompt displays to overwrite or synchronize with that diagram</p> <p>Select the appropriate radio button to:</p> <ul style="list-style-type: none"> <li>• Overwrite the existing diagram (delete the existing diagram and elements, and create a new diagram and elements) or</li> <li>• Synchronize the elements in the existing diagram with the scenario steps (however, Sequence and Robustness diagrams cannot be synchronized)</li> </ul>	

**Notes:**

- The **Synchronize elements in existing diagram** option enables the **Preserve Diagram Layout** checkbox, which you can select to preserve the existing arrangement of elements and connectors on the diagram. Any new elements are added to the diagram in the default position, and you manually position them in the diagram as required. If you do not select the checkbox, the diagram is recast in the default layout.

It is recommended that you uncheck the **Preserve Diagram Layout** checkbox if you are synchronizing elements with scenario steps:

- When new steps have been added or existing steps have been deleted or moved within the Use Case
- For the first time in a Use Case that has been imported from XML with the **Strip GUIDs** option selected
- For the first time in a Use Case that has been copied and pasted in the Project Browser, or
- For the first time in a Use Case whose containing package has been copied and pasted in the Project Browser

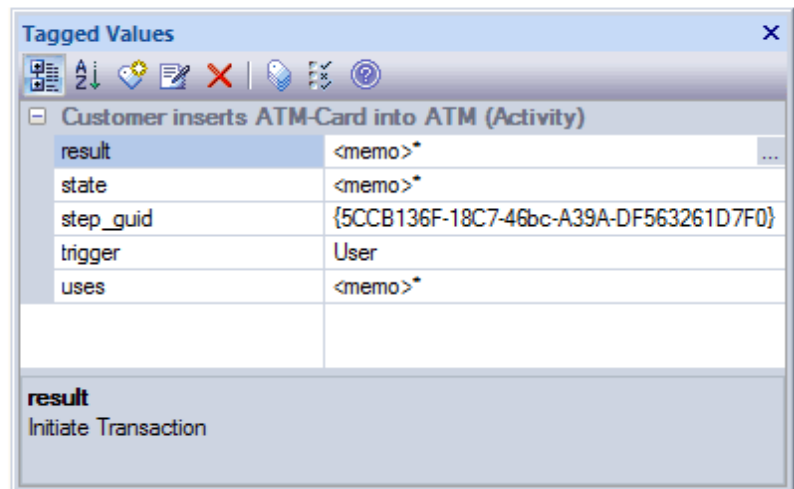

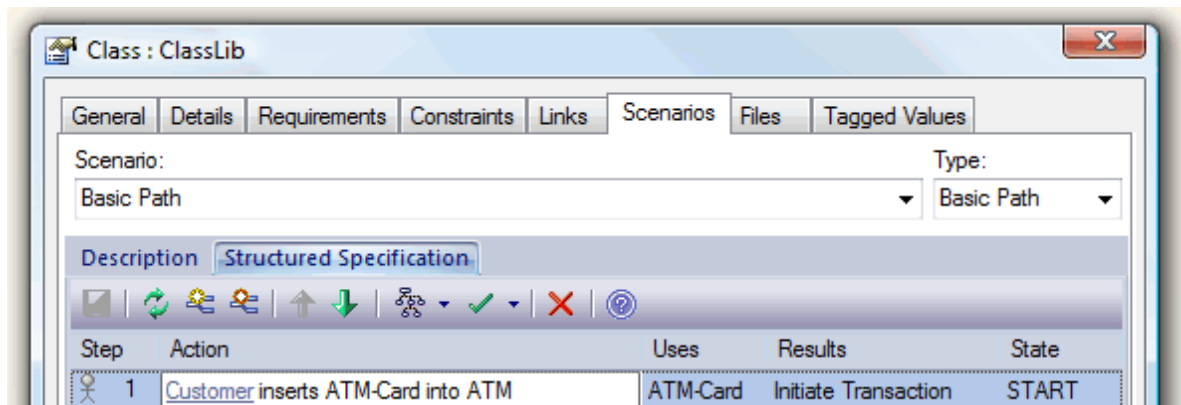

**Learn More**

- [Generate Activity Diagram](#) [679]
- [ActivityParameter](#) [679]
- [Action](#) [679]

- [Generate Rule Flow Diagram](#) [680]
- [Generate State Machine Diagram](#) [681]
- [Generate Sequence Diagram](#) [683]
- [Generate Robustness Diagram](#) [685]
- [Import from XML](#) [324]
- [Copy Element Between Packages](#) [636]
- [Copy A Package](#) [537]

An Activity is generated as a child of the selected element, to act as a container for the diagram.

- The scenario steps are modeled as Activities
- The values of the *Uses*, *Results* and *State* columns for each step are added as Tagged Values of the corresponding Activity

**Example:**

#### Topics:

Topic	Detail	See also
Activity with ActivityParameter	<ul style="list-style-type: none"> <li>The values of the Uses and Results columns are modeled as ActivityParameters</li> <li>The value of the State column is added as a Tagged Value of the Activities</li> <li>ActivityParameters are added to the Project Browser and not to the diagram</li> </ul>	
Activity with Action	<ul style="list-style-type: none"> <li>The scenario steps are modeled as Actions</li> <li>The values of the Uses, Results and State columns are added as Tagged Values of the Actions</li> </ul>	
Activity with ActionPin	<ul style="list-style-type: none"> <li>The scenario steps are modeled as Actions</li> <li>The values of the Uses and Results columns are modeled as Input Pins and Output Pins respectively</li> <li>The value of the State column is added as a Tagged Value of the Actions</li> <li>ActionPins are added to the <b>Project Browser</b> and not to the diagram</li> </ul>	

A Rule Flow Activity is created as a child of the selected element, to act as a container for the diagram.

- The scenario steps are modeled as RuleTasks.
- The values of the *Uses*, *Results* and *State* columns are added as Tagged Values of the RuleTasks

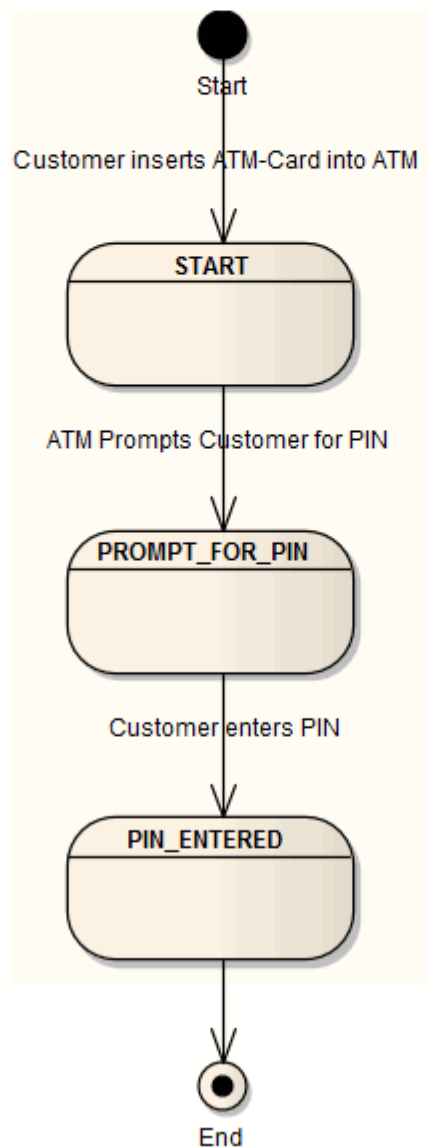

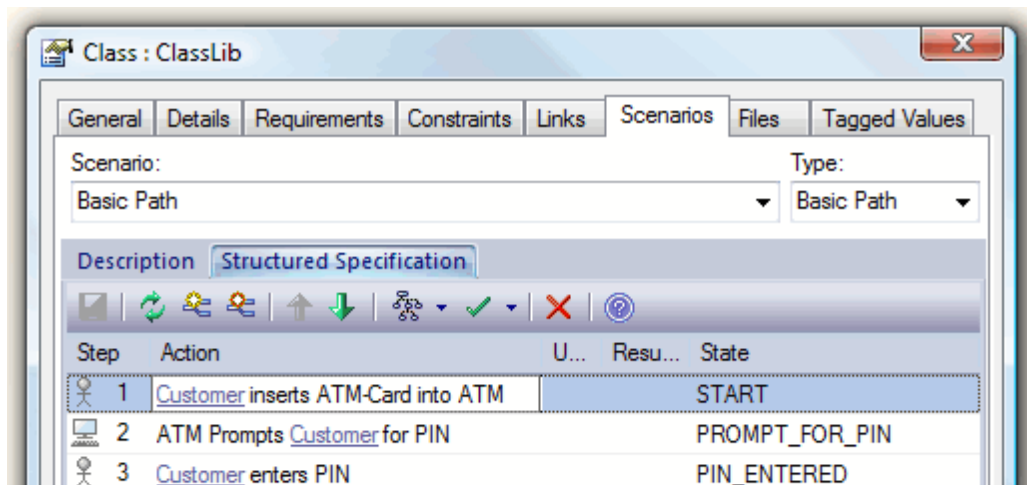

---

A StateMachine is created as a child of the selected element, to act as a container for the diagram.

- Each value in the *State* column is modeled as a State.
- The scenario steps become the Transition connectors between the States
- The values of the *Uses* and *Results* columns are added as Tagged Values of the Transitions.

**Example:**

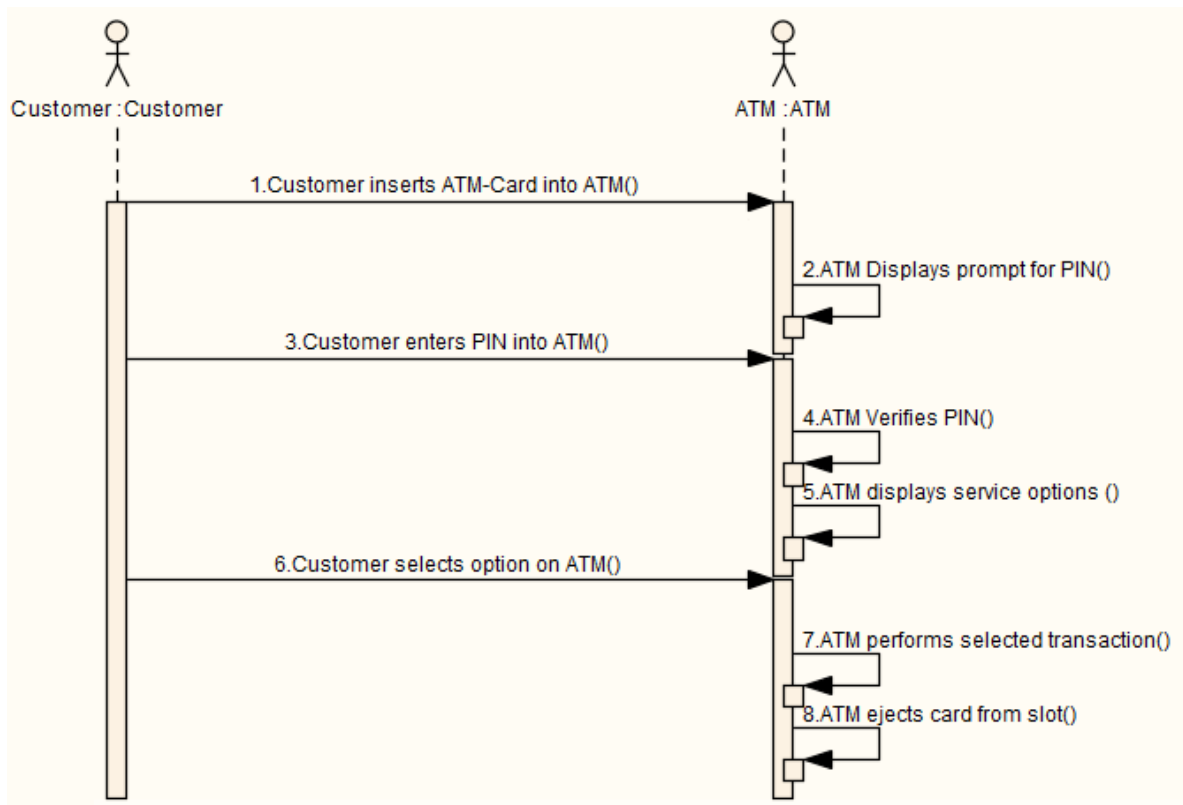

An Interaction is created as a child of the selected element, to act as a container for the diagrams - the Basic, Alternate and Exception paths are modeled as separate Sequence diagrams under the Interaction.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>All the elements involved in the scenario should be identified in the Context Reference tab. That is, relationships must already exist between the scenario parent element and the other elements named in the scenario.</p> <ul style="list-style-type: none"> <li>• Each Context Reference element named in a scenario step is modeled as a Lifeline</li> <li>• The step itself becomes the Message between an originator and its destination(s)</li> <li>• The first Context Reference element in a step is treated as the originator</li> <li>• The subsequent Context Reference element(s) become the destination(s)</li> </ul> <p>Because the diagram generator acts on element names in the step, you should take care to avoid using the element names as normal text. For example, in step 1 in the dialog below, the term ATM-Card is interpreted as a reference to the ATM element, and two Customer inserts ATM-Card into ATM Messages are generated for the step. (To avoid confusion, in the diagram the first Message has been deleted.)</p> <p>If the <b>Show Sequence Numbering</b> checkbox on the Diagram Sequence page of the Options dialog is not selected, the Message name on the Sequence diagram is prefixed by the step number, as shown in the diagram below. If the checkbox is selected, the message sequence number is shown instead of the step number</p> <p>The values of the Uses, Results and State columns are added as Tagged Values of the Message</p>	<p><a href="#">Context Reference Tab</a><sup>[688]</sup></p> <p><a href="#">Sequence</a><sup>[433]</sup></p>

**Example:**

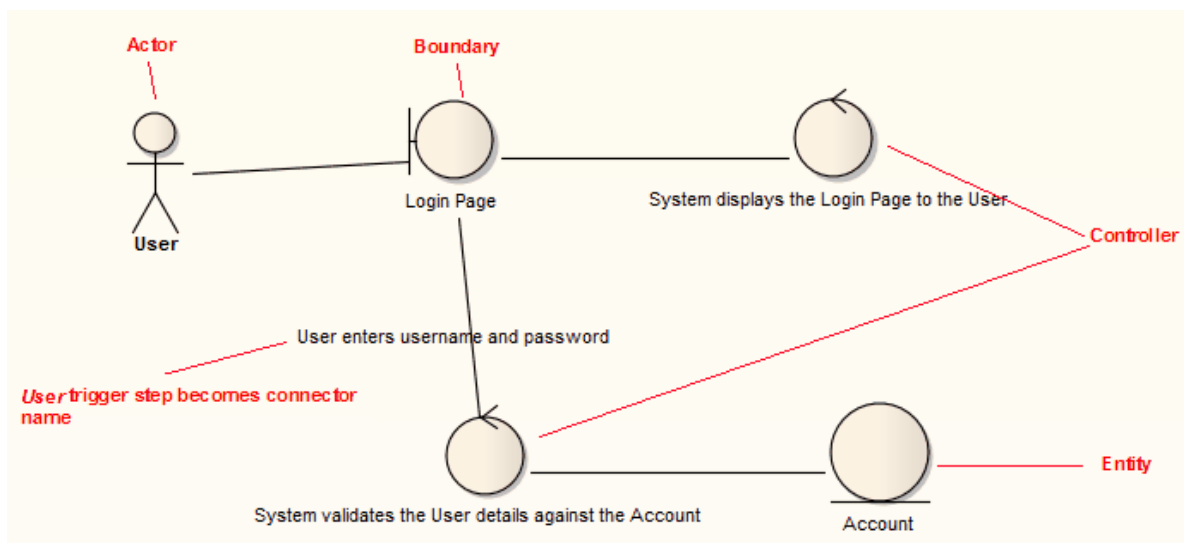

A Collaboration is created as a child of the selected element, to act as a container for the Robustness diagram.

**Example:**

Step	Action
 1	System displays the <a href="#">Login Page</a> to the <a href="#">User</a>
 2	<a href="#">User</a> enters username and password
 3	System validates the <a href="#">User</a> details against the <a href="#">Account</a>

#### Notes:

- All the elements involved in the scenario should be identified in the Context Reference tab. That is, relationships must already exist between the scenario parent element and the other elements named in the scenario
- Any values in the *Uses*, *Results* and *State* columns are ignored and not represented in the diagram
- Each UI element in a step becomes a Boundary element. A Dependency relationship is created from this Boundary element to the UI element (this connector is not shown on the diagram)
- Each Actor referenced in a step is dropped into the Robustness diagram as a simple link
- Each Class referenced in a step is dropped into the Robustness diagram as a simple link, and is given the stereotype *entity*
- Each step with a *System* trigger becomes a Controller. Alternate/exception path Controllers are displayed with a red background color
- Each step with a *User* trigger becomes the name of the Association between Controllers

#### 5.6.4.1.8.3 Generate Scenario From Activity Diagram

You can generate a range of diagrams from a scenario in an element. Conversely, you can also generate a structured scenario within an element from an Activity diagram, reverse engineering the steps from the diagram elements (effectively either regenerating the scenario within the Use Case, or transferring a scenario into another Use Case).

#### How To:

To generate the scenario from the Activity diagram, follow the steps below:

Step	Action	See Also
1	Open the element Properties dialog, select the Scenarios tab, and select the Structured Specification tab	
2	Right-click in the empty space within the tab, and select the <b>Create Structure From Generated Activity Diagram</b> context menu option  The Select an Activity (generated from a UseCase Scenario) containing the Diagram dialog displays	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>
3	Search for and select the Activity containing the required diagram. Enterprise Architect validates the diagram (displaying the results in the <b>Output</b> window) and, if the diagram is valid, generates the scenario steps in the <b>Structured Specification</b> tab (replacing any existing scenario steps).	<a href="#">Output Window</a> <sup>[128]</sup>

**Notes:**

- The source Activity diagram must be generated from another Use Case Scenario
- Any existing scenario steps are deleted and replaced by the generated scenario
- This facility does not operate on the enhanced Activity diagrams generated from a Use Case - those generated with ActivityParameters, Actions and Action Pins

**Learn More:**

- [Generate Diagrams](#) <sup>[678]</sup>

**5.6.4.1.8.4 Generate Test Cases**

When you select a scenario and click on the **Test Case Generation** icon in the window toolbar, Enterprise Architect prompts you to select to generate either an Internal Test Case or an External Test Case.

**Topics:**

Topic	Detail	See also
<b>Internal Test Case</b>	<p>A test is generated for the basic path and each alternate and exception path in the scenario, and added to the selected element</p> <p>In addition, for each step in the basic, alternate and exception paths that has a value in the <b>Results</b> column, a test is generated and added to the selected element</p> <p>A diagram is created under the selected element, to which the selected element and a Note (showing the element's Structured Specification) is added</p> <p>The created tests are displayed in the <i>Test Scripts</i> compartment of the selected element on the diagram</p> <p>Another way to view these tests is to click on the element and display the Testing window</p> <p>These generated tests are written to the Scenario test tab of the Testing window; you can move the tests to another test-type tab if required</p>	<p><a href="#">Show Test Scripts compartment</a> <sup>[1719]</sup></p> <p><a href="#">The Testing Window</a> <sup>[1707]</sup></p> <p><a href="#">Move Or Copy Tests Between Categories</a> <sup>[1719]</sup></p>
<b>External Test Case</b>	<p>A Test Case element is created, linked to the selected element using the Trace connector</p>	<p><a href="#">Show Test Scripts compartment</a> <sup>[1719]</sup></p>

Topic	Detail	See also
	<p>A diagram is created under this Test Case element, to which the selected element, the Test Case element and a Note (showing the element's Structured Specification) is added</p> <p>The created tests are displayed in the <i>Test Scripts</i> compartment of the Test Case element on the diagram</p> <p>A test case is generated and added to the Test Case element for the basic path, and for each alternate and exception path</p> <p>In addition, for each step in the basic, alternate and exception paths that has a value in the <b>Results</b> column, a test is generated and added to the Test Case element</p> <p>You can review the tests within the Test Case element using the Testing window, as for Internal Test Cases</p>	<p><a href="#">Test Case</a><sup>[1302]</sup></p> <p><a href="#">Trace</a><sup>[1014]</sup></p>

#### 5.6.4.1.8.5 Context References Tab

On the Scenarios page of the element Properties dialog, the Context References tab displays a list of all elements that are either:

- Connected to the current element by any connector, on the current diagram or another, or
- Defined as a cross reference (or custom reference) on the current element

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>This page enables you to add custom references - right-click anywhere in the list and select the <b>Add Reference</b> context menu option</p> <p>The Select Element dialog displays, in which you can locate and select the required cross reference element or elements</p> <p>For each cross reference you can also use context menu options to delete the entry in the list, or to open the <b>Comment</b> field so that you can add or edit comment text</p> <p>For each element in the <b>Context References</b> list, wherever the name of that element appears in the structured specification, the name is highlighted and underlined; press ( <b>Ctrl</b> ) + <b>click</b> on the highlighted name to view the element Properties dialog</p>	<p><a href="#">Select &lt;Item&gt; Dialog</a><sup>[692]</sup></p>

#### Learn More:

- [Custom/Cross Reference](#)<sup>[632]</sup>

#### 5.6.4.1.8.6 Scenario Constraints Tab

The Structured Specification Constraints tab is a simple link to the Constraints tab of the element overall. It lists existing constraints; if you select the toolbar icons to add or edit a constraint, control switches to the element Constraints tab.

#### Learn More:

- [Constraints](#)<sup>[668]</sup>

### 5.6.4.1.9 Associated Files

An element can be linked to files held in the database, using the Files page of the element's Properties dialog.

Field/Button	Usage	See Also
<b>File Path</b>	Specifies the directory path and name of the file	
<b>Type</b>	Display the local file or web address	
<b>Last Write</b>	Display the date and time the file was last updated	
<b>Size</b>	Display the size of the file	
<b>Notes</b>	Indicates extra information about the file	
<b>Files</b>	Display the list of linked files	
<b>Launch</b>	Open the selected file  Local files open with their default application and web files open in the default browser	

**Notes:**

- Linked files are a good way to link elements to additional documentation and/or source code
- You can also insert hyperlinks in diagrams to other files, and launch them directly from the diagram

**Learn More:**

- [Hyperlinks](#) <sup>[1295]</sup>

### 5.6.4.2 The Element Browser

The Element Browser window lists a range of added-on properties of the selected element.

**Access:** [View](#) | [More Element Tools](#) | [Element Browser](#)

**Topics:**

Topic	Detail	See also
<b>Properties</b>	The following properties are listed, where they are present in the element: <ul style="list-style-type: none"> <li>• Operations</li> <li>• Attributes</li> <li>• Linked Features (Linked Operations and Attributes)</li> <li>• Tagged Values</li> <li>• Constraints</li> <li>• Internal Requirements (Responsibilities)</li> <li>• Attached Files</li> <li>• Relationships</li> <li>• Scenarios</li> <li>• Maintenance Items</li> </ul>	<a href="#">Operations</a> <sup>[709]</sup> <a href="#">Attributes</a> <sup>[697]</sup> <a href="#">Linked Features (Linked Operations and Attributes)</a> <sup>[744]</sup> <a href="#">Tagged Values</a> <sup>[764]</sup> <a href="#">Constraints</a> <sup>[668]</sup> <a href="#">Internal Requirements</a> <sup>[666]</sup> (Responsibilities)

--	---	--

**Notes:**

- If you double-click on the element name at the top of the dialog (the root node) the Properties dialog for the element displays, at the General tab
- If you right-click on a folder name, the **Edit <object>** context menu option displays; when you select this option, the appropriate window or dialog displays, or the element Properties dialog displays the appropriate tab, to enable you to update the items in the folder
- If you double-click on an item within the *Requirements*, *Scenarios* or *Constraints* folders, the docked window or view displays with the focus on the selected item
- If you double-click on an item within the *Relationships* folder, the Properties dialog displays for that relationship
- You can drag a relationship from the Element Browser onto a diagram; if the element at one or both ends of the relationship is not already on the diagram, the element is also added to the diagram, and if the relationship is already on the diagram, but hidden, it becomes visible again
- Instead of dragging the relationship onto the diagram, you can right-click on it and select context menu options to place the relationship and elements on the diagram, and to show or hide the relationship
- If you double-click on an item within the *Files* folder, the file opens either on a separate tab in the Diagram View workspace (if the file can be opened within Enterprise Architect) or in the default Windows viewer/editor for the file type (if the file cannot be opened within Enterprise Architect)
- If you double-click on an operation or attribute in the *Operations* or *Attributes* folders, the appropriate Properties dialog displays
- If you right-click on an attribute or operation, whether in the *Attributes* or *Operations* folder or in the *Linked Features* folder, a context menu displays that enables you to display the source code; alternatively, click on the attribute or operation and press ( **Ctrl+E** ), or - in the *Linked Features* folder - double-click on the attribute or operation
- The source code viewer in which the source code displays depends on which editor you select as the default, either for the project as a whole or for a specific programming language; if you select the Enterprise Architect internal editor, the code displays in the Source Code Viewer with the cursor positioned on the selected feature
- The right-click context menu for an operation also provides options to set a number of types of recording marker

### 5.6.4.3 Properties Window

The Properties window provides a convenient way to view (and in some cases edit) common properties of elements. When an element is selected, the Properties window shows the element's name, stereotype, version, author, dates and other pertinent information.

**Access:** [View | Element Properties](#)

**Topics:**

Topic	Detail	See also
Properties Sections	The Properties window is divided into three expandable sections: <ul style="list-style-type: none"> <li>• &lt;Element type&gt; Settings - for the basic element details</li> <li>• Project - for general housekeeping settings</li> <li>• Advanced - only active for generalizable elements</li> </ul>	

**Notes:**

- When you click on a field name, a brief explanation of that field displays at the bottom of the Properties window, unless you have selected the **Hide Properties Info Section** checkbox on the General page of the Options dialog
- If you click on the field value for an editable field, a drop-down arrow displays that enables you to select a different value

**Learn More:**

- [Hide Properties Info Section](#)<sup>[425]</sup>

### 5.6.4.4 The Scenarios & Requirements Window

The Scenarios & Requirements window provides a convenient way to quickly add, view, edit and delete rules applied to an element. The window shows details of the entities that impose such rules or restrictions on the element, namely:

- The element's internal responsibilities or requirements
- The element's internal constraints (not external Constraint notes)
- The element's scenarios

**Access:** [View | More Element Tools | Scenarios & Requirements](#) (Ctrl + Shift + 3)

**Topics:**

Topic	Detail	See also
Usage	The Scenarios & Requirements window is typically used to examine Use Case and Test Case elements, and any other elements that realize an external Requirement  For convenience, you can display the window as either a dockable window around the edge of your workspace, or as a view in the center of your workspace (in which the Scenarios, Constraints and Requirements are shown on separate tabs)	<a href="#">Notes</a> <sup>[915]</sup>

	Use the  icon in the window toolbar to toggle between these display options	
--	--	--

**How To:**

To review an internal requirement, constraint or scenario for an element, follow the steps below:

Step	Action	See Also
1	Select the element in the Project Browser or diagram and select the <b>Scenarios &amp; Requirements</b> menu option  The Scenarios & Requirements window displays	
2	Either: <ul style="list-style-type: none"> <li>Click on the required item in the list panel on the left of the window, or</li> <li>If the Element Browser is not already displayed, click on the  icon and select the required item from the <i>Constraints</i>, <i>Requirements</i> or <i>Scenarios</i> folder</li> </ul> The appropriate screen displays, with the details of the selected item in the fields	<a href="#">Element Browser</a> <sup>[689]</sup>
3	The toolbar icons, from left to right, enable you to: <ul style="list-style-type: none"> <li>Add a new rule to the current screen (click on the appropriate folder to create an item of a different type)</li> <li>Save the new or edited item</li> <li>Save the current (edited) item as a new item</li> <li>Delete the current item</li> <li>Sort the contents of the selected folder into alphabetical order</li> <li>(Print icon unavailable)</li> <li>Display the Element Browser window, or highlight the current item in the Element Browser window</li> <li>Switch between a docked window display and a workspace view display</li> </ul> You can also add or edit formatted notes in the <b>Notes</b> field, using the Notes toolbar at the top of the field  The list panel also provides a context menu that provides options for adding a new item to a folder, deleting the selected item or, for a requirement, converting an internal responsibility into an external Requirement element	<a href="#">Notes Toolbar</a> <sup>[772]</sup> <a href="#">Converting an Internal Responsibility Into an External Requirement</a> <sup>[1170]</sup> <a href="#">Scenarios</a> <sup>[669]</sup> <a href="#">Constraints</a> <sup>[668]</sup> <a href="#">Requirements</a> <sup>[666]</sup>

**5.6.4.5 Select <Item> Dialog**

The Select <Item> dialog is a multi-purpose browser and search tool for locating model items such as Classifier elements, properties, attributes and behaviors. The <Item> in the dialog title changes to represent the type of item the original operation is working on.

**Topics:**

Topic	Detail	See also
Usage	The dialog is called in a range of operations; for example, setting: <ul style="list-style-type: none"> <li>The base type or classifier for an Object, Swimlane or</li> </ul>	<a href="#">Using Classifier</a> <sup>[708]</sup> <a href="#">Objects</a> <sup>[959]</sup>

	<p>Lifeline</p> <ul style="list-style-type: none"> <li>• Classifiers for the return types for operations</li> <li>• Classifiers for generalization sets</li> <li>• The associated behavior for a behavior call</li> <li>• The type and return type for operation parameters</li> <li>• Activities for State transitions</li> <li>• Use Case Scenarios</li> <li>• Pattern element defaults</li> <li>• Activities from which to generate code</li> <li>• The values of Tagged Values</li> </ul>	<p><a href="#">Swimlanes</a> <sup>[592]</sup></p> <p><a href="#">Lifeline</a> <sup>[912]</sup></p> <p><a href="#">Return Types</a> <sup>[710]</sup></p> <p><a href="#">Generalization Sets</a> <sup>[752]</sup></p> <p><a href="#">Associate with Different Behaviour</a> <sup>[718]</sup></p> <p><a href="#">Insert Operation Parameters</a> <sup>[728]</sup></p> <p><a href="#">Transitions</a> <sup>[1015]</sup></p> <p><a href="#">Generate Scenarios from Activity Diagram</a> <sup>[686]</sup></p> <p><a href="#">Use a Pattern</a> <sup>[1026]</sup></p> <p><a href="#">Assigning Tagged Values</a> <sup>[766]</sup></p>
<b>Multiple Selection</b>	<p>Where an operation permits the selection of multiple items, the Select &lt;Item&gt; dialog is automatically enabled to support this; to select the items, press ( <b>Ctrl</b> ) as you click on each item</p> <p>Having selected an item, you can continue to expand and browse the hierarchy, and/or search for items; the dialog retains the existing selections until you click on the <b>OK</b> button</p>	

**How To:**

To select a required item, follow the steps below:

Step	Action	See Also
1	<p>During an operation, when it is necessary to locate an element or feature, click on the ( ... ) (browse) button</p> <p>The Select &lt;Item&gt; dialog displays</p>	
2	<p>If required, in the <b>Go To Namespace</b> field select a namespace to reduce the scope of the displayed hierarchy</p> <p>The dialog opens the section of the hierarchy associated with that namespace, and closes all previously-open sections associated with other namespaces</p>	
3	<p>You can either:</p> <ul style="list-style-type: none"> <li>• Expand the selected area of the hierarchy on the Browse tab, or any other package, and locate the required item (go to step 5) or</li> <li>• Click on the Search tab and, in the <b>Find</b> field, type a partial or complete text string to search for the item</li> </ul>	
4	<p>On the Search tab, you can filter the search further by selecting the <b>Whole Word</b> and <b>Match Case</b> checkboxes</p> <p>Each list entry shows the name of the item, the type, any stereotype the item has,</p>	

Step	Action	See Also
	<p>the immediate package in which the item is held, and any successive parent packages (the package path)</p> <p>You can either:</p> <ul style="list-style-type: none"> <li>• Select the item immediately on the Search tab or</li> <li>• Right-click on one item or a group of items and select the <b>Locate item(s) in tree</b> context menu option; this redisplay the Browse tab and highlights each selected item in the &lt;namespace&gt; hierarchy</li> </ul>	
5	Click on the required item	
6	Click on the <b>OK</b> button	

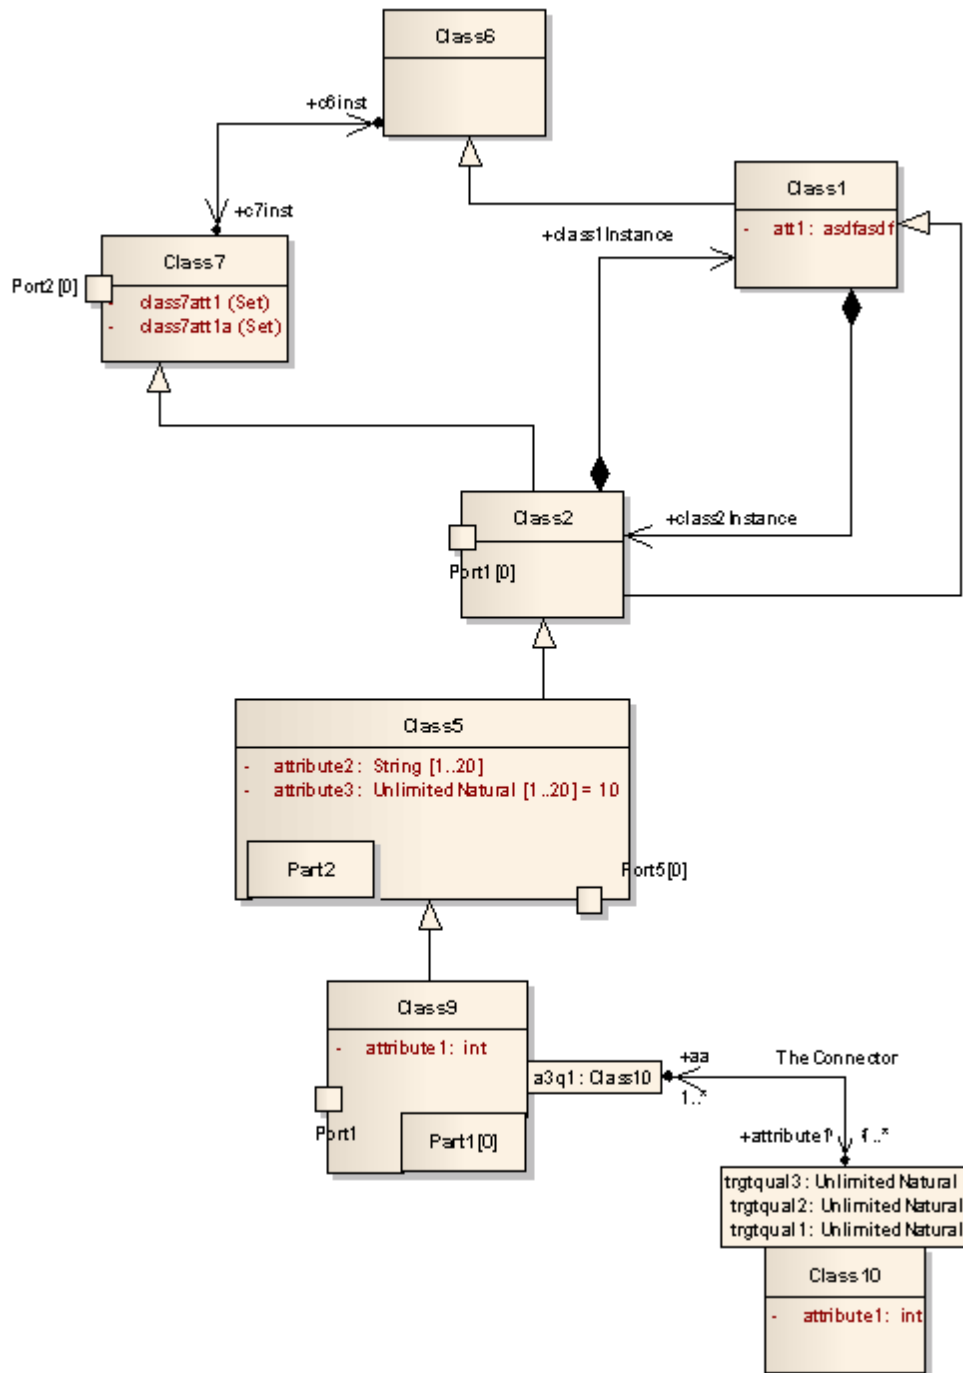

**Notes:**

- When you have selected an item, the Select <Item> dialog retains the context and item; next time you display the dialog, if the context is similar the dialog opens to the same Namespace and item - for example, if you have selected an activity for a State transition and you start to do the same for another transition, the dialog opens to the activity you previously selected
- If the context is totally dissimilar, the dialog opens with the Namespace <any> and a collapsed model hierarchy
- If the available items do not meet your requirements, you can create a new item and define the appropriate properties - click on the **Add New** button; the appropriate Add <Item> dialog displays, on which you define the required item
- The **Add New** button is not always available, depending on the context and the type of item being searched for

**5.6.4.5.1 Select Property Dialog**

The Select Property dialog is a specific instance of the Select <Item> dialog; it is used to select Ports, Parts, Attributes and Association Ends as *redefined* or *subsetting* properties, from a *hierarchical list* of Classes and their contained properties in the model. For example, consider the section of the model below:

**Example:**

This would be represented in the dialog as follows:

Locate and click on the required object to select it, then click on the **OK** button (to select several objects at once, press and hold (**Ctrl**) while you click on each object).

#### Notes:

- AssociationEnds should be owned by the Class to be listed in the dialog

#### Learn More:

- [Select <Item> Dialog](#)<sup>[692]</sup>

#### 5.6.4.5.2 Set Feature Dialog

The Set Feature dialog is the Set Operation dialog used to change the operation represented by an Action on an Activity diagram.

As the Set Operation or Set Attribute dialog, it is also used to set the *Value* operation or attribute for Tagged Values of type RefGUID or for the target of a hyperlink in a diagram.

#### How To:

To locate and select a value operation or attribute, follow the steps below:

Step	Action	See Also
1	The Set Operation (or Set Attribute) dialog displays, with the model hierarchy	

Step	Action	See Also
	opened at the point at which you selected the original operation or attribute	
2	If required, in the <b>In Namespace</b> field, click on the drop-down arrow and select another model that contains the required operation or attribute The package hierarchy for that model displays	
3	Browse through the hierarchy, or use the Search tab to locate the required operation or attribute, then double-click on the item to select it	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>

**Learn More:**

- [Class Operations In Activity Diagrams](#)<sup>[874]</sup>
- [Pre-defined Structure Types - RefGUID](#)<sup>[1112]</sup>
- [Hyperlinks](#)<sup>[1295]</sup>

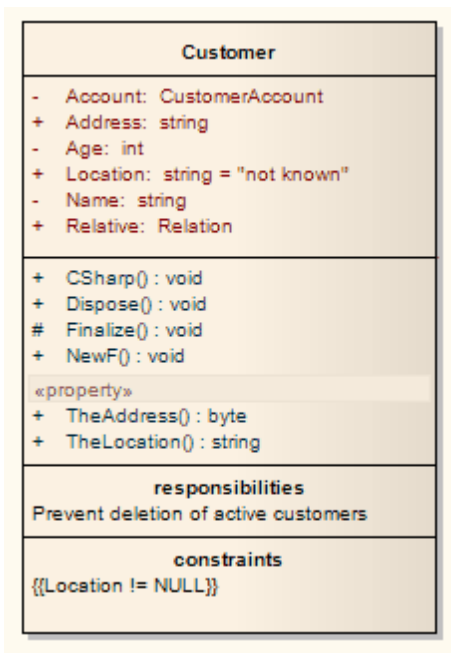

### 5.6.5 Attributes

Attributes are features of an element that represent the properties or internal data elements of that element. Not all element types support attributes, and others have restrictions - for example, attributes of Interfaces must have Public scope.

Elements with attributes (typically Classes) display their features in diagrams in the manner illustrated below. Attributes display in the first compartment of properties in colored text - the default color is red (for example, *Age : int*).

**Example:**

For a Customer Class, **CustomerName** and **CustomerAddress** can be attributes. Attributes have several important characteristics, such as **type**, **scope** (visibility), **static**, **derived** and **notes**.

Topics:

Topic	Detail	See also
<b>Create and Modify Element Attributes</b>	<p>In the Project Browser, Classes with attributes have their features collected beneath them, each preceded by a blue box (  )</p> <p>In the Diagram view, either:</p> <ul style="list-style-type: none"> <li>• Right-click on the element to be edited, and from the context menu select the <b>Attributes</b> menu option</li> <li>• Click on the element and press ( <b>F9</b> ), or</li> <li>• Drag the attribute from the Project Browser onto the element</li> </ul> <p>The &lt;Element name&gt; Attributes dialog displays</p> <p>This facility is only available if the element supports attributes</p>	

Notes:

- If you make changes and do not save them, the **Cancel** button prompts you to save or cancel the changes, whilst the **Close** button closes the dialog immediately and does not save the changes
- If you are creating many attributes, go to the Attribute/Operations page of the Options dialog (**Tools | Options | Source Code Engineering | Attribute/Operations**) and select the **After save, re-select edited item** checkbox; now, when you create an attribute and click on the **Save** button, the dialog fields clear ready for you to enter the details of the next attribute - this helps you when you want to create attributes quickly and might not necessarily want to fully define each one as you create it
- If the parent element provides source or target roles for a connector, the connector can be attached to a specific attribute (feature)

- [Connect to Element Feature](#) <sup>[744]</sup>

**5.6.5.1 Attributes Dialog - General**

This topic describes the fields and options of the General page of the Attributes dialog.

Reference:

Field	Usage	See also
<b>Name</b>	Display the name of the attribute; for a new attribute, type the name (with no spaces)	
<b>Type</b>	Display the attribute's type; if necessary, either: <ul style="list-style-type: none"> <li>• Click on the drop-down arrow and select a different type, or</li> </ul>	<a href="#">Data Types</a> <sup>[779]</sup> <a href="#">Instance</a>

Field	Usage	See also
	<ul style="list-style-type: none"> <li>Click on the ( ... ) button to open the Select &lt;Item&gt; dialog and select or define a different attribute classifier type that might not be in the <b>Type</b> drop-down list</li> </ul> <p>The type can be defined by the code language (data type) or by a classifier element; when you click on the drop-down arrow, the first set of values in the list provides the data types, and the second (longer) set provides the possible classifiers</p> <p>To add new code language data types that can be displayed in this list, see the <i>Data Types</i> topic</p>	<a href="#">Classifier</a> <sup>[692]</sup>
<b>Initial Value</b>	Display an optional initial value; if necessary, type in or browse for a new initial value	
<b>Stereotype</b>	Define the optional stereotype of the attribute; if necessary, either: <ul style="list-style-type: none"> <li>Type a different stereotype name</li> <li>Click on the drop-down arrow and select a stereotype, or</li> <li>Click on the ( ... ) button and browse for the stereotype</li> </ul>	
<b>Alias</b>	Display an optional alias for the attribute; if necessary, type in a new alias	
<b>Scope</b>	Define the attribute as <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> ; if necessary, click on the drop-down arrow and select a different scope	
<b>Static</b>	Indicate that the attribute is a static member	
<b>Const</b>	Indicate that the attribute is a constant	
<b>Is Literal</b>	(For Enumeration elements) Defaults to selected, to define the attribute as an enumeration literal  Deselect to define the attribute as a normal element attribute  In the <i>Attributes</i> compartment on the diagram, the enumeration literals are listed separately, above the normal attributes (ensure that the <b>Stereotype</b> field for the normal attribute is not set to <b>enum</b> )	
<b>Derived</b>	Indicate that the attribute is derived from one or more other attributes; for example, full name can be derived from the <i>last name</i> and <i>first name</i> attributes	
<b>Containment</b>	Define the containment type ( <b>By Reference</b> , <b>By Value</b> or <b>Not Specified</b> ); if necessary, click on the drop-down arrow and select a different containment type	
<b>Property</b>	Indicate that the attribute has automatic property creation; when you select this checkbox, the Create Property Implementation dialog displays	<a href="#">Create Properties</a> <sup>[702]</sup>
<b>Notes</b>	Enter any free text notes associated with the attribute; you can format the notes text using the Notes toolbar at the top of the field	<a href="#">Notes Toolbar</a> <sup>[772]</sup>

**Topics:**

Topic	Detail	See also
<b>Usage</b>	To change the position of a selected attribute in the list at the bottom of the dialog, click on the <b>Scroll Up</b> or <b>Scroll Down</b> (hand) buttons	

Topic	Detail	See also
	<p>To review an existing attribute, click on the attribute name in the list</p> <p>To delete an existing attribute, click on the attribute name in the list and click on the <b>Delete</b> button</p> <p>To create a new attribute, either:</p> <ul style="list-style-type: none"> <li>• Click on the <b>New</b> button, or</li> <li>• Click on an existing attribute name in the list, and click on the <b>Copy</b> button</li> </ul> <p>If you have changed the attribute details, click on the <b>Save</b> button to save the changes</p>	

Notes:

- By default, the attributes are listed in alphabetical order; before changing this sequence, you must deselect the **Sort Features Alphabetically** checkbox on the Objects page of the Options dialog (**Tools | Options | Objects**)

### 5.6.5.2 Attributes Dialog - Detail

This topic describes the fields and options of the Detail page of the Attributes dialog.

Reference:

Field	Action	See also
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection	
<b>Allow Duplicates</b>	Indicate that duplicates are allowed Maps to the UML property isUnique, value FALSE	
<b>Ordered Multiplicity</b>	Indicate that the collection is ordered	
<b>Redefined Property</b>	Review the redefined properties for the attribute Add redefined properties by clicking on the <b>Add</b> button to display the Select Property dialog	<a href="#">Select Property dialog</a> <sup>[694]</sup>
<b>Subsetted Property</b>	Review the subsetted properties for the attribute Add subsetted properties by clicking on the <b>Add</b> button to display the Select Property dialog	
<b>Collection</b>	Code the attribute as an array, so that it can contain multiple concurrent values rather than a single value	
<b>Attribute is a Collection</b>	Indicate that the attribute is a collection (array)	
<b>Container Type</b>	Enter the name of the container type	
<b>Transient</b>	(For Java code) indicate that the attribute can change	

Field	Action	See also
	regardless of what the code is performing	
<b>Qualifiers</b>	Click on this button to add Qualifiers to the attribute The Qualifiers dialog displays	<a href="#">Qualifiers</a> <sup>[973]</sup> <a href="#">Qualifiers dialog</a> <sup>[974]</sup>

### 5.6.5.3 Attributes Dialog - Constraints

Attributes can have constraints associated with them; typically these indicate such things as maximum value, minimum value and length of field.

These constraints are managed on the Constraints page of the Attributes dialog.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	Select the Constraints page to define the constraints <ul style="list-style-type: none"> <li>To review an existing constraint, click on the constraint name in the panel at the bottom of the dialog</li> <li>To delete an existing constraint, click on the constraint name in the panel and click on the <b>Delete</b> button</li> <li>To create a new constraint, click on the <b>New</b> button</li> </ul> Review, edit or complete the fields as indicated in the table below If you have created or edited the data, click on the <b>Save</b> button to save the changes	

**Reference:**

Field	Usage	See also
<b>Constraint</b>	Type in the constraint name	
<b>Type</b>	Type in the constraint type	
<b>(Notes)</b>	Type in any comments or notes concerning the constraint	

### 5.6.5.4 Attribute Tagged Values

You can define Tagged Values for an attribute. Tagged Values are a convenient means of extending the properties a model element supports. This in turn can be used by code generators and other utilities to transform UML models into other forms.

**How To:**

To add a Tagged Value to an attribute, follow the steps below:

Step	Action	See Also
1	Click on the Tagged Values tab of the Attribute Properties dialog	

Step	Action	See Also
2	Click on the <b>New tag</b> button (  ) The Tagged Value dialog displays	
3	In the <b>Tag</b> field, type the tag name or click on the drop-down arrow and select a defined tag	
4	If appropriate, in the <b>Value</b> field type a specific value for the tag	
5	Click on the <b>OK</b> button to confirm the operation The tag name and value are displayed under the attribute in the Tagged Values tab	

**Notes:**

- Tagged Values are supported for attributes, operations, objects and connectors
- You can define custom tags by creating a Custom Tagged Value Type

**Learn More:**

- [Creating a Custom Tagged Value Type](#) 

**5.6.5.5 Create Properties**

Enterprise Architect has capabilities for automatically creating properties in various languages. Property creation is controlled from the General page of the Attributes dialog.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>On the General page, select the <b>Property</b> checkbox</p> <p>The Create Property Implementation dialog immediately displays</p> <p>The Language panel defaults to the Class language; however, you can change this and generate the properties for any language, including Action Script</p> <p>Each language has slightly different syntax and generates slightly different results; for example:</p> <ul style="list-style-type: none"> <li>• Java and C++ generate get and set functions</li> <li>• C# and VB.Net create property functions</li> <li>• Delphi creates get and set functions as well as a specialized Delphi property Tagged Value</li> </ul> <p>Type in the required details and click on the <b>OK</b> button</p> <p>Enterprise Architect generates the required operations and properties to comply with the selected language.</p> <p>Note that get and set functions are stereotypes with «<i>property get</i>» «<i>property set</i>» making it easy to recognize property functions; you can also hide these specialized functions by deselecting the <b>Property Methods</b> checkbox in the Features tab of the Diagram Properties dialog for a specific diagram (select the <b>Diagram   Properties</b> menu option) - this makes it</p>	<a href="#">Compartments</a> 

Topic	Detail	See also
	<p>easier to view a Class, uncluttered by many <i>get</i> and <i>set</i> methods</p> <p>Note that for Delphi you must enable the Tagged Values compartment to see the generated properties</p>	

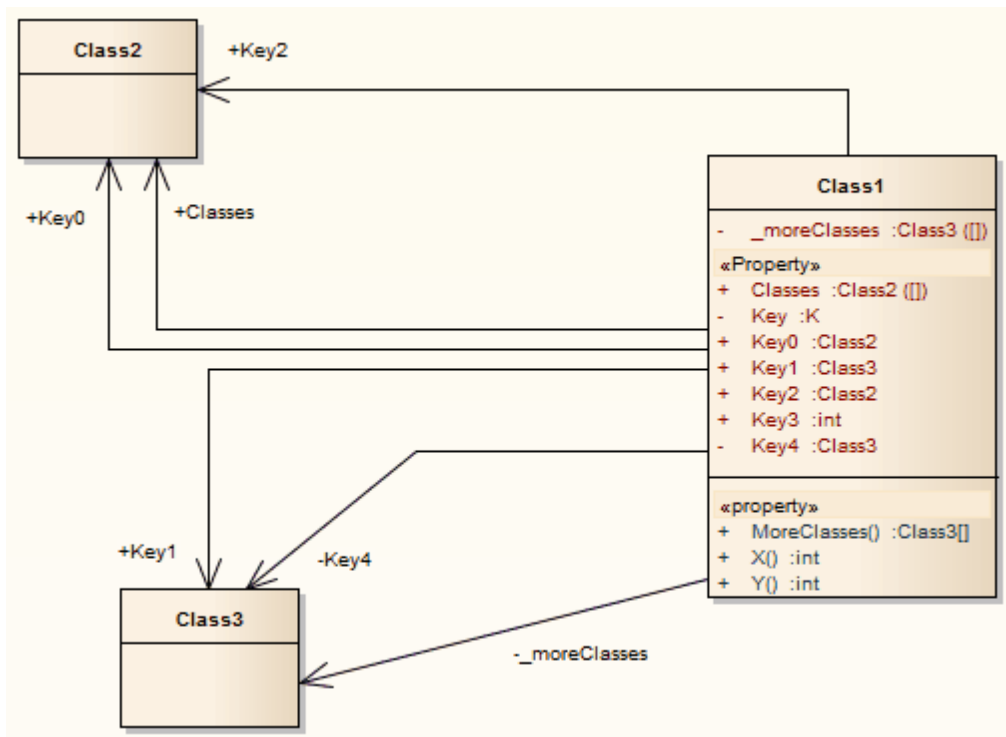

### 5.6.5.6 C# Automatic Property Support

For C# at and beyond release 4.0, Enterprise Architect enables you to model *automatic properties* as «*Property*» stereotyped attributes.

**Topics:**

Topic	Detail	See also
<b>Properties of Attributes</b>	<p>When you create the attribute, on the General page of the Attributes dialog simply set the <b>Stereotype</b> field to <b>Property</b>; the generated code resembles the following:</p> <pre>public class Class1 {     public Class2( ) Classes {get; set;} }</pre> <p>This is in contrast to the Enterprise Architect facilities for modeling get/set methods as properties of an attribute in various other languages, generating code such as:</p> <pre>public class Class1 {     public Class3( ) m_delivery;     :     public Class3( ) delivery     {         get{ }         set{ }     } }</pre> <p>You cannot create properties with get/set methods on an automatic properties attribute; whilst the «<i>Property</i>» stereotype is assigned in the Attributes dialog, the <b>Property</b> checkbox is grayed out</p>	<p><a href="#">Create Properties</a> <sup>702</sup></p>
<b>Tagged Values</b>	<p>You can also add the following Tagged Values to automatic properties to denote specific characteristics, if required:</p> <ul style="list-style-type: none"> <li>• <b>writeonly</b> - the property only has a <i>set method</i>; e.g. <code>public int Prop1 { set; }</code></li> <li>• <b>readonly</b> - the property only has a <i>get method</i>; e.g. <code>public int Prop2 { get; }</code></li> <li>• <b>GetScope</b> - specifies the property's <i>Get Scope</i>; e.g. <code>public int Prop3 { protected get; set; }</code></li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li><b>SetScope</b> - specifies the property's <i>Set Scope</i>; e.g. <code>public int Prop4 { get; protected set; }</code></li> </ul>	
<b>Reverse Engineering</b>	Imported automatic properties generate attributes with a « <i>property</i> » stereotype and appropriate Tagged Values, and - if the property type is a recognized element in the model - an Association connector	

**Example:****5.6.5.7 Display Inherited Attributes**

When displaying a Class with attributes in a diagram, you can also show the inherited attributes from all parents in the elements type hierarchy (ancestors).

**Access:** **Right-Click element (on diagram) context menu | Feature Visibility (Ctrl + Shift + Y)**

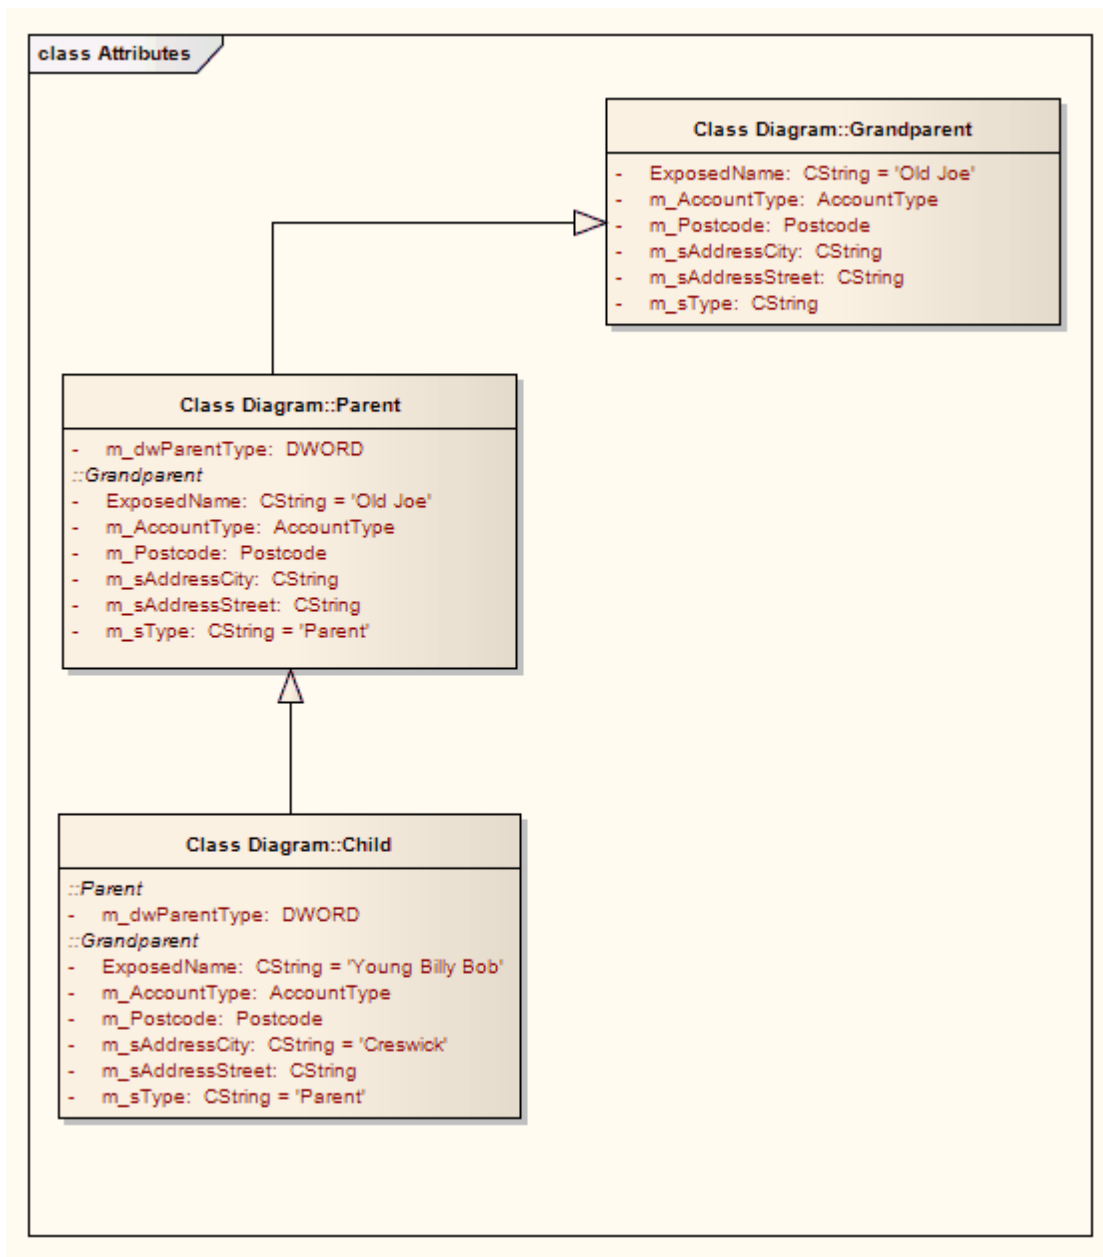

**Topics:**

Topic	Detail	See also
<b>Override Attribute Initializers</b>	<p>Note that for elements that have attributes, you can also override an inherited attribute's initial value using the element context menu option <b>Advanced   Override Attribute Initializers</b> to display the Override Attribute Initializers dialog</p> <p>In this dialog, select the variable name and enter a new initial value</p>	

Topic	Detail	See also
	<p>If required, type a note in the <b>Note</b> field</p> <p>When you display inherited attributes, Enterprise Architect merges the list of attributes from all ancestors and merges the attribute initializers, so that the final child Class displays the correct attribute set and initial values</p>	

Example:

Learn More:

- [Feature Visibility](#)<sup>587</sup>

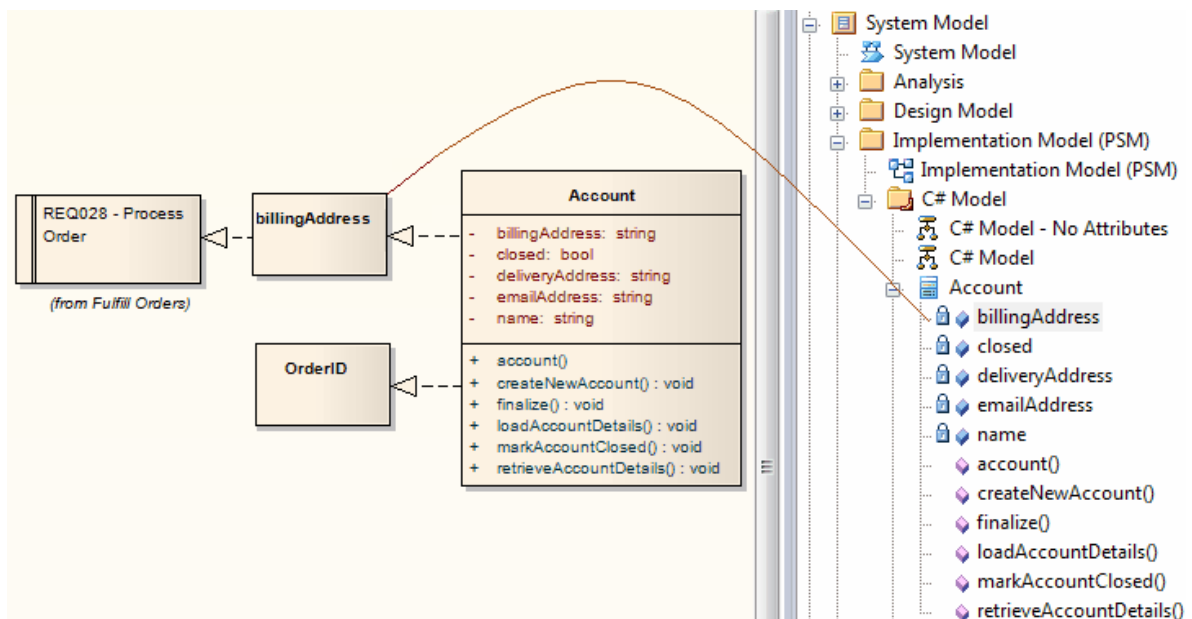

### 5.6.5.8 Create Object From Attribute

If you drag an attribute from the Project Browser onto an *Activity* diagram, the attribute generates an Object element of the same name. This is very useful for creating connectors between elements and specific attributes. For example, a Class element of stereotype *table* defines its fields as attributes; Requirement elements that define requirements for those fields can then be linked to the appropriate table fields via the attribute Object elements.

#### Topics:

Topic	Detail	See also
<b>Explanation</b>	<p>In the following diagram, the <i>billingAddress</i> Object was generated by dragging the <i>billingAddress</i> attribute from the <i>Account</i> Class in the Project Browser onto the diagram</p> <p>The user then created <i>Realize</i> relationships between the <i>Account</i> element and the <i>billingAddress</i> element, and between the <i>billingAddress</i> element and the <i>REQ028 Requirement</i> element</p>	

#### Example:

#### Notes:

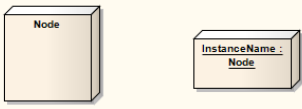

- From Enterprise Architect release 7.5, you can create this relationship more directly by linking an attribute in an element to another element, or linking two attributes in different elements

#### Learn More:

- [Connect to Element Feature](#) <sup>[744]</sup>

## 5.6.6 Object Classifiers

### Topics:

Image	Topic	Detail	See also
	<p><b>Object Classifiers</b></p>	<p>Many elements model classifications (such as Classes and Actors), whilst other elements model instances of such classifications (such as Objects, Actors again, and Sequence diagram objects). These instance elements represent real things in a run-time scenario; for example, a <i>Person</i> element named <i>Joe Smith</i>. In UML this is written as <i>Joe Smith: Person</i>.</p> <p>You can define a classifier first, and then instances of that classifier. Alternatively, as a model develops from a rough sketch to a detailed design, many objects become examples of a defined Class, so in the early analysis phase you might model a <i>Joe Smith</i> and a <i>Jane Smith</i>, and later a <i>Person Class</i> from which <i>Joe</i> and <i>Jane</i> are instantiated.</p> <p>Enterprise Architect enables you to associate an Object with its template element (its classifier), such as a Class. Doing this greatly increases the descriptive power of the model in capturing the functionality and responsibility of Objects at run-time and their associated state. For example, if you describe a <i>Person Class</i> with attributes such as <i>Age</i>, <i>Name</i>, <i>Address</i> and <i>Sex</i>, and functions such as <i>GetAge</i> and <i>GetName</i>, then when you associate your Object with the <i>Person Class</i> it is seen to have all the <i>Person Class</i> behavior and state (as well as inherited state and behavior from <i>Person's ancestors</i>).</p> <p>Elements that are classifiers and support instances of themselves at runtime can be dropped from the <b>Project Browser</b> as a link to the classifier itself, or a new instance of the classifier. The example below shows a linked Node element on the left and an instance of the Node on the right. Note that the instance is drawn like a simple element with the : &lt; <i>ElementName</i>&gt; displayed. If you name your instance it displays &lt; <i>InstanceName</i>&gt; : &lt; <i>ElementName</i>&gt;.</p>	

### Notes:

- This is a powerful means of moving your model from the analysis phase into detailed design

### 5.6.6.1 Using Classifiers

If you right-click on an Object in a diagram, the element context menu displays the **Advanced | Instance Classifier** menu option. Select this option to choose a single element (generally a Class) as the classifier or template for this Object.

The **Select <Item> dialog** displays. Use this to set the instance classifier.

The Object name is then displayed as *Object: Classifier*, for example a Person object named Joe Smith is displayed as *Joe Smith: Person*.

#### Topics:

Topic	Detail	See also
<b>If an object has a Classifier</b>	<p>It is important to remember that an Object is only an instance of a classifier at runtime, so the appropriate attributes and operations are those of the classifier, not the Object. Therefore, in the context menu for the Object, if you select the <b>Attributes</b> or <b>Operations</b> menu options, the <b>Attributes</b> or <b>Operations</b> dialog displays for the classifier, not the Object.</p> <p>If you set the classifier for an Object in a Sequence diagram, when you add a message the drop-down list of available messages derived from the target Object come from the classifier, not the Object selected. This enables you to associate Sequence diagram objects with Classes and use the defined behavior of the Class to model actual behavior at run time.</p> <p>You can also select a message for a State Flow connector. The same rules apply as for Sequence diagram objects.</p> <p>Note that in the <b>Message</b> dialog you can also select to include messages defined in the target classifier's inheritance hierarchy.</p>	

#### Learn More:

- [Select <Item> Dialog](#)<sup>[692]</sup>

### 5.6.7 Behavior

Enterprise Architect enables you to define an element's behavior through the element's operations and parameters. You can also define the behavior of more specific behavioral elements such as Activities, Interactions, Actions and Interaction Occurrences, through the **Behavior** and **Call** tabs of the element **Properties** dialogs.

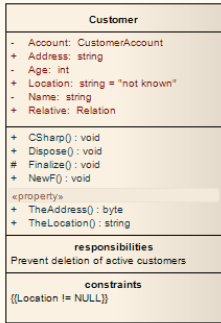

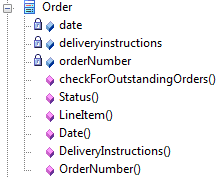

#### Learn More:

- [Operations](#)<sup>[709]</sup>
- [Interactions and Activities](#)<sup>[717]</sup>
- [Behavior Calls](#)<sup>[717]</sup>
- [Behavior Parameters](#)<sup>[719]</sup>
- [Behavior Call Arguments](#)<sup>[718]</sup>

### 5.6.7.1 Operations

Operations are features of a Class or other element that represent the behavior or services an element supports. For a Customer Class, *UpdateCustomerName* and *GetCustomerAddress* can be operations. Operations have several important characteristics, such as type, scope (visibility), static, abstract and notes.

**Topics:**

Images	Topic	Detail	See also
	<p><b>How to Access Operations</b></p>	<p>If an element supports operations (typically Classes and Interfaces), the right-click context menu contains the <b>Operations menu</b> item. Select this to open the <b>Operations dialog</b>. Alternatively, press ( <b>F10</b> ) .</p>	<p><a href="#">Operations dialog</a><sup>[710]</sup></p>
	<p><b>How Operations Appear in Diagrams</b></p>	<p>Elements with operations (typically Classes) display their features in diagrams in the manner shown below. Operations display in the second compartment of properties in colored text - the default color is dark green (for example, <i>Finalize() : void</i>). Some characteristics display in shorthand form; for example, static displays as \$, abstract as *.</p>	
	<p><b>Operations in the project Browser</b></p>	<p>In the <b>Project Browser</b>, Classes with operations have their features collected beneath them, each preceded by a pink box (  ). Right-click on an operation and select the <b>Operation Properties</b> context menu option to open the <b>Operations dialog</b> and edit details for the feature.</p> <p>From the <b>Project Browser</b>, you can drag operations onto new elements to give them the same operations.</p>	

**Notes:**

- If the parent element provides source or target roles for a connector, the connector can be attached to a specific operation. See the *Connect to Element Feature* topic

**Learn More:**

- [Behavior Parameters](#)<sup>[719]</sup>
- [Connect to Element Feature](#)<sup>[744]</sup>

### 5.6.7.1.1 Operations Dialog - General

The **Operations** dialog has seven tabs:

- General
- Parameters
- Behavior
- Advanced
- Tagged Values
- Pre-conditions and Post conditions (that is, Constraints)

The **General** tab of the **Operations** dialog enables you to define new operations and set the most common properties, including name, access type and return.

Field/Button	Usage	See also
<b>Name</b>	Display the selected operation name.	
<b>Parameters</b>	Display the parameter list. See Parameters Dialog for information regarding what this string can contain.	<a href="#">Parameters Dialog</a> <sup>[719]</sup>
<b>Edit Parameters</b>	Open the <b>Parameters</b> dialog.	
<b>Return Type</b>	(Not shown for <i>State</i> or <i>State Machine</i> elements.) Display the data type returned by the operation.  The type can be defined by the code language (data type) or by a classifier element. When you click on the drop-down arrow, the set of values in the list provides the appropriate data types.  To select or define possible classifiers, either click on the Select Type option in the list, or click on the ( ... ) (Select) button to display the <b>Select &lt;Item&gt;</b> dialog.  To add new code language data types that can be displayed in this list, see the Data Types topic.	<a href="#">Instance classifier</a> <sup>[692]</sup> <a href="#">Data Types</a> <sup>[779]</sup>
( ... ) (Return Type Browse button)	Open the <b>Select &lt;Item&gt;</b> dialog to select the operation return type. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	<a href="#">Instance classifier</a> <sup>[692]</sup>
<b>Action</b>	Define the action of the operation: <b>do</b> , <b>exit</b> or <b>entry</b> . (For <i>State</i> or <i>State Machine</i> elements.)	<a href="#">State</a> <sup>[919]</sup> <a href="#">State Machine</a> <sup>[927]</sup>
<b>Scope</b>	Select <b>Public/Protected/Private/Package</b> .	
<b>Stereotype</b>	Specify an optional stereotype for this operation.	
<b>Concurrency</b>	Set the concurrency of the operation.	
<b>Alias</b>	Define an optional alias for the operation.	
<b>Notes</b>	Enter free text notes. You can format this text if necessary, using the Notes toolbar at the top of the field.	<a href="#">Notes toolbar</a> <sup>[772]</sup>
<b>Virtual/Abstract</b>	If the operation's language is set to C++, map to the C++ <i>Virtual</i> keyword. Otherwise this option is <i>Abstract</i> , pertaining to an abstract function.  (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Return Array</b>	Indicate that the return value is an array.	

Field/Button	Usage	See also
	(Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Synchronized</b>	Specify a code engineering flag that relates to multi threading in Java. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Static</b>	Indicate that the operation is a static member. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Const</b>	Indicate that the return type of this method is constant. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Pure</b>	Indicate that C++ is pure virtual syntax - for example: <i>virtual void myFunction() = 0;</i> (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>IsQuery</b>	Indicate that this method does not modify the object. (Not shown for <i>State</i> or <i>State Machine</i> elements.)	
<b>Operations</b>	List the defined operations.	
<b>Up/Down Buttons</b>	Change the order of operations in the list.	
<b>New</b>	Create a new operation.	
<b>Copy</b>	Copy the currently selected operation.	
<b>Save</b>	Save a new operation, or save modified details for existing operation.	
<b>Delete</b>	Delete the currently selected operation.	

**Notes:**

- The **General** tab can vary according to the type of element you are adding an operation to. If defining operations for a data modeling table, see the Indexes, Triggers and Check Constraints topics
- If you make changes and do not save them, the **Cancel** button prompts you to confirm or cancel the changes, whilst the Close button closes the dialog immediately and does not save the changes
- If you are creating many operations, go to the **Attribute/Operations** page of the **Options** dialog (**Tools | Options | Source Code Engineering | Attribute/Operations**) and select the **After save, re-select edited item** checkbox. Now, when you create an operation and click on the Save button, the dialog fields clear ready for you to enter the details of the next operation. This helps you when you want to create operations quickly and might not necessarily want to fully define each one as you create it

**Learn More:**

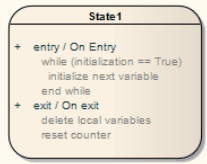

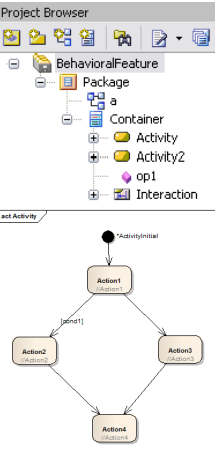

- [Operation Parameters](#) <sup>[719]</sup>
- [Behavior](#) <sup>[712]</sup>
- [Operation Constrains](#) <sup>[713]</sup>
- [Indexes](#) <sup>[1372]</sup>
- [Triggers](#) <sup>[1375]</sup>
- [Check Constraints](#) <sup>[1376]</sup>

### 5.6.7.1.1.1 Operations Dialog - Behavior

This topic illustrates how to elaborate a method's function in a diagram. The **Behavior** tab of the **Operations** dialog enables you to enter free text to describe the functionality of an operation. Use pseudo-code, structured English or just a brief description.

You can also use the **Behavior** tab to formally describe a method or State action and have the text appear under the method/action name in a diagram.

#### Topics:

Images	Topic	Detail	See also
	<b>State Operations - Behaviour</b>	A State's <i>do</i> , <i>entry</i> and <i>exit</i> operations optionally refer to other behaviors such as Activities, Interactions or Operations. Use the ( ... ) (browse) button to invoke the <b>Select &lt;Item&gt;</b> dialog, and locate and select the required behavior.	<a href="#">Select &lt;Item&gt; Dialog</a> 6921
	<b>Associate with Behaviour</b>	A Class operation can be associated with a behavior elsewhere in the model. Display the operation's <b>Properties</b> dialog, select the <b>Behavior</b> tab, click on the ( ... ) (browse) button and select the required behavior from the <b>Select Element</b> dialog. The behavior is set in the <b>Behavior</b> field, and the operation is then set as the specification of the associated behavior.  In behavioral code generation, the behavior of the associated behavioral element is generated as the <i>operation's</i> code. In the following illustration, <i>Op1</i> is associated with the <i>Activity Activity</i> .	
	<b>Example Code</b>	The generated code for Op1 is as follows: <pre> package Package; public class Container {     public Container(){     }      public void finalize() throws Throwable {     }      public void op1(){         /*Activity element(Activity1)'s behavior         operation(op1)'s code*/         //Action1;         if (cond1)         {             //Action2;         }         else         {             //Action3;         }         //Action4;     }     /*Activity element(Activity1)not rendered     public void Activity2() </pre>	

Images	Topic	Detail	See also
		<pre> {     // behavior is a Activity }  public void Interaction() {     // behavior is a Interaction } } //end Container </pre>	

**Learn More:**

- [Initial Code](#)<sup>[713]</sup>

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>On the <b>Behavior</b> tab of the <b>Operations</b> dialog, you can use the <b>Initial Code</b> field to enter code to be inserted into an operation body when the operation is first generated to file. After this point, forward code generation and synchronization do not replace the existing operation code with the <b>Initial Code</b> field.</p> <p>By default, the <b>Initial Code</b> field also is not imported into the model during reverse engineering, but you can select to import the field by selecting the <b>Include method bodies in model when reverse engineering</b> checkbox on the <b>Options</b> dialog.</p> <p>This field is most useful when combined with <b>UML Patterns</b>. Elements within a pattern often require the same stub code. Notice that the language specific patterns available from <a href="http://www.sparxsystems.com/resources/developers/uml_patterns.html">www.sparxsystems.com/resources/developers/uml_patterns.html</a> include initial code for some of the defined operations. This helps speed up the process of applying patterns from model to implementation. The <b>Initial Code</b> section is also useful for ensuring that the generated code is directly compilable.</p>	<p><a href="#">Options- Attributes/ Operations</a><sup>[1531]</sup></p> <p><a href="#">UML Patterns</a><sup>[1023]</sup></p> <p><a href="http://www.sparxsystems.com/resources/developers/uml_patterns.html">www.sparxsystems.com/resources/developers/uml_patterns.html</a></p>

**5.6.7.1.1.2 Operations Dialog - Constraints****Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Operations can have pre- and post- conditions defined. For each type, give the condition a name, a type and enter notes.</p> <p>Constraints define the contractual behavior of an operation, what must be true before they are called and what is true after. In this respect they are related to the state model of a Class and can also relate to the guard conditions that apply to a transition.</p>	

### 5.6.7.1.2 Operation Tagged Values

Operations can have Tagged Values associated with them. Tagged Values offer a convenient extension mechanism for UML elements, so you can define any tags you like and then assign values to them using this form.

Tagged Values are written to the XML output, and can be input to other third party tools for code generation or other activities.

#### How To:

To add a Tagged Value for an operation, follow the steps below:

Step	Action	See Also
1	Click on the Tagged Values tab of the operation Properties dialog	
2	Click on the <b>New Tags</b> button The Tagged Value dialog displays	
3	In the <b>Tag</b> field, type the tag name (or select a defined tag from the drop-down list) In the <b>Value</b> field type the initial tag value	
4	Click on the <b>OK</b> button to confirm the operation	

#### Notes:

- Tagged Values are supported for attributes, operations, objects and connectors
- You can define custom tags using a predefined Tagged Value Type

#### Learn More:

- [Create a Custom Tagged Value](#)<sup>[1116]</sup>

### 5.6.7.1.3 Override Parent Operations

In Enterprise Architect, you can automatically override methods from parent Classes and from realized Interfaces.

**Access:** [Element](#) | [Advanced](#) | [Overrides & Implementations](#)

#### Topics:

Topic	Detail	See also
<b>Usage</b>	In the <b>Override Operations/Interfaces</b> dialog, check the operations/interfaces to automatically override and click on the <b>OK</b> button. Enterprise Architect generates the equivalent function definitions in your child Class.  You can configure Enterprise Architect to display this dialog each time you add a Generalization or Realization connector between Classes, and review their possible operations/interfaces to override/implement. Do this from the <b>Links</b> page of the <b>Options</b> dialog (select the <b>Tools</b>   <b>Options</b>   <b>Links</b> menu	

---

Topic	Detail	See also
	option).	

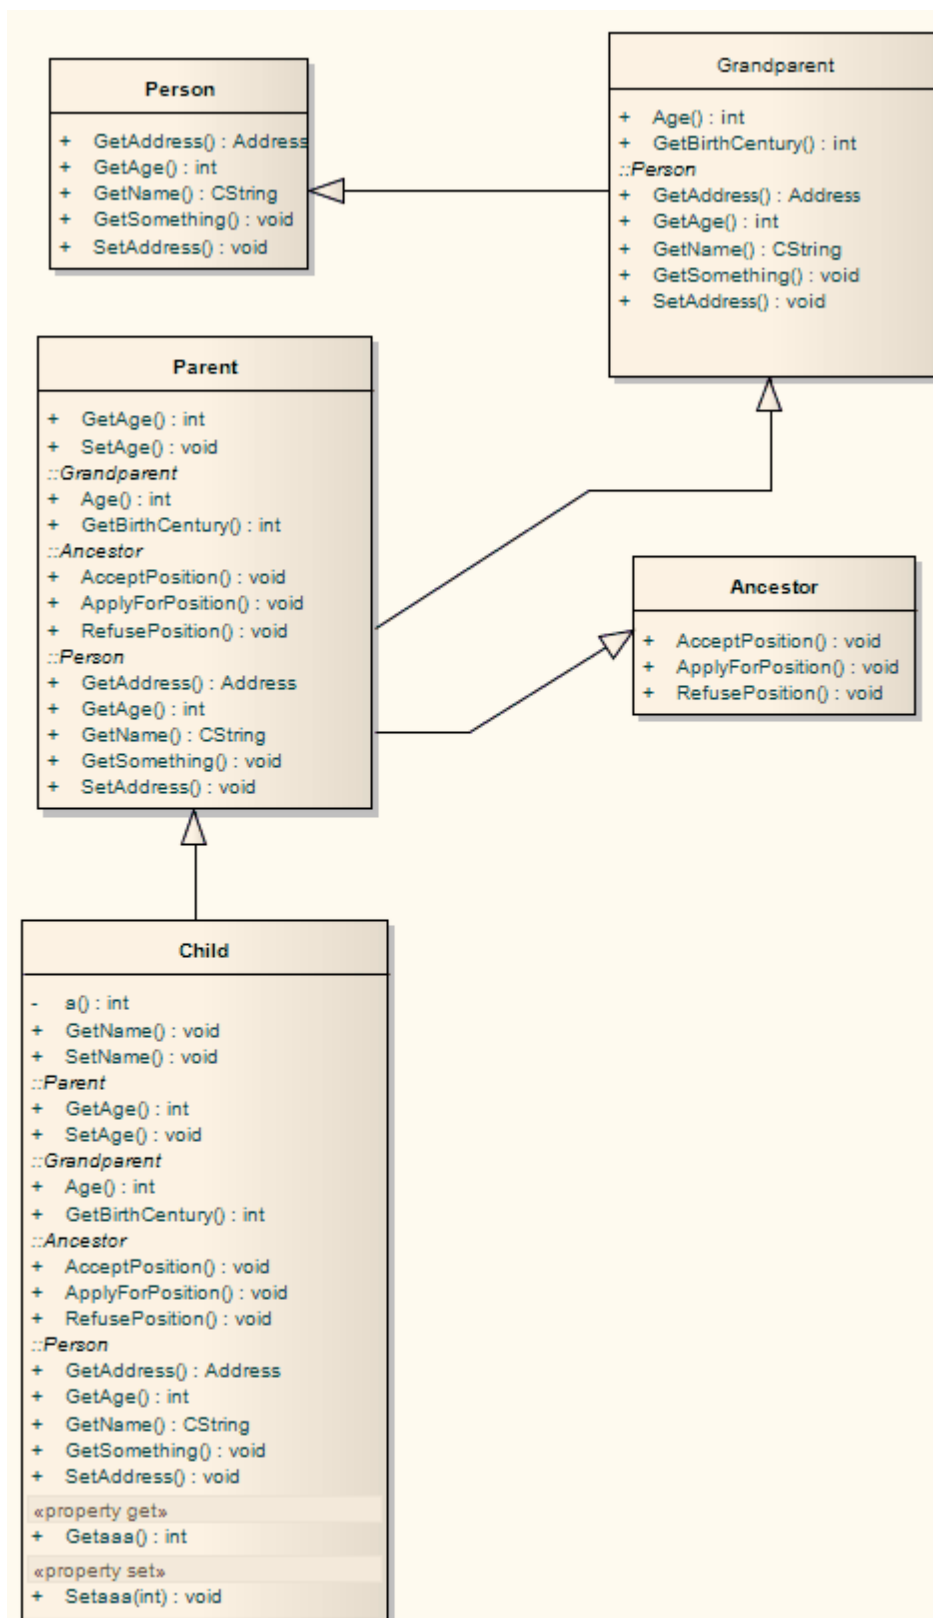

#### 5.6.7.1.4 *Display Inherited Operations*

You can configure an element in a diagram to display the complete operation set obtained from all ancestors in the element's type hierarchy, as well as those directly owned.

**Access:** **Element | Feature Visibility | Shortcut: ( Ctrl+Shift+Y )**

**Example:**

The following diagram illustrates this behavior when enabled for each element in a simple hierarchy.

### 5.6.7.2 Interactions and Activities

The behavioral aspects of Interactions and Activities are modeled using the **Behavior** tab of the element **Properties** dialog, which enables you to assign parameters and return types to the elements.

**Topics:**

Topic	Detail	See also
Usage	<p>Use the <b>Edit Parameters</b> button to edit an element's parameters. When you create a new parameter using the dialog, it internally creates an Activity Parameter Node for an Activity or an Interaction Parameter for an Interaction. In the Return field, click on the drop-down arrow and select the return type of the element.</p> <p>The specification field is populated automatically when an operation is associated with the activity as a behavior.</p>	<p><a href="#">Parameters Dialog</a><sup>[719]</sup></p> <p><a href="#">Activity Parameter Nodes</a><sup>[877]</sup></p> <p><a href="#">Operations Dialog - Behaviour</a><sup>[712]</sup></p>

### 5.6.7.3 Behavior Calls

A behavior call is the invocation of a behavior. You can represent an invocation with a Call Operation Action (Operation), Call Behavior Action (Activity) or Interaction Occurrence (Interaction) element. You model the properties of the behavior call using the **Call** tab of the element **Properties** dialog.

**Use To:**

- Edit Arguments
- Re-associate the call with a different behavior
- Synchronize the arguments with the parameters in the associated behavior

**Topics:**

Topic	Detail	See also
Usage	<p>Click on the <b>Edit</b> button to create and delete arguments, and relate them to a corresponding parameter in the associated behavior.</p> <p>Click on the ( ... ) (<b>Select Behavior</b>) button to re-associate the invocation with a different behavior or to remove any association with the current behavior.</p> <p>The <b>Interaction Occurrence</b> panel is displayed only for Interaction Occurrence elements. It enables you to enter the return value and attribute of the behavior call.</p>	

**Learn More:**

- [Action Notation](#)<sup>[868]</sup>
- [Interaction Occurrence](#)<sup>[908]</sup>
- [Arguments](#)<sup>[718]</sup>
- [Associate with Different Behavior](#)<sup>[718]</sup>
- [Synchronize Arguments](#)<sup>[718]</sup>

### 5.6.7.3.1 Associate with Different Behaviors

On the **Call** tab of the **Behavior Call** Properties dialog, when you click on the ( ... ) (**Select Behavior**) button the **Select <Item>** dialog displays, listing all available behaviors in the model.

#### Topics:

Topic	Detail	See also
Usage	Select <b>&lt;none&gt;</b> to remove any existing association between an invocation and a behavior, or select another classifier to re-associate the invocation with a different behavior.  The <b>Synchronize with Parameters</b> button is enabled only if a valid behavior is identified in the Behavior field.	

#### Learn More:

- [Select <Item> Dialog](#)<sup>[692]</sup>

### 5.6.7.3.2 Synchronize Arguments

#### Topics:

Topic	Detail	See also
Usage	On the <b>Call</b> tab of the element <b>Properties</b> dialog, click on the <b>Synchronize with Parameters</b> button to synchronize the number of arguments in the invocation element with the number of parameters in the associated behavior. This automatically creates or deletes arguments based on the number of parameters in the behavior. If any arguments are to be deleted, Enterprise Architect prompts you to confirm the operation. Click on the <b>Yes</b> button to confirm.	

#### Notes:

- The **Synchronize with Parameters** button is enabled only if the invocation is associated with a valid behavior, as identified in the **Behavior** field

### 5.6.7.4 Behavior Call Arguments

You define the arguments of a Behavior Call using the Arguments dialog, which you display by clicking on the **Edit** button on the Call tab of the element Properties dialog.

#### How To:

To define the arguments of a Behavior Call, follow the steps below:

Step	Action	See Also
1	In the <b>Name</b> field, type the name of an argument to map to the behavior	
2	In the <b>Parameters</b> field, click on the drop-down arrow and select a behaviors parameter from the list of parameters associated with the behavior	

Step	Action	See Also
3	In the <b>Value</b> field, set any required value.	
4	If a diagram is displayed, and if required, select the <b>Show in current diagram</b> checkbox to add an Action Pin on the diagram	<a href="#">Action Pin</a>  87↑
5	Click on the <b>Save</b> button	
6	If appropriate, click on the <b>New</b> button and repeat steps 1 to 5 for another argument: parameter mapping	

**Notes:**

- If you attempt to map a newly created argument to a parameter that is already associated with a different argument, Enterprise Architect identifies the mapping and prompts you to confirm that you intend to change the association

**Learn More:**

- [Behavior Calls](#)<sup>|71↑</sup>

### 5.6.7.5 Behavior Parameters

This topic area describes the facilities for defining, editing and extending the parameters of behavioral operations, Activities and Interactions.

**Learn More:**

- [Parameters Dialog](#)<sup>|719↑</sup>
- [Parameter Tagged Values](#)<sup>|720↑</sup>
- [Operation Parameters By Reference](#)<sup>|721↑</sup>

#### 5.6.7.5.1 Parameters Dialog

The **Parameters** dialog enables you to define the parameters of an operation, Activity or Interaction. The parameter list is reproduced in code in the order the parameters appear in the parameters list, so use the **Up** and **Down** buttons to move parameters into their required positions. Additionally, you can select the **Add new to end** checkbox to force new parameters to appear at the end of the list instead of the top.

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates the parameter name.	
<b>Type</b>	Select the data type of the parameter.  Alternatively, click on the ( ... ) button and select the element classifier to define the type.	
<b>Default</b>	Indicates an optional default value for the parameter.	
<b>Stereotype</b>	Indicates a stereotype name, specification of a Stereotype name can also be chosen via the drop-down list.	
<b>Kind</b>	Indicate the way a parameter is passed to a function:	

Field	Usage	See also
	<ul style="list-style-type: none"> <li>• <b>In</b> = By Value</li> <li>• <b>InOut</b> = By Reference</li> <li>• <b>Out</b> is passed by Reference, but only the return value is significant.</li> </ul>	
<b>Fixed</b>	Set the parameter to <i>const</i> , even if passed by reference.	
<b>Alias</b>	Indicates an optional alias for the parameter.	
<b>Add new to end</b>	Place new parameters at the end of the list instead of the start.	
<b>Multiplicity</b>	Display the <b>Multiplicity</b> dialog, to specify the multiplicity of the parameters.	
<b>Notes</b>	Indicates any additional notes on the parameter.	

Below is information regarding the Multiplicity dialog.

**Reference:**

Field	Usage	See also
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection.	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection.	
<b>Allow Duplicates</b>	Indicate that duplicates are allowed. Maps to the UML property <code>isUnique</code> , value FALSE).	
<b>Multiplicity is Ordered</b>	Indicate that the collection is ordered.	

**Notes:**

- Set the amount of parameter detail to display in a specific diagram using the **Show Parameter Detail** drop-down list on the **Diagram Properties** dialog. The setting applies only to the current diagram. The default is to show the type only

**Learn More:**

- [Parameter Tagged Values](#)<sup>[720]</sup>
- [Operation Parameters by Reference](#)<sup>[721]</sup>
- [Visible Class Members](#)<sup>[577]</sup>

#### 5.6.7.5.1.1 Parameter Tagged Values

Behavioral parameters can have Tagged Values associated with them. **Tagged Values** offer a convenient extension mechanism for UML elements; you can define any tags you like and then assign values to them using this form.

Tagged Values are written to the XML output, and can be input to other third party tools for code generation or other activities.

**How To:**

To add a Tagged Value for a parameter, follow the steps below:

Step	Action	See Also
1	Double-click on the operation, Activity or Interaction containing the parameter in a diagram or in the Project Browser The Properties dialog displays	
2	Click on the Tagged Values tab, which shows the Tagged Values for the selected object and its parameters	
3	Click on the required parameter in the Parameters compartment of the Tagged Values tab, and click on the <b>New Tags</b> button The Tagged Value dialog displays	
4	In the <b>Tag</b> field, type the tag name (or select a defined tag from the drop-down list) In the <b>Value</b> field type the initial tag value	
5	Click on the <b>OK</b> button to confirm the Tagged Value	

**Notes:**

- Tagged Values are supported for attributes, operations, objects and connectors
- Custom tags can be created using a predefined Tagged Value Type

**Learn More:**

- [Create a Custom Tagged Value](#)<sup>[1116]</sup>

**5.6.7.5.2 Operation Parameters by Reference**

**Access:** **Tools | Options | Objects : Feature reference indicator**

**Topics:**

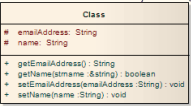

Image	Topic	Detail	See also
 <pre> Class - emailAddress: String - name: String + getEmailAddress(): String + getName(stname :String) : boolean + setEmailAddress(emailAddress :String) : void + setName(name :String) : void </pre>	<b>Usage</b>	<p>You can select to highlight parameters declared as 'Kind: <i>inout</i>' or 'Kind: <i>out</i>' with an additional user-defined prefix or suffix.</p> <p>If you select the <b>Highlight References</b> checkbox, you can also indicate whether a prefix or suffix should be used, and the actual reference character to use. In the example above, the <b>&amp;</b> character has been set as a prefix.</p> <p>When you declare a parameter of type <i>inout</i>, it is assumed you are passing the parameter by reference rather than by value. If you have elected to highlight references, then this is displayed in the <b>Diagram View</b>.</p>	<a href="#">Objects</a> <sup>[434]</sup>

Image	Topic	Detail	See also
		The example to the left shows that, in the <i>getName</i> operation, the parameter <i>strName</i> is a string reference, and is highlighted using the chosen character and position.	

**Notes:**

- This facility currently applies to operations only

### 5.6.8 In-place Editing Options

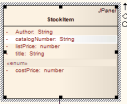

This topic explores the tasks that can be performed using in-place editing of elements on a diagram in Enterprise Architect. The tasks include:

- [View Properties](#) <sup>[723]</sup>
- [Edit Element Item Name](#) <sup>[724]</sup>
- [Edit Feature Stereotype](#) <sup>[724]</sup>
- [Edit Feature Scope](#) <sup>[725]</sup>
- [Edit Attribute Keyword](#) <sup>[726]</sup>
- [Edit Operation Parameter Keyword](#) <sup>[726]</sup>
- [Insert Operation Parameter](#) <sup>[728]</sup>
- [Edit Parameter Kind](#) <sup>[727]</sup>
- [Insert New Feature](#) <sup>[728]</sup> (Attribute or Operation)
- [Insert Maintenance Feature](#) <sup>[729]</sup>
- [Insert Testing Features](#) <sup>[730]</sup>
- [Delete Selected from Model](#) <sup>[723]</sup>

#### 5.6.8.1 In-place Editing Tasks

**How To:**

To use the in-place editing menu options, follow the steps below:

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element, and on the item to manipulate within the element  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Edit and manipulate the items in the element, either by pressing the appropriate keyboard keys or by right-clicking on the highlighted item and choosing a task from the <b>Element Items</b> context menu  The available commands are listed in the table below	

**Reference:**

Menu option...	Usage	Shortcut	See also
<b>Edit Selected</b>	Change the name, scope or stereotype of the element or element item	<b>F2</b>	
<b>View Properties</b>	Display the dialog containing details of the element	<b>Enter</b>	
<b>Insert New After Selected</b>	Insert a new item in the element	<b>Insert</b>	
<b>Find in Project Browser</b>	Locate the item in the Project Browser		
<b>Add Attribute</b>	Add an attribute to the element	<b>Ctrl + Shift + F9</b>	
<b>Add Operation</b>	Add an operation to the element	<b>Ctrl + Shift + F10</b>	
<b>Add Other</b>	Insert a feature on the specific element item, such as Maintenance features and Testing features	<b>Ctrl + F11</b>	
<b>Delete Selected from Model</b>	Delete the selected item from the model	<b>Delete</b>	
<b>View Source code</b>	Display the source code for the element, in the default external editor	<b>F12</b>	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>
<b>Set Breakpoint</b>	Set a breakpoint on a highlighted operation (including a breakpoint, start recording marker, end recording marker or stack auto-capture marker)		<a href="#">Breakpoint and Marker Management</a> <sup>[1444]</sup> <a href="#">Marker types</a> <sup>[1653]</sup>
	Navigate Diagram Selection, to navigate the diagram between elements without having to use the mouse	<b>Ctrl + Shift + arrow key</b>	
	Toggle element highlight option on and off	<b>Shift + Enter</b>	

Other options that are available while editing element attributes or operations in a diagram include:

Menu options	Usage	Shortcut	See also
	Accept current changes	<b>Enter</b>	
	Accept current changes and open a new slot to add a new item	<b>Ctrl + Enter</b>	
	Abort the edit, without save	<b>Esc</b>	
	Move the cursor between segments of a feature definition	<b>Tab or Shift + Tab</b>	
	Display the context menu for in-place editing	<b>Shift + F10</b>	
	Invoke the <b>Select &lt;Item&gt;</b> dialog	<b>Ctrl + Shift + Space</b>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>

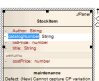

Menu options	Usage	Shortcut	See also
	Display an autocompletion list for a feature classifier	<b>Ctrl + Space</b>	

**Notes:**

- Most of the in-place editing menu commands have keyboard alternatives; for many of them, if the selected item happens to be off-screen when you press the appropriate keys, the diagram automatically scrolls to show the whole element, so that you can see what you are changing

**5.6.8.2 Edit Element Item Name****How To:**

To change the name of the element, or the name of an operation or attribute, directly from the diagram, follow the steps below

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element and on the name to change within the element  The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Right-click on the item  The context menu displays	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the item directly from the diagram  The name of the attribute or operation is highlighted	
	5	Delete or type over the name	
	6	Press ( <b>Enter</b> ) to accept the change, or ( <b>Esc</b> ) to cancel the change	

**5.6.8.3 Edit Feature Stereotype****How To:**

To change the stereotype of an operation or attribute directly from the diagram, follow the steps below:

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element, and on the item to edit within the element  The item line is highlighted in a lighter shade (the default is white), to	

Images	Step	Action	See Also
		indicate that it has been selected	
	3	Right-click on the item The context menu displays	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> )) to enable you to edit the attribute or operation directly from the diagram The name of the item is highlighted	
	5	Move the cursor to the position before the name or within the existing attribute or operation stereotype (denoted by «stereotype name»)	
	6	Delete or type over the previous name to change the stereotype name of the attribute or operation	
	7	Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change	

**Notes:**

- You can assign multiple stereotypes by including a comma-separated list inside the stereotype markers

**5.6.8.4 Edit Feature Scope**

To rapidly change the scope of an attribute or operation directly from the diagram, follow the steps below

**How To:**

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element and on the item to edit within the element The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Right-click on the item The context menu displays	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> )) to enable you to edit the attribute or operation directly from the diagram The name of the item is highlighted.	
	5	Move the cursor to the scope of the item and delete the previous entry	
	6	Reassign the entry by typing in one of the following symbols: <ul style="list-style-type: none"> <li>+ indicates that the scope is Public</li> <li>- indicates that the scope is Private</li> <li>~ indicates that the scope is Package</li> <li># indicates that the scope is Protected</li> </ul>	
	7	Press ( <b>Enter</b> ) to save the change, or ( <b>Esc</b> ) to cancel the change	

Images	Step	Action	See Also
		The diagram is updated to reflect the changes (also see the <i>catalogNumber</i> attribute in the screen illustrations to the left)	

### 5.6.8.5 Edit Attribute Keyword

You can add features such as attribute keywords and classifiers directly to an element, using the **Element Keywords and Classifiers** menu. This enables you to rapidly assign details element item by element item, directly from a diagram.

#### How To:

To add features directly to an element, follow the steps below:

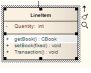

Images	Step	Action	See Also
	1	In Enterprise Architect, open the diagram containing the element	
	2	Click on the element, and on the attribute to edit within the element The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Right-click on the item The context menu displays.	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> ) ) to enable you to edit the attribute directly from the diagram The name of the attribute is highlighted	
	5	Right-click on the attribute name to display the context menu	
	6	From the context menu, you can: <ul style="list-style-type: none"> <li>Change the attribute classifier to static or fixed - select the <b>static</b> or <b>fixed</b> menu options as appropriate; the diagram is updated to reflect the changes</li> <li>Display the Class properties - click on the <b>Goto Definition</b> menu option; Enterprise Architect locates the Class in the Project Browser and opens its Properties dialog</li> </ul> <p>If the data type is a raw data type, Enterprise Architect displays the message: <i>The data type is a raw data type</i></p>	<a href="#">Properties Dialog</a> <sup>[662]</sup>

### 5.6.8.6 Edit Operation Parameter Keyword

You can directly edit operation classifiers by element, using the in-place editing menu. This enables you to rapidly assign parameter keywords.

#### How To:

To directly edit operation classifiers by element, follow the steps below:

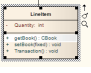

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element, and on the operation to edit within the element The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Right-click on the item The context menu displays	
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> )) to enable you to edit the operation directly from the diagram The name of the operation is highlighted	
	5	Right-click on the data type of a parameter to display the context menu	
	6	From the context menu you can: <ul style="list-style-type: none"> <li>Change the operation classifier by clicking on the appropriate menu option - <b>static</b>, <b>isquery</b>, <b>abstract</b> or <b>fixed</b>; the diagram is updated to reflect the changes</li> <li>Display the Class properties - click on the <b>Goto Definition</b> menu option</li> </ul> <p>If the data type is Class, Enterprise Architect locates the Class in the Project Browser and opens its Properties dialog</p> <p>If the data type is a raw data type, Enterprise Architect displays the message <i>This data type is a raw data type</i></p> <p>If the data type is not defined in the model, the message is: <i>The data type is not defined in the model</i></p>	<a href="#">Properties Dialog</a> <sup>[662]</sup>

### 5.6.8.7 Edit Parameter Kind

You can edit operation parameter kinds such as *( in )*, *( inout )* and *( out )* directly from a diagram element by element, using the **Element Keywords and Classifiers** menu. This enables you to rapidly assign the parameter directly from a diagram.

#### How To:

To edit operation parameter kinds directly from a diagram, follow the steps below:

Images	Step	Action	See Also
	1	In Enterprise Architect, open the diagram containing the element	
	2	Click on the element, and on the operation to edit within the element The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Right-click on the item The context menu displays	

Images	Step	Action	See Also
	4	Select the <b>Edit Selected</b> menu option (or press ( <b>F2</b> )) to enable you to edit the item directly from the diagram The name of the item is highlighted	
	5	Right-click on the item name to display the context menu	
	6	Select the appropriate menu option for the parameter kind value: ( <b>in</b> ), ( <b>inout</b> ) and ( <b>out</b> ) The diagram is updated to reflect the change	

### 5.6.8.8 Insert New Feature

#### How To:

To add attributes and operations to a Class diagram element, follow the steps below:

Images	Step	Action	See Also
	1	Open the diagram containing the element to which you are adding an attribute or operation	
	2	Click on the element and, within the element, on the item after which to insert the operation or attribute The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Either: <ul style="list-style-type: none"> <li>• Press ( <b>Insert</b> ) or</li> <li>• Right-click on the selected element item to display the context menu and select the <b>Insert New After Selected menu</b> option</li> </ul> Enterprise Architect inserts a new data line in the diagram, underneath the selected item	
	4	Type in the relevant information for the attribute or operation Use the ( <b>Tab</b> ) and ( <b>Tab+Shift</b> ) keys to move the cursor through the segments of the attribute or operation, and select the classifier from either the: <ul style="list-style-type: none"> <li>• Autocompletion list (press the ( <b>Ctrl+Space</b> ) keys) or</li> <li>• Select &lt;Item&gt; dialog (press the ( <b>Ctrl+Shift+Space</b> ) keys)</li> </ul>	<a href="#">Autocompletion List<sup>[1407]</sup></a> <a href="#">Select &lt;Item&gt; Dialog<sup>[692]</sup></a>
	5	Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change The diagram is updated to reflect the changes	

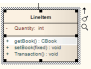

### 5.6.8.9 Insert Operation Parameter

You can add operation parameters to an operation through the in-place editing options, using hotkey commands or menu shortcuts.

#### How To:

To add parameters to operations in a Class diagram element, follow the steps below:

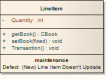

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element, and on the operation to update within the element The item line is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Press ( <b>F2</b> ), or right-click on the selected item to display the context menu and select the <b>Edit Selected</b> option	
	4	Move the cursor inside the parameter brackets and type the parameter name, followed by a colon (for example, <b>bks:</b> for a vector containing books)	
	5	Give the parameter a type Place the cursor after the colon at the end of the name and add the classifier; either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+Space</b> ) to invoke the classifier <b>autocompletion list</b></li> <li>Press ( <b>Ctrl+Shift+Space</b> ) to select a classifier from the <b>Select &lt;Item&gt; dialog</b> or</li> <li>Right-click the mouse to display the inline editing options context menu and select the <b>Insert Classifier</b> option</li> </ul> The Select <Item> dialog displays	<a href="#">Autocompletion List</a> <sup>[1407]</sup> <a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>
	6	Press ( <b>Enter</b> ) to accept the change or ( <b>Esc</b> ) to cancel the change The diagram is updated to reflect the changes.	

### 5.6.8.10 Insert Maintenance Feature

#### How To:

To rapidly assign maintenance details such as Defects, Changes, Issues and Tasks directly to an element from a diagram, follow the steps below:

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element name The name is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+F11</b> ) or</li> <li>Right-click on the highlighted name to display the context menu, and select the <b>Add Other</b> option</li> </ul> The Insert Feature dialog displays	
	4	Click on the appropriate radio button option to associate the required maintenance feature with the element item	
	5	Click on the <b>OK</b> button	

Images	Step	Action	See Also
		The <Maintenance Feature> details for <element> dialog displays	
	6	Complete the fields to define the maintenance activity, and then click on the <b>Apply</b> button  To create a subsequent maintenance activity of this type, click on the <b>New</b> button	
	7	When you have defined all of the maintenance activities of this type, click on the <b>OK</b> button  The maintenance details are added to the element	

**Notes:**

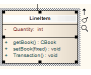

- To ensure that the maintenance items are visible in the diagram element, as shown in step 7, select the **Maintenance** checkbox on the Elements tab of the Diagram Properties dialog

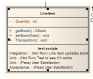

**Learn More:**

- [Show Maintenance Script in Diagram](#)<sup>[1729]</sup>

**5.6.8.11 Insert Testing Features****How To:**

To rapidly add testing features such as Unit, Integration, System, Acceptance and Scenario tests to an element directly from a diagram, follow the steps below:

Images	Step	Action	See Also
	1	Open the diagram containing the element	
	2	Click on the element  The element name is highlighted in a lighter shade (the default is white), to indicate that it has been selected	
	3	Either: <ul style="list-style-type: none"> <li>Press ( <b>Ctrl+F11</b> ) or</li> <li>Right-click on the highlighted name to display the context menu and select the <b>Add Other</b> option</li> </ul> The Insert Feature dialog displays	
	4	Click on the appropriate radio button option to associate the required testing feature with the element	
	5	Click on the <b>OK</b> button  The <b>Testing</b> window opens, showing the appropriate panel for the type of test selected	
	6	Complete the fields to define the test activity, and then click on the <b>Save</b> icon in the window toolbar  The test is added to the element	<a href="#">The Testing Workspace</a> <sup>[1707]</sup>

Images	Step	Action	See Also
	7	To create a subsequent test activity of this type, click on the <b>New</b> icon To add items for other types of test, click on the appropriate tab	

**Notes:**

- To ensure that the test items are visible in the diagram element, as shown in step 7, select the **Testing** checkbox on the Elements tab of the Diagram Properties dialog

**Learn More:**

- [Show Test Script Compartments](#)<sup>[1719]</sup>

### 5.6.9 Linked Documents

In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, you can link an RTF document to any UML element in the model.

All editions of Enterprise Architect provide an additional UML Artifact - Document Artifact - that can contain an RTF document internally.

You create linked documents from Linked Document Templates, which you define with the Document Template Editor.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Documents created via the Document Artifact element are rendered into RTF Documentation by selecting the <b>Linked Document</b> checkbox in the RTF Style Template Editor.</p> <p>The <b>Linked Document</b> checkbox is within the Element hierarchy, towards the end. Remember that checkboxes can be moved up and down the hierarchy to position information in the generated document as you require. In some templates, the <b>Linked Document</b> checkbox is only available as a child of the <b>External Requirements</b> checkbox.</p> <p>The linked document is rendered into the RTF documentation at:</p> <p><i>linked document &gt;</i></p> <p><i>&lt;linked document</i></p>	

**Notes:**

- When you have saved the document, an **A** symbol displays in the bottom right corner of the element

**Learn More:**

- [Document Artifact](#)<sup>[953]</sup>

### 5.6.9.1 Create Document Artifact

#### Topics:

Topic	Detail	See also
Usage	<p>You create a Document Artifact element In a Component or Deployment diagram.</p> <p>Drag and drop the Document Artifact element from the Toolbox into your diagram.</p> <p>Double-click on the Document Artifact element. The Linked Document Editor opens, with the New Linked Document dialog.</p> <p>In the <b>Copy template</b> field, click on the drop-down arrow and select a previously-created Linked Document Template. Click on the <b>OK</b> button.</p>	<p><a href="#">Component Diagram</a><sup>[809]</sup></p> <p><a href="#">Deployment Diagram</a><sup>[806]</sup></p> <p><a href="#">Linked Document</a><sup>[733]</sup></p> <p><a href="#">Create Linked Document Templates</a><sup>[736]</sup></p> <p><a href="#">Edit Linked Document Templates</a><sup>[736]</sup></p>

### 5.6.9.2 Link Document to UML Element

#### How To:

Step	Action	See Also
1	<p>Click on an element in the Project Browser, Diagram List, Package Browser, Model Search or diagram, and either:</p> <ul style="list-style-type: none"> <li>• Select the <b>Element   Linked Document</b> menu option</li> <li>• In the Notes window, click on the <b>Linked Document</b> icon in the toolbar</li> <li>• Press ( <b>Ctrl+Alt+D</b> ) or</li> <li>• Right-click and select the <b>(Create) Linked Document</b> option from the context menu</li> </ul> <p>Alternatively, open the element Properties dialog and click on the <b>Linked Document</b> icon in the toolbar in the <b>Notes</b> field</p>	
2	The New Linked Document dialog displays	
3	Select the previously-created template from which to create the document	
4	<p>Click on the <b>OK</b> button</p> <p>The Linked Document editor displays</p>	<a href="#">Linked Document Editor</a> <sup>[733]</sup>
5	Enter the text of the document	

#### Notes:

- This operation is available in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions
- When you have saved the document, an **A** symbol displays in the bottom right corner of the element

**Learn More:**

- [Create Linked Document Templates](#) [736]
- [Edit Linked Document Templates](#) [736]

**5.6.9.3 Edit Linked Documents**

**Topics:**

Topic	Detail	See also
Usage	<p>Enterprise Architect provides a Windows-like word processor to help you edit Linked Documents. This is a simplified version of the RTF Style Template Editor, and it provides the same convenient features.</p> <p>The main difference between the two editors is that you access the RTF Style Template Editor features through a menu bar at the top of the screen, whilst you access the Linked Document Editor features through a context menu. To access the context menu, just right-click anywhere on the document.</p> <p>You can format and edit the document in a number of ways, and add links from and references to the content of the document. For example, you can highlight a word or term in the linked document and select <b>Create   Glossary Definition</b> to create a glossary definition for that term. Anyone reading the document can, if they check for the term in the Project Glossary, read the definition.</p>	

**Learn More:**

### 5.6.9.4 Hyperlink From Linked Document

#### Topics:

Topic	Detail	See also
How To	<p>To do this, click on the object in the <b>Project Browser</b> and drag it to the point at which to create the hyperlink. The linked document editor automatically creates the hyperlink, using the object name as the hyperlink text. You can edit this text if required.</p> <p>Similarly, you can create a hyperlink to an element in the model by highlighting the link text in the linked document, right-clicking on it and selecting the <b>Create   Link to Existing Element</b> context menu option. This displays the <b>Select Classifier</b> dialog, from which you select the element to link to.</p> <p>In either case, when you next open the document, you can double-click on the hyperlink to locate and highlight the object in the <b>Project Browser</b>. You can then perform all normal operations on the object, including opening any linked document on the highlighted element.</p> <p>You can also create a hyperlink to a wide range of additional objects, such as web pages, Help files, <b>Model Searches</b> and <b>Team Review</b> Forums, by highlighting the appropriate text and then selecting the <b>Create   New   Hyperlink</b> context menu option. This displays the <b>Hyperlink Details</b> dialog. When specifying the object location, you can use full paths or local (path substitution) paths.</p> <p>For an alternative method of creating a hyperlink to an external document, Help file or web page, see the <b>Hyperlinks and Bookmarks</b> topic.</p>	<p><a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup></p> <p><a href="#">Model Searches</a> <sup>[484]</sup></p> <p><a href="#">Team Review</a> <sup>[217]</sup></p> <p><a href="#">Hyperlinks</a> <sup>[1295]</sup></p> <p><a href="#">Hyperlinks and Bookmarks</a> <sup>[1768]</sup></p>

### 5.6.9.5 Create Element From Document

Using the **Linked Document Editor**, you can create document-specific elements and diagrams in the **Project Browser**, with hyperlinks from the document to the created item. When you click on the hyperlink, the element or diagram is highlighted in the **Project Browser**. The element or diagram is created in the same package as the element for which the linked document was created.

#### Topics:

Topic	Detail	See also
Usage	<p>You can create and link to any type of element or diagram, but the facility has specific options for the following element types:</p> <ul style="list-style-type: none"> <li>• Class</li> <li>• Requirement</li> <li>• Issue</li> </ul> <p>You can create the same arrangement with existing elements, diagrams and packages by dragging them from the Project Browser into the text of the document, creating a hyperlink with the item name as the text</p>	<p><a href="#">Class</a> <sup>[943]</sup></p> <p><a href="#">Requirement</a> <sup>[1157]</sup></p> <p><a href="#">Issue</a> <sup>[1731]</sup></p> <p><a href="#">Hyperlink From Linked Document</a> <sup>[734]</sup></p>

#### How To:

Step	Action	See Also
1	Open the linked document, either from a Document Artifact element or through the context menu for an existing element (Corporate, Business and Software Engineering, System Engineering and Ultimate editions)	<a href="#">Document Artifacts</a> <sup>[732]</sup> <a href="#">Linking Document to UML Element</a> <sup>[732]</sup>
2	Enter some text, including appropriate text to act as the link (such as the element or diagram name)	
3	Highlight the appropriate text and right-click on it The editor context menu displays	
4	Select the <b>Create   New</b> menu option, and the required submenu option If you select the: <ul style="list-style-type: none"> <li>• <b>Class, Requirement</b> or <b>Issue</b> option, the corresponding element is immediately created in the Project Browser</li> <li>• <b>Other</b> option, the New Element dialog displays; specify the element type and - if appropriate - stereotype, and click on the <b>Create</b> button</li> <li>• <b>Diagram</b> option, the New Diagram dialog displays; specify the diagram type and click on the <b>OK</b> button</li> </ul>	<a href="#">New Elements</a> <sup>[629]</sup> <a href="#">New Diagrams</a> <sup>[570]</sup>
5	The highlighted text is now a hyperlink Click on the link to highlight the new element or diagram in the Project Browser You can now edit or expand the element or diagram as required	

### 5.6.9.6 Replace or Delete Documents

If a linked document is out of date, you can either edit the text or replace the entire contents from another file.

#### How To:

To replace the contents, follow the steps below:

Step	Action	See Also
1	Click in the body of the document and press ( <b>Ctrl+A</b> ) to select all the document text	
2	Press ( <b>Delete</b> )	
3	Right-click and select the <b>File   Import</b> context menu option The Windows Open dialog displays, in which you can browse for the file to import into the document	
4	Click on the <b>Save</b> icon in the Linked Document screen toolbar	

To delete the linked document, follow the steps below:

Step	Action	See Also
1	Click on an element in the <b>Project Browser</b> or diagram, and either: <ul style="list-style-type: none"> <li>select the <b>Element   Delete Linked Document</b> menu option or</li> <li>right-click and select the <b>Delete Linked Document</b> context menu option</li> </ul>	
2	Enterprise Architect prompts you to confirm the deletion; click on the <b>Yes</b> button. If required, you can now create another linked document for the element.

## 5.7 Connectors

UML connectors, along with elements, form the basis of a UML model. Connectors link elements together to denote some kind of logical or functional relationship between them. Each connector has its own purpose, meaning and notation and is used in specific kinds of UML diagrams.

### Topics:

Topic	Detail	See also
<b>Off-Page Connector</b>	<p>UML, and therefore Enterprise Architect, does not have a connector that continues activity flow between two diagrams</p> <p>In creating a model diagram, if it becomes necessary to continue flow to another diagram, you should consider revising and simplifying the structure of the process so that groups of Actions are captured in composite Activity elements, and each group of Actions is modeled within the child diagram of an Activity</p> <p>BPMN, however, does enable you to create off-page connectors</p> <p>You can also use the <b>Suppress Line Segments</b> menu option to indicate continuation of flow in a large diagram that, when printed, occupies several pages; be aware that these options are purely diagrammatic and do not indicate any diagram relationships in any of the relationship tools</p>	<p><a href="#">BPMN</a> <sup>[123]</sup></p> <p><a href="#">Style Menu Section</a> <sup>[74]</sup></p>

### Learn More:

### 5.7.1 Connector Context Menu

If you right-click on a connector in a diagram, the connector context menu displays. This provides quick access to some important functions.

### Topics:

Topic	Detail	See also
<b>Context Menu</b>	<p>The menu is split into up to seven distinct sections:</p> <ul style="list-style-type: none"> <li>• <b>Add-Ins</b> - displays in the first section only if you have Add-Ins installed and registered, such as Eclipse</li> <li>• <b>Properties</b></li> <li>• <b>Type Specific</b></li> <li>• <b>Advanced</b></li> </ul>	<p><a href="#">Properties Menu Section</a> <sup>[73]</sup></p> <p><a href="#">Type-Specific Menu Section</a> <sup>[73]</sup></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Style</b></li> <li>• <b>Appearance</b></li> <li>• <b>UML Help</b> - Displays the Enterprise Architect Help topic for this connector type</li> <li>• <b>Delete</b> - delete the connector with this option</li> </ul>	<a href="#">Advanced Menu Section</a> <sup>[740]</sup> <a href="#">Style Menu Section</a> <sup>[741]</sup> <a href="#">Appearance Menu Section</a> <sup>[742]</sup>
<b>Connector Role Context Menu</b>	<p>For connectors with Roles, right-clicking a connector within up to 60 pixels of an end point displays a role-specific context menu.</p> <p>The Role context menu has three additional menu options:</p> <ul style="list-style-type: none"> <li>• A <b>Source/Target Role...</b> menu option that opens the connector specification dialog with the respective role page selected</li> <li>• A <b>Multiplicity</b> submenu that enables you to set the multiplicity for the role</li> <li>• A <b>Link to Element Feature</b> menu option that displays a dialog through which you can attach the end of the connector to a specific attribute or operation</li> </ul>	<a href="#">Source Role</a> <sup>[760]</sup> <a href="#">Connect To Element Feature</a> <sup>[744]</sup>

**Notes:**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

**5.7.1.1 Properties Menu Section**

The *Properties* section of the connector context menu contains the following options:

Menu Option	Action	Shortcut	See also
<Connector type> <b>Properties</b>	Open the Properties window for the selected connector		<a href="#">Properties Window</a> <sup>[758]</sup>
<b>Advanced</b>	Display the <b>Advanced</b> menu		<a href="#">Advanced Menu</a> <sup>[740]</sup>
<b>Attach Note or Constraint</b>	Attach a note or constraint to the connector		<a href="#">Attach a Note or Constraint</a> <sup>[745]</sup>

**Notes:**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

**5.7.1.2 Type-Specific Menu Section**

The *Type-Specific* section of the connector context menu is specific to the object, and only appears for a few different connectors. Some examples are shown below:

Connector	Menu Option	Action
Transition	<b>Locate in State Table</b>	Switch a State Machine diagram to a State Table, with the

Connector	Menu Option	Action
		selected Transition cell highlighted on the table
Transition	<b>Message</b>	Set the value of the Message
Transition	<b>Find Triggers Associated</b>	Identify hidden triggers, and locate a trigger in the Project Browser; if there: <ul style="list-style-type: none"> <li>• Is one trigger, it is immediately highlighted in the Project Browser</li> <li>• Are two or more triggers the Element Usage dialog displays, listing the triggers; double-click on the required trigger to highlight it in the Project Browser</li> </ul>
Association	<b>Find Association Class</b>	Locate and highlight the Association Class element in the Project Browser
Aggregation	<b>Set Aggregation to Composite</b>	Change the Aggregation to composite
Aggregation	<b>Set Aggregation to Shared</b>	Set the Aggregation to shared; this appears after <b>Set Aggregation to Composite</b> has been selected
InformationFlow	<b>Find Information Item</b>	(Listed only if there are Information Items on the connector) Locate the Information Item in the Project Browser; if there: <ul style="list-style-type: none"> <li>• Is one item, it is immediately highlighted in the Project Browser</li> <li>• Are two or more items the Element Usage dialog displays, listing the items; double-click on the required item to highlight it in the Project Browser</li> </ul>

**Notes:**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

**5.7.1.3 Advanced Menu Section**

The *Advanced* section of the connector context menu contains the following options:

Menu Option	Action	Shortcut	See also
<b>Set Source and Target</b>	Change the source and/or target of the connector		<a href="#">Change the source and/or target</a> <sup>[747]</sup>
<b>Change Type</b>	Change the connector type		<a href="#">Change the connector type</a> <sup>[746]</sup>
<b>Reverse Direction</b>	Reverse the direction of the connector; for example, if the connector is an arrow, the arrowhead swaps to the other end		
<b>Specialize Associations</b>	Specify how the properties of this Association specialize the properties of other Associations		
<b>Information Flows Realized</b>	Realize any information items conveyed on an Information Flow connector between these		<a href="#">Information Item Realized</a> <sup>[987]</sup>

Menu Option	Action	Shortcut	See also
	same two elements		<a href="#">Information Item Conveyed</a> <sup>[986]</sup> <a href="#">Information Flow</a> <sup>[985]</sup>
<b>Dependency Stereotypes</b>	Select a stereotype for the Dependency (or Trace, Role Binding, Occurrence or Represents connector)		

**Notes:**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

**5.7.1.4 Style Menu Section**

The *Style* section of the connector context menu provides the following options:

Action	Usage	Shortcut	See also
<b>Line Style</b>	Set the connector line style - options are: <ul style="list-style-type: none"> <li>Direct</li> <li>Auto Routing</li> <li>Custom</li> <li>Bezier</li> <li>Tree (Horizontal, Vertical, Lateral Horizontal or Lateral Vertical)</li> <li>Orthogonal (with Square or Rounded corners)</li> </ul>		<a href="#">Set the connector line style</a> <sup>[747]</sup>
<b>Pin End(s)</b>	Pin the connector start and/or end to the current position on the target element; a sub-menu displays to offer the options of pinning the start point only, the end point only, or both  Once one or both ends are pinned, a fourth option is available to unpin both ends		
<b>Bend Line at Cursor</b>	Insert an anchor point on the line at the point of the cursor so you can change the shape of the line	<b>Ctrl + Q</b>	<a href="#">Insert an anchor point</a> <sup>[747]</sup>
<b>Suppress Line Segment</b>	Hide a segment of a connector so that you can view a part of the diagram that it crosses  To reverse the change, right-click on the connector and select the <b>Show All Line Segments</b> context menu option		
<b>Straighten Line at Cursor</b>	Remove an anchor point on the line at the point of the cursor  (This is the exact opposite of <b>Bend Line at Cursor</b> , and <b>(Ctrl+Q)</b> toggles the connector point between the options)	<b>Ctrl + Q</b>	<a href="#">Connector styles</a> <sup>[747]</sup>

**Notes:**

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included
- If two connectors cross, the later connector has a 'hoop' at the intersection, indicating that the connectors are crossing

### 5.7.1.5 Appearance Menu Section

The *Appearance* section of the connector context menu provides the following options:

Menu Option	Action	Shortcut	See also
<b>Appearance</b>	Set the line color and line thickness of the connector		
<b>Visibility</b>	Set connector visibility; see the table below for sub-menu options		
<b>Tidy Line Angles</b>	Tidy the line angles of a custom connector		<a href="#">Tidy the line angles</a> <sup>[747]</sup>

#### Visibility Sub-Menu:

Menu Option	Action	Shortcut	See also
<b>Hide Connector</b>	Hide the connector To show the connector again, follow the steps in the <i>Hide/Show Connectors</i> topic		<a href="#">Hide/Show Connectors</a> <sup>[753]</sup>
<b>Hide Connector in Other Diagrams</b>	Hide or show the connector in other diagrams		<a href="#">Hide/Show Connectors</a> <sup>[753]</sup>
<b>Hide All Labels</b>	Hide or show all labels attached to the connector		
<b>Set Label Visibility</b>	Hide or show labels attached to the connector, individually		<a href="#">Hide or show labels</a> <sup>[754]</sup>

#### Notes:

- Context menus vary slightly between connector types, and not all menu options are present on all connector context menus; the type-specific menu options are not always included

## 5.7.2 Connector Tasks

This topic details some of the tasks associated with managing model connectors, such as:

- [Connect Elements](#) <sup>[743]</sup>
- [Connect to an Element Feature](#) <sup>[744]</sup>
- [Change Connector Styles](#) <sup>[747]</sup>
- [Arrange Connectors](#) <sup>[746]</sup>
- [Change Connector Type](#) <sup>[746]</sup>
- [Create Connector in Project Browser](#) <sup>[750]</sup>
- [Reverse Connector](#) <sup>[753]</sup>
- [Delete Connectors](#) <sup>[752]</sup>
- [Hide/Show Connectors](#) <sup>[753]</sup>
- [Hide/Show Labels](#) <sup>[754]</sup>

- [Create Generalization Set](#)<sup>[752]</sup>
- [Change the Source or Target Element](#)<sup>[747]</sup>
- [Set Relation Visibility](#)<sup>[751]</sup>
- [Add a Note to a Connector](#)<sup>[745]</sup>
- [Use Tree Style Hierarchy](#)<sup>[757]</sup>
- [Create Connector in Project Browser](#)<sup>[750]</sup>
- [Show Uses Arrow Head](#)<sup>[756]</sup>
- [Set Association Specializations](#)<sup>[755]</sup>
- [Change Sequence Message Scope](#)<sup>[756]</sup>

#### Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions, if security is enabled, you must have **Update Element** permission to update or delete a connector

#### Learn More:

- [List of Available Permissions](#)<sup>[206]</sup>

### 5.7.2.1 Connect Elements

#### Topics:

Topic	Detail	See also
<b>Connect Elements on a Diagram</b>	<p>The fastest and simplest ways to create connectors are using the Quick Linker and using the Toolbox</p> <p>To create another connector of the same type as the last connector you used, click on the appropriate source element and press ( <b>F3</b> )</p>	<p><a href="#">Create Connectors In Place Using the Quick Linker</a><sup>[626]</sup></p> <p><a href="#">Create Connectors Using the Toolbox</a><sup>[548]</sup></p> <p><a href="#">Create a Group of Elements Using UML Patterns</a><sup>[1023]</sup></p> <p><a href="#">Create Domain Specific Connectors From UML Profiles</a><sup>[1028]</sup></p>
<b>Selecting Connectors</b>	<p>To select a connector, simply click on it; drag handles display, indicating that the connector is selected</p> <p>This gives the connector focus for keyboard commands such as ( <b>Delete</b> ), and displays connector properties in docked windows such as the Tagged Values window</p> <p>If there is more than one connector on a diagram, you can cycle through them using the arrow keys</p>	
<b>Drag Connectors</b>	<p>You can drag a connector to position it; click on the connector and drag it to where it is to appear - note that there are some limitations on how far or to where you can drag a connector</p> <p>You can also reattach the end of a connector to a different source or target element</p>	<p><a href="#">Change the Source or Target Element</a><sup>[747]</sup></p>
<b>Connector Properties and Commands</b>	<p>You can double-click on a connector to change properties, or right-click to display the context menu containing commands to change connector type and direction</p>	<p><a href="#">Connector Properties</a><sup>[758]</sup></p>

Topic	Detail	See also
	You can also highlight the connectors on a specific element; select the element and press ( L ) - all the connectors issuing from or terminating at that element are highlighted	<a href="#">Change Connector Type</a> <sup>[746]</sup> <a href="#">Reverse Connector</a> <sup>[755]</sup>
<b>Create Connectors Without a Diagram</b>	Sometimes it is useful to create relationships between elements without a diagrammatic representation; you can do this using the Project Browser and the Relationship Matrix	<a href="#">Add Connectors With the Project Browser</a> <sup>[750]</sup> <a href="#">Add Connectors With the Relationship Matrix</a> <sup>[502]</sup>

**Notes:**

- You can reposition a connector by selecting and dragging the connectors as required
- If a connector has source and target roles, you can attach either end of the connector to a specific attribute or operation in the source or target element

**Learn More:**

- [Connect to Element Feature](#)<sup>[744]</sup>

**5.7.2.2 Connect to Element Feature**

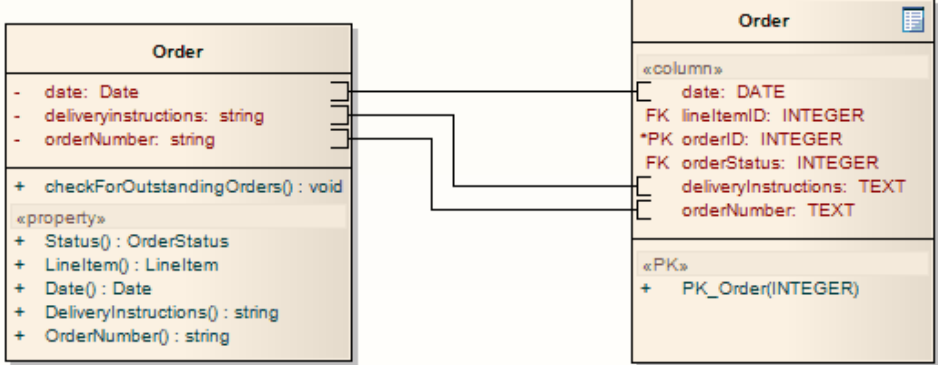

If a connector has source and target roles, you can connect either end of the connector to a specific operation or attribute in the source or target element. This is entirely a visual aid, to indicate which features are significant in the relationship. In code generation or transformation, the link is interpreted as a normal source-element to target-element relationship.

**How to:**

To connect the end of the connector to a specific operation or attribute, follow the steps below:

Step	Action	See also
1	Right-click on the end of the connector joined to the element containing the required feature	
2	Select the <b>Link to Element Feature</b> context menu option The Link to Element Feature dialog displays	
3	In the <b>Feature Type</b> field, click on the drop-down arrow and select the required feature type - <b>Attribute</b> or <b>Operation</b> The attributes or operations from the element are listed in the <b>Feature</b> field	
4	Click on the required attribute or operation, and click on the <b>OK</b> button The end of the connector changes to a bracket next to the selected feature  You might create a number of feature-to-feature relationships between two elements (such as a Class and a Table that represents the Class data) to produce a diagram similar to the following:	

Step	Action	See also
	 <p>You can change the feature to which the connector is attached by following the above procedure and selecting the new feature</p> <p>You can break the link to the selected feature in the following ways:</p> <ul style="list-style-type: none"> <li>• Follow the above procedure, setting the <b>Feature Type</b> to <b>None</b></li> <li>• Delete the attribute or operation from the element</li> <li>• Change the connector type to a type that does not have source and target roles</li> <li>• Change the connector to a different source or target element that does not contain the feature</li> </ul> <p>Note that reversing the direction of the connector does not break the connector's attachment to the feature</p>	

### 5.7.2.3 Add a Note to a Connector

This topic describes how you can connect notes and constraints to graphical relationships.

Notes enable you to provide explanations and further detail for one or more connectors on a diagram, with a visible Note element.

#### How To:

To add a note or constraint to a connector, follow the steps below:

Step	Action	See also
1	Right-click on one of the connectors to attach a note to The context menu displays	
2	Select the <b>Attach Note or Constraint</b> menu option The Link Relations dialog displays	
3	Select the appropriate radio button in the Link Type panel	
4	Check all the connectors that participate in the set	
5	Click on the <b>OK</b> button to complete the note or constraint creation	
6	Use the normal Note dialog to enter the appropriate text for the note or constraint	

**Notes:**

- The constraint note is drawn slightly differently to a regular note, and has { and } automatically added to visually indicate the constraint form
- As an alternative to the procedure above, you can drag the Quick Linker arrow on an existing Note or Constraint, and drag it to the required connector; a Notelink is automatically created to attach the Note or Constraint to the connector

**Learn More:**

- [Quick Linker](#)<sup>[624]</sup>

**5.7.2.4 Arrange Connectors**

Connectors between two elements can be moved around the element borders to create a good layout. There is a limit to how much a connector can be moved around, but generally it is very easy to find an acceptable layout. For the best layouts, use the *custom* line style; this enables you to add as many line points and bends as you require to create a clean and readable diagram.

**How to:**

To move and arrange connectors on a diagram, follow the steps below:

Step	Action	See also
1	Click once on the connector to select it	
2	Holding the mouse button down, move the connector in the required direction	
3	To refine the movement, click and hold very near to one end of the connector; this enables a slightly different movement range	
4	To further refine the movement and range, select either a routed, direct or custom line style; each behaves slightly differently	<a href="#">Connector Styles</a> <sup>[747]</sup>

**5.7.2.5 Change Connector Type****How To:**

To change a connector type, follow the steps below:

Step	Action	See also
1	In the Diagram View, right-click on the connector to change The context menu displays	
2	Select the <b>Connection Detail   Change Type</b> menu option	
3	In the <b>Connector Type</b> field, click on the drop-down arrow and select the required connector type	
4	Click on the <b>OK</b> button to apply changes	

### 5.7.2.6 Change the Source or Target Element

After you have created a connector between two elements, you might later want to change either the source or target. Instead of deleting and re-creating the connector, Enterprise Architect enables you to change the source or target. There are two ways of doing this: using the Set Source and Target dialog or using the mouse.

#### How to:

To change the source or target element of a connector using the Set Source and Target dialog, follow the steps below:

Step	Action	See also
1	Right-click on the connector to open the context menu	
2	Select the <b>Advanced   Set Source and Target</b> menu option The Set Source and Target dialog displays	
3	Click on the drop-down arrows on the <b>From Element</b> and <b>To Element</b> fields, and select the source and target elements	
4	Click on the <b>OK</b> button to apply changes	

To change the source or target element of a connector using the mouse, follow the steps below:

Step	Action	See also
1	Click on the connector and position the cursor over the 'handle' at one end	
2	When the cursor changes, click the mouse and drag the handle to the new element	

#### Notes:

- The connector does not actually move until you release the mouse button over the new source or target element; however:
  - A dotted line shows where the connector would be during the move
  - The solid outline of the nearest element or extension changes to a hatched outline as you move the cursor onto it; this helps you identify where the connector should connect to, if there are many closely-arranged elements, Parts, Ports and other extensions

### 5.7.2.7 Connector Styles

Connectors come in seven different routing styles. Additionally, if one connector crosses another, the second one 'hoops' over the first.

#### Reference:

Style	Description	See also
<b>Direct</b>	A straight line from element A to element B You can move the line (back and forward, up and down) to a	

Style	Description	See also
	limited degree	
<b>Auto Routing</b>	A vertical and horizontal route from A to B with 90-degree bends You can move the line to improve the route, but the location and number of bends are not configurable	
<b>Bezier</b>	A smooth curved line from A to B Bezier style is directly available for Data Flow diagram connectors, Mind Mapping connectors, State Flows, State Transitions, Object Flows, and Control Flows <ul style="list-style-type: none"> <li>You can convert other types of relationship to Bezier style by assigning the Tagged Value <code>_Bezier</code>, with an integer value other than <b>0</b>; however, some relationship types (such as Aggregate) do not accommodate this style very well</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	<a href="#">Connector Properties</a> 758
<b>Custom Line</b>	The most flexible option; you can add one or more line points and bend and push the line into virtually any shape, using the <b>Toggle Line Point at Cursor</b> option	
<b>Tree Style - Vertical</b> <b>Tree Style - Horizontal</b>	A line from element A to B with two right-angle bends, and the end points fixed to selected locations on the elements (Vertical or Horizontal) <ul style="list-style-type: none"> <li>You can convert relationships to Tree Style by assigning the Tagged Value <code>_TreeStyle</code>, with a value of <b>H</b> (Horizontal) or <b>V</b> (Vertical)</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	
<b>Lateral - Vertical</b> <b>Lateral - Horizontal</b>	A line from element A to B with a single right-angle bend, and the end points fixed to selected locations on the elements (Vertical or Horizontal) <ul style="list-style-type: none"> <li>You can convert relationships to Lateral style by assigning the Tagged Value <code>_TreeStyle</code>, with a value of <b>LH</b> (lateral-horizontal) or <b>LV</b> (lateral vertical)</li> <li>This Tagged Value over-rides the value of the <b>Style</b> field in the connector Properties dialog</li> </ul>	
<b>Orthogonal - Square Corner</b> <b>Orthogonal - Rounded Corner</b>	You can add one or more line points and bend and push the line into a variety of shapes, using the <b>Toggle Line Point at Cursor</b> option All line segments thus created are either vertical or horizontal	

**How to:**

To set the connector style, follow the steps below:

Step	Action	See also
1	Right-click on the connector to change The context menu displays	
2	Select the <b>Line Style</b> option	

Step	Action	See also
3	From the submenu, select the required style: <ul style="list-style-type: none"> <li>• <b>Direct</b></li> <li>• <b>Auto Routing</b></li> <li>• <b>Custom</b></li> <li>• <b>Tree</b></li> <li>• <b>Lateral</b></li> <li>• (or <b>Bezier</b>, where appropriate)</li> </ul>	

Alternatively:

Step	Action	See also
1	Select the connector to change	
2	Press the following keys to change the style: <ul style="list-style-type: none"> <li>• ( <b>Ctrl+Shift+D</b> ) for Direct</li> <li>• ( <b>Ctrl+Shift+A</b> ) for Auto Routing</li> <li>• ( <b>Ctrl+Shift+C</b> ) for Custom</li> <li>• ( <b>Ctrl+Shift+Z</b> ) for Bezier (where appropriate)</li> </ul>	

To bend a connector to quickly and easily route connectors in the required layout, follow the steps below:

Step	Action	See also
1	Right-click on the connector The context menu displays	
2	Set the line style to Custom Line ( <b>Ctrl+Shift+C</b> ); this enables the <b>Bend Line at Cursor</b> option in the context menu	
3	Click on the <b>Bend Line at Cursor</b> option to add a line point Right-clicking a line point displays the <b>Straighten Line at Cursor</b> context menu option, which you can use to remove the line point	
4	Using the mouse, drag the line point to the required position	

Alternatively:

Step	Action	See also
1	Hold down ( <b>Ctrl</b> ) or ( <b>Shift</b> ) and click on a point on the connector to create a line point ( <b>Ctrl</b> )+click also removes a line point	
2	Using the mouse, drag the line point to the required position	

To tidy line angles (custom connector), follow the steps below:

Step	Action	See also
1	Right-click on the connector The context menu displays.	
2	Click on the <b>Tidy Line Angles</b> menu option; this nudges the custom line in horizontal and vertical increments, saving you the time of trying to get a good layout manually  You can set the <b>Tidy Line Angles</b> option to operate by default; click on the <b>Tools   Options</b> menu option to display the Options dialog, and select the Diagram Behavior page	

To suppress individual line segments, follow the steps below:

Step	Action	See also
1	Right-click on the connector The context menu displays	
2	Set the line style to Custom Line ( <b>Ctrl+Shift+C</b> ) This enables the <b>Suppress Line Segment</b> option in the context menu	
3	Click on the <b>Suppress Line Segment</b> option to suppress a line between two bend points  The segment you right-clicked on is suppressed	
4	To show the segment again, right-click on the line and click on the <b>Show All Line Segments</b> context menu option  One application for this is to represent the continuation of flow when your diagram crosses the page boundary marker in the Diagram View  When you suppress the line segment that crosses the boundary, the link name (connector properties) displays at both ends of the hidden segment; when you print the diagram on multiple pages, the link name identifies the connection apparently broken by the page boundary	

### 5.7.2.8 Create Connector in Project Browser

You can create a connector from one element to another directly in the Project Browser.

#### How to:

To connect elements from the Project Browser, follow the steps below:

Step	Action	See also
1	In the Project Browser, either:	

	<ul style="list-style-type: none"> <li>Right-click on the element to create a connector for, and select the <b>Add   Create Link</b> context menu option, or</li> <li>Select the element, press ( <b>Insert</b> ) and select the <b>Create Link</b> context menu option</li> </ul> <p>The Create Link dialog displays</p>	
2	In the <b>Direction</b> field, click on the drop-down arrow and select the direction of the new connector ( <b>Outgoing</b> means this element is the source)	
3	In the <b>Link Type</b> field, click on the drop-down arrow and select the type of connector	
4	In the <b>Choose target(s)</b> list, click on the name of the target  (If necessary, in the <b>Select Target Type</b> field click on the drop-down arrow and select a feature to list only elements having that feature)	
5	Click on the <b>OK</b> button to create the connector	

**Notes:**

- You can also reproduce an existing connector between two elements when you paste those elements from the Project Browser into a diagram as instances; an option enables you to copy just the elements, or the relationship as well

**Learn More:**

- [Pasting From the Tree](#)<sup>[578]</sup>

**5.7.2.9 Relationship Visibility**

You can change the visibility of individual connectors or relationships, diagram by diagram.

**Access:** **Diagram | Advanced | Visible Relations ( Ctrl+Shift+I )**

**How To:**

To set relationship visibility, follow the steps below:

Step	Action	See also
1	Open the diagram to change	
2	Select the <b>Visible Relations</b> menu option  The Set Visible Relations dialog displays	
3	Select the checkbox against each list item to show, and clear the checkbox against each item to hide  If you want to display the information in a more readable layout, you can resize the dialog	
4	Click on the <b>OK</b> button to apply the changes	

### 5.7.2.10 Delete Connectors

#### How to:

To delete a connector, follow the steps below:

Step	Action	See also
1	Right-click on the connector The context menu displays	
2	Select the <b>Delete Connector</b> menu option The Remove Connector dialog displays; this dialog provides the options to hide the connector so that it remains functional, or remove the connector completely	
3	Click on the appropriate radio button and click on the <b>OK</b> button If you select the <b>Hide</b> option, it has the same effect as hiding the connector on the Links tab of the source element Properties dialog, or using the <b>Visibility   Hide Connector</b> context menu option It also hides the connector on the Relationships window	<a href="#">Hiding the Connector</a> [753] <a href="#">Relationships</a> [506]

#### Notes:

- The dialog does not display if:
  - You have previously selected the **Don't ask again** checkbox or
  - On the Links page of the Options dialog (**Tools | Options | Links**) the **Prompt on connector deletes** checkbox is not selected
- Selecting the **Don't ask again** checkbox also deselects the **Prompt on connector deletes** checkbox
- Selecting the **Prompt on connector deletes** checkbox restores the dialog if you have used the **Don't ask again** checkbox
- If you hide the dialog, the **Delete Connector** context menu option defaults to the setting you last used on the dialog; make sure that you have selected the right option to default to

### 5.7.2.11 Generalization Sets

A Generalization Set enables you to specify the relationship of a group of Generalizations. Each Generalization is a binary relationship that relates a specific Classifier to a more general Classifier (e.g. from a class to its superclasses). Each Generalization Set defines a particular set of Generalization relationships that describe the way in which a general Classifier (or superclass) can be divided using specific subtypes.

**Access:** **connector context menu | Advanced | Generalization Set | New**

#### How to:

To create a generalization set, follow the steps below

Step	Action	See also
1	Select the <b>New</b> menu option	

	The Generalization Set dialog displays	
2	In the <b>Name</b> field, type the name of the Generalization set; for example, <b>Gender</b>	
3	In the <b>Power Type</b> field, either: <ul style="list-style-type: none"> <li>Type a new power type, or</li> <li>Click on the drop-down arrow or browser button ( ... ) and select an existing one from the Select &lt;Item&gt; dialog</li> </ul>	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>
4	Check the <b>IsMember</b> column for the child subtypes that are part of this Generalization set	

### 5.7.2.12 Hide/Show Connectors

Connectors/relations that appear in multiple diagrams can be selectively shown or hidden. This makes it easier to read diagrams where elements might have many connectors, but not all are relevant in the context of the current diagram.

#### How to:

To hide or show a connector in the current diagram, follow the steps below:

Step	Action	See also
1	Double-click on the required diagram element in the Diagram view The element Properties dialog displays	
2	Select the Links tab This lists the connectors linked to the element, whether or not they are hidden on the diagram	
3	Right-click on the connector to hide or show The context menu displays	
4	Select the <b>Show Relation</b> option to show the hidden connector on the diagram, or the <b>Hide Relation</b> option to hide the visible connector  Alternatively, hide a connector by right-clicking on it on the diagram and selecting the <b>Visibility   Hide Connector</b> context menu option; however, you must use the Links tab of the element Properties dialog to show the relationship again	

To hide or show a connector in other diagrams, follow the steps below:

Step	Action	See also
1	Right-click on the connector in the diagram The context menu displays	
2	Select the <b>Visibility   Hide Connector in Other Diagrams</b> menu option The Set Connector Visibility dialog displays	

Step	Action	See also
3	<p>If the two connected elements have been included in other diagrams, these diagrams are listed here</p> <p>In the list, all diagrams for which the checkbox is selected show the connector; deselect the checkbox for any diagrams in which to hide the connector</p> <p>If you want to display the information in a more readable layout, you can resize the dialog</p> <p>To hide the connector in all of the diagrams listed, click on the <b>Suppress All</b> button</p>	
4	Click on the <b>OK</b> button to save the changes	

**Notes:**

- Certain elements, such as Requirements, do not have a Links tab in the Properties dialog

In these cases, open the Relationships window (**View | Relationships**) for the element, right-click on the relationship in the list and select the context menu option to hide or show that relationship in the diagram

Be aware that, in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions with security on, locks on the diagram and elements can make the required option unavailable

**Learn More:**

- [Relationships](#) <sup>[506]</sup>

**5.7.2.13 Hide/Show Labels****How to:**

To hide or display one or more labels on a connector, follow the steps below:

Step	Action	See also
1	<p>Right-click on the connector</p> <p>The context menu displays</p>	
2	<p>Select the <b>Visibility   Set Label Visibility</b> menu option</p> <p>The Label Visibility dialog displays; if you have several long labels, you can resize this dialog for greater clarity</p>	
3	Select the checkbox against each label to display, and clear the checkbox against each label to hide	
4	Click on the <b>OK</b> button	

### 5.7.2.14 Connector In-place Editing Options

You can edit many of the Enterprise Architect connector labels directly on the diagram. Each label can be bound to a single connector field.

Topic	Detail	See also
<b>Putting a label in Edit Mode</b>	<p>To put a label into Edit mode, either:</p> <ul style="list-style-type: none"> <li>• Select the <b>Edit Label</b> option from the context menu, or</li> <li>• Select a label and press ( <b>F2</b> )</li> </ul> <p>To save the current text to the field, either press ( <b>Return</b> ) or deactivate the Edit window</p> <p>To cancel edit mode without saving any changes, press ( <b>Esc</b> ).</p>	

### 5.7.2.15 Reverse Connector

You can reverse the direction of a connector without having to delete and re-create it. This is helpful if your design changes or you add the connector wrongly to begin with.

#### How To:

Step	Action	See also
1	Right-click on the incorrect connector	
2	Select the <b>Connection Detail   Reverse Direction</b> context menu option	

### 5.7.2.16 Set Association Specializations

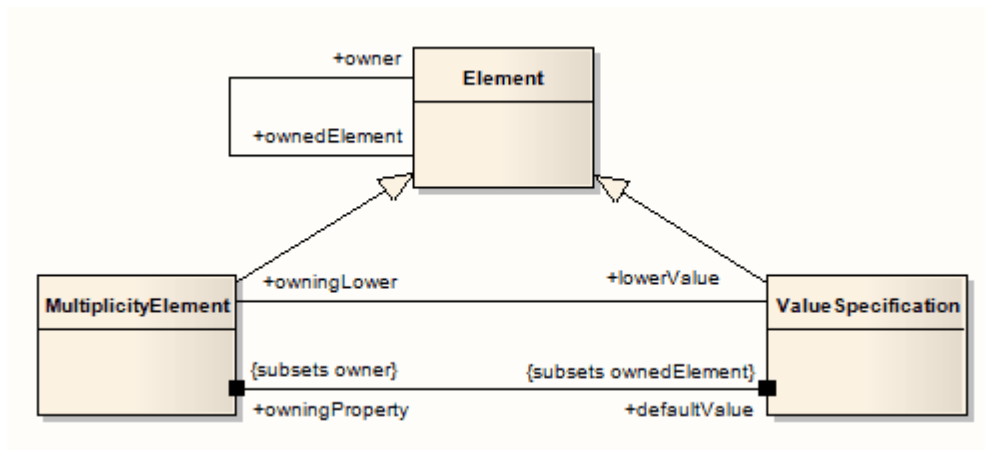

UML enables specialization of properties defined by Associations. Enterprise Architect enables this through the **Specialize Associations** option in the advanced section of the context menu for an Association.

A dialog displays, showing all Associations between the two Classes connected by the current Association and their parents.

The left two columns define the source role of the current Association, while the right two define the target role. With this you are able to select the relationships of each end of the properties listed. When a relationship is set then this is drawn at the corresponding end of the connector on any diagram it appears on.

The dialog displays when you select the **Advanced | Specialize Associations** context menu option on the lowest Association connector in the following diagram.

#### Example:

### 5.7.2.17 Change Sequence Message Scope

A message in a Sequence diagram represents a dynamic interaction from one element to another. Sometimes when you are designing your model you might have to change either the start or end point of a message as the responsibilities of elements change during design. For this reason, Enterprise Architect enables you to change the message scope by setting a new start or end element.

#### How To:

Step	Action	See also
1	Select the message in the Sequence diagram	
2	Right-click on the message to open the context menu	
3	Select <b>Advanced   Set Source and Target</b>	
4	In the pop up dialog, in the <b>From Element</b> and <b>To Element</b> fields, click on the drop-down arrows and select the required elements	
5	Click on the <b>OK</b> button to save changes The message is re-routed to meet your changed requirements	

### 5.7.2.18 Show Uses Arrow Head

By default the *Use* connector in Use Cases has no arrow head.

#### How to:

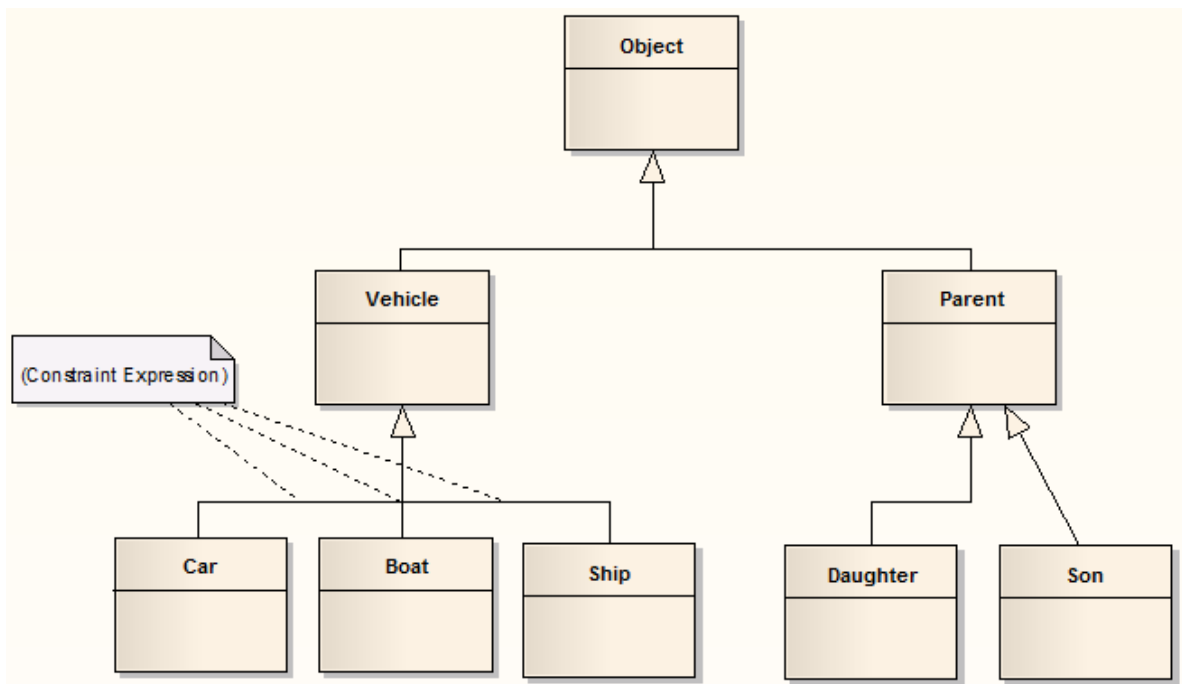

To generate arrow heads on Use connectors, follow the steps below:

Step	Action	See also
1	Select the <b>Tools   Options   Links</b> menu option The Links page of the Options dialog displays	
2	In the General panel, select the <b>Show Uses arrowheads</b> checkbox	

Step	Action	See also
3	Click on the <b>Close</b> button  When you save the Use Case diagram, the Use connectors change to display arrowheads	

### 5.7.2.19 Tree Style Hierarchy

In Enterprise Architect you can create a tree style inheritance diagram using a special form of the *Generalization* connector, as shown below.

#### How To:

To create a tree style connector, follow the steps below

Step	Action	See also
1	Create a normal Generalization between two elements	
2	Right-click on the connector to open the context menu	
3	Select the <b>Line Style   Tree Style - Vertical</b> or the <b>Line Style   Tree Style - Horizontal</b> menu option	
4	Enterprise Architect automatically makes the Generalization layout conform to a specific shape  By adding more Generalization connectors, and checking their Tree Style options, you can achieve the appearance of the diagram above  You can slide the root and child Classes left and right to achieve the required result; Enterprise Architect maintains the conformity of the branch connectors	

To set this style of connector as default, follow the steps below:

Step	Action	See also
1	Select the <b>Tools   Options   Links</b> menu option The Links page of the Options dialog displays.	
2	Select the <b>Generalization link style Default = Tree</b> checkbox to make this branching style the default style for inheritance connectors	

**Notes:**

- In the example diagram, the *Son ->Parent* connector has not yet been put in **Tree Style - Vertical** style
- This style of diagram provides a clearer layout for inheritance hierarchies and is easy to work with

### 5.7.3 Connector Properties

To access the connector Properties dialog, double-click on a connector in a diagram. You can change several characteristics of connectors from this dialog. Many of these characteristics generate text labels on or around the connector. You can change these labels using the **Label** context menu.

The connector Properties dialog has the following pages:

- General (see below)
- Constraints
- Binding
- Source Role
- Target Role
- Tagged Values
- Advanced properties.

The General page enables you to configure the name of the connector, the direction, the line style, the stereotype (optional) and a comment.

**Reference:**

Field	Usage	See also
<b>Source</b>	Indicates in the name of the source element for the connector	
<b>Target</b>	Indicates in the name of the target element for the connector	
<b>Name</b>	(Optional) Indicates a name for the connector; if entered, the name displays on the diagram	
<b>Alias</b>	(Optional) Indicates an alternative name or alias for the connector	
<b>Direction</b>	Select the appropriate direction details: from source to destination, destination to source, or bi-directional  Some connectors have arrow heads that depend on this setting; some connectors are logically dependent on this (such as Inheritance)	
<b>Style</b>	Select the appropriate connection style; choose from: <ul style="list-style-type: none"> <li>• Direct</li> </ul>	

Field	Usage	See also
	<ul style="list-style-type: none"> <li>• Auto-Routing</li> <li>• Bezier</li> <li>• Custom</li> <li>• Tree (Vertical, Horizontal, Lateral Vertical or Lateral Horizontal), or</li> <li>• Orthogonal (Square Corners or Rounded Corners)</li> </ul>	
<b>Stereotype</b>	<p>(Optional) Indicate the name of a stereotype for the connector, or click on the drop-down arrow and select one</p> <p>Alternatively, click on the ( ... ) button and select the stereotype from the Stereotype Selector dialog</p> <p>If entered, the stereotype is displayed on the diagram and overrides the connector type in the RTF documentation</p>	<a href="#">Stereotype Selector</a> <sup>[1019]</sup>
<b>Virtual Inheritance</b>	Indicates that inheritance is virtual; available only for <i>Generalization</i> connectors	
<b>Scope</b>	Select the appropriate value for the scope (used for inheritance); available only for <i>Generalization</i> connectors where the child Class is C++	
<b>Notes</b>	<p>(Optional) Specifies any notes on the connector; the notes are displayed in documentation, if required</p> <p>As for the Notes window, you can format the text using the Notes toolbar at the top of the field</p>	<a href="#">Notes Window</a> <sup>[771]</sup> <a href="#">Notes Toolbar</a> <sup>[772]</sup>

**Notes:**

- Generalize, Realize, Associate and Template Binding connectors also have a Binding page, which enables you to define binding expressions and parameter substitutions for the connector

**Learn More:**

- [Message Scope](#)<sup>[756]</sup>
- [Constraints](#)<sup>[759]</sup>
- [Binding](#)<sup>[760]</sup>
- [Source Role](#)<sup>[760]</sup>
- [Target Role](#)<sup>[762]</sup>
- [Connector Advanced](#)<sup>[763]</sup>
- [Tagged Values](#)<sup>[762]</sup>
- [Template Binding](#)<sup>[1012]</sup>
- [Label](#)<sup>[599]</sup>

**5.7.3.1 Connector Constraints**

A UML connector can also have associated constraints placed on it. Constraints tell us something about the rules and conditions under which a relation operates. For example, it might be a pre-condition that a customer is of a certain type before an Association connector to an Account is allowed.

**How to:**

To set constraints on a connector, follow the steps below:

Step	Action	See also
1	Double-click on a connector to open the Connector Properties dialog	
2	Select the Constraints tab	
3	Fill in details of the constraint(s) that apply and click on the <b>Save</b> button	

**Reference:**

Field	Usage	See also
<b>Constraint</b>	The name of the constraint	
<b>Type</b>	Specifies the type of constraint (such as pre-condition)	
<b>Notes</b>	Indicates notes on the connector	
<b>Defined Constraints</b>	Displays the list of constraints for this connector	

**Notes:**

- Constraints about an Association (connector) can be added to further refine the model; constraints detail the business and operational rules for the model

### 5.7.3.2 Binding

Generalize, Realize, Associate and Template Binding connectors have a Binding tab on their Properties dialog. This enables you to define binding expressions and parameter substitutions for the connector.

**Learn More:**

- [Template Binding](#) <sup>[1012]</sup>
- [Parameter Substitution](#) <sup>[1013]</sup>
- [Parameterized Classes \(Templates\)](#) <sup>[945]</sup>
- [Class Details](#) <sup>[665]</sup>

### 5.7.3.3 Source Role

A connector can have certain properties assigned to one end, and be associated with the particular role that element plays in the relationship. You can enter details about this role to further develop your model.

This description refers to the role of the *Source* element in a relationship, but applies equally to the role of the *Target* element.

**How to:**

To set the source role details, follow the steps below:

Step	Action	See also
1	Double-click on a connector to open the Connector Properties dialog	
2	Select the Source Role tab	

Step	Action	See also
3	Enter the required details and click on the <b>OK</b> button	

**Reference:**

Field	Usage	See also
<b>&lt;Type&gt; Role</b>	Enter the name of the role to be played	
<b>Alias</b>	Enter an alias for the role, if required	
<b>Role Notes</b>	Enter notes about the role	
<b>Derived</b>	Indicate that the role value or values can be computed from other information	
<b>Owned</b>	Indicate that the role is owned by the opposite Class rather than the Association  Selecting this checkbox adds a 'dot' to the appropriate end of the connector (  )	
<b>Derived Union</b>	Indicate that the role is derived from the properties that subset it	
<b>Multiplicity</b>	Specify the role multiplicity (you can define the values of this field on the Cardinality tab of the UML Types dialog)  This is the range of instances of the role that can be active in the relationship - for example, <i>one</i> employee can be assigned to tasks; for the target role you define the range of instances (such as tasks) the employee could be assigned to  The values have the following formats: <ul style="list-style-type: none"> <li>• *, or <b>0..*</b> - zero, one or many instances</li> <li>• <b>0..n</b> - zero or up to n instances, but no more than n</li> <li>• <b>n</b> - exactly n instances</li> <li>• <b>n..*</b> - n, or more than n instances</li> </ul> You can also define source and target element multiplicity in the element Attribute properties	<a href="#">Cardinality</a> [778]  <a href="#">Attribute properties</a> [700]
<b>Ordered</b>	Indicate that the role is a list and the list is ordered	
<b>Allow Duplicates</b>	Indicate that the role can contain duplicate elements (relevant only if multiplicity is > 1)  This field maps to the UML property <i>isUnique</i> (selecting the checkbox maps to the <i>isUnique</i> value of <i>FALSE</i> )	
<b>Containment</b>	Indicate the nature of the containment at the Destination (reference, value...)	
<b>Access</b>	Indicate the access level for the role	
<b>Aggregation</b>	Indicate the type of aggregation that this role uses	
<b>Target Scope</b>	Indicate the level at which this role applies (instance or classifier)	
<b>Navigability</b>	Indicate whether or not this role is navigable (non-navigable ends are shown depending on diagram properties)	

Field	Usage	See also
<b>Changeable</b>	Indicate whether this role is subject to change	
<b>Constraint(s)</b>	Indicate a constraint on the role	
<b>Qualifier(s)</b>	Indicate any qualifiers or restrictions on the role; separate multiple qualifiers with a semi-colon  Alternatively, click on the ( ... ) button at the end of the field, and define a new qualifier on the Qualifiers dialog (qualifiers typed into the <b>Qualifier (s)</b> field are also automatically added to this dialog)	<a href="#">Qualifiers Dialog</a> <sup>[974]</sup>
<b>Stereotype</b>	(Optional) Indicate the name of a stereotype that applies to this end of the Association, or click on the ( ... ) button at the end of the field and select a stereotype from the Stereotype Selector dialog	<a href="#">Stereotype Selector</a> <sup>[1019]</sup>
<b>Member Type</b>	Indicate a role type that can be used when generating collection Classes for multiplicity > 1	

**Notes:**

- Source role details are displayed at the start end of a connector; if you have drawn the connector the wrong way, you can always use the **Reverse Direction** menu option from the connector context menu

**5.7.3.4 Target Role**

A connector can have certain properties assigned to one end, and be associated with the particular role that element can play in the relationship.

You can enter details about this role to further develop your model.

**How to:**

To set the destination role details, follow the steps below:

Step	Action	See also
1	Double-click on a connector to open the Connector Properties dialog	
2	Select the Target Role tab	
3	The details and appearance of this tab are identical to the Source Role tab	<a href="#">Source Role</a> <sup>[760]</sup>

**Notes:**

- Destination role details are displayed at the terminating end of a connector on the diagram

**5.7.3.5 Connector Tagged Values**

The Tagged Values tab of the connector Properties dialog simply provides the Tagged Values window within the frame of the Properties dialog.

You can define Tagged Values for the connector and, on Association and Aggregation connector types, you can set additional Tagged Values for the source and/or target role.

**How to:**

To set Tagged Values for the connector, follow the steps below:

Step	Action	See also
1	On the Properties dialog for the connector, click on the Tagged Values tab	
2	Select the connector type, <b>Connector Source</b> or <b>Connector Target</b> as required	
3	Either click on the <b>New Tags</b> button or press ( <b>Ctrl+N</b> ) The Tagged Value dialog displays	
4	In the <b>Tag</b> field type the tag name and value, or click on the drop-down arrow and select a predefined Tagged Value type	
5	Click on the <b>OK</b> button to save the changes	

**Learn More:**

- [Tagged Values](#) 

**5.7.3.6 Connector Advanced**

The Advanced page displays the advanced properties of the connector (where they exist) and enables you to reset the values of these properties.

**How to:**

To set a value for an advanced (or custom) property, follow the steps below:

Step	Action	See also
1	Click on the data field to the right of the property name	
2	Depending on the property, either: <ul style="list-style-type: none"> <li>• Type the value in free text</li> <li>• Click on the drop-down arrow and select the value from the list</li> <li>• Click on the ( ... ) Browse button and search for the required value</li> </ul>	
3	Click on the <b>OK</b> button	

## 5.8 Tagged Values

### Topics:

Topic	Detail	See also
<b>What is a Tagged Value</b>	<p>Tagged Values are a convenient way of adding additional information to an element, beyond what is directly supported by UML. The UML specification provides the Tagged Value element for just this purpose. Often Tagged Values are used during code generation or by other tools to pass information or operate on elements in particular ways. Tagged Values are the preferred method of extending the code generation capabilities of the modeling tool per element / per language.</p> <p>A Tagged Value, strictly, is the value of a property of a modeling item, the property being called a tag. For example, a Class element called Person might have a tag called Age with the Tagged Value of 42. The combination of tag and value, however, is often referred to as a Tagged Value.</p> <p>Enterprise Architect defines a Tagged Value Type, which constrains the possible values of a tag and can specify how a value is assigned to the tag. For example, the tag Age might have a Tagged Value Type of Integer, so the user simply types in a numeric value. Alternatively, the type could be Spin, with lower and upper limits of, say, 20 and 120, so the user sets a value by clicking on arrows in the field to increment or decrement the value within the limits of 20 and 120.</p> <p>To quickly add Tagged Values to one of more elements, see the Quick Add - Tagged Value to Elements topic.</p>	<a href="#">Tagged Value Type</a> <sup>[777]</sup> <a href="#">Quick Add - Tagged Value to Elements</a> <sup>[765]</sup>
<b>The Tagged Values Window</b>	<p>The Tagged Values window is used to view and modify Tagged Values for the currently selected modeling item, either in the current diagram or in the Project Browser.</p> <p>The Tagged Values window is a dockable window. You can use it to perform the following actions:</p> <ul style="list-style-type: none"> <li>• Assign a Tagged Value to an Item</li> <li>• Modify Tagged Values</li> <li>• Assign Notes to a Tagged Value</li> <li>• Perform advanced tag management</li> </ul> <p>A Technology Developer can also create new structured Tagged Values, reference data Tagged Values and custom Tagged Values from predefined Tagged Value Types.</p>	<a href="#">Assign a Tagged Value to an Item</a> <sup>[766]</sup> <a href="#">Modify Tagged Values</a> <sup>[768]</sup> <a href="#">Assign Notes to a Tagged Value</a> <sup>[767]</sup> <a href="#">Perform Advanced Tag Management</a> <sup>[769]</sup> <a href="#">Custom Tagged Values</a> <sup>[1116]</sup> <a href="#">Tagged Value Types</a> <sup>[1117]</sup>
<b>Model Elements and Features</b>	<p>The following model components can use the Tagged Values window as a convenient way to quickly view and modify Tagged</p>

Component	Description															
<b>Elements</b>	Elements display their own Tagged Values and inherited values.															
<b>Object Instances</b>	Object Instances display owned tags and those inherited from their classifier.															
<b>Ports and Parts</b>	Ports and parts display information similar to the Port/Part 'Type' instead of a classifier. Tags are inherited from parents and other structures of the Ports type.															
<b>Attributes</b>	Include owned Tagged Values and those inherited from type classifiers, with the inclusion of any inherited values.															
<b>Operations</b>	Owned properties only.															
<b>Connectors</b>	Owned properties only.															
Tagged Values Toolbar Buttons	<p>The buttons in the Tagged Values toolbar enable you to add, edit, sort, delete and arrange the Tagged Values of model features</p>  <p>From left to right, the button functions are as follows:</p> <ul style="list-style-type: none"> <li>• The <b>Show in compartments</b> button displays the Tagged Values in element compartments on diagrams</li> <li>• The <b>Sort and Show Alphabetically</b> button sorts the current Tagged Values for the element alphabetically</li> <li>• The <b>New Tagged Value</b> button adds a new tag, to which you assign a value</li> <li>• The <b>Edit Tagged Value Notes</b> button enables you to create notes that explain the purpose of the Tagged Value</li> <li>• The <b>Delete Tagged Value</b> button removes the currently selected Tagged Value</li> <li>• The <b>Default Tagged Value Types</b> button enables quick access to tag definitions created in the Configuration menu</li> <li>• The <b>Tagged Value Options</b> button enables you to show or hide the fully qualified paths for the Tagged Values in the window, and to show duplicate Tagged Values</li> <li>• The <b>Help</b> button displays help relating to use of the Tagged Values window</li> </ul>															

### 5.8.1 Quick Add - Tagged Value To Elements

You can add a Tagged Value to one or more elements with a special shortcut. You can also use the Current Element toolbar. The last button is a shortcut to the **Add Tagged Value** function.

To delete this property you must open the element Properties dialog, go to the Tagged Values tab and

manually delete the item. There is currently no shortcut to delete tags from multiple elements simultaneously.

To add notes to the Tagged Value, go to the Tagged Values tab, click on the Tagged Value name, and click on the **Edit Notes** button in the tab toolbar. The Notes dialog displays.

Any Notes text you enter also displays in the Info section at the bottom of the Tagged Values window.

**Access:** **Add | Tagged Value**

**Use to:**

- Add Tagged values to elements

**How To:**

Step	Action	See also
1	From an element context menu (or the context menu of a multi-selection) choose the <b>Add   Tagged Value</b> menu option  (Alternatively, select one or more elements and press ( <b>Shift+Ctrl+T</b> ) )  The Tagged Values dialog displays, which enables you to enter a Name and Value for the tag	
2	Click on the <b>OK</b> button to add your new Tagged Value to all the currently selected elements	

### 5.8.2 Assign a Tagged Value to an Item

You can assign Tagged Values to several model features.

**Access:** **View | Tagged Value**

**Use to:**

- Assign a Tagged Value to an item

**How To:**

Step	Action	See also
1	Select the model feature to associate with the defined Tagged Value	
2	Ensure that the Tagged Values window is visible (select the <b>View   Tagged Values</b> menu option, or press ( <b>Ctrl+Shift+6</b> ) )  Alternatively, open the Properties dialog for the object and select the Tagged Values tab	
3	Either click on the <b>New Tags</b> button  or press ( <b>Ctrl+N</b> )  The Tagged Value dialog displays	

Step	Action	See also
4	In the <b>Tag</b> field, type the tag name or click on the drop-down arrow and select the appropriate tag to assign to the item	
5	If appropriate, type a specific value for the tag in the <b>Value</b> field	
6	To confirm selection of the Tagged Value, click on the <b>OK</b> button	

#### Learn More

- [Predefined Tagged Value Types](#)<sup>[1111]</sup>
- [Assign Notes to a Tagged Value](#)<sup>[767]</sup>
- [Modify Tagged Values](#)<sup>[768]</sup>
- [Model Elements and Features with Tagged Values](#)<sup>[764]</sup>

### 5.8.3 Assign Notes to a Tagged Value

Once a Tagged Value has been assigned to a model feature, you can add information and notes describing the Tagged Value to the information property of the Tagged Value.

**Access:** **View | Tagged Values** (Ctrl+Shift+6)

#### Use to:

- Assign a note to a Tagged Value

#### How To:

Step	Action	See also
1	Select the <b>Tagged Values</b> menu option The Tagged Values window displays	
2	Click on the model feature for which to edit the Tagged Values Its Tagged Values display in the Tagged Values window	
3	Click on the Tagged Value to add information to	
4	Click on the <b>Edit Tagged Value Notes</b> button or press ( <b>Ctrl+E</b> ) The Tagged Value Note dialog displays	
5	In the <b>Note</b> field, type the information relating to the Tagged Value Click on the <b>OK</b> button The information is displayed in the lower portion of the Tagged Values window whenever the Tagged Value is selected	

#### Learn More:

- [Model Features](#)<sup>[764]</sup>

### 5.8.4 Modify Tagged Values

Once a Tagged Value has been assigned to the model feature it is possible to edit the values from the Tagged Values window.

#### Use to:

- Edit Tagged Values

#### How To:

Step	Action	See also
1	Click on the <b>View   Tagged Values</b> menu option, or press ( <b>Ctrl+Shift+6</b> ) The Tagged Values window displays	
2	Click on the model feature for which to edit the Tagged Values The window shows all of the tags for the selected feature, each with their current value	
3	Edit the fields as appropriate; the information entered can only reflect the value types that have been defined by the tag's Tagged Value Type  There are four types of value field for a Tagged Value: <ul style="list-style-type: none"> <li>• 'Open' fields', in which you can type any appropriate value</li> <li>• 'Drop-down list' fields, where you click on the drop-down arrow to select from a discrete list of possible values such as <b>M</b> or <b>F</b>, or <b>Win</b>, <b>Lose</b> or <b>Draw</b></li> <li>• 'Spin' fields, where you click on up or down arrows in the field to increase or decrease the value within certain limits</li> <li>• 'Further detail' fields, where you click on an ellipsis ( ... ) in the field to display a dialog in which you enter information (such as notes) or indicate a source of further information (such as a classifier)</li> </ul>	<a href="#">Instance Classifier</a> [692]

#### Notes:

- To override a Tagged Value defined in a parent element, edit the value in the from <parentname> compartment of the Tagged Values window

Once this has been done the tag is moved into the selected element's Tagged Values; this does not affect the Tagged Values defined in the parent element

### 5.8.5 Show Duplicate Tags

Tagged Values are by default set to hide duplicate values. This setting is used to facilitate inherited and overridden tag names.

#### How To:

To set the Tagged Values window to show duplicate values, follow the steps below:

Step	Action	See also
1	On the Tagged Values window toolbar, click on the Options icon	

Step	Action	See also
2	Select the <b>Show Duplicate Tags</b> context menu option	

**Alternatively:**

Step	Action	See also
1	Select the <b>Tools   Options</b> menu option The Options dialog displays	
2	From the hierarchical tree, select the <b>Objects</b> item	
3	Select the <b>Show Duplicate Tags</b> checkbox	

**Notes:**

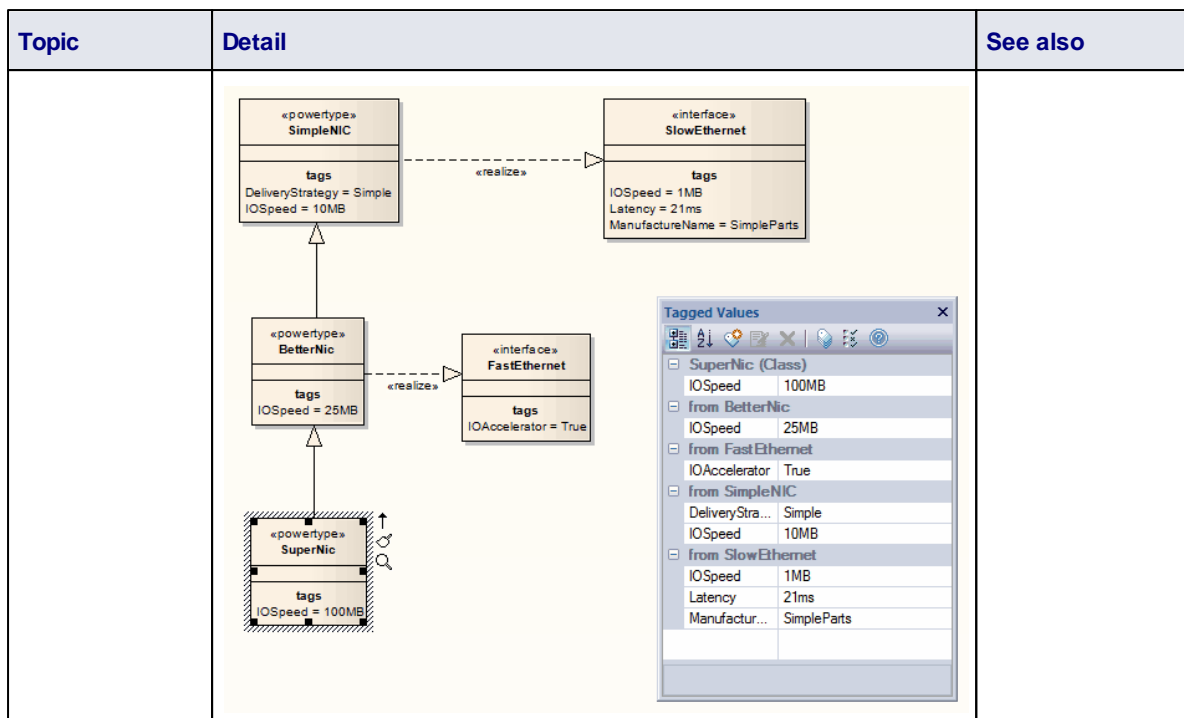

- In either procedure, to hide duplicate values again deselect the option or check box

**5.8.6 Advanced Tag Management**

Tagged Values can also be managed within a type hierarchy and with respect to element instances, using the Tagged Values window.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	Using the Tagged Values window it is possible to: <ul style="list-style-type: none"> <li>• View Tagged Values inherited from parent Classes or realized interfaces or applied stereotypes</li> <li>• Override Tagged Values derived from parents or applied stereotypes with a unique value for the current element</li> <li>• Delete Tagged Values from the current element (if a parent version of the Tagged Value exists, it re-appears in the list after the override is deleted).</li> </ul>	
<b>Tag Hierarchy</b>	The diagram below illustrates a complex tag hierarchy and the way Tagged Values can be either inherited or overridden in specialized Classes to create the final tagged property set for an element.  Note also that a similar concept applies to instances, in which case the full tag set is created from the directly owned tags, plus all of those merged in from the classifier's type hierarchy, additional stereotypes and realized interfaces.	

**Learn More:**

- [Tagged Values](#) <sup>764</sup>

## 5.9 Notes

Notes are the main documentation feature you use to describe an element, diagram, feature or connector; in the documentation that Enterprise Architect generates, notes feature prominently. You can record and view notes on a modeling object using the Notes window.

**Access:** **View | Notes (Ctrl + Shift + 1)**

### Topics:

Topic	Detail	See also
<p><b>Usage</b></p>	<p>You use the Notes window to view and edit the documentation (notes) associated with elements, diagrams, attributes, operations and connectors, either from a diagram or from the Project Browser</p> <p>When you select an element, the note displayed changes to reflect the current selection; if you make changes to notes in this window, they are saved</p> <p>If you want to display the Notes information in a more readable layout, you can resize the window</p> <p>You can also format the notes text using the Notes toolbar at the top of the Notes window</p> <p>You can cut, copy, paste and delete text in the Notes window, or in any <b>Notes</b> or <b>Description</b> field that shows the Notes toolbar, using a right-click context menu; from the context menu, you can also select an option to spell-check a highlighted word</p> <p>You can also edit notes by double-clicking on an element or connector in a diagram or in the Project Browser, to open the Properties dialog; any formatting changes made in one display are reflected in the other</p> <p>On the Testing, Maintenance and Project Management windows, any descriptive, history, input or results text for a selected item is also displayed in the Notes window; you cannot edit this text in the Notes window</p>	<p><a href="#">Notes Toolbar</a><sup>[772]</sup></p>
<p><b>Glossary Entries</b></p>	<p>The Notes window or field also enables you to create a Project Glossary entry from text you have highlighted in the window or field</p> <p>To create the Glossary entry, follow the steps below:</p> <ul style="list-style-type: none"> <li>• Highlight the notes text to use as the Glossary definition (if suitable text is available), and press ( <b>Ctrl+C</b> ) to copy it</li> <li>• Highlight the text to use as the Glossary term, and right-click on it to display the context menu</li> <li>• Select the <b>Create   Glossary Definition</b> menu option; the Glossary Detail dialog displays, with the selected term in the <b>Term</b> field</li> <li>• If you have copied some definition text, paste it into the <b>Meaning</b> field; otherwise type a suitable definition of the term in this field</li> <li>• In the <b>Type</b> field, select the appropriate term type</li> <li>• Click on the <b>Apply</b> button to save the new Glossary</li> </ul>	<p><a href="#">Project Glossary</a><sup>[364]</sup></p> <p><a href="#">Glossary Detail</a><sup>[364]</sup></p>

	<p>definition</p> <p>The term displays in the Notes text as a roll-over hyperlink which, when you move the cursor over it, displays the Glossary definition of the term</p> <p>Having created a glossary definition anywhere else in the model, you can insert the glossary term in the text of the Notes window (or Notes panel of a dialog) as a rollover hyperlink to the definition</p>	
<b>Inserting a Glossary term in a Notes Window</b>	<ul style="list-style-type: none"> <li>• In the <b>Notes</b> window, move the cursor to the point in the text at which to insert the glossary term</li> <li>• Press ( <b>Ctrl+Space</b> ); the glossary term selection list displays</li> <li>• Double-click on the term to insert in the Notes text; the term is inserted as a rollover hyperlink to the definition</li> </ul>	
<b>Additional keyboard shortcuts</b>	<ul style="list-style-type: none"> <li>• Insert Date and Time (<b>F5</b>)</li> <li>• Select line of text (<b>F8</b>)</li> <li>• Spell check Notes text only (<b>F7</b>)</li> <li>• Undo changes ( <b>Ctrl+Z</b> )</li> <li>• Redo changes ( <b>Ctrl+Y</b> ) or ( <b>Ctrl+Shift+Z</b> )</li> <li>• Copy ( <b>Ctrl+C</b> )</li> <li>• Paste ( <b>Ctrl+V</b> )</li> <li>• Cut ( <b>Ctrl+X</b> )</li> </ul> <p>Any Note text appearing in the element Note compartments in diagrams is not formatted</p>	

### 5.9.1 Notes Toolbar

Although it is not an independent toolbar that you can pin to the screen top or sides, or float in your work area, the Notes toolbar appears in many places across Enterprise Architect in the **Notes**, **Description** and **History** fields.

#### Topics:

Topic	Detail	See also
<b>Where the Toolbar Appears</b>	<p>Throughout Enterprise Architect on various tabs and pages of, for example, the:</p> <ul style="list-style-type: none"> <li>• Element and Connector Properties dialogs</li> <li>• Operations and Attributes Properties dialogs</li> <li>• Diagram Properties dialog</li> <li>• Hyperlink Details dialog</li> <li>• Testing window descriptions</li> <li>• Notes window</li> <li>• Glossary Detail dialog</li> <li>• Assigned Resources dialog</li> <li>• Project Management window</li> <li>• Scenarios &amp; Requirements window</li> </ul>	
<b>Options</b>		<p><a href="#">Hyperlinks</a> 1295</p> <p><a href="#">Linked</a></p>

	<p>The options of this toolbar operate on selected text and any new text continuing from the formatting</p> <p>The options (with some keyboard shortcuts) are, from left to right:</p> <ul style="list-style-type: none"><li>• Make text bold ( <b>Ctrl+B</b> )</li><li>• Make text italic ( <b>Ctrl+I</b> )</li><li>• Underline text ( <b>Ctrl+U</b> )</li><li>• Change the font color of the text</li><li>• Insert list bullet points ( <b>Ctrl+.</b> ) (full stop)</li><li>• Insert list numbering ( <b>Ctrl+1</b> )</li><li>• Make text superscript</li><li>• Make text subscript</li><li>• Insert a hyperlink - this displays the Hyperlink Details dialog, on which you specify the type of hyperlink and type in or browse for the location of the target of the hyperlink; you can use full paths or local (path substitution) paths</li><li>• Create a new linked document for the element, or edit an existing one; if the element does not have a linked document, the New Linked Document dialog displays</li></ul>	<a href="#">Documents</a> [732]
--	---	------------------------------------

**Notes:**

- If the toolbar is displayed but grayed out, the text field is read-only and cannot be edited; other long text fields in Enterprise Architect might not have the toolbar, in which case the Notes facility is not available for those fields
- For any Notes text that is displayed on a diagram, you must select the **Render Formatted Notes** checkbox on the Feature Visibility dialog in order to reproduce the formatting
- You can create a Project Glossary term and definition from text in any field that has the Notes toolbar

**Learn More:**

- [Feature Visibility dialog](#) [587]
- [Project Glossary](#) [364]
- [Notes](#) [771]

## 5.10 Reference Data

Reference data is used in many places to provide content for drop-down list boxes. Setting up a project often involves setting up the base set of reference types to use. Reference data options can be set up from the **Settings** menu, including:

- **People**
- **General Types**
- **Maintenance**
- **Metrics and Estimation**
- **UML**
- **Data Types**

Having set up the reference data in a project, you can also export and import it between projects.

### Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Manage Reference Data - Update permission to update and delete reference items.

### Learn More:

- [People](#) <sup>[780]</sup>
- [General Types](#) <sup>[784]</sup>
- [Maintenance](#) <sup>[789]</sup>
- [Metrics and Estimation](#) <sup>[789]</sup>
- [UML](#) <sup>[774]</sup>
- [Data Types](#) <sup>[779]</sup>
- [Export and Import](#) <sup>[237]</sup>
- [Manage Reference Data - Update](#) <sup>[206]</sup>
- [Applying Stereotypes](#) <sup>[1019]</sup>
- [Custom Stereotypes](#) <sup>[1041]</sup>

### 5.10.1 UML Types

The **UML Types** dialog enables you to configure stereotypes, Tagged Value types and the cardinality list for your project.

**Access:** **Settings | UML Types**

### Use to:

- Add, modify and delete stereotypes
- Customize stereotypes appearance
- Updating shape scripts and metafiles associated with Stereotypes
- Create/modify tagged values
- Define cardinality rules

**Learn More:**

- [Stereotypes](#) <sup>[775]</sup>
- [Tagged Value Types](#) <sup>[777]</sup>
- [Cardinality](#) <sup>[778]</sup>

**5.10.1.1 Stereotype Settings**

Enterprise Architect has an extensive set of Standard Element Stereotypes that you can apply to any UML construct. Using the **Stereotypes** tab of the **UML Types** dialog, a Technical Developer can also customize the stereotypes for your project by adding, modifying and deleting them. For information on customizing stereotypes, see Custom Stereotypes.

Stereotypes can be modified to make use of metafiles (image files) or customized colors, or to make use of the Enterprise Architect Shape Scripts to make new element shapes to determine the shape and dimensions of the element.

**Access:** **Settings | UML Types > Stereotypes**

**Use to:**

- Add, modify and delete stereotypes
- Customize stereotypes appearance
- Updating shape scripts and metafiles associated with Stereotypes

**Reference:**

Field	Usage	See also
<b>Stereotype</b>	Specify the name of the stereotype.	
<b>Group name</b>	Enable grouping of stereotype features by a plural name, for attributes and operations, which is shown on diagrams in the attribute and operations compartments.	
<b>Base Class</b>	Enable the stereotyped element to inherit the base characteristics from a pre-existing element type.	
<b>Notes</b>	Indicates any notes concerning the stereotype (not the elements to which the stereotype is to be applied).	
<b>None</b>	Switch to the default element appearance.	
<b>Metafile</b>	Enable an image file to be used for the appearance of the stereotype.	
<b>Shape Script</b>	Specify custom shapes for the stereotype using the Enterprise Architect Shape Scripting language. For more information see the Shape Scripts topic.	<a href="#">Shape Scripts</a> <sup>[1097]</sup>
<b>Assign</b>	Add the associated metafile or Shape Script from the stereotyped element.	
<b>Remove</b>	Remove the associated metafile or Shape Script from the stereotyped element.	
<b>Fill</b>	Set the default background color of the element.	

Field	Usage	See also
<b>Border</b>	Control the border color.	
<b>Font</b>	Control the color of the stereotype font.	
<b>Reset</b>	Reset the appearance of the element to the default element appearance.	
<b>Preview</b>	Provides a visual representation of the currently active Stereotype.	
<b>New</b>	Enables a new stereotype to be created.	
<b>Save</b>	Saves the Stereotype details and adds the Stereotype to the Defined Stereotypes list.	
<b>Delete</b>	Removes a Stereotype from the Defined Stereotypes list.	

**Learn More:**

- [Standard Element Stereotypes](#) <sup>[102]</sup>
- [Applying Stereotypes](#) <sup>[1019]</sup>
- [Custom Stereotypes](#) <sup>[104]</sup>

#### 5.10.1.1.1 Shape Editor

The **Shape Editor** enables a Technology Developer to specify custom shapes via a scripting language; that is, to create *Shape Scripts*. These custom shapes are drawn instead of the standard UML notation. Each script is associated with a particular Stereotype, and is drawn for every element of that stereotype.

**Access:** [Settings](#) | [UML Types > Stereotypes : Assign](#)

**Use to:**

- Create a custom shape

**Reference:**

Field	Usage	See also
<b>Format</b>	The format in which the script is written.	
<b>Import</b>	Opens a Windows browser dialog, allowing for a script file to be loaded.	
<b>Export</b>	Opens a Windows browser dialog, allowing for a script file to be saved.	
<b>Edit window</b>	The area in which a script can be written.	
<b>Preview of main</b>	A visual representation of the compiled script. Nothing displays until the <b>Refresh</b> button is clicked.	
<b>Next Shape</b>	If a composite shape is defined within the <b>Edit Window</b> , clicking on the <b>Next Shape</b> button pages through the components of the shape.	

<b>Refresh</b>	Parses your script and produces a visual example of the shape in the <b>Preview of main</b> window.	
<b>OK</b>	Exit from the Shape Editor; don't forget to save your scripts from the <b>Stereotype</b> tab.	<a href="#">Getting Started With Shape Scripts</a> <sup>[1093]</sup>

**Notes:**

- Shape Scripts adopt the same color gradient settings as normal elements, as defined in the **Standard Colors** page of the **Options** dialog
- If an element's appearance is modified by a Shape Script, many of the Advanced context menu options for that element are disabled
- Once you have finishing writing your Shape Script, click on the **OK** button. To save the Shape Script you must click on the **Stereotypes** tab

**Learn More:**

- [Writing Scripts](#) <sup>[1093]</sup>
- [Advanced Settings](#) <sup>[651]</sup>

**5.10.1.2 Tagged Value Types**

Tagged Values are used in a variety of places within Enterprise Architect to specify additional information about an element or connector. The Tagged Value Types tab of the UML Types dialog enables a Technology Developer to rapidly create Tagged Values, using a range of predefined structured Tagged Values to create structured tags that adhere to a specific format. For example, for model features that use the predefined tag Boolean you can use the Tagged Values window to assign a value of *True* or *False* and no other value.

You can also add default Tagged Value names and create predefined reference data Tagged Value types and custom masked Tagged Value types.

Any Tagged Value names created display in the drop-down lists of Tagged Value names in the Tagged Value dialogs for elements, operations and attributes.

**Access:** **Settings | UML Types > Tagged Value Types**

**Use to:**

- Create new tagged values

**Reference:**

Field	Usage	See also
<b>Tag Name</b>	Type the new name of the Tagged Value.	
<b>Description</b>	Type a description of the Tagged Value.	
<b>Detail</b>	Type any additional information necessary.	
<b>New</b>	Click to begin creating a new Tagged Value.	
<b>Save</b>	Click to save the details of a Tagged Value.	
<b>Delete</b>	Click to delete a Tagged Value from the <b>Defined Tag Types</b> list.	

Field	Usage	See also
Defined Tag Types	A list of previously defined Tagged Values.	

**Notes:**

- You can transport these Tagged Value Type definitions between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu. Tagged Value Types are exported as *Property Types*

**Learn More:**

- [Predefined Structured Tagged Values](#) <sup>[1111]</sup>
- [Create Structured Tags](#) <sup>[1114]</sup>
- [Predefined Reference Data Tagged Value Types](#) <sup>[1115]</sup>
- [Custom Masked Tagged Value Types](#) <sup>[1116]</sup>
- [Tagged Values Window](#) <sup>[764]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

**5.10.1.3 Cardinality**

The **Cardinality Values** tab of the **UML Types** dialog enables you to add, modify and delete values in the default cardinality list.

The cardinality values are used to define the multiplicity of source and target elements in relationships. This is the range of instances of the role that can be active in the relationship; for example, one employee can be assigned to tasks; for the target role you define the range of instances (such as tasks) the employee could be assigned to.

The cardinality values are also used to define the multiplicity of a Classifying element; that is, the number of instances of the element that can exist. For example, the Class element *Building Walls* might have a multiplicity of 2..n, meaning that at least two walls must exist (to support the roof) but there can be many walls if the building design required it.

The values have the following formats:

- \***, or **0..\*** - zero, one or many instances
- 0..n** - zero or up to n instances, but no more than n
- n** - exactly n instances
- n..\*** - n, or more than n instances.

**Access:** **Settings | UML Types > Cardinality Values**

**Use to:**

- Create Cardinality values

**Reference:**

Field	Usage	See also
Cardinality	Type the new name of the Cardinality Value.	

Field	Usage	See also
<b>New</b>	Type a description of the Cardinality Value.	
<b>Save</b>	Saves the Cardinality value and adds it to the <b>Cardinality List</b> .	
<b>Delete</b>	Deletes a Cardinality value from the <b>Cardinality List</b> .	
<b>Cardinality List</b>	A list of already defined Cardinality values.	

**Notes:**

- You can transport these cardinality values between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>
- [Source Role](#)<sup>[760]</sup>
- [Destination Role](#)<sup>[762]</sup>

**5.10.1.4 Data Types**

Different programming languages support different inbuilt data types. The **Programming Languages Datatypes** dialog enables you to extend and manage the set of inbuilt data types associated with a language as well as create new programming languages for use within Enterprise Architect.

**Access:** **Settings > Code Datatypes**

**Use to:**

- Create new programming languages to use within Enterprise Architect
- Extend and manage inbuilt data types

**Reference:**

Field	Usage	See also
<b>Product Name</b>	Specify the name of the programming language.	
<b>Add Product</b>	Add a new programming language to the drop-down fields for Class elements within the Enterprise Architect model and enable the new language to be made available to the Code Template Editor once at least one datatype has been added to the language.	<a href="#">Code Template Editor</a> <sup>[149]</sup>
<b>Datatype</b>	Specify the name of the datatype; this is the language-specific name of the datatype.	
<b>Common Type</b>	Specify the common type, the generic name of the datatype; for example, the Java <i>boolean</i> datatype has a common datatype <i>Boolean</i> .	
<b>New</b>	Create a new data type.	
<b>Save</b>	Save the newly created datatype.	

Field	Usage	See also
Delete	Delete the selected datatype.	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Configure Datatypes permission to update and delete data types
- You can delete data types that you have defined, but you cannot delete any of the predefined data types
- You can transport these data types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>
- [Permission List](#)<sup>[760]</sup>

## 5.10.2 People

**Access:** **Settings | Project Types | People**

**Use to:**

- Maintain Authors involved within a project
- Define role types that are captured within Enterprise Architect
- Record information on project resources
- Capture client details associated with the current model

**Learn More:**

- [Project Authors](#)<sup>[780]</sup>
- [Project Roles](#)<sup>[782]</sup>
- [Project Resources](#)<sup>[783]</sup>
- [Project Clients](#)<sup>[784]</sup>

### 5.10.2.1 Project Authors

You can define the people who are working on a project, such as the authors of specific elements.

**Access:** **Settings | Project Types | People > Project Authors(s)**

**Use to:**

- Maintain Authors involved within a project

**Reference:**

Field	Usage	See also
Name(s)	Specifies the name of the person registered as a Project Author.	<a href="#">Select Users</a> <sup>[781]</sup>

	<p>If you are using a Windows Active Directory, you can select names from the directory. Click on the ( ... ) (Browse) button to display the Select Users dialog.</p> <p>You can also indicate a list of names separated by semi-colons. This enables you to define a group of people sharing a role, such as a team of Developers, Testers or Analysts. Do not leave any spaces between the names and the semicolon.</p>	
<b>Role</b>	<p>Specifies the role the Project Author plays in the project (such as Designer, Analyst, or Architect).</p> <p>You can specify a role name or click on the drop-down arrow and select a role defined through the Project Roles tab.</p>	<a href="#">Project Roles</a> <sup>[782]</sup>
<b>Notes</b>	Specify any additional notes concerning the Project Author.	
<b>New</b>	Add further Authors.	
<b>Save</b>	Add the new Author to the Defined Authors list.	
<b>Delete</b>	Removes an Author from the Defined Authors list.	
<b>Defined Authors</b>	Review the Project Authors already defined.	

**Notes:**

- If you enter multiple names, Enterprise Architect adds them separately and in alphabetical order to the **Defined Authors** list. If you then click on one of these names, Enterprise Architect displays that name only in the **Name(s)** field
- If you type a role, this is not added to the roles or the **Project Roles** tab
- You can transport these author definitions between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**5.10.2.1.1 Select Users**

If your company is using a Windows Active Directory, you can select the Project Author names from the local or corporate-wide directory.

**Access:** **Settings | Project Types | People > Project Authors(s) : (...)**

**Use to:**

- Select Project Authors from a Windows Active Directory directory

**Reference:**

Field	Usage	See also
<b>Object Types...</b>	Opens the Object Types dialog, this dialog provides a choice of object types that can be used.	

<b>Locations...</b>	Defines the root location from which to begin a search.	
<b>Check Names</b>	Matches object names listed in the <b>Enter the object name to select</b> section	
<b>Enter the object names to select</b>	Specify object names to search for.	
<b>Advanced...</b>	Opens the Advanced dialog to provide further search options. For more information on this dialog, please refer to Windows Help and Support	

**Notes:**

- Multiple Entries can be typed into the **Enter the object names to select** section, ensure that each object is separated with a semicolon (Example: Name01; Name02)

**5.10.2.2 Project Roles**

People associated with a project play a *role* in analysis, design or implementation, such as Application Analyst, Architect, Developer and Project Manager. Project roles define the activities that resources can undertake.

**Access:** [Settings](#) | [Project Types](#) | [People](#) > [Project Roles](#)

**Use to:**

- Define role types that are captured within Enterprise Architect

**Reference:**

Field	Usage	See also
<b>Role</b>	Indicates the name of the role.	
<b>Description</b>	Indicates a description of the role.	
<b>Notes</b>	Specifies any additional information related to the role.	
<b>New</b>	Add further Roles.	
<b>Save</b>	Add the new role to the Defined Roles list.	
<b>Delete</b>	Removes a role from the Defined Role list.	
<b>Defined Roles</b>	Review the Project Roles already defined.  The Defined Roles list is available for selection for any element in the model; for example, you can select roles on the Project Authors tab of the People dialog, and the Resource Allocation tab of the Project Management window. You can also specify other roles on these dialogs, but such roles are not added to the Defined Roles list.	<a href="#">Project Authors</a> <sup>1780</sup> , <a href="#">Resource Allocation</a> <sup>135</sup>

**Notes:**

- Deleting a role has no effect on any Project Author definition having this role; the deleted role becomes a simple text entry in the Project Author definition

- You can transport these role definitions between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 5.10.2.3 Project Resources

*Resources* are, for example, project authors, analysts, programmers and architects. That is, anyone who might work on the system over time, either adding to the model or programming and designing elements of the system outside Enterprise Architect.

**Access:** **Settings | Project Types | People > Project Resources**

**Use to:**

- Record information on project resources

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates the name of the person listed as a resource. The resource name is available for use in Resource Management.	<a href="#">Resource Management</a> <sup>[351]</sup>
<b>Organization</b>	Indicates the name of the organization employing the resource.	
<b>Role(s)</b>	Indicates the role the resource plays in the project (for example, Designer, Analyst, Architect).	
<b>Phone 1, Phone 2, Mobile, Fax</b>	Indicates the contact telephone numbers for the resource.	
<b>Email</b>	Indicates the email address for the resource.	
<b>Notes</b>	Indicates any additional notes on the resource.	
<b>Available Resources</b>	Review resources that have already been defined.	
<b>New</b>	Adds further resources.	
<b>Save</b>	Adds a new resource to the Available Resource list.	
<b>Delete</b>	Deletes a resource from the Available Resources list.	

**Notes:**

- You can transport these resource definitions between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>

- [Import Reference Data](#)<sup>[240]</sup>

### 5.10.2.4 Project Clients

*Project clients* are the eventual owners of the software system.

**Access:** [Settings](#) | [Project Types](#) | [People](#) > [Project Clients](#)

**Use to:**

- Capture client details associated with the current model

**Reference:**

Field	Usage	See also
<b>Name</b>	Indicates the name of the client.	
<b>Organization</b>	Indicates the name of the organization that employs the client.	
<b>Role(s)</b>	Indicates the role the client plays in the project (for example, Manager, Sponsor).	
<b>Phone 1, Phone 2, Mobile, Fax</b>	Indicates the contact telephone numbers for the client.	
<b>Email</b>	Indicates the email address of the client.	
<b>Notes</b>	Indicates any additional notes on the client.	
<b>Defined Clients</b>	Review clients that have already been defined.	
<b>New</b>	Adds details of further clients.	
<b>Save</b>	Adds a new client to the Defined Client list.	
<b>Delete</b>	Deletes a client record from the Defined Client list.	

**Notes:**

- You can transport these client definitions between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 5.10.3 General Types

The General Types dialog enables you to configure:

- Status Types
- Constraint Types
- Constraint Status Types
- Requirement Types

- Scenario Types

**Access:** [Settings](#) | [Project Types](#) | [General Types](#)

**Learn More:**

- [Status Types](#) <sup>[785]</sup>
- [Constraint Types](#) <sup>[786]</sup>
- [Constraint Status Types](#) <sup>[787]</sup>
- [Requirement Types](#) <sup>[787]</sup>
- [Scenario Types](#) <sup>[788]</sup>

### 5.10.3.1 Status Types

You can configure a basic list of status types used in Enterprise Architect. Note that whilst most dialogs use this list, not all do so.

**Access:** [Settings](#) | [Project Types](#) | [General Types](#) > [Status](#)

**Use to:**

- Configure Status Types

**Reference:**

Field	Usage	See also
<b>Status</b>	Indicates the name of the status.	
<b>Description</b>	Indicate a short description for the status.	
<b>Status Type Color</b>	Enables a color to be applied to a Status Type.	
<b>Preview</b>	Provides a visual representation of a Status.	
<b>Restore Default</b>	Restores the Status Type Color to it's default.	
<b>Applies to...</b>	By default, status colors only apply to Requirement, Issue and Change elements. You might decide to also apply these colors to other UML elements, such as Use Cases or Classes. To do this, click on the <b>Applies to...</b> button and select the checkbox against each required element type in the <b>Applied Status Colors</b> list.	<a href="#">Requirement</a> <sup>[1157]</sup> , <a href="#">Issue</a> <sup>[1731]</sup> <a href="#">Change</a> <sup>[1733]</sup>
<b>New</b>	Creates a new status.	
<b>Save</b>	Saves the status, adds the status to the status list.	
<b>Delete</b>	Deletes a status that has been highlighted.	
<b>Type List</b>	This list details the current status types and descriptions for each status.	

**Notes:**

- You can transport the status types (and the colors assigned to status types) between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export**

menu

- To ensure status colors display on your diagrams, open the Options dialog at the Objects page and select the Show status colors on diagrams checkbox
- Requirement, Feature, Issue and Change elements have a status color compartment, but other elements do not. The status color for these elements is applied to the element shadow. Therefore, on the Options dialog Diagram Appearance page you must also select the Element Shadows on checkbox

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>
- [Object Appearance](#)<sup>[434]</sup>
- [Diagram Appearance](#)<sup>[429]</sup>

### 5.10.3.2 Constraint Types

The **Constraint** tab of the **General Types** dialog enables you to define constraints. These are picked up in a variety of places where constraints might fall into more categories than the basic (default) *Pre-*, *Post-* and *Invariant* conditions.

**Access:** **Settings | Project Types | General Types > Constraint**

**Use to:**

- Allows for definition of constraints

**Reference:**

Field	Usage	See also
<b>Constraint</b>	Indicates the name of the constraint.	
<b>Description</b>	Indicates a brief description of the constraint.	
<b>Note</b>	Indicates any additional information required.	
<b>Defined Constraint Type</b>	A list of defined constraint types.	
<b>New</b>	Add a new constraint.	
<b>Save</b>	Saves the constraint and adds it to the Defined Constraint Type list.	
<b>Delete</b>	Removes a constraint from the Defined Constraint Type list.	

**Notes:**

- You can transport these constraints between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 5.10.3.3 Constraint Status Types

You can configure the basic list of *constraint status types* used in Enterprise Architect.

**Access:** [Settings](#) | [Project Types](#) | [General Types](#) > [Constraint Status](#)

**Use to:**

- Allows for configuration of basic constraint status types

**Reference:**

Field	Usage	See also
Status	Indicates the name of the constraint status.	
Status List	A list of defined constraint types.	
New	Add a new constraint status.	
Save	Saves the constraint status and adds it to the Status list.	
Delete	Removes a constraint status from the Status list.	

**Notes:**

- You can transport these constraint status types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 5.10.3.4 Requirement Types

The **Requirement** tab of the **General Types** dialog enables you to specify the generic set of requirement types that can be entered into the requirements sections of dialogs. This helps to maintain a single set of typed requirements.

**Access:** [Settings](#) | [Project Types](#) | [General Types](#) > [Requirement](#)

**Use to:**

- Specify the generic set of requirement types

**Reference:**

Field	Usage	See also
Requirement	Indicates the name of the requirement.	
Description	Indicates a short description of the requirement.	

<b>Weight</b>	Indicates a weighting to apply to the requirement type.	
<b>Defined Requirement Types</b>	Displays all of the pre-defined and saved requirement types.	
<b>New</b>	Add a new requirement.	
<b>Save</b>	Saves the requirement details and adds it to the Defined Requirement Types list.	
<b>Delete</b>	Deletes a requirement from the Defined Requirement Types list.	

**Notes:**

- You can transport these requirement types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**5.10.3.5 Scenario Types**

A drop-down list of scenario types is available in the Scenario tab of an element Properties dialog, with the standard types *Basic Path*, *Exception* and *Alternate Flow*. You can set additional scenario types using the Scenario tab the General Types dialog.

**Access:** **Settings | Project Types | General Types > Scenario**

**Use to:**

- Add additional Scenario Types

**Reference:**

<b>Field</b>	<b>Usage</b>	<b>See also</b>
<b>Scenario Type</b>	Indicates the name of the scenario.	
<b>Description</b>	Indicates a short description of the scenario.	
<b>Weight</b>	Indicates a weighting to apply to the scenario type.	
<b>Note</b>	Indicates any additional information on the scenario type.	
<b>Defined Scenario Types</b>	Displays all of the pre-defined and saved scenario types.	
<b>New</b>	Add a new scenario.	
<b>Save</b>	Saves the scenario details and adds it to the Defined Scenario Types list.	
<b>Delete</b>	Deletes a scenario from the Defined Scenario Types list.	

**Notes:**

- You can transport these scenario types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu

**Learn More:**

- [Scenarios](#) <sup>[669]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

### 5.10.3.6 Metrics and Estimation

TCF values, EFC values and Default Hour Rate for a project are controlled from the **Estimation Factors** dialog.

Risk, metric and effort types for a project are controlled from the **Project Indicators** dialog.

For further information on these see the [Project Management](#) <sup>[348]</sup> and [Resource Management](#) <sup>[350]</sup> topics, or specifically:

- [Technical Complexity Factors](#) <sup>[403]</sup>
- [Environment Complexity Factors](#) <sup>[404]</sup>
- [Default Hours](#) <sup>[406]</sup>
- [Effort Types](#) <sup>[355]</sup>
- [Metric Types](#) <sup>[356]</sup>
- [Risk Types](#) <sup>[357]</sup>

### 5.10.4 Maintenance

**Access:** **Settings | Project Types | Maintenance**

**Use to:**

- Set the base Problem Types that are handled

**Learn More:**

- [Testing Types](#) <sup>[790]</sup>

#### 5.10.4.1 Problem Types

**NOT CURRENTLY USED**

For the maintenance and change control screens, you can use the **Maintenance** dialog to set the base *Problem Types* that are handled. Examples are hardware-related issues, performance problems, software bugs and network problems.

**Access:** **Settings | Project Types | Maintenance > Problem Types**

**Use to:**

- Set the base Problem Types that are handled

Reference:

Field	Usage	See also
<b>Problem Type</b>	Indicates the name of the problem type.	
<b>Description</b>	Indicates a short description of the problem type.	
<b>Weight</b>	Indicates a weighting to apply to the problem type.	
<b>Note</b>	Indicates any additional information on the problem type.	
<b>Defined Types</b>	Displays all of the pre-defined and saved problem types.	
<b>New</b>	Add a new problem type.	
<b>Save</b>	Saves the scenario details and adds it to the Defined Types list.	
<b>Delete</b>	Deletes a scenario from the Defined Types list.	

Notes:

- You can transport these problem types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu
- You transport the problem types together with test types as a *Maintenance Types* file

Learn More:

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**5.10.4.2 Testing Types**

Use the **Test Types** tab of the **Maintenance** dialog to add testing types to the basic set that comes with Enterprise Architect. Typical test types are load tests, performance tests and function tests.

**Access:** **Settings | Project Types | Maintenance > Test Types**

Use to:

- Add Testing Types

Reference:

Field	Usage	See also
<b>Test Type</b>	Type the name of the test type.	
<b>Description</b>	Type a short description of the test type.	
<b>Weight</b>	Type a weighting to apply to the test type.	
<b>Note</b>	Type any additional information on the test type.	
<b>Defined Types</b>	Displays all of the pre-defined and saved test types.	

<b>New</b>	Add a new test type.	
<b>Save</b>	Saves the scenario details and adds it to the Defined Types list.	
<b>Delete</b>	Deletes a scenario from the Defined Types list.	

**Notes:**

- You can transport these test types between models, using the Export Reference Data and Import Reference Data options on the **Project | Model Import/Export** menu
- You can either export the test types together with the default problem types, as a *Maintenance Types* file, or separately as a *Test Types* file

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**5.10.5 Resources**

The **Resources** window displays a tree of MDG Technologies, Templates, Documents, UML Profiles and Patterns, commonly-used model elements and Matrix profiles. This view provides useful shortcuts and re-use functions that you can use to add stock elements to the current model, and patterns and elements for additional information.

**Access:** [View | More Project Tools > Project Resources](#)

**Use to:**

- Add Stock elements to the current model
- Add patterns and elements

**Reference:**

Field	Usage	See also
<b>MDG Technologies</b>	Provides a convenient way to insert complex new elements and features without having to retype or reconfigure each element.	<a href="#">MDG Technologies</a> <sup>[1033]</sup>
<b>Templates</b>	Provides a range of templates for creating HTML (web) reports, RTF reports in either the legacy report generator or the extended RTF report generator, linked documents and MDG Technology reports; you can create, edit, copy and delete your own templates, and view and copy system-supplied or technology-supplied templates using context menu options.	<a href="#">HTML (web)</a> <sup>[1819]</sup> , <a href="#">RTF</a> <sup>[1738]</sup> , <a href="#">legacy report generator</a> <sup>[1807]</sup> , <a href="#">Extended RTF report generator</a> <sup>[1739]</sup> , <a href="#">linked documents</a> <sup>[731]</sup>
<b>Documents</b>	Provides a shortcut to saved RTF documents.	
<b>Matrix Profiles</b>	Provides quick access to saved Relationship Matrix profiles; double-click on a profile to load the matrix with the saved settings and source-target packages.	
<b>Favorites</b>	Provides a shortcut to elements that you configure as a shortcut	
<b>Stylesheets</b>	Enables you to import XSL Style sheets, which are then available in	

Field	Usage	See also
	the drop-down list on the XML Export dialog.	
<b>UML Profiles</b>	Provides a convenient way to insert complex new elements and features without having to retype or reconfigure each element.	<a href="#">UML Profiles</a> <sup>[1028]</sup>
<b>UML Patterns</b>	Provides a convenient way to insert complex new elements and features without having to retype or reconfigure each element.	<a href="#">UML Patterns</a> <sup>[1023]</sup>

**Notes:**

- In the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Configure Resources** permission to maintain Resources window items
- From release 7.5 of Enterprise Architect, a method of importing MDG Technologies into the Resources window is available but *Not Recommended*. However, you might previously have imported Technologies into the Resources window, and these are still available until you specifically delete them (right-click on the Technology and select the **Delete Technology** context menu option). The preferred method of making MDG Technologies available to your users is to import them into the % APPDATA% folder.
- You can also synchronize the Tagged Values and constraints for any elements created from a profile element in the Resources window
- To add a document to the shortcut list, select the **Project | Documentation | Rich Text Format (RTF) Report** menu option. Once you have defined your document click on the **Resource Document** button and type in a name. The document name then displays in the **Resources** window. By right-clicking on the document name you can regenerate documents individually or as a batch, or open them directly from Enterprise Architect
- If you select a style sheet on export, Enterprise Architect applies that style sheet to the XML generated before saving to file. This makes it convenient to generate other forms of output from the base XML content. Combined with UML Profiles, this is a powerful means of extending Enterprise Architect to generate almost any content required

**Learn More:**

- [Permission List](#) <sup>[206]</sup>
- [Importing MDG Technologies](#) <sup>[1037]</sup>
- [Synchronize Tagged Values and Constraints](#) <sup>[1031]</sup>
- [Resource Documents](#) <sup>[1744]</sup>

**5.10.5.1 Favorites**

The **Resources** window contains a *Favorites* folder. Here you can hyperlink to any UML element from the model as a whole, and conveniently drag and drop instances or links to this element into other diagrams. This is particularly useful where certain elements - such as the list of Actors in a system - are re-used again and again, and switching to the *Actors* folder is not convenient. In cases like this, using the Favorites folder makes managing and creating your model much easier.

**Topics:**

Topic	Detail	See also
<b>Add to the Favorites Folder</b>	To add an element to the Favorites folder: <ul style="list-style-type: none"><li>• In a diagram, right-click on the element to add</li><li>• From the context menu select the Find   Add to Favorites option</li><li>• Switch back to the Resources window and check the Favorites folder; the new element should be listed in its category within the favorites</li></ul>	
<b>Delete from the Favorites Folder</b>	To delete a favorite: <ul style="list-style-type: none"><li>• Right-click on it within the Favorites folder in the Resources window</li><li>• Select Delete Favorite from the context menu</li><li>• Confirm the action by clicking on the Yes button</li></ul>	
<b>View Properties of a Favorite</b>	To view a favorite's properties from the Favorites folder: <ul style="list-style-type: none"><li>• Select and right-click on the favorite in the Resources window</li><li>• Select Element Properties from the context menu</li></ul>

## 6 Standard UML Models

This topic provides an introduction to Enterprise Architect's diagrams, elements and connectors, and its modeling process.

It also illustrates its alignment to the Unified Modeling Language (UML) 2.3, an open modeling standard, defined and maintained by the Object Management Group.

Topic	Detail	See also
<b>The Unified Modeling Language (UML)</b>	<p>The UML standard defines notations and rules for specifying business and software systems; the notation supplies a rich set of graphic elements for modeling object oriented systems, and the rules state how those elements can be connected and used</p> <p>UML is not a tool for creating software systems; instead, it is a visual language for communicating, modeling, specifying and defining systems</p> <p>UML is not a prescriptive process for modeling software systems; it does not supply a method or process, simply the language. You can therefore use UML in a variety of ways to specify and develop your software engineering project</p> <p>This language is designed to be flexible, extendable and comprehensive, yet generic enough to serve as a foundation for all system modeling requirements. With its specification, there is a wide range of elements characterized by the kinds of diagrams they serve, and the attributes they provide. All can be further specified by using stereotypes, Tagged Values and profiles.</p> <p>Enterprise Architect supports many different kinds of UML elements (as well as some custom extensions); together with the connectors between elements, these form the basis of the model</p>	<p><a href="#">UML Diagrams</a> <sup>[797]</sup></p> <p><a href="#">UML Elements</a> <sup>[866]</sup></p> <p><a href="#">UML Connectors</a> <sup>[968]</sup></p> <p><a href="#">UML Stereotypes</a> <sup>[1018]</sup></p> <p><a href="#">UML Profiles</a> <sup>[1028]</sup></p> <p><a href="#">Tagged Values</a> <sup>[764]</sup></p>
<b>Wide Range of Applications</b>	<p>Although initially conceived as a language for software development, UML can be used to model a wide range of real world domains and processes (in business, science, industry, education and elsewhere), organizational hierarchies, deployment maps and much more</p> <p>Enterprise Architect also provides additional custom diagrams and elements, to address further modeling interests.</p>	<p><a href="#">Modeling Basics</a> <sup>[517]</sup></p>
<b>Extending UML for New Domains</b>	<p>Using UML Profiles, UML Patterns, Grammars, Data Types, Constraints, MDG Technologies and other extensions, UML and Enterprise Architect can be tailored to address a particular modeling domain not explicitly covered in the original UML specification</p>	<p><a href="#">UML Profiles</a> <sup>[1028]</sup></p> <p><a href="#">UML Patterns</a> <sup>[1023]</sup></p> <p><a href="#">MDG Technologies</a> <sup>[1033]</sup></p>

Topic	Detail	See also
	Enterprise Architect makes extending UML simple and straightforward and, best of all, the extension mechanism is still part of the UML Specification.	
<b>Recommended Reading</b>	In addition to the UML Specification available from the OMG, two books that provide excellent introductions to UML are: <ul style="list-style-type: none"><li data-bbox="539 504 1118 616">• <i>Schaum's Outlines: UML</i> by Bennet, Skelton and Lunn Published by McGraw Hill. ISBN 0-07-709673-8</li><li data-bbox="539 627 1118 710">• <i>Developing Software with UML</i> by Bern Oestereich Published by Addison Wesley. ISBN 0-201-36826-5</li></ul>

## 6.1 UML Diagrams

A UML diagram is a representation of the components or elements of a system or process model and, depending on the type of diagram, how those elements are connected or how they interact from a particular perspective. For example, how and why an object changes state, or how requirements are realized by the process or a system.

### Topics:

Topic	Detail	See also
<b>Working with Diagrams</b>	Diagrams are developed in the main workspace, in which you create and connect model elements  You create diagrams by right-clicking a package and selecting the <b>New Diagram</b> context menu option, or load them by double-clicking on their diagram icon in the Project Browser	<a href="#">Diagram Tasks</a> <sup>[569]</sup>
<b>Types of Diagram</b>	There are two major groupings of UML diagrams: <ul style="list-style-type: none"> <li>• Structural Diagrams which depict the structural elements composing a system or function, reflecting the static relationships of a structure, or run-time architectures.</li> <li>• Behavioral Diagrams which show a dynamic view of the model, depicting the behavioral features of a system or business process.</li> </ul>	<a href="#">Structural Diagrams</a> <sup>[798]</sup> <a href="#">Behavioral Diagrams</a> <sup>[813]</sup>
<b>Extended Diagrams</b>	Enterprise Architect provides a set of additional diagram types that extend the core UML diagrams for domain-specific models	<a href="#">Extended Diagrams</a> <sup>[1184]</sup>
<b>Custom Diagrams</b>	Enterprise Architect also supports diagram types specific to MDG Technologies, including integrated technologies	<a href="#">Specialized UML Models</a> <sup>[1181]</sup>

## 6.2 UML Structural Models

Structural diagrams depict the structural elements composing a system or function. These diagrams reflect the static relationships of a structure, such as Class or Package diagrams, or run-time architectures such as Object or Composite Structure diagrams.

Structural diagrams include the following diagram types:

Diagram Type	Detail	See also
<b>Class Diagrams</b>	Class diagrams capture the logical structure of the system, the Classes and objects that make up the model, describing what exists and what attributes and behavior it has.	<a href="#">Class diagrams</a> <sup>[800]</sup>
<b>Composite Structure Diagrams</b>	Composite Structure diagrams reflect the internal collaboration of Classes, Interfaces and Components (and their properties) to describe a functionality.	<a href="#">Composite Structure diagrams</a> <sup>[803]</sup>
<b>Component Diagrams</b>	Component diagrams illustrate the pieces of software, embedded controllers and such that make up a system, and their organization and dependencies.	<a href="#">Component diagrams</a> <sup>[809]</sup>
<b>Deployment Diagrams</b>	Deployment diagrams show how and where the system is to be deployed; that is, its execution architecture.	<a href="#">Deployment diagrams</a> <sup>[806]</sup>
<b>Object Diagrams</b>	Object diagrams depict object instances of Classes and their relationships at a point in time.	<a href="#">Object diagrams</a> <sup>[807]</sup>
<b>Package Diagrams</b>	Package diagrams depict the organization of model elements into packages and the dependencies amongst them.	<a href="#">Package diagrams</a> <sup>[798]</sup>
<b>Profile Diagrams</b>	Profile Diagrams are those created in a «profile» package, to extend UML elements, connectors and components.	<a href="#">Profile Diagrams</a> <sup>[811]</sup>

### 6.2.1 Package Diagram

Package diagrams depict the organization of model elements into packages and the dependencies amongst them, including package imports and package extensions. They also provide a visualization of the corresponding namespaces.

#### Use To:

- depict the organization of model elements into packages
- show dependencies between packages
- visualize namespaces

**Example Diagram:** [Example Package Diagram](#) <sup>[799]</sup>

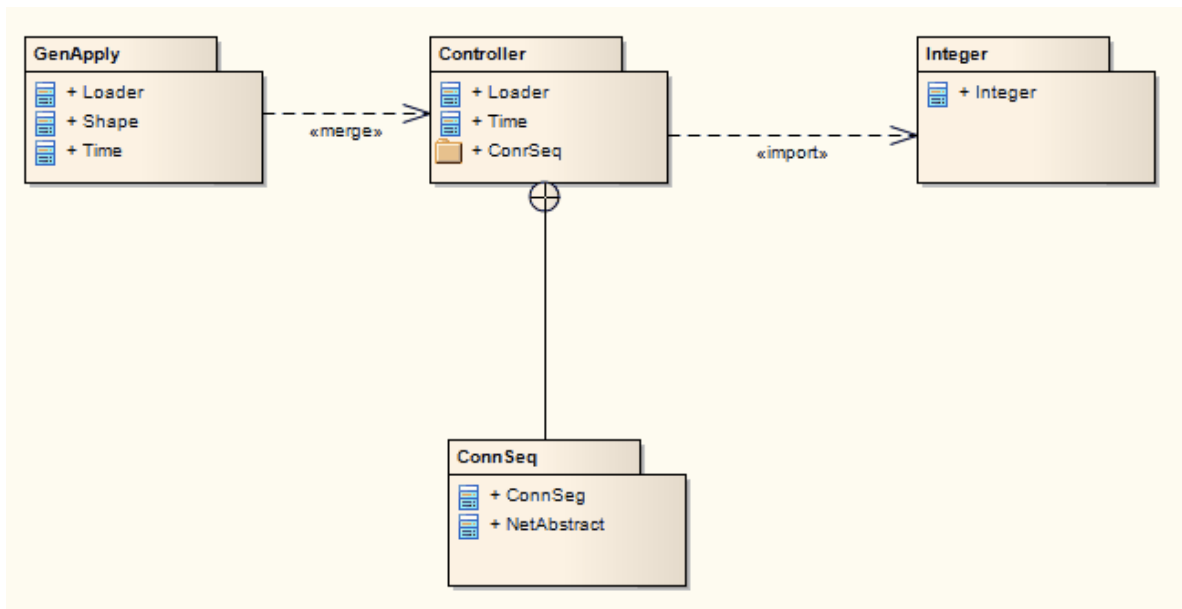

#### Tools:

Select Package diagram elements and connectors from the Class pages of the Toolbox.

Package Diagram Elements	Package Diagram Connectors
Package	Associate
Class	Generalize
Interface	Compose
Data Type	Aggregate
Enumeration	Association Class
Primitive	Assembly
Table	Realize
Signal	Nesting
Association	Package Merge
	Package Import

### 6.2.1.1 Example Package Diagram

The following example demonstrates a basic Package diagram.

Item	Description	See Also
Nesting connector between <b>ConnSeq</b> and <b>Controller</b>	The nesting connector between <b>ConnSeq</b> and <b>Controller</b> reflects what the package contents reveal. Package contents can be listed by clicking on the diagram background to display	<a href="#">Properties</a> <sup>57</sup> dialog

Item	Description	See Also
	the diagram's <b>Properties</b> dialog, selecting the <b>Elements</b> tab and selecting the <b>Package Contents</b> checkbox.	
«import» connector	The «import» connector indicates that the elements within the target Integer package, which in this example is the single Class Integer, are imported into the package Controller. The Controller's namespace gains access to the Integer Class; the Integer namespace is not affected.	
«merge» connector	The «merge» connector indicates that the package Controller's elements are imported into GenApply, including Controller's nested and imported contents. If an element already exists within GenApply, such as Loader and Time, these elements' definitions are expanded by those included in the package Controller. All elements added or updated by the merge are noted by a generalization relationship back to that package.	

## 6.2.2 Class Diagram

The Class diagram captures the logical structure of the system - the Classes - and things that make up the model. It is a static model, describing what exists and what attributes and behavior it has, rather than how something is done.

### Use To:

Illustrate relationships between Classes and Interfaces. Generalizations, Aggregations and Associations are all valuable in reflecting inheritance, composition or usage, and connections, respectively.

**Example Diagram:** [Example Class Diagram](#) 

### Tools:

Select Class diagram elements and connectors from the Class pages of the Toolbox.

Class Diagram Elements	Class Diagram Connectors
 Package	 Associate
 Class	 Generalize
 Interface	 Compose
 Data Type	 Aggregate
 Enumeration	 Association Class
 Primitive	 Assembly
 Table	 Realize
 Signal	 Nesting

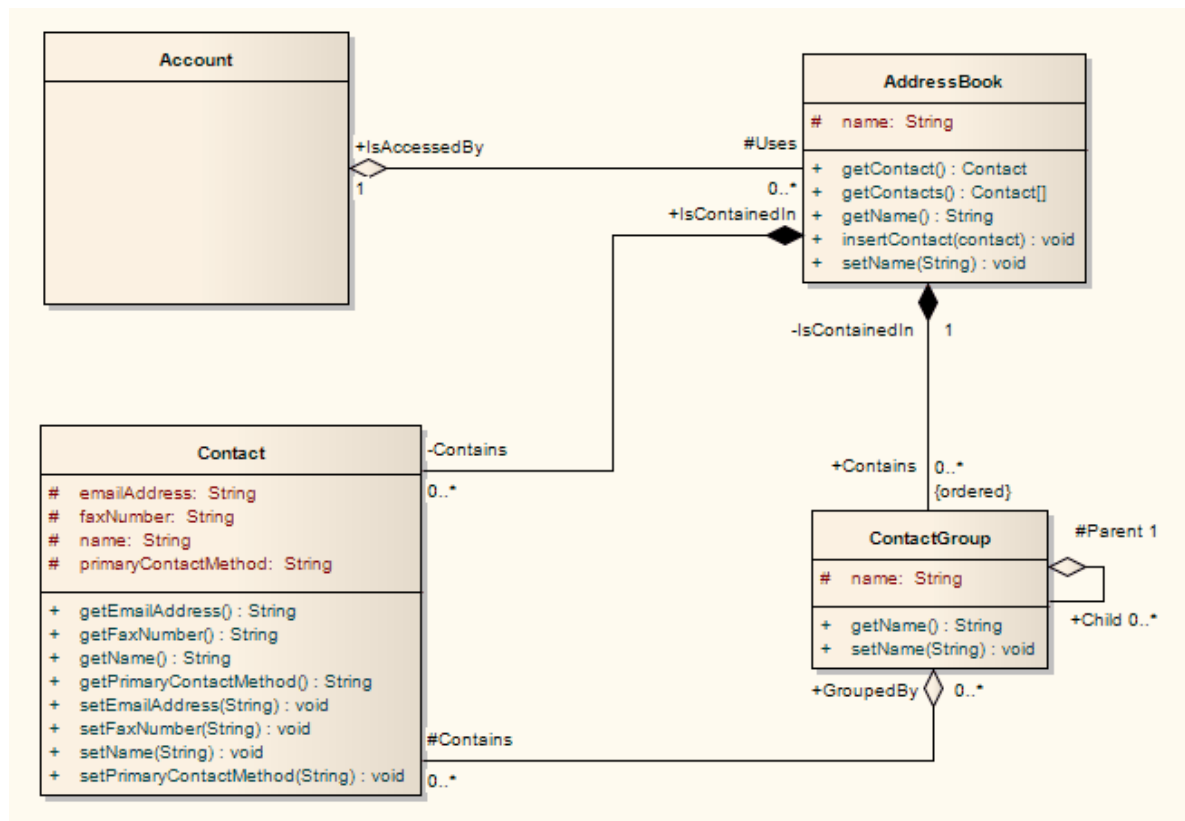

Class Diagram Elements	Class Diagram Connectors
 Association	 Package Merge
	 Package Import

**Learn More:**

- [Active Classes](#) <sup>[945]</sup>
- [Parameterized \(template\) Classes](#) <sup>[945]</sup>
- [Stereotyped Business Interaction Elements](#) <sup>[1194]</sup>

**6.2.2.1 Example Class Diagram**

There are two forms of the [Aggregation](#) <sup>[970]</sup> relationship in the following diagram. The pale form indicates that the Class *Account* uses *AddressBook*, but does not necessarily contain *AddressBook*. The dark *Composite* Aggregation form indicates ownership or containment by the target Classes (at the diamond end) of the source Classes.

**6.2.3 Object Diagram**

An Object diagram is closely related to a Class diagram, with the distinction that it depicts object instances of Classes and their relationships at a point in time. This might appear similar to a Composite Structure diagram, which also models run-time behavior; the difference is that Object diagrams exemplify the static Class diagrams, whereas Composite Structure diagrams reflect run-time architectures different from their

static counterparts. Object diagrams do not reveal architectures varying from their corresponding Class diagrams, but reflect multiplicity and the roles instantiated Classes could serve.

#### Use To:

They are useful in understanding a complex Class diagram, by creating different cases in which the relationships and Classes are applied. An Object diagram can also be a kind of Communication diagram, which also models the connections between objects, but additionally sequences events along each path.

**Example Diagram:** [Example Object Diagram](#) <sup>[802]</sup>

#### Tools:

Select Object diagram elements and connectors from the Object pages of the Toolbox.

Object Diagram Elements	Object Diagram Connectors
 Actor	 Information Flow
 Object	 Associate
 Collaboration	 Dependency
 Collaboration Use	
 Information Item	
 Boundary	
 Control	
 Entity	

#### See Also:

- [Business Modeling Objects](#) <sup>[194]</sup>
- [Communication diagram](#) <sup>[861]</sup>

### 6.2.3.1 Example Object Diagram

The following example first shows a simple Class diagram, with two Class elements connected.

The Classes above are instantiated below as Objects in an Object diagram. There are two instances of **Computer** in this model, which can prove useful for considering the relationships and interactions Classes play in practice, as Objects.

### 6.2.4 Composite Structure Diagram

A Composite Structure diagram reflects the internal collaboration of Classes, Interfaces or Components (and their Properties) to describe a functionality. Composite Structure diagrams are similar to Class diagrams, except that they model a specific usage of the structure. Class diagrams model a static view of Class structures, including their attributes and behaviors.

**Use To:**

A Composite Structure diagram is used to express run-time architectures, usage patterns and the participating elements' relationships, which might not be reflected by static diagrams.

In a Composite Structure diagram, Classes are accessed as Parts or run-time instances fulfilling a particular role. These Parts can have multiplicity, if the role filled by the Class requires multiple instances. Ports defined by a Part's Class should be represented in the composite structure, maintaining that all connecting Parts provide the required interfaces specified by the Port. There is extensive flexibility, and an ensuing complexity, that come with modeling composite structures. To optimize your modeling, consider building Collaborations to represent reusable patterns responding to your design issues.

**Example Diagram:** [Example Composite Structure Diagram](#)<sup>[804]</sup>

**Tools:**

Select Composite Structure diagram elements and connectors from the Composite pages of the Toolbox.

Composite Structure Diagram Elements	Composite Structure Diagram Connectors
Class	Connector
Interface	Assembly
Part	Role Binding
Port	Represents

Composite Structure Diagram Elements	Composite Structure Diagram Connectors
 Collaboration	 Occurrence
 Collaboration Use	 Delegate
 Expose Interface	

#### Learn More:

- [Business Use Case Realization](#)<sup>[1194]</sup>

### 6.2.4.1 Example Composite Structure Diagram

The following diagram shows a Collaboration used in Composite Structure diagrams to model common patterns. This particular example shows a relationship for performing an installation.

The following diagram uses the Install Collaboration in a Collaboration Use, and applies it to the UtilLoad Class via a «represents» relationship. This indicates that the classifier UtilLoad uses the collaboration pattern within its implementation.

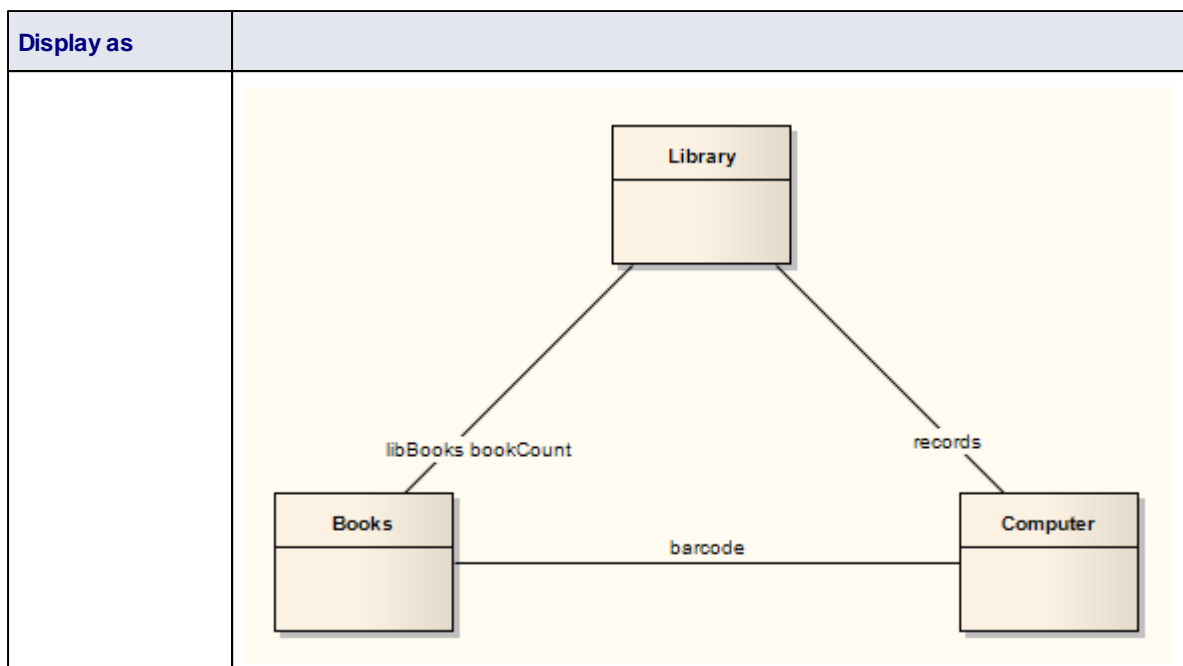

#### See Also:

- [Collaboration Use](#)<sup>[948]</sup>

### 6.2.4.2 Properties

A *property* is a nested structure within a classifier, which is usually a Class or an Interface, on a Composite Structure diagram. The contained structure reflects instances and relationships reflected within the containing classifier. Properties can have multiplicity.

<p><b>Display as</b></p>	
<p><b>Parts</b></p>	<div data-bbox="517 551 1401 987" data-label="Diagram"> <pre> classDiagram     class Library     class libBooks["libBooks :Books [bookCount]"]     class records["records :Computer"]     Library -- libBooks     Library -- records     libBooks -- records : barcode     </pre> </div> <p>There are two Parts, libBooks and records, which are instances corresponding to the Classes Books and Computer respectively. After dragging Parts from the Toolbox out to the workspace, right-click on a Part and select the <b>Advanced   Set Property Type</b> context menu option to connect to a classifier.</p> <p>If Parts disappear when dragged onto the Class, adjust the Z-order of the Class (right-click on it and select the <b>Z-Order</b> context menu option).</p> <p>The relationship between the two Parts is indicated by the connector, reflecting that communication between the Parts is via the barcode. This contained structure and its Parts are properties owned by the Library Class. To indicate a property that is not owned by composition to the containing classifier, use a box symbol with a dashed outline, indicating association. To do this, right-click on the Part and select the <b>Properties</b> context menu option, then select the Advanced page of the Properties dialog and set the <b>IsReference</b> option to <b>true</b>.</p>
<p><b>Association Roles</b></p>	<p>Properties can also be reflected using a normal composite structure (without containing it in a Class), with the appropriate connectors, parts and relationships indicated through connections to the Class. This alternative representation is shown in the following diagram. However, this depiction fails to express the ownership immediately reflected by containing properties within a classifier.</p>

### 6.2.5 Deployment Diagram

A Deployment diagram shows how and where the system is to be deployed; that is, its execution architecture. Hardware devices, processors and software execution environments (system Artifacts) are reflected as Nodes, and the internal construction can be depicted by embedding or nesting Nodes. Deployment relationships indicate the deployment of Artifacts, and Manifest relationships reveal the physical implementation of components. As Artifacts are allocated to Nodes to model the system's deployment, the allocation is guided by the use of deployment specifications.

**Example Diagram:** [Example Deployment Diagram](#)<sup>[808]</sup>

#### Tools:

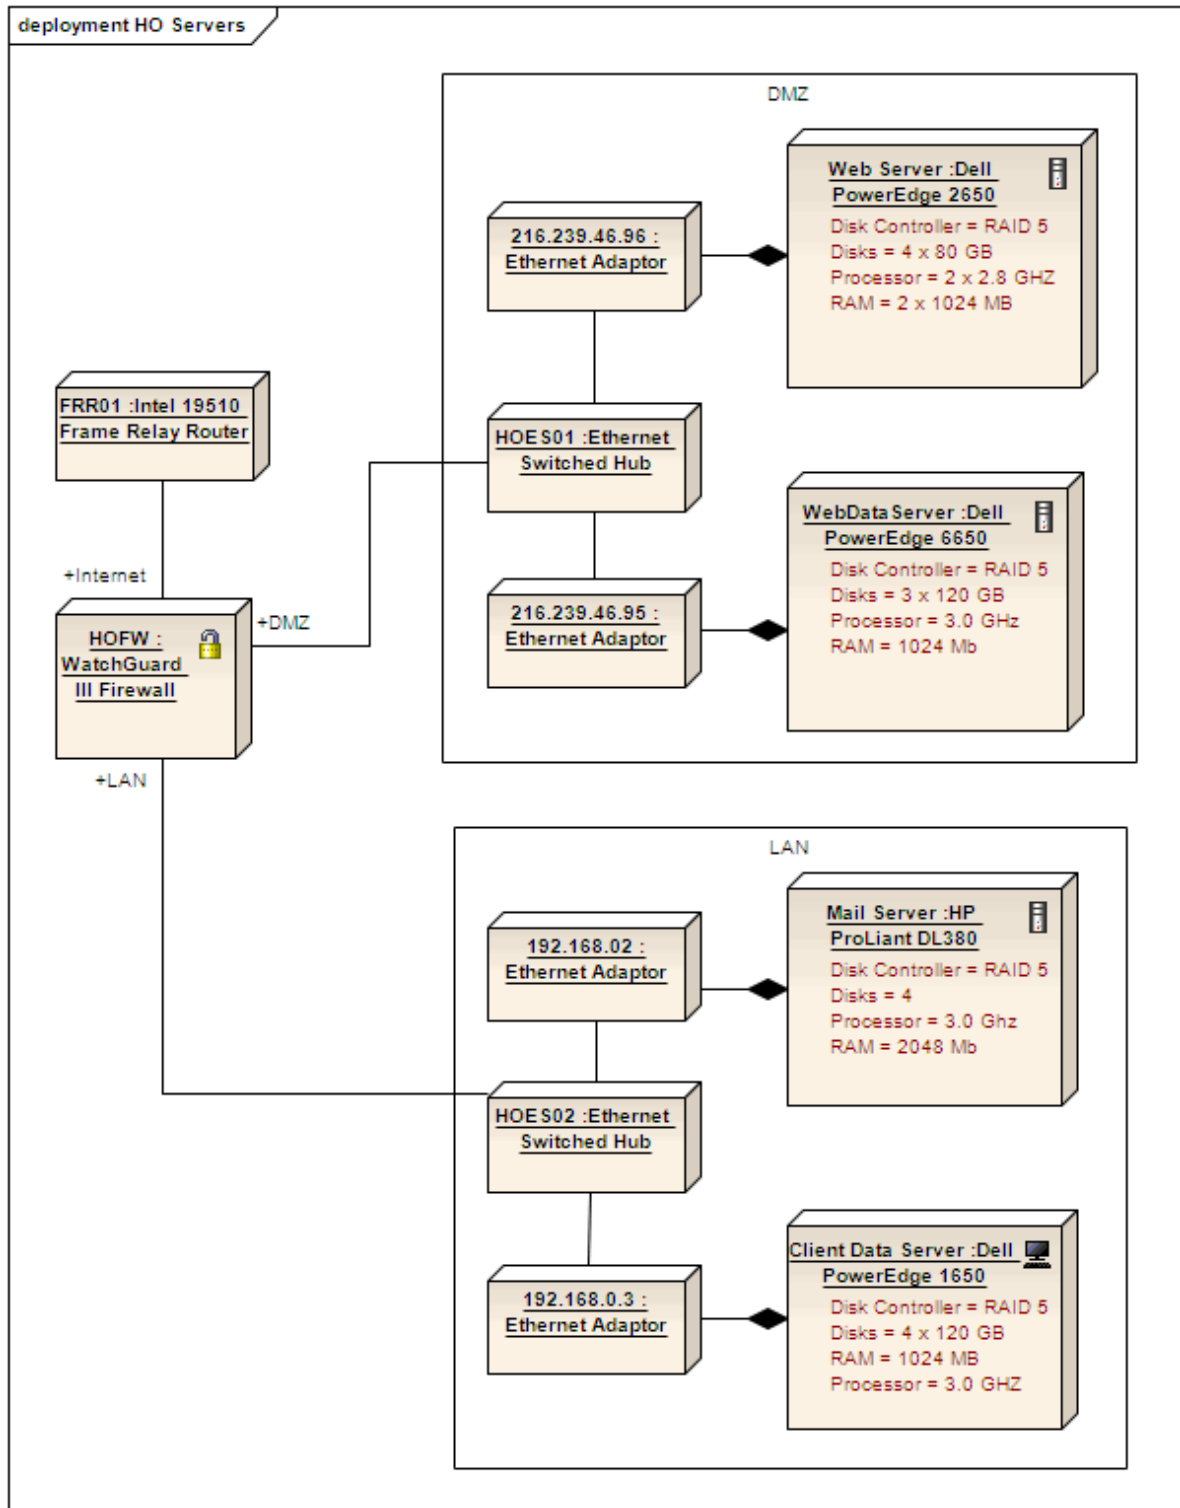

Select Deployment diagram elements and connectors from the Deployment pages of the Toolbox.

Deployment Diagram Elements	Deployment Diagram Connectors
 Node	 Associate
 Device	 Communication Path
 Execution Environment	 Association Class
 Component	 Generalize
 Interface	 Realize
 Artifact	 Deployment
 Document Artifact	 Manifest

Deployment Diagram Elements	Deployment Diagram Connectors
 Deployment Specification	 Nesting
 Package	

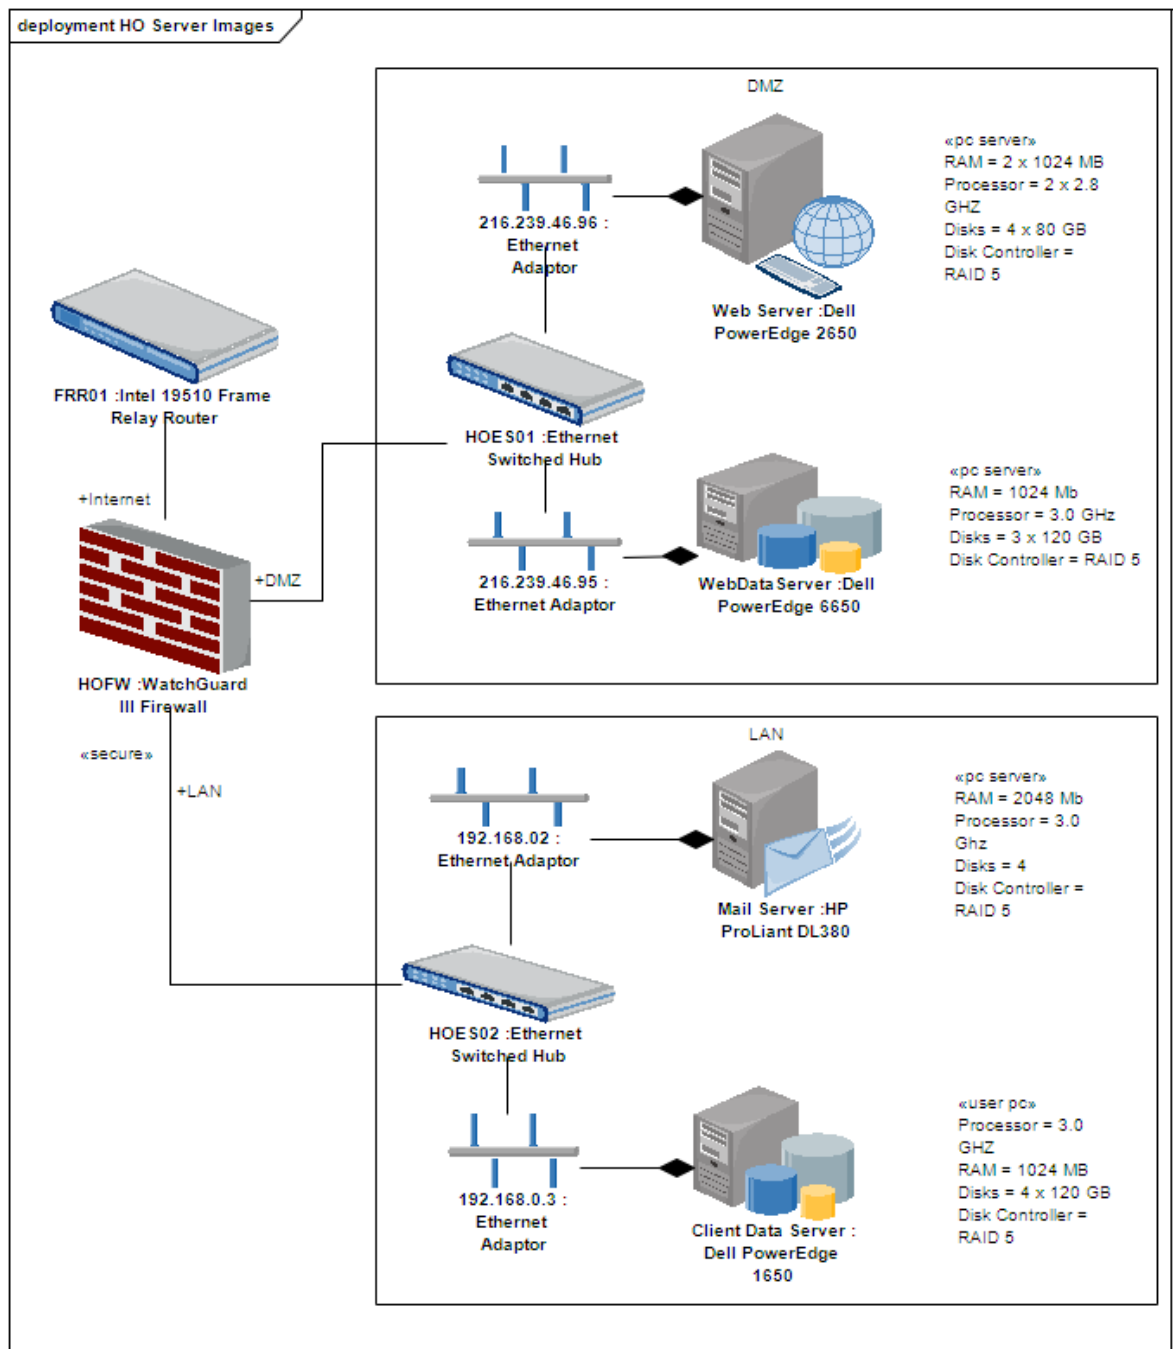

### 6.2.5.1 Example Deployment Diagram

A simple Deployment diagram is shown below, representing the arrangement of servers at a head office. The servers are represented by Nodes linked by either simple or aggregate Association relationships.

Deployment diagrams are ideal for using alternative images for the objects that the elements represent. Such images can be substituted for the elements in the above diagram, as shown below:

**See Also:**

- [Alternative Images](#) <sup>[595]</sup>

**6.2.6 Component Diagram**

A Component diagram illustrates the pieces of software, embedded controllers and such that make up a system, and their organization and dependencies. A Component diagram has a higher level of abstraction than a Class diagram; usually a component is implemented by one or more Classes (or Objects) at runtime. They are building blocks, built up so that eventually a component can encompass a large portion of a system.

**Example Diagram:** [Example Component Diagram](#) <sup>[810]</sup>

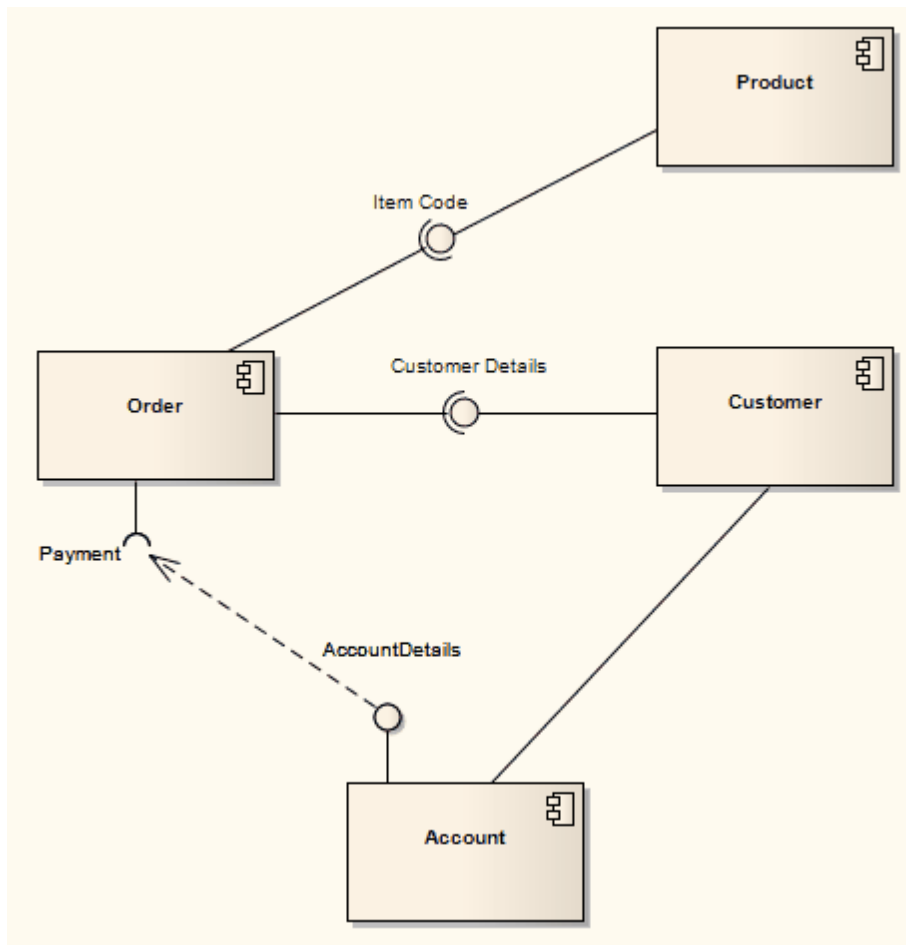

**Tools:**

Select Component diagram elements and connectors from the Component pages of the Toolbox.

Component Diagram Elements	Component Diagram Connectors
 Package	 Assembly
 Packaging Component	 Delegate
 Component	 Associate
 Class	 Realize
 Interface	 Generalize
 Object	
 Port	
 Expose Interface	
 Artifact	
 Document Artifact	

### 6.2.6.1 Example Component Diagram

The following diagram demonstrates some components and their inter-relationships. Assembly connectors connect the provided interfaces supplied by Product and Customer to the required interfaces specified by Order. A Dependency relationship maps a customer's associated account details to the required interface Payment, indicated by Order.

**Learn More:**

- [Assembly](#)<sup>[97]</sup>
- [Dependency](#)<sup>[98]</sup>

**6.2.7 Profile Diagram**

A Profile diagram is any diagram created in a «profile» package.

Profiles provide a means of extending the UML. They are based on additional stereotypes and Tagged Values that are applied to UML elements, connectors and their components. A Profile is a collection of such extensions that together describe some particular modeling problem and facilitate modeling constructs in that domain.

**Example Diagram:** [Example Profile Diagram](#)<sup>[812]</sup>

**Tools:**

Select the following Profile diagram elements and connectors from the Profile pages of the Toolbox.

Profile Diagram Elements	Profile Diagram Connectors
 Profile	 Extension

Profile Diagram Elements	Profile Diagram Connectors
 Stereotype	 Generalize
 Metaclass	 Application
 Enumeration	 Tagged Value
	 Redefinition

#### Learn More:

- [Developing Profiles](#) <sup>[1041]</sup>
- [Create Profiles](#) <sup>[1043]</sup>

### 6.2.7.1 Example Profile Diagram

A typical unit on a Profile diagram resembles the following illustration:

## 6.3 UML Behavioral Models

Behavioral diagrams depict the behavioral features of a system or business process. Behavioral diagrams include the following diagram types:

Diagram Type	Detail	See also
<b>Activity Diagrams</b>	Activity diagrams model the behaviors of a system, and the way in which these behaviors are related in an overall flow of the system.	<a href="#">Activity diagrams</a> <sup>[813]</sup>
<b>Use Case Diagrams</b>	Use Case diagrams capture Use Cases and relationships among Actors and the system; they describes the functional requirements of the system, the manner in which external operators interact at the system boundary, and the response of the system.	<a href="#">Use Case diagrams</a> <sup>[815]</sup>
<b>State Machine Diagrams</b>	State Machine diagrams illustrate how an element can move between states, classifying its behavior according to transition triggers and constraining guards.	<a href="#">State Machine diagrams</a> <sup>[817]</sup>
<b>Timing Diagrams</b>	Timing diagrams define the behavior of different objects within a time-scale, providing a visual representation of objects changing state and interacting over time.	<a href="#">Timing diagrams</a> <sup>[832]</sup>
<b>Sequence Diagrams</b>	Sequence diagrams are structured representations of behavior as a series of sequential steps over time. They are used to depict work flow, message passing and how elements in general cooperate over time to achieve a result.	<a href="#">Sequence diagrams</a> <sup>[851]</sup>
<b>Communication Diagrams</b>	Communication diagrams show the interactions between elements at run-time, visualizing inter-object relationships.	<a href="#">Communication diagrams</a> <sup>[861]</sup>
<b>Interaction Overview Diagrams</b>	Interaction Overview diagrams visualize the cooperation between other interaction diagrams (Timing, Sequence, Communication and Interaction Overview diagrams) to illustrate a control flow serving an encompassing purpose.	<a href="#">Interaction Overview diagrams</a> <sup>[863]</sup>

- [Code Generation from Behavioral Models](#) <sup>[1503]</sup>

### 6.3.1 Activity Diagram

**Activity diagrams** are used to model the behaviors of a system, and the way in which these behaviors are related in an overall flow of the system. The logical paths a process follows, based on various conditions, concurrent processing, data access, interruptions and other logical.

#### Use to:

- Model system behavior
- Model dynamic element interactions

**Example:** [Example Activity Diagram](#) <sup>[815]</sup>

**Tools:** Select Activity diagram elements and connectors from the Activity pages of the **Toolbox**. Click on the

following elements and connectors for more information.

Activity Diagram Elements	Activity Diagram Connectors
 Activity	 Control Flow
 Structured Activity	 Object Flow
 Action	 Interrupt Flow
 Partition	
 Object	
 Central Buffer Node	
 Datastore	
 Decision	
 Merge	
 Send	
 Receive	
 Synch	
 Initial	
 Final	
 Flow Final	
 Region	
 Exception	
 Fork/Join	
 Fork/Join	

**Notes:**

- You can create Analysis diagrams (Simplified Activity), containing the elements most useful for business process modeling, using the New Diagram dialog.

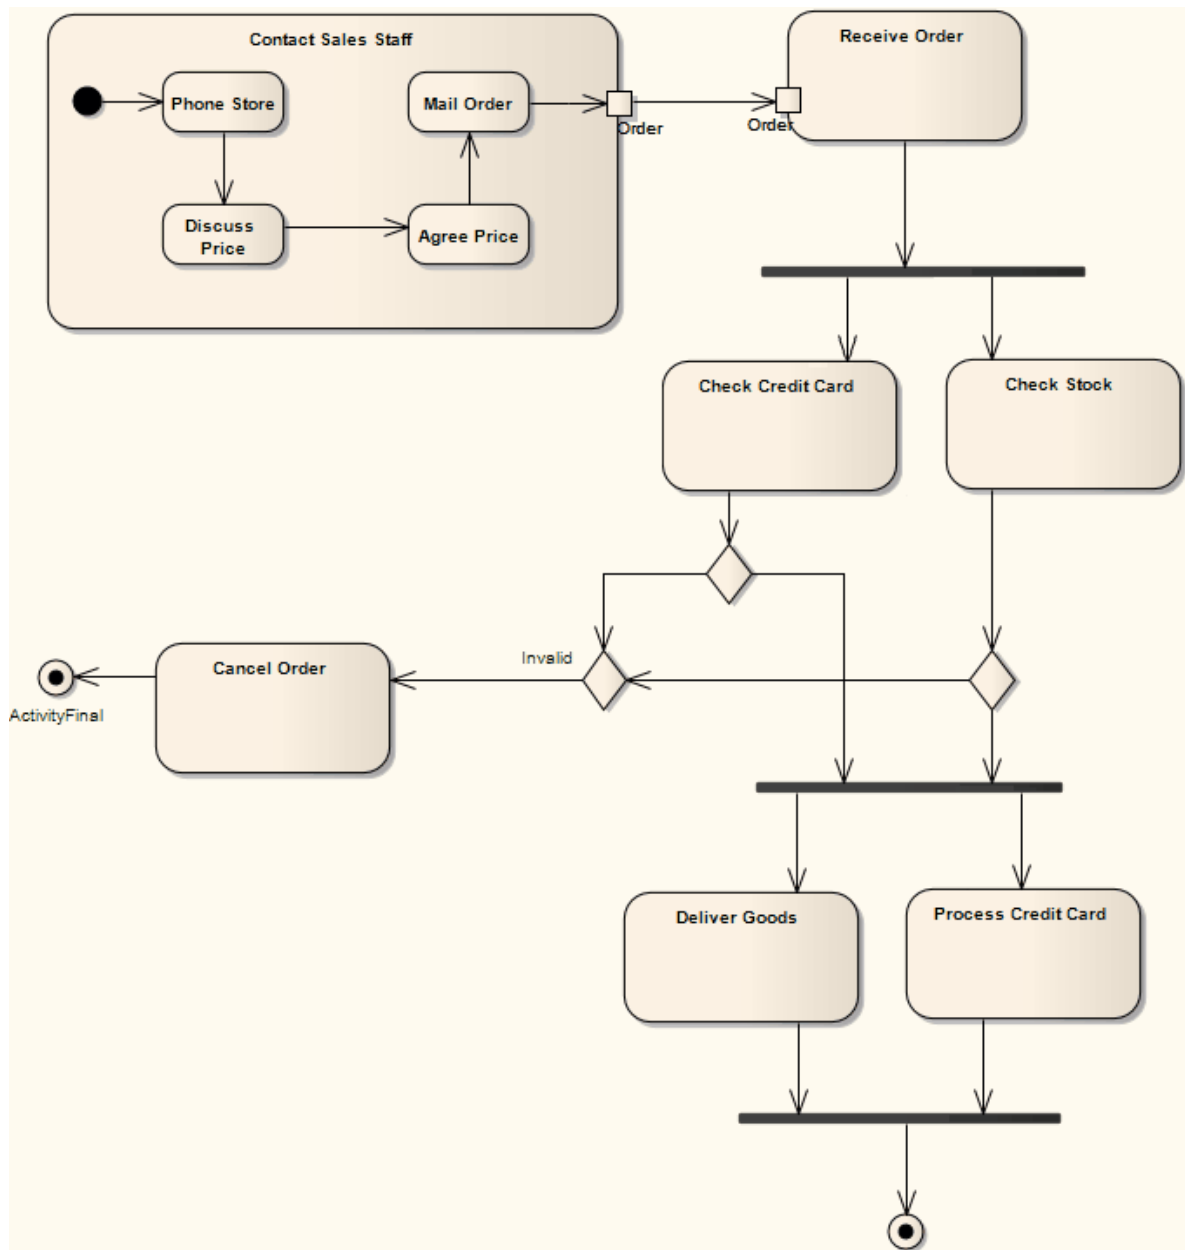

**Learn More:**

- [Analysis diagrams](#) <sup>[1190]</sup>
- [New Diagram](#) <sup>[570]</sup>

- [Activity pages](#) <sup>[560]</sup>

### 6.3.1.1 Example Activity Diagram

The following diagram illustrates some of the features of Activity diagrams, including Activities, Actions, Start Nodes, End Nodes and Decision points.

### 6.3.2 Use Case Diagram

**Use Case diagrams** capture Use Cases and relationships between Actors and the subject (system).

#### Use To:

- Describe the functional requirements of the system

- Describe the manner in which outside things (Actors) interact at the system boundary
- Describe the response of the system.

**Example Diagram:** [Example Use Case Diagram](#) <sup>[817]</sup>

**Tools:** Select Use Case diagram elements and connectors from the Use Case pages of the **Toolbox**. Click on the following elements and connectors for more information.

Use Case Diagram Elements	Use Case Diagram Connectors
 Actor	 Use
 Use Case	 Associate
 Test Case	 Generalize
 Collaboration	 Include
 Collaboration Use	 Extend
 Boundary	 Realize
 Package	 Invokes
	 Precedes

**Notes:**

- Invokes and Precedes relationships are defined by the Open Modeling Language (OML). They are stereotyped Dependency relationships; Invokes indicates that Use Case A, at some point, causes Use Case B to happen, whilst Precedes indicates that Use Case C must complete before Use Case D can begin.

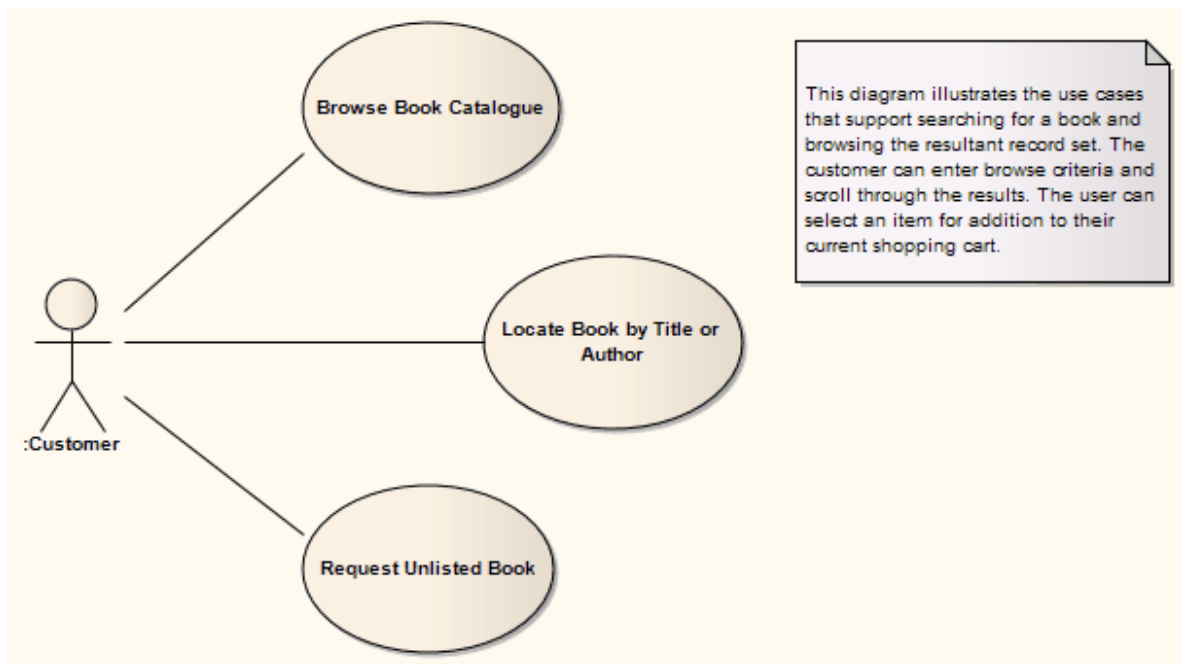

**Learn More:**

- [Business Use Case](#) <sup>[1194]</sup>
- [Use Case pages](#) <sup>[555]</sup>

### 6.3.2.1 Example Use Case Diagram

The following diagram illustrates some features of Use Case diagrams:

### 6.3.3 State Machine Diagrams

State Machine diagrams illustrate how an element (often a Class) can move between states, classifying its behavior according to transition triggers and constraining guards.

#### Naming:

- State Machine diagrams were formerly known as State diagrams.
- State Machine representations in UML are based on the Harel State Chart Notation and therefore are sometimes referred to as State Charts.

#### State Tables:

You can display a State Machine as a diagram (as below) or as a table in one of three relationship formats.

#### How to:

To select the display format, follow the steps below:

Step	Action	See Also
1	Right-click on the diagram background to display the context menu	
2	Select the <b>Statechart Editor</b> option	
3	Select the appropriate display option: <ul style="list-style-type: none"> <li>• <b>Diagram</b></li> <li>• <b>Table (State-Next State)</b></li> </ul>	

Step	Action	See Also
	<ul style="list-style-type: none"> <li>• <a href="#">Table (State-Trigger)</a></li> <li>• <a href="#">Table (Trigger-State)</a></li> </ul>	

**Example Diagram:** [Example State Machine Diagram](#) <sup>[819]</sup>

**Tools:** Select State Machine diagram elements and connectors from the State pages of the Toolbox. Click on the elements and connectors below for more information.

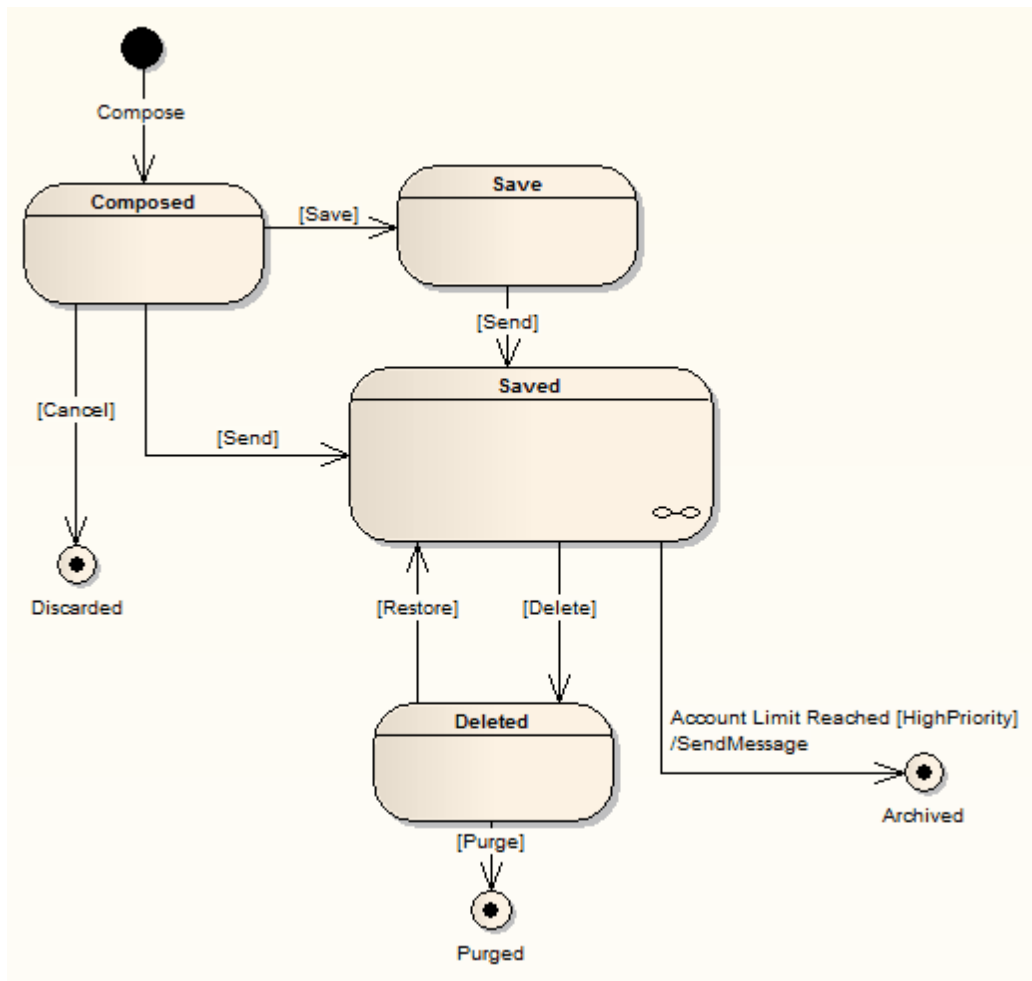

State Machine Diagram Elements	State Machine Diagram Connectors
 State	 Transition
 State Machine	 Object Flow
 Initial	
 Final	
 History	
 Synch	
 Object	
 Choice	
 Junction	
 Entry	
 Exit	
 Terminate	
 Fork/Join	
 Fork/Join

- [State Machine Modeling for HDLs](#) <sup>[1511]</sup>
- [State Machine Table](#) <sup>[823]</sup>
- [State Group](#) <sup>[560]</sup>

### 6.3.3.1 Example State Machine Diagram

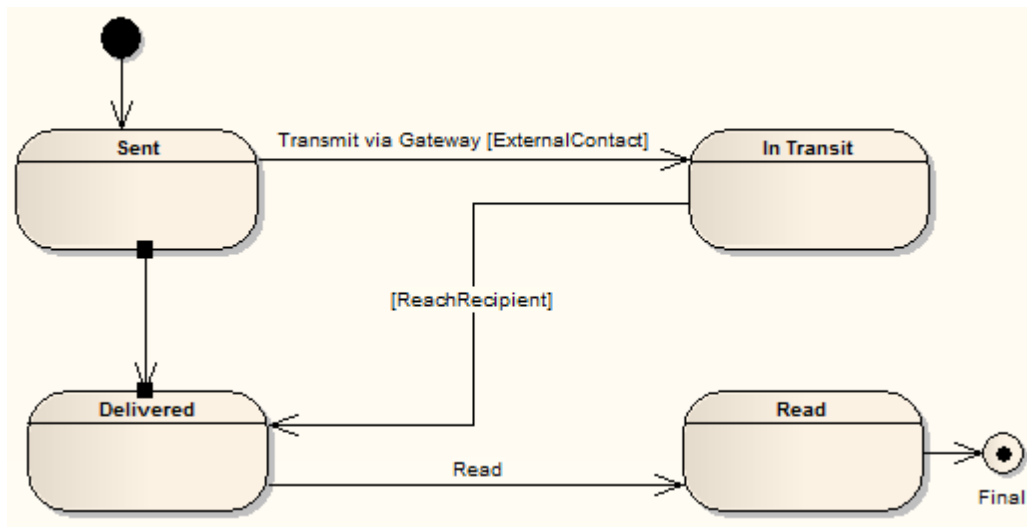

The following diagram illustrates some features of State Machine diagrams.

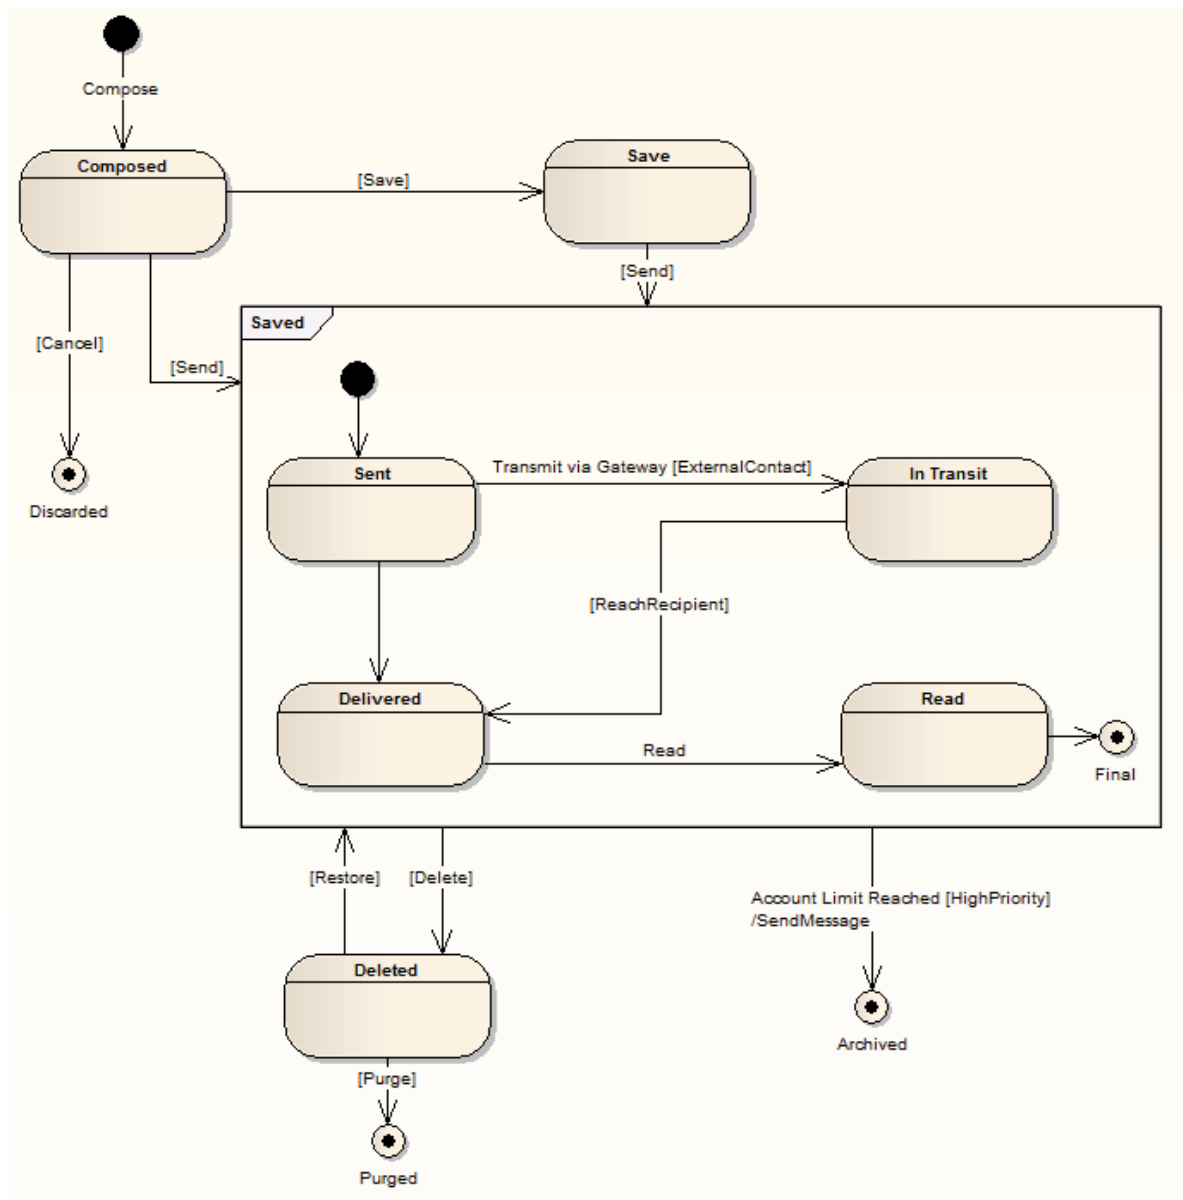

#### **Composite States:**

The chain-link symbol in the bottom right corner of the Saved state indicates that it is a Composite state.

You have two options for exposing the contents of a composite State. Firstly, you can double-click on the element to display its child diagram separately, as shown below:

Alternatively, you can right-click on the composite element and select the **Advanced | Show Composite Diagram** context menu option, which displays the child diagram in the context of the parent diagram.

**Notes:**

- State elements can display either with or without a line across them. The line - as shown above - displays when the element has features such as attributes (which could be hidden) or when the Show State Compartment checkbox is selected in the Objects page of the Options dialog. See: [Show State Compartment](#)<sup>[434]</sup>.

**Learn more:**

- [Composite States](#)<sup>[927]</sup>
- [Pseudo-states](#)<sup>[822]</sup>
- [State Elements](#)<sup>[919]</sup>
- [Regions](#)<sup>[822]</sup>

### 6.3.3.2 Pseudo-States

Pseudo-states are a UML abstraction for various types of transient vertices used in State Machine diagrams. Pseudo-states are used to express complex transition paths. The following types of pseudo-state are available:

Type	See
 Initial	<a href="#">Initial</a> <sup>[905]</sup>
 Entry	<a href="#">Entry Point</a> <sup>[893]</sup>
 Exit	<a href="#">Exit Point</a> <sup>[897]</sup>
 Choice	<a href="#">Choice</a> <sup>[887]</sup>
 Junction	<a href="#">Junction</a> <sup>[910]</sup>
 History	<a href="#">History</a> <sup>[904]</sup>
 Terminate	<a href="#">Terminate</a> <sup>[935]</sup>
 Final	<a href="#">Final</a> <sup>[897]</sup>
 Fork/Join  Fork/Join	<a href="#">Fork</a> <sup>[902]</sup>
 Fork/Join  Fork/Join	<a href="#">Join</a> <sup>[903]</sup>

#### Learn More:

- [State Machine Diagrams](#)<sup>[817]</sup>

### 6.3.3.3 Regions

Regions can be created in Composite States or State Machines on a State Machine diagram. Regions indicate concurrency, such that a single State is active in each region. Multiple transitions can occur from a single event dispatch, so long as similarly triggered transitions are divided by Regions.

#### How to:

To create a Region in a Composite State or State Machine element, follow the steps below:

Step	Action
1	Right-click on the element, and select the <b>Advanced   Define Concurrent Substates</b> context menu option The State Regions dialog displays
2	Create the Regions of a State, which can be named or anonymous

3	Click on the <b>OK</b> button
---	-------------------------------

**Learn More:**

- [Composite States](#) <sup>[827]</sup>
- [State Machines](#) <sup>[819]</sup>
- [State Machine diagram](#) <sup>[817]</sup>

**6.3.4 State Machine Table**

A State Machine table is one of two variants of a State Machine (the other is the State Machine diagram). It displays the information of the State Machine in table form, and is a method of specifying the discrete behavior of a finite state-transition system; that is, what state the State Machine moves to and the conditions under which the transition takes place.

You can display the state transition as one of two different relationships:

Display Type	Description	See Also
<b>State - Trigger</b>	The rows indicate the current states and the columns indicate trigger events (or the other way around if you prefer, in a <b>Trigger - State</b> format). The cell at the intersection of a row and column identifies the target state in the transition if the trigger occurs, and the condition (or guard) of the transition.	<a href="#">Example State-Trigger Table</a> <sup>[831]</sup>
<b>State - Next State</b>	The rows and columns both indicate states, and the cell at the intersection of a row and column indicates the event that triggers a transition from the current (row) state to the next (column) state, the condition (or guard) of the event, and the effect of the transition.	<a href="#">Example State-Next State Table</a> <sup>[832]</sup>

You can display a State Machine as a diagram or table, and as a table in one of three relationship formats.

**How to:**

To select the display format, follow the steps below:

Step	Action
1	Right-click on the diagram background to display the context menu
2	Select the <b>Statechart Editor</b> option
3	Select the appropriate display option: <ul style="list-style-type: none"> <li>• <b>Diagram</b></li> <li>• <b>Table (State-Next State)</b></li> <li>• <b>Table (State-Trigger)</b></li> <li>• <b>Table (Trigger-State)</b></li> </ul>

**Learn More:**

- [State Machine Table Options](#) <sup>[824]</sup>
- [State Machine Table Operations](#) <sup>[825]</sup>
- [State Machine diagram](#) <sup>[817]</sup>

### 6.3.4.1 State Machine Table Options

You can choose the State Machine table layout and set other options from the **State Machine Diagram: Options** dialog, which you display by either:

- Double-clicking on the State Machine table background or
- Right-clicking on the background and selecting the **State Table Options** context menu option

Field	Usage	See also
<b>Table Format</b>	Select the required table format: <ul style="list-style-type: none"> <li>• <b>State - Trigger:</b> rows represent States, each state name in a left edge cell; columns represent Triggers, each trigger name in a column header cell; the intersection of a row and column identifies the Transition (if there is one); the Transition cell displays information about the next State and the condition (guard) of the Transition</li> <li>• <b>Trigger - State:</b> as above, except that rows represent triggers and columns represent states</li> <li>• <b>State - Next State:</b> both rows and columns represent states; intersection of row and column defines the transition (if there is one) from the row state to the column state.</li> </ul>	
<b>Cell Size</b>		
<b>Transition Cell Width</b>	Specify the width of the transition cells (that is, the column width).	
<b>Transition Cell Height</b>	Specify the height of the transition cells (that is, the row height).	
<b>Left Edge Cell Width</b>	Specify the width of the left edge (row title) cells.	
<b>Top Edge Cell Height</b>	Specify the height of the top edge (column title) cells.	
<b>Cell Color</b>		
<b>State/Trigger Cell</b>	Select the color of the row and column title cells.	
<b>State/Trigger Enumeration</b>	Select the color of the enumeration (row/column numbering) cells.  You must select at least one of the <b>Enable State Enumeration</b> and <b>Enable Event Enumeration</b> checkboxes to set this color.	
<b>Transition Cell</b>	Select the color of the transition cells (in the main body of the table).	
<b>Highlight Options</b>		
<b>Highlight Zones Related to Selected Transition</b>	Highlight the cells for all elements involved in a selected transition - the initial state, the target state, and the trigger.	
<b>Highlight Color</b>	Select the color of the highlight.	
<b>Use Different Color for Target State</b>	Highlight the cell for the target element in a transition in a different color to the cell for the source element.	
<b>Target Zone Color</b>	Select the color of the highlight.	

Field	Usage	See also
<b>Display Options</b>		
<b>Always Display an Empty State Zone</b>	Add an empty row (and, on a <i>State - Next State</i> table, an empty column) to the end of the table.  The title cell contains an ellipsis (...). You can click twice (not double-click) on the ellipsis to edit it and identify a new state. In this case, another empty state zone is automatically added.	
<b>Enable State Enumeration</b>	Add a cell to each state title cell, to number the state. Numbering starts at 0.	
<b>Prefix</b>	If required, type a prefix for the state number or delete the default <b>S</b> to have no prefix.	
<b>Enable Event Enumeration</b>	Add a cell to each event or trigger title cell, to number the event. Numbering starts at 0.	
<b>Prefix</b>	If required, type a prefix for the event number or delete the default <b>E</b> to have no prefix.	
<b>Sample State Table</b>	Display a preview of the table format as you define it.	
<b>Advanced</b>	Define diagram options. The <b>State Machine Diagram Properties</b> dialog displays.	<a href="#">Set Appearance Options</a>
<b>Restore Defaults</b>	Reapply the State Table diagram default values.	
<b>Apply</b>	Apply changed options to the State Table diagram.	

### 6.3.4.2 State Machine Table Operations

As a State Machine table is a variant of a State Machine diagram, most of the operations for manipulating the data are the same as for State Machine diagrams. The operations specific to State Machine tables are described in the following topics:

Operation	See Also
Change State Machine Table Position	<a href="#">Change Position of State Machine Table</a>
Change State Machine Table Size	<a href="#">Change Size of State Machine Table</a>
Insert New State	<a href="#">Insert New State (and Substate)</a>
Insert Trigger	<a href="#">Insert Trigger</a>
Insert/Change Transition	<a href="#">Insert/Change Transition</a>
Reposition State or Trigger Cells	<a href="#">Reposition State/Trigger Cells</a>
Add Legend	<a href="#">Add Legend</a>
Locate Cell in State Machine Diagram	<a href="#">Find Cell in State Machine Diagram</a>
State Machine Table Conventions	<a href="#">State Machine Table Conventions</a>
Export State Table To CSV File	<a href="#">Export State Table To CSV File</a>

**Learn More:**

- [State Machine diagram](#) <sup>[817]</sup>
- [State Machine table](#) <sup>[823]</sup>

**6.3.4.2.1 Change State Machine Table Position**

If necessary, you can move the State Machine table around in the Diagram View.

**How to:**

To change the position of the State Machine table, follow the steps below:

Step	Action
1	Press ( <b>Ctrl+A</b> ) or double click on the top left cell to select the whole State Machine table
2	Drag and drop the State Machine table to the required position Alternatively, use ( <b>Shift</b> ) + ( ← ) , ( ↑ ) , ( → ) or ( ↓ ) to move the State Machine table

**6.3.4.2.2 Change State Machine Table Size**

There are three ways to change the size of the State Machine table:

Action	See Also
Change the cell size on the State Machine Diagram: Options dialog	<a href="#">State Machine Table: Options</a> <sup>[824]</sup>
Press ( <b>Ctrl+A</b> ) or double click on the top left cell to select the whole State Machine table, then press ( <b>Ctrl</b> ) + ( ← ) , ( → ) , ( ↑ ) or ( ↓ ) to change the size	
Select the State Machine table, then drag the shape handles to change the size	

**6.3.4.2.3 Insert New State**

Action	Description
<b>Insert a new State in the State Machine table</b>	<p>You can insert a new State in the State Machine table, using one of following methods:</p> <ul style="list-style-type: none"> <li>• In the top left cell in the State Machine table, move the cursor to the word <b>State</b> to display a <b>+</b> at the end of the word; click on the <b>+</b> to create a new State</li> <li>• Right-click in the top left cell in the State Machine table to display the context menu, and select the <b>Add State</b> menu option</li> <li>• Right-click on an existing State cell in the State Machine table to display the context menu, and select the <ul style="list-style-type: none"> <li>• <b>Insert New State Before</b> option to insert a new State before the current State, or</li> <li>• <b>Insert New State After</b> option to insert a new State after the current State</li> </ul> </li> <li>• Click on an existing State cell in the State Machine table, and press ( <b>Insert</b> ) to create and insert a new State above the selected State</li> <li>• In the <b>Toolbox</b>, on the <b>State Elements</b> page, click on an element and then click</li> </ul>

	<p>on:</p> <ul style="list-style-type: none"> <li>the diagram background to add a new State to the end of the table, or</li> <li>an existing State cell to add the new State just above it.</li> </ul> <p>From the <b>State Elements</b> page of the <b>Toolbox</b> you can insert State, Initial, Final, Entry, Exit and Terminate elements.</p>
<b>Add a Substate to a selected State</b>	<p>To add a Substate to a selected State, follow the steps below</p> <ol style="list-style-type: none"> <li>Right-click on the required State cell in the State Machine table; the context menu displays</li> <li>Select the <b>Add Substate</b> menu option; Enterprise Architect adds the Substate to the State</li> </ol> <p>Note: If the selected State does not allow a Substate, then the <b>Add Substate</b> menu option is grayed out.</p> <p>You can also drag one existing State over another. If the second State allows Substates, the dragged State then becomes its Substate.</p> <p>Similarly, you can change the parent State of a Substate by dragging the Substate from the original parent State to a different State.</p>
<b>Remove the parent relation of a Substate and make it a separate State</b>	<p>To remove the parent relation of a Substate and make it a separate State, follow the steps below</p> <ol style="list-style-type: none"> <li>Right-click on the Substate in the State Machine table. The context menu displays.</li> <li>Select the <b>Remove Parent Relation</b> menu option. The Substate cell becomes a State cell.</li> </ol> <p>You can also drag and drop the Substate onto the top left cell of the State Machine table. The dragged Substate again becomes a State cell.</p>

#### 6.3.4.2.4 Insert Trigger

If the State Machine table format is either *State-Trigger* or *Trigger-State*, you can use one of the following methods to insert a new Trigger:

Method	Action
<b>a</b>	In the top left cell in the State Machine table, move the cursor to the word <b>Event</b> to display a <b>+</b> at the end of the word; click on the <b>+</b> to create a new Trigger
<b>b</b>	In the top left cell in the State Machine table, right-click to display the context menu and select the <b>Add Trigger</b> menu option to create a new Trigger
<b>c</b>	Select an existing Trigger in the State Machine table, then press <b>( Insert )</b> to insert a new Trigger before the existing Trigger
<b>d</b>	Click on an existing Trigger in the State Machine table, right-click to display the context menu and select either the: <ul style="list-style-type: none"> <li><b>Insert New Trigger Before</b> option to insert a new Trigger before the current Trigger, or</li> <li><b>Insert New Trigger After</b> option to insert a new Trigger after the current Trigger</li> </ul>

#### 6.3.4.2.5 Insert/Change Transition

Action	Description	See Also
<b>Insert a new</b>	You can insert a new Transition using one of the following	

<b>Transition</b>	<p>methods:</p> <ul style="list-style-type: none"> <li>• Right-click on the cell in which to create a Transition, to display the context menu <ul style="list-style-type: none"> <li>• If the State Machine table format is State-Trigger or Trigger-State, the context menu lists the States you can choose as the target of the Transition; click on the required State name to create the Transition</li> <li>• If the State Machine table format is State-Next State, click on the Insert Transition menu option to create the Transition.</li> </ul> </li> <li>• In the State Relationships page of the Toolbox, select the Transition element, then click on the cell in the State Machine table in which to create the Transition. Double-click on the Transition to define it in the Transition Properties dialog.</li> </ul>	
<b>Change the Transition</b>	As for the State Chart diagram, to change the properties of a Transition double-click the Transition cell and edit the details on the Transition Properties dialog.	<a href="#">State Machine Diagrams</a> <sup>[817]</sup>
<b>Change Transition States</b>	<p>You can change the source and target of the Transition by right-clicking the Transition and selecting the Advanced   Set Source and Target context menu option.</p> <p>Alternatively, you can change the Transition source, target or Trigger by clicking on the Transition and dragging it to a different cell.</p> <p>If the State Machine table format is either State-Trigger or Trigger-State, you can change the target state of a transition by:</p> <ol style="list-style-type: none"> <li>1. Highlighting the target state name in the Transition cell and clicking on it to display a list of the states in the table.</li> <li>2. Clicking on the preferred target state name.</li> </ol>	
<b>Highlight States and Trigger Related to Transition</b>	<p>You can select options to highlight the source State, target State and Trigger cells associated with a Transition, using the Highlight Options panel on the State Machine Diagram: Options dialog. When you click on the Transition cell its associated State and Trigger cells are highlighted.</p> <p>Alternatively, click on the Transition cell and press and hold ( L ).</p>	<a href="#">State Machine Diagram: Options</a> <sup>[824]</sup>

#### 6.3.4.2.6 Reposition State or Trigger Cells

You can change the position of a selected State or Trigger cell in one of the following ways:

- Right-click on the State or Trigger title cell and select the appropriate **Order | Move xxx** context menu option
- Click on the cell and press ( **Shift** ) + ( **→** ), ( **←** ), ( **↑** ) or ( **↓** ).

#### 6.3.4.2.7 Add Legend

You can add a simple legend to any State Machine Table cell that has no transition. The two legend symbols are:

- **I** - Ignore
- **N** - Never Happen

**How to:**

To assign a legend symbol to a State Machine Table cell, follow the steps below:

Step	Action
1	<p>Click on the cell to which to assign the legend and press:</p> <ul style="list-style-type: none"> <li>• <b>( I )</b> to insert the Ignore legend, or</li> <li>• <b>( N )</b> to insert the Never Happen legend</li> </ul> <p>The required symbol displays in the center of the cell</p>

Alternatively:

Step	Action
1	<p>Right-click on the cell to which to assign the legend</p> <p>The context menu displays</p>
2	<p>Select the appropriate menu option:</p> <ul style="list-style-type: none"> <li>• <b>Legend   Ignore</b></li> <li>• <b>Legend   Never Happen</b></li> </ul> <p>The required symbol displays in the center of the cell</p>

**Notes:**

- To remove a legend symbol from a cell, either:
  - Click on the cell and press **( Delete )**, or
  - Right-click on the cell and select the **Legend | Remove Legend** context menu option

**6.3.4.2.8 Find Cell in State Machine Diagram**

Locate	Description
<b>in State Chart</b>	<p>On the State Machine table you can select a State or Trigger element and locate it in a State Machine diagram, by selecting the <b>Find   Locate in State Chart</b> context menu option. Enterprise Architect switches to the State Machine diagram and highlights the selected element. You can locate a Transition relationship in a similar way, by selecting the <b>Locate in State Chart</b> context menu option.</p> <p>A Trigger on a State Machine table might or might not exist on the corresponding State Machine diagram. If the Trigger does not exist on the State Machine diagram, the <b>Locate in State Chart</b> option is disabled.</p>
<b>in State Table</b>	<p>Conversely, on the State Machine diagram, you can select a State or Trigger element and locate it on the corresponding State Machine table, by selecting the <b>Find   Locate in State Table</b> context menu option. Enterprise Architect switches to the State Machine table and highlights the selected element. You can locate a Transition relationship in a similar way, by selecting the <b>Locate in State Table</b> context menu option.</p>

### 6.3.4.2.9 State Machine Table Conventions

#### Trigger

- Deleting a Trigger removes it completely from the model, therefore you cannot UNDO a Trigger deletion
- There is a <None> column at the end of the **Event** heading row. This is for Transitions that have no Trigger information.

#### State

From the **Toolbox** you can insert the following *State* element types only (although the State Machine table might pick up and display other types, such as *Submachine State*):

- State
- Initial
- Final
- Entry
- Exit
- Terminate.

#### Transition

The Transition cell displays its properties in one of two ways, depending on the State Machine table format. If the State Machine table format is *State - Trigger* or *Trigger - State*, the Transition cell displays the *Guard* and *Target* as shown below:

If the State Machine table format is *State - Next State*, then the Transition cell displays the *Trigger*, *Guard* and *Effect* as shown below:

The State Machine table enables you to edit the *Guard* and *Effect* in place. If the *Guard* or *Effect* is empty for your selected Transition cell, the cell displays an ellipsis ( ... ) instead. Click twice (not double-click) on the ellipsis to type in the *Guard* and *Effect* names.

### 6.3.4.2.10 Export State Table To CSV File

To export a State Machine Table to a CSV file, follow the steps below:

Step	Action
1	Open the required State Machine Table
2	Right-click on the diagram background and select the <b>Export Statechart to CSV file</b> context menu option The Save As browser dialog displays
3	Select the appropriate directory location and type in the .CSV filename

4	Click on the <b>Save</b> button
---	---------------------------------

### 6.3.4.3 Example State-Trigger Table

**State - Trigger:**

The rows indicate the current states and the columns indicate trigger events (or the other way around if you prefer, in a **Trigger - State** format). The cell at the intersection of a row and column identifies the target state in the transition if the trigger occurs, and the condition (or guard) of the transition.

		Trigger		Event1	Event2	Event3	Event4	<None>
		State		E0	E1	E2	E3	E4
Initial		S0						S1
State1		S1					S2	
State2		S2	S6	[Guard] S4				
	SubState1	S3		S4				
	SubState2	S4			[Cond] S2			
	SubState3	S5						
State3		S6						S7
Final		S7						

### 6.3.4.4 Example State-Next State Table

**State - Next State:** The rows and columns both indicate states, and the cell at the intersection of a row and column indicates the event that triggers a transition from the current (row) state to the next (column) state, the condition (or guard) of the event, and the effect of the transition.

Next State		Initial		State 1			State 2			State 3	Final
							SubState 1	SubState 2	SubState 3		
		State		S0	S1	S2	S3	S4	S5	S6	S7
Initial		S0		_____							
State 1		S1			Event4 _____						
State 2		S2					Event2 [Guard] _____		Event1 _____		
	SubState 1	S3					Event2 _____				
	SubState 2	S4			Event3 [Cond] _____						
	SubState 3	S5									
State 3		S6									_____
Final		S7									

### 6.3.5 Timing Diagram

A Timing diagram defines the behavior of different objects within a time-scale. It provides a visual representation of objects changing state and interacting over time.

#### Use To:

- to define hardware-driven or embedded software components; for example, those used in a fuel injection system or a microwave controller.
- to specify time-driven business processes.

**Example Diagram:** [Example Timing Diagram](#) <sup>[833]</sup>

**Tools:** Select Timing diagram elements and connectors from the Timing pages of the **Toolbox**. Click on the elements and connectors below for more information.

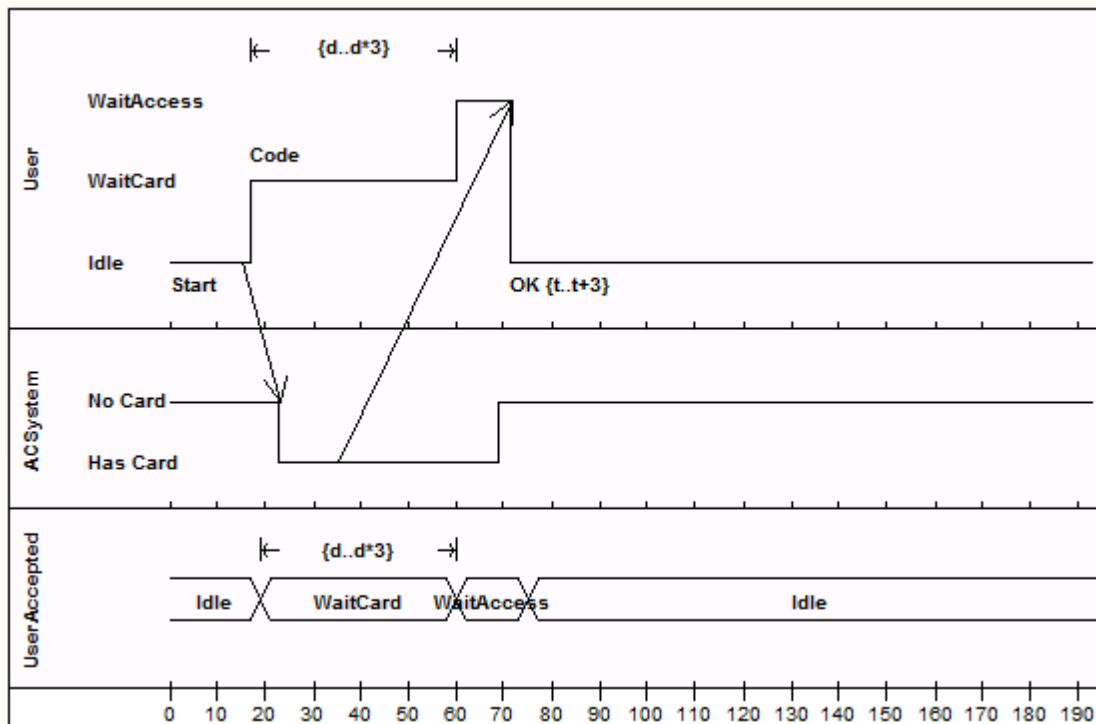

Timing Diagram Elements	Timing Diagram Message
 State Lifeline	 Message
 Value Lifeline	
 Message Label	
 Message Endpoint	
 Diagram Gate	

**Learn More:**

- [Set a Time Range](#)<sup>[834]</sup>
- [State Lifeline](#)<sup>[925]</sup>
- [Value Lifeline](#)<sup>[940]</sup>
- [Edit a Timing Diagram](#)<sup>[835]</sup>
- [Time Intervals](#)<sup>[845]</sup>
- [Message \(Timing Diagram\)](#)<sup>[1001]</sup>
- [Timing](#)<sup>[559]</sup> [pages](#)<sup>[559]</sup>

**6.3.5.1 Example Timing Diagram**

An example of a Timing diagram is shown below:

### 6.3.5.2 Create a Timing Diagram

To create a Timing diagram, follow the steps below:

Step	Action
1	Right-click on a package in the Project Browser The context menu displays
2	Select the <b>Add   Add Diagram</b> menu option The New Diagram dialog displays
3	In the Select From panel, select <b>UML Behavioral</b>
4	In the Diagram Types panel, select <b>Timing</b>
5	Click on the <b>OK</b> button The Diagram View displays, on which you create the Timing elements for the diagram

#### Learn More:

- [Set a Time Range](#)<sup>[834]</sup>
- [Edit a Timing Diagram](#)<sup>[835]</sup>

### 6.3.5.3 Set a Time Range

To set a time range before adding Lifeline elements to your Timing diagram, follow the steps below:

Step	Action
1	Right-click on the diagram The context menu displays
2	Select the <b>Set Timeline Range</b> option The Set Timeline Range dialog displays
3	In the <b>Start Time</b> and <b>End Time</b> fields, type the numeric values for the start and end points of the timeline; for example, set the range <b>0</b> to <b>100</b> The start time must be less than the end time
4	In the <b>Time Units</b> field, type the unit in which the time is measured; for example, seconds or minutes
5	If it is not necessary to show the time range on the diagram, select the <b>Suppress In Diagram</b> checkbox
6	Click on the <b>OK</b> button If you have not suppressed it, the time range displays underneath the Lifeline elements that you create on the diagram

### 6.3.5.4 Edit a Timing Diagram

On a Timing Diagram, you can add State Lifeline elements and Value Lifeline elements. You can maintain the states and transitions on these Lifeline elements either on the diagram itself or via the Configure Timeline dialog.

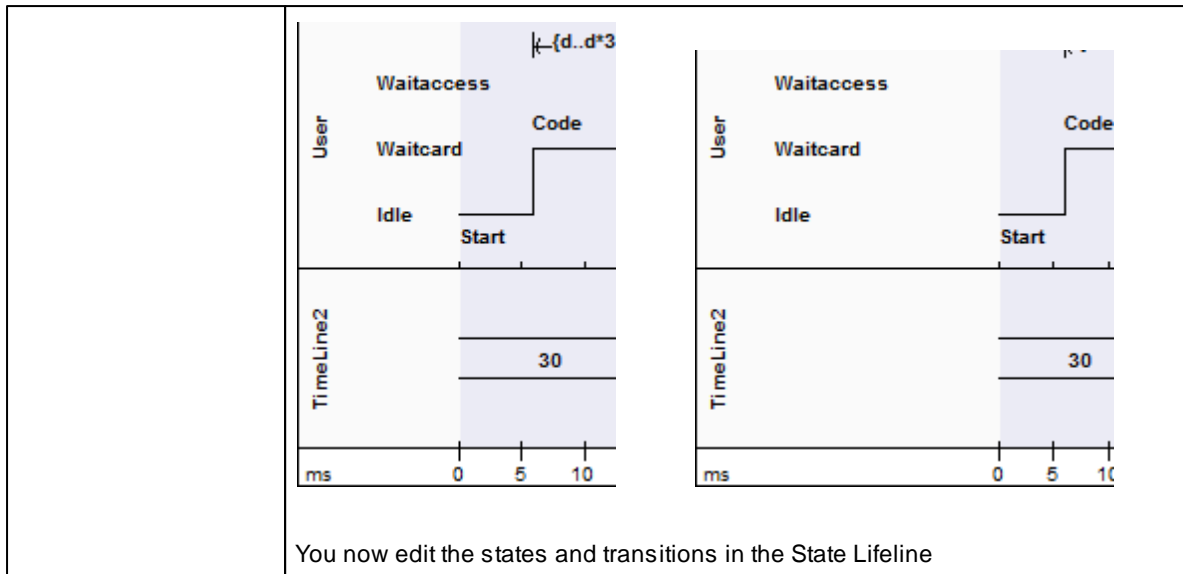

#### Learn More:

- [Add and Edit a State Lifeline Element](#)<sup>[835]</sup>
- [Add States to a State Lifeline](#)<sup>[836]</sup>
- [Edit States in a State Lifeline](#)<sup>[837]</sup>
- [Delete States in a State Lifeline](#)<sup>[837]</sup>
- [Edit Transitions in a State Lifeline Element](#)<sup>[837]</sup>
- [Add and Edit a Value Lifeline Element](#)<sup>[840]</sup>
- [Add States in a Value Lifeline Element](#)<sup>[840]</sup>
- [Edit Transitions in a Value Lifeline Element](#)<sup>[840]</sup>
- [Configure Timeline dialog - States Tab](#)<sup>[842]</sup>
- [Configure Timeline dialog - Transitions Tab](#)<sup>[844]</sup>

#### 6.3.5.4.1 Add and Edit State Lifeline

From the Timing elements page of the Toolbox drag a State Lifeline element onto your diagram. The element displays on the diagram.

Task	Action
<b>Define the name of the State Lifeline</b>	<ol style="list-style-type: none"> <li>1. Right-click on the element; the context menu displays</li> <li>2. Select the <b>Other Properties</b> option; the Timeline &lt;name&gt; dialog displays, showing the General tab</li> <li>3. Overtyping the <b>Name</b> field</li> <li>4. Click on the <b>Apply</b> button and the <b>OK</b> button</li> </ol>
<b>Sizing and Scale</b>	<p>In the top left corner of a selected Lifeline element are the left and right quick sizing buttons (  )</p> <p>These buttons increase or decrease the width of the Lifeline element, which in turn controls the scale width of each time unit; by increasing the width of the element you increase the resolution when adding transitions, which makes them easier to edit</p> <p>In order to edit the State Lifeline element, you must click on it to select it</p>
<b>Set Timeline Start Position</b>	<p>You might require more space at the start of your timelines; for example, to use long state names</p> <p>To insert more space in all the timelines on a diagram, follow the steps below:</p> <ol style="list-style-type: none"> <li>1. Right-click on the diagram background to display the context menu</li> <li>2. Select the <b>Set Timeline Start Position</b> menu option; the Set Timeline Start Position dialog displays</li> <li>3. The <b>Value 80 to 300</b> field defaults to <b>80</b> as the minimum distance in pixels between the start of the timeline element and the start of the timeline itself; type a new value up to 300 pixels and click on the <b>OK</b> button to increase the space at the start of the timeline, as shown in the following diagrams (80 pixels and 150 pixels respectively)</li> </ol>

- [Add States to a State Lifeline](#)<sup>[836]</sup>
- [Edit States in a State Lifeline](#)<sup>[837]</sup>
- [Delete States in a State Lifeline](#)<sup>[837]</sup>
- [Edit Transitions In State Lifeline](#)<sup>[837]</sup>

#### 6.3.5.4.2 Add States to a State Lifeline

To add States to a State Lifeline, follow the steps below:

Step	Description	See Also
1	Click on the <i>State Lifeline</i> element  The <b>New State</b> button (  ) and <b>Edit States</b> button (  ) display at the bottom left of the element	
2	Click on the <b>New State</b> button  The New State dialog displays	
3	In the <b>State</b> field, type the name of the state	
4	Click on the <b>OK</b> button  You must add at least two states; for example, <b>On</b> and <b>Off</b>	
5	As you add states, increase the height of the element by dragging a handle-box (  ) on the edge of the element  You can also add states using the States tab of the Configure Timeline dialog; add either: <ul style="list-style-type: none"> <li>• Discrete states to the Timeline, or</li> <li>• A continuous range of numeric states</li> </ul>	<a href="#">Add a New State</a> <sup>[842]</sup>  <a href="#">Numeric Range Generator</a> <sup>[843]</sup>

#### 6.3.5.4.3 Edit States in a State Lifeline

To edit States in a State Lifeline, follow the steps below:

Step	Description	See Also
1	Click on the State Lifeline element and click on the required state The Edit State dialog displays	
2	In the <b>State</b> field, change the name as required	
3	Click on the <b>OK</b> button	
4	If necessary, change the order of the states by either: <ul style="list-style-type: none"> <li>Clicking on the up or down arrows (⬆ and ⬇) beside each state name, or</li> <li>Right-clicking on the state name and selecting the <b>Move Up</b> or <b>Move Down</b> context menu options</li> </ul> You can also edit the states using the States tab of the Configure Timeline dialog	<a href="#">States</a> <sup>[842]</sup>

#### 6.3.5.4.4 Delete States in a State Lifeline

To delete States in a State Lifeline, follow the steps below:

Step	Description
1	Right-click on the state name The context menu displays
2	Select the <b>Delete</b> option

Alternatively:

Step	Description
1	Click on the State Lifeline element
2	Hold down ( <b>Ctrl</b> ) and move the cursor over the state name The cursor changes form (↔)
3	Click the mouse button The state name is deleted

#### 6.3.5.4.5 Edit Transitions In State Lifeline

Task	Action	See Also
<b>Add and Move Transitions</b>	After you have added states, you can add transitions via the diagram	<a href="#">Add and Move Transitions</a> <sup>[838]</sup>
<b>Change the Transition</b>	Move the cursor over one or other of the vertical	

<b>Time</b>	<p>transition lines and drag the line left or right to change the time of the transition</p> <p>While on the line, the cursor shape changes to the horizontal movement cursor (←→)</p>	
<b>Merge Transitions</b>	<p>If necessary, you can 'push' a transition to merge it with the next or previous transition point on any Lifeline element on the diagram</p> <p>Position the cursor off the appropriate side of the transition line; the cursor changes form ( ← or → )</p> <p>Click the mouse button; the system locates the nearest transition in the required direction, on any element on the diagram, and merges the current transition with that transition</p>	
<b>Delete Transitions</b>	<p>Transitions are automatically deleted when you move the transition to the same state as the previous transition state, and release the cursor</p> <p>Alternatively, right-click on the transition line to display the context menu, and select the <b>Delete</b> menu option</p>	

#### 6.3.5.4.5.1 Add and Move Transitions

After you have added states, you can add transitions via the diagram. As you move the cursor over the timeline, the cursor changes to one of three shapes.

<b>Task</b>	<b>Action</b>	<b>See also</b>
<b>The move cursor</b> (↕)	<p>Displays when it is directly over the timeline</p> <p>Hold down the mouse button and drag the line to move the timeline to a state above or below the current position; you can move the transition more than one state up or down, if necessary</p>	
<b>The new transition up cursor</b> (↑)	<p>Displays when it is just below the timeline, and there is another state above the line</p> <p>Press and hold ( <b>Alt</b> ); the cursor changes (↑)</p> <p>Click to create a new transition to the state above the line</p> <p>To push the transition up more than one state, move the cursor onto the line and drag it up</p> <p>The transition is for one interval unit; you can make it longer by changing the transition time</p> <p>If you do not hold ( <b>Alt</b> ), the cursor does not change and the whole timeline from the transition onwards moves up</p>	<a href="#">Edit Transitions In State Lifeline</a> <sup>[837]</sup>
<b>The new transition down cursor</b> (↓)	<p>Displays when it is just above the transition line, and there is another state below the line</p> <p>Press and hold ( <b>Alt</b> ); the cursor changes (↓)</p>	<a href="#">Edit Transitions In State Lifeline</a> <sup>[837]</sup>

	<p>Click to create a new transition to the state below the line</p> <p>To push the transition down more than one state, move the cursor onto the line and drag it down</p> <p>The transition is for one interval unit; you can make it longer by changing the transition time</p> <p>If you do not hold ( <b>Alt</b> ), the cursor does not change and the whole timeline from the transition onwards moves down</p>	
--	--	--

As you move the cursor over the vertical line of a transition, the time at which the transition occurs displays next to the line.

#### How to:

To edit Transitions, follow the steps below:

Step	Action
1	Click directly on the appropriate transition line, after the transition begins Alternatively, right-click on the transition line to display the context menu, and select the <b>Edit</b> menu option The Edit Transition dialog displays; the fields in this dialog are all optional
2	In the <b>At Time</b> field, type the point on the timescale at which the transition occurs
3	In the <b>Transition To</b> field, type the name of the state to which the transition occurs
4	In the <b>Event</b> field, type the name of the event that the transition represents; this displays on the Timeline element just above the transition line
5	In the <b>Duration Constraint</b> field, type any constraint on the duration of the transition; this displays on the Timeline element, along the top of the element over the transition
6	In the <b>Time Constraint</b> field, type any constraint on the start of the transition This displays on the Timeline element at the start of the transition
7	Click on the <b>OK</b> button

#### Notes:

- Once Event, Duration Constraint or Time Constraint are displayed on the diagram, you can edit them directly by clicking on them to display their specific dialog
- You can delete them by pressing and holding ( **Ctrl** ) as you click on them; the cursor changes form when you press ( **Ctrl** )
- You can also edit transitions using the Transitions tab of the Configure Timeline dialog

#### Learn More:

- [Transitions](#) <sup>[844]</sup>

#### 6.3.5.4.6 Add and Edit Value Lifeline

From the Toolbox drag a Value Lifeline element onto your diagram. The element displays on the diagram.

##### How to:

To edit the Value Lifeline name, follow the steps below:

Step	Action
1	Right-click on the element The context menu displays
2	Select the <b>Other Properties</b> option The Timeline <name> dialog displays, showing the General tab
3	Overtyping the <b>Name</b> field
4	Click on the <b>Apply</b> button and the <b>OK</b> button

##### Sizing and Scale

In the top left corner of a selected Lifeline element are the left and right *quick sizing* buttons (   ). These buttons increase or decrease the width of the Lifeline element, which in turn controls the scale width of each time unit. By increasing the width of the element you increase the resolution when adding transitions, which makes them easier to edit.

##### Learn More:

- [Value Lifeline](#)<sup>[940]</sup>
- [Add States in a Value Lifeline](#)<sup>[840]</sup>
- [Edit Transitions in a Value Lifeline](#)<sup>[840]</sup>

#### 6.3.5.4.7 Add States In Value Lifeline

Adding States to a Value Lifeline is similar to adding states to a State Lifeline element.

For a Value Lifeline, only the first state displays on the diagram. The other states are added to a list to access when creating transitions; they only display on the Lifeline element as you create transitions to those states.

You can only edit or delete states in a Value Lifeline element using the **States** tab of the **Configure Timeline** dialog.

##### Learn More:

- [Add States to a State Lifeline](#)<sup>[836]</sup>

#### 6.3.5.4.8 Edit Transitions In Value Lifeline

##### How to:

To add transitions to the states on a Value Lifeline element, via the diagram, follow the steps below:

Step	Action
1	Move the cursor above the transition line The cursor changes form (  )
2	Click the mouse button The New Transition Event dialog displays
3	In the <b>Transition To</b> field, click on the drop-down arrow and select a state from the list of available states; this displays on the Lifeline element within the transition box The remaining fields on the dialog are optional
4	In the <b>Event</b> field, type the name of the event that the transition represents; this displays on the Lifeline element just below and at the start of the transition line
5	In the <b>Duration Constraint</b> field, type any constraint on the duration of the transition; this displays on the Lifeline element, along the top of the element over the transition
6	In the <b>Time Constraint</b> field, type any constraint on the start of the transition This displays on the Lifeline element at the start of the transition, just after the Event name
7	Click on the <b>OK</b> button to create the new transition

To edit a transition, follow the steps below:

Step	Action
1	Click on the state name in the transition Alternatively, right-click on the state name to display the context menu, and select the <b>Edit</b> menu option The Edit Transition dialog displays, which is the same as the New Transition Event dialog, except that the <b>At Time</b> field is enabled
2	If necessary, overwrite the <b>At Time</b> field to define a different start point You cannot change the <b>At Time</b> field for the first state in the timeline; this is always <b>0</b>
3	Edit the remaining fields as necessary
4	Click on the <b>OK</b> button to save the changes

To change the Transition Time, follow the steps below:

Step	Action
1	To change the start or end time of a transition, click on the start or end point of the transition and drag it to the new position While on the line, the cursor shape changes to the horizontal movement cursor (  )

To delete Transitions, follow the steps below:

Step	Action
1	To delete a transition, press and hold ( <b>Ctrl</b> ) and click on the transition state name While you hold ( <b>Ctrl</b> ) on the transition state name, the cursor changes form ( ↖ ). Alternatively, right-click on the state name to display the context menu, and select the <b>Delete</b> menu option

#### 6.3.5.4.9 Configure Timeline - States

You can manage states using the States tab of the Configure Timeline dialog. To display this, either:

- Double-click on the Lifeline element
- Right click on the Lifeline element and, from the context menu, select the **Properties** option, or
- On a Value Lifeline, click on the **Edit States** button (  )

The Configure Timeline dialog defaults to the States tab.

All states currently defined for the Lifeline element are listed in the **States** panel.

#### How to:

To add a new State, follow the steps below:

Step	Action
1	In the <b>State Name</b> field, type the name of the first new state in the Lifeline element; for example, <b>WaitState</b>
2	Click on the <b>Save</b> button The state is added to the <b>States</b> panel and (for a State Lifeline Element) to the diagram
3	Click on the <b>New</b> button
4	In the <b>State Name</b> field, type the name of the next state in the Lifeline element
5	Repeat steps 2 to 5 until you have added all required states (you must add at least three to the Lifeline element)
6	When you have added all the required states, click on the <b>OK</b> button to close the Configure Timeline dialog

To edit an existing state, follow the steps below:

Step	Action
1	Click on the state in the <b>States:</b> list
2	In the <b>State Name</b> field, change the name of the state
3	Click on the <b>Save</b> button

To delete an existing State, follow the steps below:

Step	Action
1	Click on the state in the <b>States:</b> list
2	Click on the <b>Delete</b> button

To change the order of States, follow the steps below:

Step	Action
1	Click on the state in the <b>States:</b> list.
2	Click on the  or  buttons to move the state up or down the sequence

**See Also:**

- [Numeric Range Generator](#)<sup>[843]</sup>

#### 6.3.5.4.10 Numeric Range Generator

You can also use the Configure Timeline dialog to create a range of states having numeric values to be applied to the Timeline.

**Important:** This operation deletes all existing states and transitions for the Timeline element.

**How To:**

To create a range of states having numeric values, follow the steps below:

Step	Action
1	Double-click on the Lifeline element The Configure Timeline dialog displays
2	Click on the <b>Create Continuous Numeric States</b> button The Numeric Range Generator dialog displays
3	In the <b>High Value</b> and <b>Low Value</b> fields, type the upper and lower values of the range
4	In the <b>Step Value</b> field, type the increase interval Nonsense values do not parse; <b>Low Value</b> must be less than <b>High Value</b> , and <b>Step Value</b> must be a positive value smaller than the total range
5	In the <b>Units</b> field, type the name of the measurement unit; for example, <b>minutes</b>
6	Click on the <b>OK</b> button Enterprise Architect displays a warning that existing states and transitions are to be deleted
7	Click on the <b>Yes</b> button

	The Configure Timeline dialog redisplay, with the defined range of states listed in the States panel
<b>8</b>	<p>Click on the <b>OK</b> button</p> <p>For a:</p> <ul style="list-style-type: none"> <li>• Value Lifeline, the first state is shown on the Timeline for the full time range of the Timeline</li> <li>• State Lifeline, the range of states is displayed as the y-axis of the Timeline</li> </ul>

#### 6.3.5.4.11 Configure Timeline - Transitions

You can also manage transitions using the Transitions tab of the Configure Timeline dialog. To display this, either:

- Double-click on the Lifeline element
- Right click on the Lifeline element and, from the context menu, select the **Properties** option, or
- On a Value Lifeline, click on the **Edit States** button (  ).

The Configure Timeline dialog defaults to the States tab. Click on the Transitions tab.

All transitions defined for the Timeline element are listed in the Transition Points panel.

#### How To:

To add a new transition, follow the steps below:

Step	Action
1	Click on the <b>New</b> button
2	In the New Transition panel, type the details of the transition
3	Click on the <b>Save</b> button

To edit a transition, follow the steps below

Step	Action
1	Click on a transition in the list
2	In the Edit Transition panel, edit the fields for the transition as required
3	Click on the <b>Save</b> button

To delete a transition, follow the steps below

Step	Action
1	Click on a transition in the list
2	Click on the <b>Delete</b> button

	The transition is removed from the dialog and the Lifeline
3	Click on the <b>OK</b> button

### 6.3.5.5 Time Intervals

You create and manage Time Intervals using the *Interval Bar* (the pale line along the top of each selected Lifeline element). Time Intervals enable you to perform various operations on transitions, such as copy and paste. They also enable you to compress sections of the timeline so that they are not visible.

Each Time Interval displays across all Timeline elements down to the last element on the diagram.

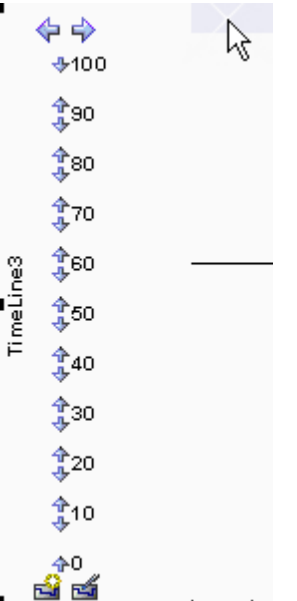

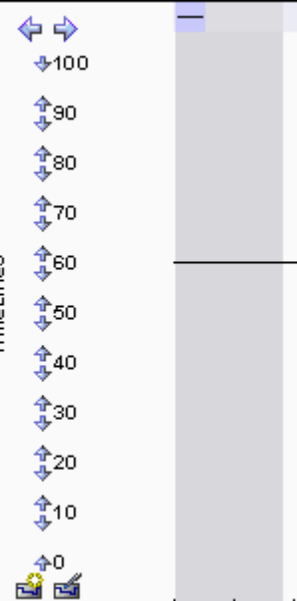

Action	Description	See
<b>Create Time Intervals</b>	You can create a Time Interval using the Interval Bar - Context Menu, using the Interval Bar - ( <b>Shift</b> ) key, or using the Timeline - Context menu.	<a href="#">Create Time Intervals</a> [845]
<b>Compress Time Intervals</b>	You can compress Time Intervals to conserve space on long timelines.	<a href="#">Compress Time Intervals</a> [847]
<b>Select Time Intervals</b>	There are a number of ways to select Time Intervals for performing other operations.	<a href="#">Select Time Intervals</a> [848]
<b>Move Time Intervals</b>	To move a Time Interval, move the cursor over the Interval bar within the Time Interval, hold down the mouse button and drag the interval left or right  Time Intervals can meet, but cannot overlap.	
<b>Resize Time Intervals</b>	To resize a Time Interval, move the cursor over the Interval Bar at the start or end edge of the Time Interval, hold down the mouse button and move the edge left or right  Time Intervals can meet, but cannot overlap.	
<b>Delete Time Intervals</b>	To Delete Time Intervals, select each Time Interval to be deleted and press ( <b>Delete</b> )  Deleting the Time Interval does not delete transitions within that interval	

#### 6.3.5.5.1 Create Time Intervals

##### How to:

To create a Time Interval using the Interval Bar context menu, follow the steps below:

Step	Description	

1	<p>Right-click on the Interval Bar at approximately the point at which to start or finish the Time Interval</p> <p>The context menu displays</p>	
2	<p>Select the <b>Create Time Interval</b> option</p> <p>The Time Interval displays down all the timeline elements, as a narrow pale band with a blue compression box at the top</p>	
3	<p>Move the cursor to the edge of the Time Interval in the Interval Bar so that the cursor changes to the drag form (↔) and drag the edge to the correct start or end point</p>	

To create a Time Interval using the Interval Bar and ( **Shift** ) key, follow the steps below:

Step	Description	See also
1	<p>Move the cursor over the Interval Bar and press ( <b>Shift</b> )</p> <p>The cursor changes shape ( ↔ )</p>	
2	<p>Click to create the Time Interval</p>	
3	<p>Move the cursor to the edge of the Time Interval in the Interval</p>	

	Bar so that the cursor changes to the drag form (↔) and drag the edge to the correct start or end point	
--	---	--

To create a Time Interval using the Timeline context menu, follow the steps below:

Step	Description	See Also
1	Right-click on the timeline just after a transition The context menu displays	
2	Click on the <b>Select</b> menu option Enterprise Architect creates a Time Interval covering the period from the selected transition up to the next transition  If there are other Time Intervals in this period, Enterprise Architect replaces them with the single Time Interval for the transition state; you should consider this when creating the Time Interval, as it extends across the other Timeline elements in the diagram  A value of this method is that it creates a Time Interval for a period in which no transitions occur, which could be lengthy; you can then compress this Time Interval to hide the period of inactivity	<a href="#">Compress Timeline</a> <sup>[850]</sup>

### 6.3.5.5.2 Compress Time Intervals

You can compress Time Intervals to conserve space on long timelines.

#### Uncompressed Time Intervals

#### Compressed Time Intervals

Notice:

Item	Description
	The compression toggle boxes: <ul style="list-style-type: none"> <li>•  is expanded, click on this to compress the selected time interval</li> <li>•  is compressed, click on this to expand the selected time interval again.</li> </ul>
	The compressed sections of the timelines themselves, in all elements. If there is space between the paired symbols, there are transitions within the compressed section. If the timeline continues through the paired symbols there are no transitions in the compressed section.
25 ... 55	The compressed sections in the time range underneath the elements.

You can also compress and expand Time Intervals using context menu options; see [Time Interval Operations on Transitions](#) <sup>849</sup>.

### 6.3.5.5.3 Select Time Intervals

Task	Action	See Also
<b>Select a Time Interval across all elements on the diagram</b>	Click on the Interval Bar within the Time Interval	
<b>Select a number of individual Time Intervals</b>	Press and hold ( <b>Ctrl</b> ) while clicking on the Interval Bar within each Time Interval	
<b>Select all Time Intervals in a range</b>	Click on the Interval Bar within the first Time Interval in the range, then press and hold ( <b>Shift</b> ) and click on the Interval Bar within the last Time Interval in the range  All Time Intervals between the two are selected	

After you have selected one or more Time Intervals, you can modify the selection in the following ways:

Task	Action	See Also
<b>Exclude Lifeline elements from the selection</b>	Press and hold ( <b>Ctrl</b> ) and click on any part of the selection within that element  Repeat the step to toggle the selection and re-include the element	<a href="#">Toggle Interval Selection</a> <sup>[849]</sup>
<b>Select only one Lifeline element and exclude all others</b>	Press and hold ( <b>Shift</b> ) and click on any part of the selection within that element	

#### 6.3.5.5.4 Time Interval Operations

This topic discusses how you select and update specific Time Intervals.

Right-click on the Interval Bar within an interval. A context menu displays providing the following options:

Option	Action	See also
<b>Select Interval</b> <b>Deselect Interval</b>	Select the Time Interval or, if the interval is already selected, deselect it  You can select several Time Intervals in this way, accessing the menu separately on each interval	<a href="#">Select Time Intervals</a> <sup>[848]</sup>
<b>Toggle Interval Selection</b>	Switch the selection or deselection of the Time Interval within the selected Timeline element  You select or deselect a Time Interval across all Timeline elements, but the Toggle option acts only on the element in which you access the menu	<a href="#">Select Time Intervals</a> <sup>[848]</sup>
<b>Compress Interval</b>	Compress the Time Interval, and hide all transitions within that Time Interval  This is also useful for hiding long sections of inactivity on the time line	<a href="#">Compress Timeline</a> <sup>[850]</sup>
<b>Remove Interval</b>	Delete the Time Interval	
<b>Copy</b>	Copy the transitions for all selected Time Intervals	
<b>Cut</b>	Copy and delete the selected transitions from the diagram	
<b>Cut and Remove Time</b>	Copy and delete the transitions that lie in the selected Time Intervals from the diagram  This option also removes time from the timeline, the amount being the duration of the Time Interval  All transitions and Time Intervals to the right of the selected time interval are moved left	
<b>Delete</b>	Delete the selected transitions from the diagram	
<b>Delete and Remove Time</b>	Delete the transitions that lie in the selected Time Intervals from the diagram  This option also removes time from the timeline, the amount being the duration of the Time Interval  All transitions and Time Intervals to the right of the current Time Interval are moved left	

Option	Action	See also
<b>Insert Time</b>	Add time to the timeline and move all transitions and time intervals to the right  Also expand the duration of the current Time Interval	

#### Compress Timeline:

The Compression toggle boxes and **Compress Interval** menu option operate on the Time Interval and compress the timeline and all transitions within the Interval. You have an alternative option that operates on the timeline and compresses a single transition state.

1. Right-click on the timeline (rather than the Interval Bar) just after a transition. The context menu displays.
2. Click on the **Compress** menu option. Enterprise Architect creates a new Time Interval covering the period from the selected transition up to the next transition, and then compresses that Time Interval.

If there are other Time Intervals in this period, Enterprise Architect replaces them with the single Time Interval for the transition state. You should consider this when creating and compressing the Time Interval, as it extends across the other Timeline elements in the diagram.

A value of this method is that it creates a Time Interval for a period in which no transitions occur, which could be lengthy, and then compresses this Time Interval to hide the period of inactivity.

#### All Time Intervals in the Diagram:

To create a new Time Interval or work across all Time Intervals in the diagram, right-click on the Interval Bar between Time Intervals. A context menu displays, providing the following options (The **Paste ...** menu options become active after transitions have been copied).

Menu Option	Action	See also
<b>Create Time Interval</b>	Create a single Time Interval	<a href="#">Create Time Intervals</a> [845]
<b>Expand all Time Intervals</b>	Expand all Time Intervals over the whole diagram	
<b>Compress all Time Intervals</b>	Compress all Time Intervals over the whole diagram	
<b>Paste Combine</b>	Paste copied transitions over any existing transitions within the copied time frame  The diagram does not allow two consecutive transitions to the same state, and removes the second transition automatically	
<b>Paste Remove</b>	Delete all the transitions and then pastes the copied transition within the copied time frame	
<b>Paste Insert</b>	Insert time, moving all transitions and Time Intervals to the right to make room to paste in the copied transitions	
<b>Insert Time</b>	Add time to the timeline and move all transitions and Time Intervals to the right  This option does not change the duration of any Time Interval	

To copy and paste transitions from one timeline element to another, follow the steps below:

Step	Action	See Also
1	Press and hold ( <b>Shift</b> ) and select the Timeline element within a Time Interval to copy or cut	
2	Right-click on the Interval Bar (it doesn't matter which element you select) The context menu displays	
3	Copy or cut the transitions You can also cut and remove time	<a href="#">Copy or cut</a> <sup>[849]</sup>
4	Select the timeline to paste transitions to and right-click on the Interval Bar The context menu displays	
5	Select one of the paste operations Note that states are created if they don't already exist in the timeline Any states that don't exist in the Timeline element you are pasting to are created Any new states created might be in the wrong order; you can change the order via the diagram quick buttons	<a href="#">Quick Buttons</a> <sup>[835]</sup>

To shift transitions within a selected Time Interval or multiple selected Time Intervals, follow the steps below:

Step	Action	See Also
1	Select all the Time Intervals containing the transitions to be shifted	<a href="#">Select Time Intervals</a> <sup>[848]</sup>
2	Press and hold ( <b>Shift</b> ) and click on the Interval Bar (it doesn't matter which Timeline element you select), and move the transition left or right You cannot drag transitions over other transitions; the move stops when the moved transition collides with a stationary transition If you have collision problems, use ( <b>Shift</b> ) + select to shift transitions for a single Timeline element	

### 6.3.6 Sequence Diagram

A Sequence diagram is a structured representation of behavior as a series of sequential steps over time.

#### Use To:

- Depict work flow, message passing and how elements in general cooperate over time to achieve a result
- Capture the flow of information and responsibility throughout the system, early in analysis; messages between elements eventually become method calls in the Class model
- Make explanatory models for Use Case scenarios; by creating a Sequence diagram with an Actor and elements involved in the Use Case, you can model the sequence of steps the user and the system undertake to complete the required tasks

#### Construction:

- Each sequence element is arranged in a horizontal sequence, with messages passing back and

forward between elements

- Messages on a Sequence diagram can be of several types; the Messages can also be configured to reflect the operations and properties of the source and target elements (see the Notes in the Message topic)
- An Actor element can be used to represent the user initiating the flow of events
- Stereotyped elements, such as Boundary, Control and Entity, can be used to illustrate screens, controllers and database items, respectively
- Each element has a dashed stem called a Lifeline, where that element exists and potentially takes part in the interactions

To toggle the numbering of messages on a Sequence diagram, select or deselect the **Show Sequence Numbering** checkbox on the Options dialog.

**Example Diagram:** [Example Sequence Diagram](#) <sup>[853]</sup>

#### Tools:

Select Sequence diagram elements and connectors from the [Interaction pages](#) <sup>[558]</sup> of the Toolbox. Click on the following elements and connectors for more information.

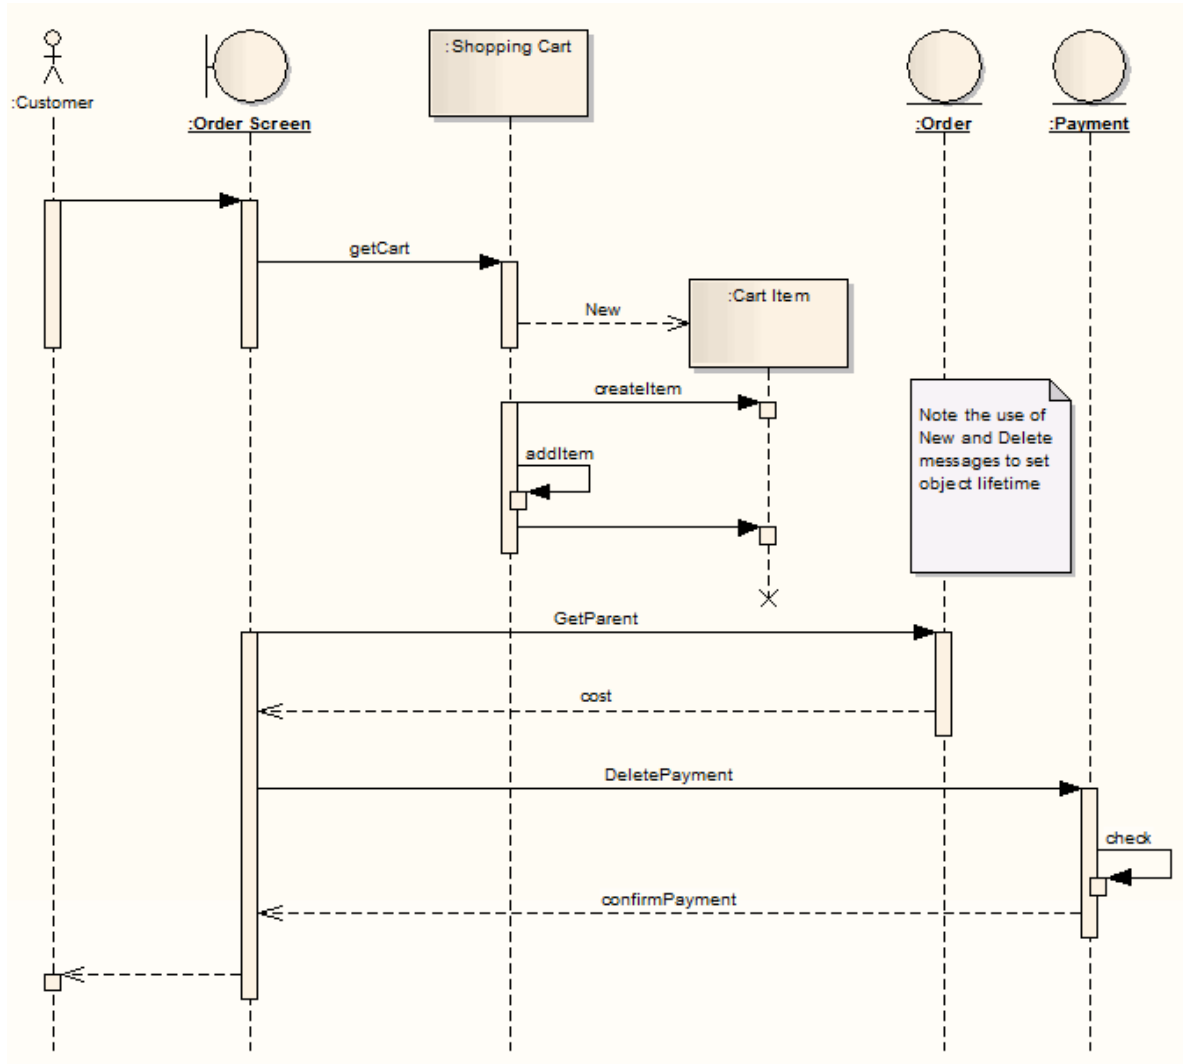

Sequence Diagram Elements	Sequence Diagram Connectors
 Actor	 Message
 Lifeline	 Self-Message
 Boundary	 Recursion
 Control	 Call
 Entity	
 Fragment	
 Endpoint	
 Diagram Gate	
 State/Continuation

### 6.3.6.1 Example Sequence Diagram

The following example Sequence diagram demonstrates several different elements:

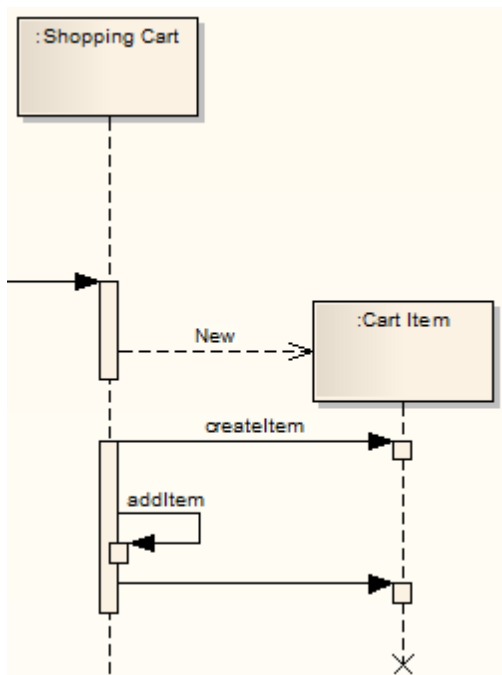

### 6.3.6.2 Denote Lifecycle of an Element

To capture element lifetimes using messages that are denoted as New or Delete message types, follow the steps below

Step	Action
1	Double-click on a message within a Sequence diagram to display the Message Properties dialog.
2	In the Lifecycle field, click on the drop-down arrow and select <b>New</b> or <b>Delete</b> .
3	Click on the <b>OK</b> button to save the changes.

**Example Diagram:** The example below shows two elements that have specific creation and deletion times

**Notes:**

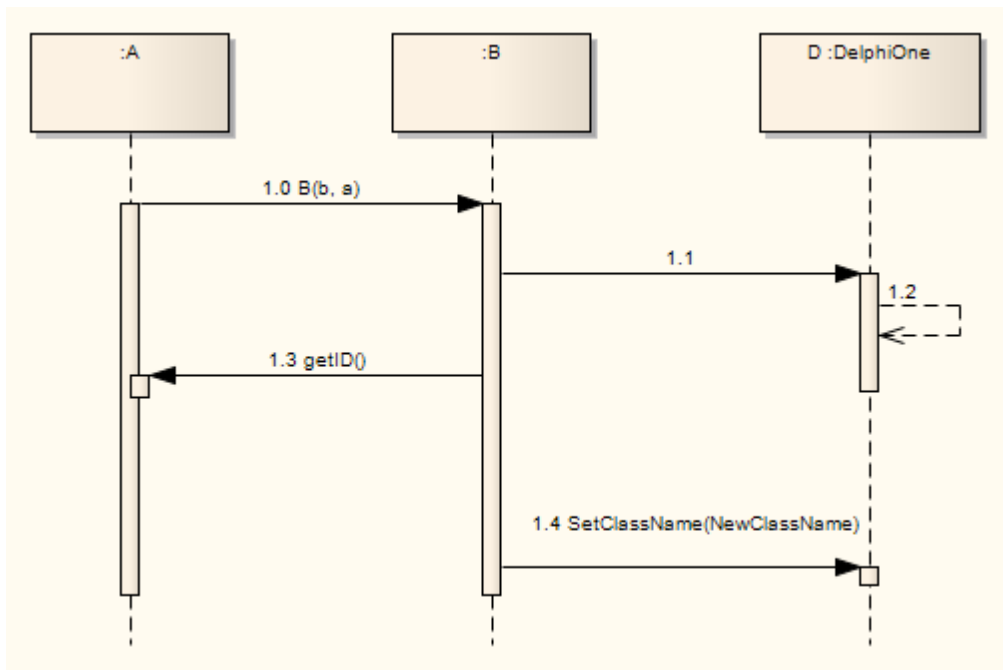

- To show the termination **X** on the lifeline in the example diagram, you must switch on garbage collection: **Tools | Options | Diagram > Sequence: Garbage Collect.**

**6.3.6.3 Layout of Sequence Diagrams**

To offset the vertical height of sequence messages to get an attractive and effective layout, follow the steps below

Step	Action
1	Select the appropriate message in a Sequence diagram
2	Use the mouse to drag the message up or down as required  As you drag a message up or down a lifeline, any messages or fragments below that message are shifted up or down the same amount; however, be aware that if you drag up or down past the next or previous message, Enterprise Architect interprets that as the requirement to swap positions, rather than simply offset a message position

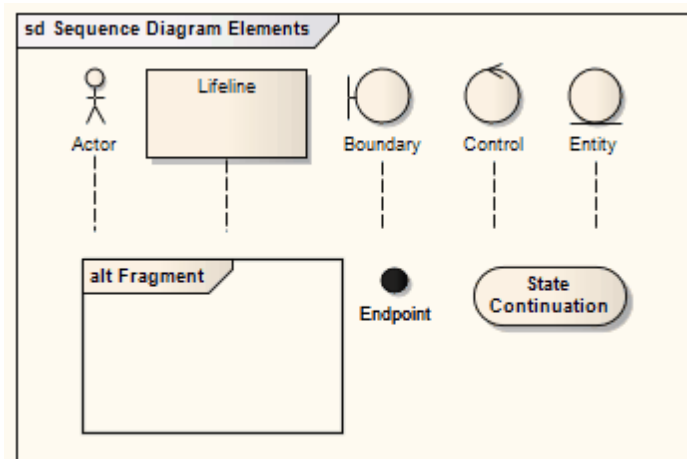

**Example Diagram:** The example below shows an economical use of space in a Sequence diagram

#### 6.3.6.4 Sequence Elements

The example below shows some possible elements of Sequence diagrams and their stereotyped display.

Element	Description	See Also
<b>Actor</b>	An instance of an actor at runtime; this can be depicted either as the human figure or in rectangle notation.	<a href="#">Actor</a> <sup>[879]</sup>
<b>Lifeline</b>	An Object element with the stereotype Lifeline.	<a href="#">Lifeline</a> <sup>[912]</sup>
<b>Boundary</b>	Represents a user interface screen or input/output device.	<a href="#">Boundary</a> <sup>[1297]</sup>
<b>Entity</b>	A persistent element - typically implemented as a database table or element.	<a href="#">Control</a> <sup>[1292]</sup>
<b>Control</b>	The active component that controls what work gets done, when and how.	<a href="#">Entity</a> <sup>[1293]</sup>

### 6.3.6.5 Sequence Diagrams and Version Control

You might create Sequence diagrams that use elements from other packages as the Lifelines within the diagram. In such cases, the diagrams could be corrupted when the element packages are checked in and out under version control. This is because during checkout the elements are first deleted from the model and then re-imported, and although they are reinstated in the diagrams, any Messages connecting them are not.

So, if the diagram and its elements reside in different packages, a round-trip of the element package through version control might damage the Sequence diagram.

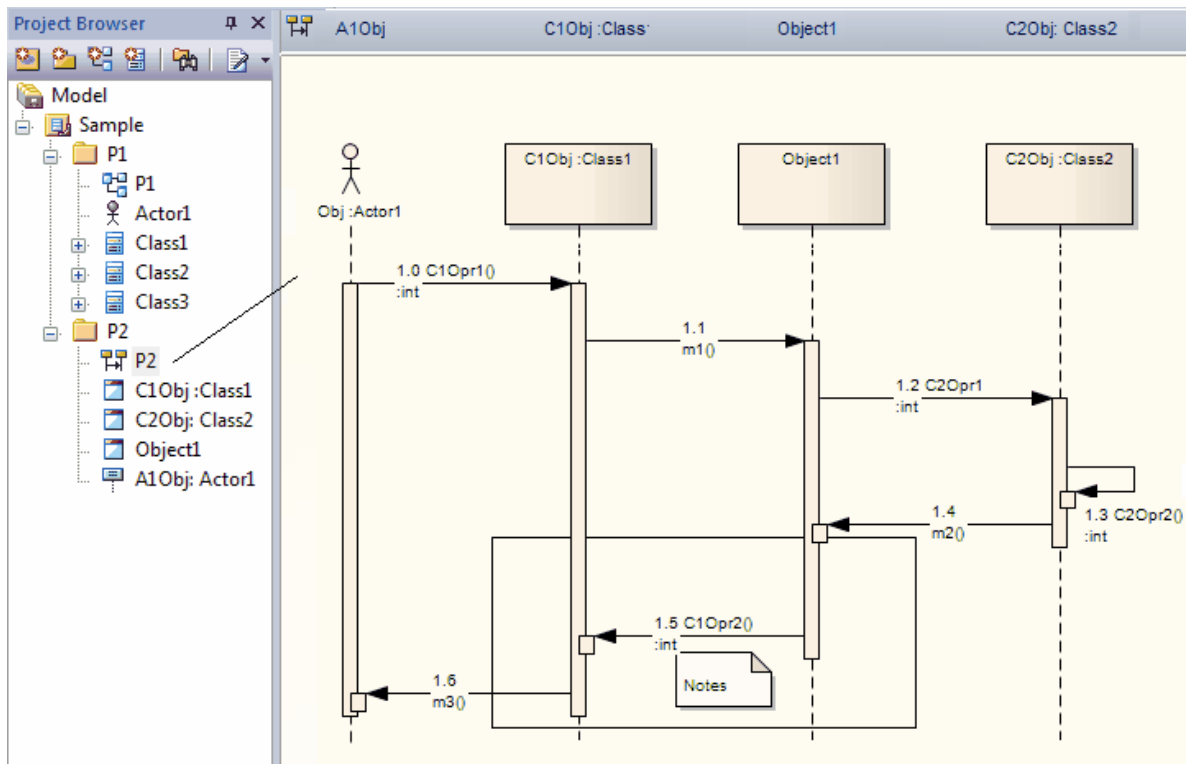

The solution is to drag-and-drop each Class onto the Sequence diagram as an *object* - when you drop the Class onto the Sequence diagram, in the **Paste Element** dialog select the **as Instance of Element (Object)** option. This creates a new object in the *diagram's* parent package, based on the selected Class element. You then create the Messages between the objects.

Therefore, to ensure that a Sequence diagram is not damaged by round-trips of other packages through version control, remember that:

- The Lifelines must be objects (even though Enterprise Architect allows you to drop elements as Lifelines onto a Sequence diagram, it is not a strictly UML compliant construct)
- The Lifelines must be in the same package as the diagram.

The following illustration shows the **Project Browser** with two packages: *P1*, containing the elements, and *P2*, containing a Sequence diagram that uses those elements. The diagram itself is also shown.

This diagram is not damaged, because all the Lifelines are objects and these objects reside in the same package as the Sequence diagram.

### 6.3.6.6 Sequence Element Activation

Sequence elements in a Sequence diagram have Activation rectangles drawn along their lifelines. These rectangles describe the time the element is active during the overall period of processing. This visual representation can be suppressed by right-clicking the Sequence diagram, and selecting the **Suppress Activations** context menu option.

In general, Enterprise Architect calculates the period of activation for you, but in some cases you might want to fine tune the rectangle length. There are several context menu options on a sequence message that you can use to accomplish this. To access the following context menu, right-click on the message and select the **Activations** context menu option.

Command	Description
<b>Start New Message Group</b>	Starts off a new round of processing in the current diagram. This enables you to describe more than one processing scenario in a single diagram.
<b>Extend Source Activation Down</b>	Forces an element to stay active beyond the normal processing period. This could be used to express an element that continues its own processing concurrently with other processes.
<b>Extend Source Activation Up</b>	Forces an element's activation upwards.
<b>End Source Activation</b>	Truncates the activation of the source element after the current message. This is useful for expressing an asynchronous message after which the source element becomes idle.
<b>End Target Activation</b>	Ends a Forced Activation started by the Extend Source Activation

	options.
<b>Raise Activation Level</b>	Displays on the context menu only where its use is appropriate. For example, after a self-message the next message starts by default at a lower activation level but the Raise Activation Level command displays on the context menu to enable you to raise its level.
<b>Lower Activation Level</b>	Displays on the context menu only where its use is appropriate.

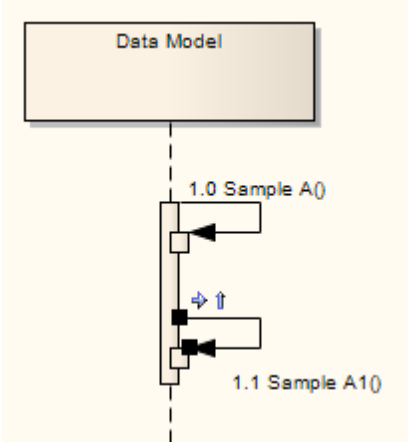

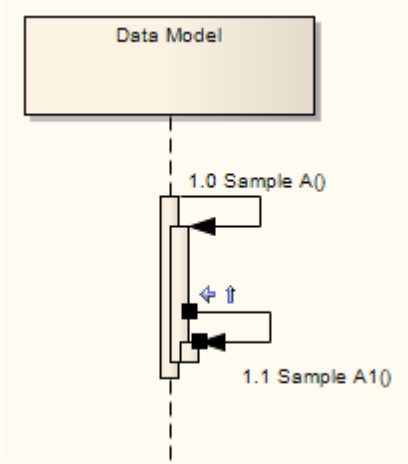

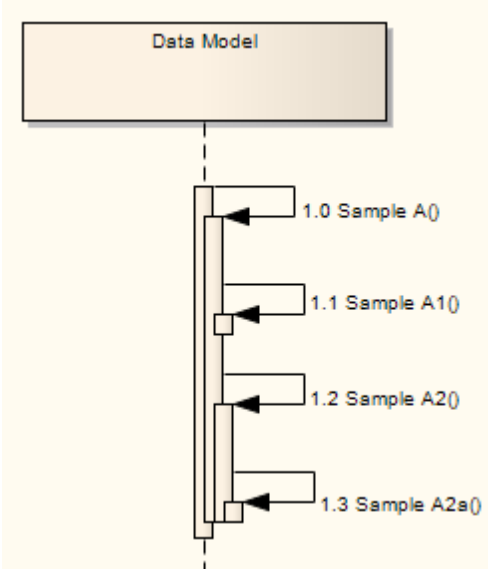

A more convenient way to change activation levels is directly on the diagram. Whenever appropriate, left and/or right arrows display on specific connectors. In the following diagram, see connector 1.3. Click on the arrow to raise or lower the activation level.

### 6.3.6.7 Lifeline Activation Levels

Complicated processing systems can be easily negotiated and reflected in Sequence diagrams, by adding activation layers on a single lifeline.

Example	Description
---------	-------------

 <p>The diagram shows a 'Data Model' box at the top. Below it is a vertical dashed line representing a lifeline. Two messages are shown: '1.0 Sample A()' and '1.1 Sample A1()'. A blue arrow points to the connector between the two messages, indicating the next step in the process.</p>	<p>A Class invokes the method Sample A, which in turn calls Sample A1.</p> <p>To produce the arrangement in the diagram, select the <b>More tools   Interaction</b> menu option, click on the Self-message icon in the Interaction Relationships panel and then click on the lifeline.</p>
 <p>The diagram is similar to the first one, but the lifeline for '1.1 Sample A1()' is now wider, indicating that its activation level has been raised during the execution of '1.0 Sample A()'.</p>	<p>In order to raise the Activation level of Sample A1, click on the raise arrow of the selected connector. The lifeline now visually depicts that method Sample A1 is called during the processing of Sample A.</p>
 <p>The diagram shows a 'Data Model' box at the top. Below it is a vertical dashed line representing a lifeline. Four messages are shown in sequence: '1.0 Sample A()', '1.1 Sample A1()', '1.2 Sample A2()', and '1.3 Sample A2a()'. Each message is a self-call to the lifeline, and each subsequent message is nested within the activation of the previous one.</p>	<p>In the example below, a few more self-messages have been added. The message Sample A2a is called from Sample A2 which in turn is called from Sample A (not Sample A1). Sample A1 is called from Sample A.</p>

### 6.3.6.8 Sequence Message Label Visibility

To hide and show the labels used in Sequence messages, follow the steps below

Step	Action
1	Right-click on the message within the Sequence diagram The message context menu displays
2	Select the <b>Set Label Visibility</b> menu option The Label Visibility dialog displays
3	Select or clear the checkbox against each message label to display or hide, respectively
4	Click on the <b>OK</b> button to save the settings

### 6.3.6.9 Change the Top Margin

In order to change the top margin of a Sequence diagram from the default 50 units, right-click on the diagram to display the context menu and select the **Set Top Margin** menu option. You can set the top margin to any value between 30 and 250 units.

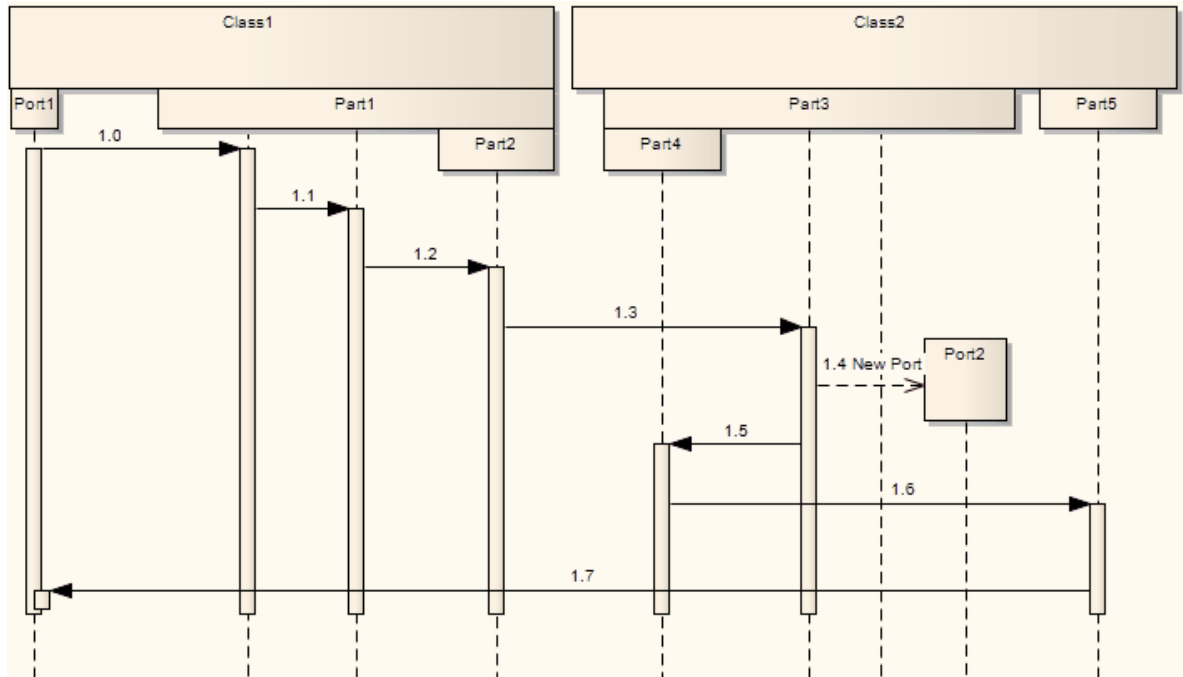

### 6.3.6.10 Inline Sequence Elements

It is possible to represent Part and Port elements on a Sequence diagram. Child Parts and Ports appear as inline sequence elements under their parent Class sequence element.

#### How to:

To represent Part and Port elements on a Sequence diagram, follow the steps below

Step	Action
1	Right-click on the sequence elements containing the child Ports or Parts, to display the context menu
2	Select the <b>Embedded Elements   Embedded Elements</b> menu option
3	Select the checkbox against each Part or Port to show, and click on the <b>Close</b> button

### 6.3.7 Communication Diagram

A Communication diagram is a diagram that shows the interactions between elements at run-time in much the same manner as a Sequence diagram. However, Communication diagrams are used to visualize inter-object relationships, while Sequence diagrams are more effective at visualizing processing over time. Communication diagrams were known as Collaboration diagrams in UML 1.

Communication diagrams employ ordered, labeled associations to illustrate processing. Numbering is important to indicate the order and nesting of processing. A numbering scheme could be:

- 1
- 1.1
- 1.1.1
- 1.1.2
- 1.2, and so on.

A new number segment begins for a new layer of processing, and would be equivalent to a method invocation.

**Example Diagram:** [Example Communication Diagram](#) <sup>862</sup>

**Tools:** Select Communication diagram elements and connectors from the Communication pages of the **Toolbox**. Click on the following elements and connectors for more information.

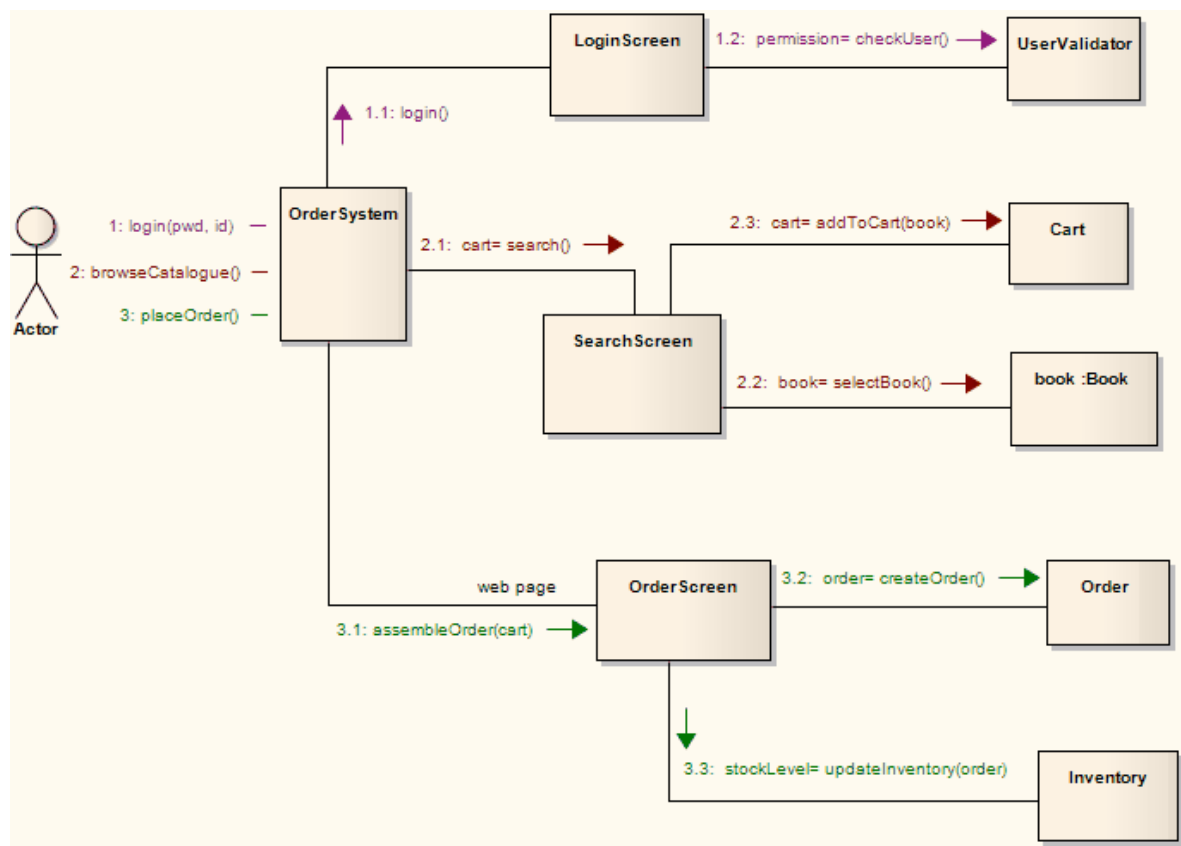

Communication Diagram Elements	Communication Diagram Connectors
 Actor	 Associate
 Object	 Nesting
 Boundary	 Realize
 Control	
 Entity	
 Package	

### Learn More:

- [Communication Diagrams in Color](#)<sup>[863]</sup>

#### 6.3.7.1 Example Communication Diagram

This example illustrates a Communication diagram among cooperating object instances. Note the use of message levels to capture related flows, and the different colors of the messages.

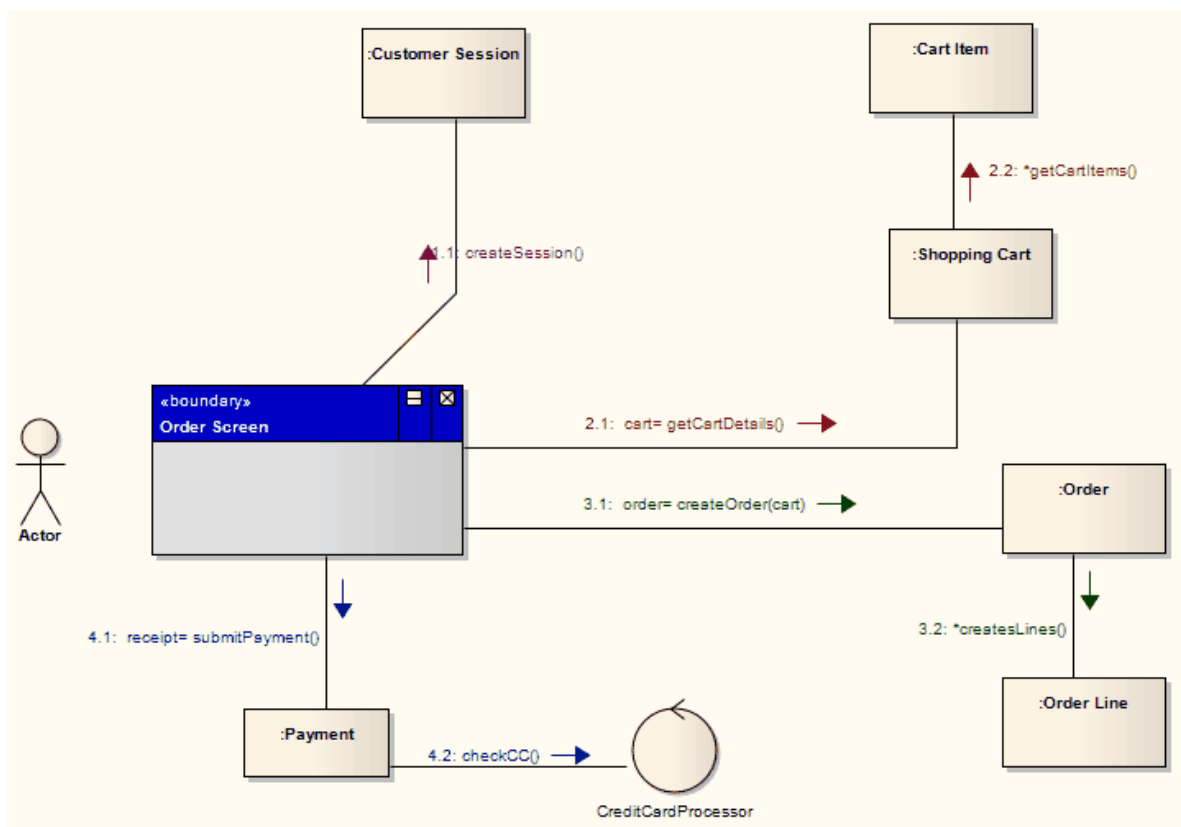

### 6.3.7.2 Communication Diagrams in Color

Enterprise Architect enables you to highlight particular message flows in a Communication diagram using different colors for each message set.

To highlight the colors in a Communication diagram, follow the steps below:

Step	Action
1	Select the <b>Tools   Options   Communication Colors</b> menu option The Communication Message Coloring page of the Options dialog displays
2	Select the <b>Use Communication Color</b> checkbox
3	Click on the drop-down arrow of each <b>Message n</b> field, and select the required color for each message group
4	Click on the <b>Close</b> button On your Communication diagram, each sequence group of messages displays in a different color, as shown below

### 6.3.8 Interaction Overview Diagram

Interaction Overview diagrams visualize the cooperation between other interaction diagrams to illustrate a control flow serving an encompassing purpose. As Interaction Overview diagrams are a variant of Activity diagrams, most of the diagram notation is the same, as is the process of constructing the diagram. Decision points, Forks, Joins, Start points and End points are the same. Instead of Activity elements, however, rectangular elements are used. There are two types of these elements:

- Interaction elements display an inline Interaction diagram, which can be any one of the four types

- Interaction Occurrence elements are references to an existing Interaction diagram: they are visually represented by a frame, with **ref** in the frame's title space; the diagram name is indicated in the frame contents.

To create an Interaction Occurrence, simply drag an Interaction diagram from the **Project Browser** onto your Interaction Overview diagram. The **ref** frame displays, encapsulating an instance of the Interaction diagram.

**Example Diagram:** [Example Interaction Overview Diagram](#)<sup>[864]</sup>

**Tools:** Select Interaction Overview diagram elements and connectors from the Activity pages of the Toolbox. Click on the following elements and connectors for more information.

Interaction Overview Diagram Elements	Interaction Overview Diagram Connectors
 Partition	 Control Flow
 Decision	 Object Flow
 Send	 Interrupt Flow
 Receive	
 Synch	
 Initial	
 Final	
 Flow Final	
 Region	
 Exception	
 Merge	
 Fork/Join	
 Fork/Join	

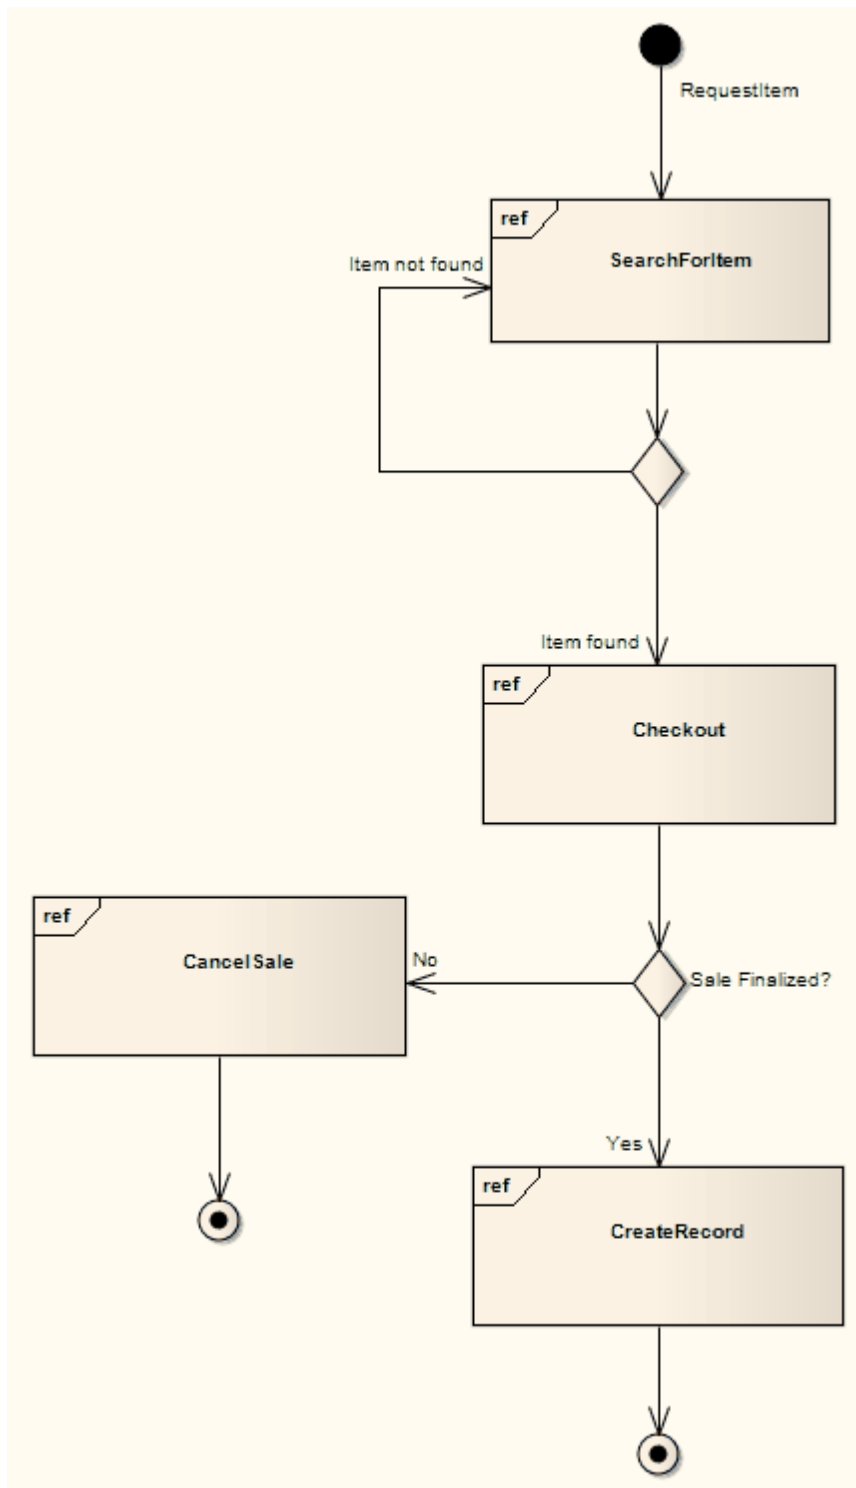

**Learn More:**

- [Interaction](#)<sup>[906]</sup>
- [Interaction Occurrence](#)<sup>[908]</sup>

### 6.3.8.1 Example Interaction Overview Diagram

This diagram depicts a sample sale process, shown in an Interaction Overview diagram, with sub-processes abstracted within Interaction Occurrences. The diagram appears very similar to an Activity diagram, and is conceptualized the same way; as the flow moves into an interaction, the respective interaction's process must be followed before the Interaction Overview's flow can advance.

## 6.4 UML Elements

Models in UML are constructed from elements such as *Classes*, *Objects*, *Interfaces*, *Use Cases*, *Components* and *Nodes*, each of which has a different purpose, different rules and different notation. Model elements are used at different stages of the design process for different purposes. For example,

- During early analysis, Use Cases, Activities, Business Processes, Objects and Collaborations are used to capture the problem domain
- During elaboration, Sequence diagrams, Objects, Classes and State Machines are used to refine the system specification
- Components and Nodes are used to model larger parts of the system as well as the physical entities that are created and deployed into a production environment.

### Topics:

Topic	Detail	See also
<b>Behavioral Diagram Elements</b>	Behavioral diagrams depict the behavioral features of a system or business process. Elements that can appear on Behavioral diagrams include Activity, Interaction, Lifeline, State Machine and Use Case.	<a href="#">Behavioral Diagram Elements</a> <sup>[866]</sup>

- [Behavioral Diagrams](#) <sup>[813]</sup>

### 6.4.1.1 Action

#### Description:

An Action element describes a basic process or transformation that occurs within a system. It is the basic functional unit within an Activity diagram. Actions can be thought of as children of Activities. Both represent processes, but Activities can contain multiple steps or decomposable processes, each of which can be embodied in an Action. An Action cannot be further broken down or decomposed.

An Action can be further defined with pre-condition and post-condition notes, and certain properties can be graphically depicted on the Action (Enterprise Architect prompts you to define the type of Action you are creating when you first drag the **Action** icon from the Toolbox). The data values passed out of and into an Action can be represented by Action Pins. For a named Action (that is, other than a basic Action) you can also assign Action Pins to represent specific properties.

For a basic (Atomic) Action, you can define the effect of the Action using the Effect tab of the element Properties dialog, and select to display the effect on the diagram.

An Action can also be depicted as an Expansion Node to indicate that the Action comprises an Expansion Region.

#### Toolbox Icon:

#### Learn More:

- [Action Notation](#) <sup>[868]</sup>
- [Action Expansion Node](#) <sup>[870]</sup>
- [Action Pin](#) <sup>[871]</sup>
- [Assign Action Pins](#) <sup>[872]</sup>
- [Local Pre/Post Conditions](#) <sup>[873]</sup>
- [Class Operations in Activity Diagrams](#) <sup>[874]</sup>
- [Activity Diagram](#) <sup>[813]</sup>
- [Activity Element](#) <sup>[875]</sup>
- [Expansion Region](#) <sup>[895]</sup>

#### OMG UML Specification:

The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 241) states:

*An action is a named element that is the fundamental unit of executable functionality. The execution of an action represents some transformation or processing in the modeled system, be it a computer system or*

otherwise.

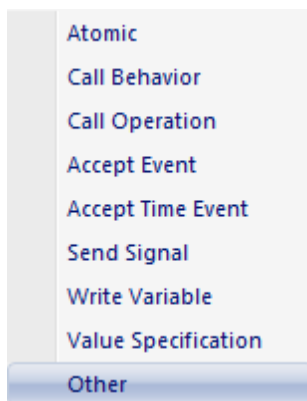

The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 313) also states:

*An action may have sets of incoming and outgoing activity edges that specify control flow and data flow from and to other nodes. An action will not begin execution until all of its input conditions are satisfied. The completion of the execution of an action may enable the execution of a set of successor nodes and actions that take their inputs from the outputs of the action.*

#### 6.4.1.1.1 Action Notation

##### Description:

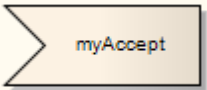

When you drag the Action icon from the Activity page of the Toolbox onto your diagram, a selection list displays showing the commonest types of Action to create. (If this list does not display, press **(Ctrl)** as you drag the icon.)

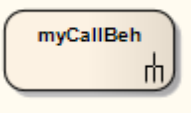

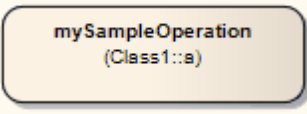

When you click on one of the specific types, that type of Action element displays on diagram. If you click on the **Other** option, the New Action dialog displays. You can again select to create a normal (Atomic) Action element, a CallOperation or a CallBehavior, or you can select the **Other** radio button and click on the drop-down arrow in the blank field to select the Action type from an extensive list.

If you later decide that the Action type is not appropriate, you can change it by right-clicking on the Action and selecting the **Properties** context menu option, and then selecting the **Advanced** page of the Properties dialog. Set the Action type by selecting a value from the **Kind** drop-down list. For a Value Specification Action, you also set the value on this page.

##### Action Kind Notation

Action Kind	Notation	See Also
AcceptEvent		<a href="#">AcceptEvent Actions</a> <sup>[869]</sup>
AcceptEventTimer		

Action Kind	Notation	See Also
CallBehavior		
CallOperation		
SendSignal		<a href="#">SendSignal Action &amp; BroadcastSignal Action</a> <sup>869</sup>

**AcceptEvent Actions:**

For an *Accept Event* Action element, the Properties dialog contains a Triggers tab on which you define one or more triggers to denote the type of events accepted by the Action, as defined in the following table:

Field	Usage	See also
Name	Specify the name of the trigger	
Type	<p>Specify the type of trigger: <b>Call</b>, <b>Change</b>, <b>Signal</b> or <b>Time</b></p> <ul style="list-style-type: none"> <li><b>Call</b> - specifies that the event is a CallEvent, which sends a message to the associated object by invoking an operation</li> <li><b>Change</b> - specifies that the event is a ChangeEvent, which indicates that the transition is the result of a change in value of an attribute</li> <li><b>Signal</b> - specifies that the event is a SignalEvent, which corresponds to the receipt of an asynchronous signal instance</li> <li><b>Time</b> - corresponds to a TimeEvent; which specifies a moment in time</li> </ul> <p>Code generation for State Machines currently supports Change and Time trigger events only, and expects a specification value</p>	
Specification	Specify the event instigating the Transition	

**SendSignal Action & BroadcastSignal Action:**

For a *SendSignal* or *BroadcastSignal* Action element, you can model the signal to be sent and the associated arguments to be conveyed, using the Signal tab of the element Properties dialog.

To model the signal to be sent and the associated arguments to be conveyed, follow the steps below:

Step	Action
1	In the <b>Signal</b> field, click on the ( ... ) button and select the required signal from the Select Signal

Step	Action
	dialog
2	In the <b>Attribute</b> field, click on the drop-down arrow and select the attribute (as previously created in the Signal element) with which the arguments are to be associated
3	In the <b>Value</b> field, type the appropriate value for the attribute
4	Identify the arguments (as ActionPins) for the Signal; click on the <b>Add</b> button under the Arguments panel, and select the appropriate Pins from the Select Pin dialog To assign more than one Pin, press ( <b>Ctrl</b> ) whilst you select each Pin
5	Click on the <b>Save</b> button

#### Structural Feature Actions:

Enterprise Architect supports the following types of *Structural Feature* Actions:

- AddStructuralFeatureValue
- ClearStructuralFeature
- ReadStructuralFeature
- RemoveStructuralFeatureValue
- WriteStructuralFeature

These actions can take Ports, Parts or Attributes as the target structural feature.

To set the appropriate target structure feature, follow the steps below:

Step	Action
1	Right-click on the Action element in the diagram, and select the <b>Advanced   Set Structural Feature</b> context menu option The Set Structural Feature dialog displays
2	To locate the structural feature, click on the <b>Add</b> button The Select Property dialog displays (a variant of the Select <Item> dialog)
3	Browse or search for the appropriate structural feature, and double-click on it The feature name and location displays in the <b>structuralFeature</b> field of the Set Structural Feature dialog
4	Click on the <b>OK</b> button to save the setting

#### 6.4.1.1.2 Action Expansion Node

#### Description

Representing an Action as an *Expansion Node* is a shorthand notation to indicate that the Action comprises an Expansion Region.

To specify an Action as an Expansion Node, right-click on the Action to display the context menu and select the **Embedded Elements | Add Expansion Node** menu option. After designating an Action as an Expansion Node, you can modify or delete it using the **Embedded Elements | Embedded Elements** menu option.

**See Also:**

- [Action](#) <sup>[867]</sup>
- [Expansion Region](#) <sup>[895]</sup>

### 6.4.1.1.3 Action Pin

**Description**

An *Action Pin* is used to define the data values passed out of and into an Action. An *input pin* provides values to the Action, whereas an *output pin* contains the results from that Action.

Action Pins are used below to connect two Actions:

Action Pins can be further characterized as defining exception parameters, streams, or states. Associating a state with a Pin defines the state of input or output values. For instance, the Pin could be called *Orders*, but the state could be *Validated* or *Canceled*.

To *add* an Action Pin to an Action, right-click on the Action to display the context menu and select the **Embedded Elements | Add Action Pin** menu option. (You can also assign Action Pins, to define specific properties of the Action.)

The Properties dialog of an Action Pin has a Pin tab on which you define the specific actions of the Pin.

A Pin serves as an argument for Call Behavior Actions and Call Operation Actions. When an Action is associated with a valid behavior in the model, the associated behavior's parameters are listed in the **Parameter** field drop-down list to facilitate a one-to-one mapping between the argument and the parameter. The fields in the Argument panel are enabled only for Pins belonging to Call Actions, and only when the Action is associated with a valid behavior with valid parameters.

You can also change certain properties of an Action Pin on the Advanced page of the element Properties dialog: right-click on the Pin and select the **Properties** context menu option. The *objectState* and *kind* properties can be set.

**See Also:**

- [Action](#) <sup>[867]</sup>
- [Assign Action Pins](#) <sup>[872]</sup>

#### 6.4.1.1.4 Assign Action Pins

Apart from *adding* Action Pins to any Action, you can *assign* specialized input or output Action Pins to Actions that have a specific type (that is, those that are not Basic or Atomic Actions). These input/output Pins signify various *properties* of the Action - they are not visible as structures on the diagram unless they have previously been added, but are listed in the Project Browser as properties of the Action.

You can only assign Pins that have already been added or assigned to the Action, or that are being created specifically to be assigned to the Action.

##### How to:

To assign Pins to an Action, follow the steps below:

Step	Action	See also
1	<p>Right-click on the Action in the diagram, and select the <b>Advanced   Assign Action Pins</b> context menu option</p> <p>The Assign Action Pins to &lt;ActionName&gt; dialog displays</p> <p>The format of this dialog depends on the type of Action: for a:</p> <ul style="list-style-type: none"> <li>• <i>SendObject</i> Action the dialog has two fields (<b>request</b> and <b>target</b>)</li> <li>• <i>TestIdentity</i> Action, three</li> <li>• <i>CallBehavior</i> Action, one (<b>result</b>)</li> </ul> <p>The fields are populated in exactly the same way</p>	
2	<p>The mandatory number and type of Pins are automatically selected (if they exist) or created</p> <p>To change or add a Pin in a field, click on the corresponding <b>Add</b> button</p> <p>The Select Pins dialog displays, showing the selected Action and listing all the input Pins currently owned by the Action</p>	<a href="#">Instance Classifier</a> [692]
3	<p>Double-click on one of the Pins (or, depending on the multiplicity of the Pin, <b>( Ctrl ) +click</b> on several Pins)</p> <p>Alternatively, if no suitable Pin exists, click on the <b>Add New</b> button and then click on the newly-created Pin</p> <p>The selected Pin is identified in the field on the Assign Action Pins to &lt;ActionName&gt; dialog</p>	
4	Click on the <b>OK</b> button	

To check the exact location of an assigned Action Pin, you can right-click on the Pin name in the dialog and select the **Find in Project Browser** context menu option.

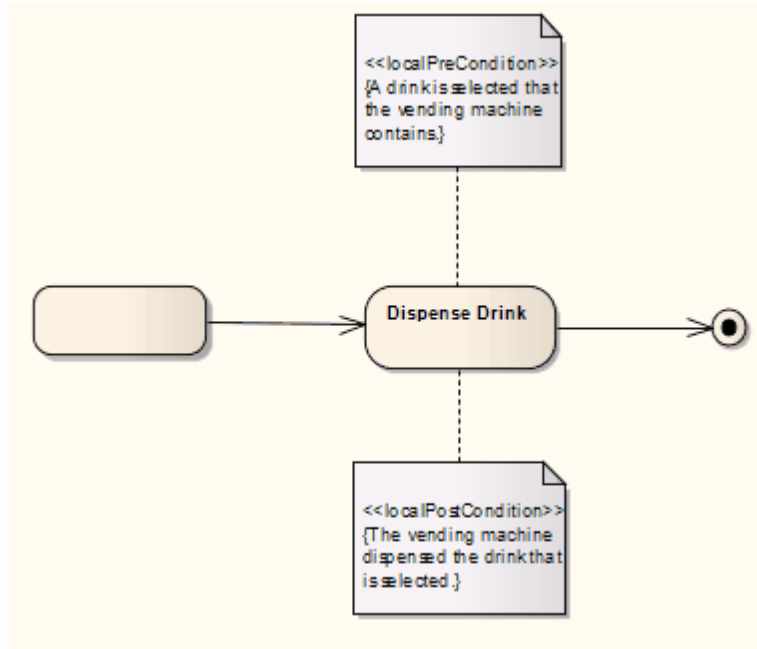

##### Learn More:

- [Action Pin](#) [871]

### 6.4.1.1.5 Local Pre/Post Conditions

Actions can be further defined with pre-condition and post-condition notes, which constrain an Action's entry and exit. These notes can be added to an Action as defined below.

#### How to:

To attach a constraint to an Action, follow the steps below:

Step	Action
1	Right-click on the Action The context menu displays
2	Select the <b>Add   Constraint</b> menu option A <i>Note</i> is created on the diagram, connected to the Action
3	Right-click on the <i>Note</i> The context menu displays
4	Select the <b>View Properties</b> menu option The Constraint dialog displays
5	In the <b>Constraint Type</b> field, click on the drop-down arrow and select the required constraint type
6	In the <b>Constraint</b> field, type the text for the constraint
7	Click on the <b>OK</b> button to save the constraint

#### Learn More:

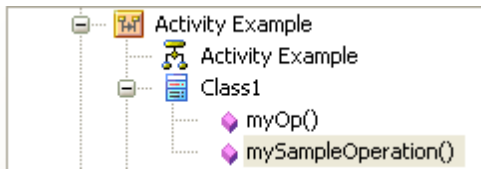

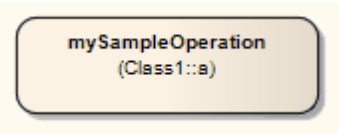

- [Action](#) <sup>867</sup>

### 6.4.1.1.6 Class Operations in Activity Diagrams

Operations from Classes can be displayed on Activity diagrams as Actions. When an operation is shown as an Action, the notation of the Action displays the name of the Class that features the operation.

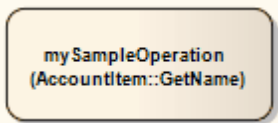

#### How to:

To add an operation to an Activity diagram, follow the steps below:

Step	Action	See Also
1	Open an Activity diagram	
2	From the Project Browser open a Class and locate the operation to be added to the Activity diagram	
3	Drag the operation on to the diagram 	
4	When the operation has been added to the Activity diagram the Action displays the name of the Class that features the operation  Right-click on the Action in the diagram to locate, in the Project Browser, the: <ul style="list-style-type: none"> <li>• Behavior classifier (CallBehavior Activity) using the <b>Find   Locate Classifier in Project Browser</b> context menu option or</li> <li>• Call operation (CallOperation Activity) using the <b>Find   Locate Operation in Project Browser</b> context menu option</li> </ul>	

If it becomes necessary to change the operation that this Action refers to, follow the steps below:

Step	Action	See Also
1	Right-click on the Action The context menu displays	
2	Select the <b>Advanced   Set Operation</b> menu option The Set Operation dialog displays	<a href="#">Set Operation dialog</a> <sup>696</sup>
3	If necessary, in the <b>In Namespace</b> field, select the model that contains the required operation	

Step	Action	See Also
4	Double-click on the required operation. The Action updates to show the new classifier and operation  	

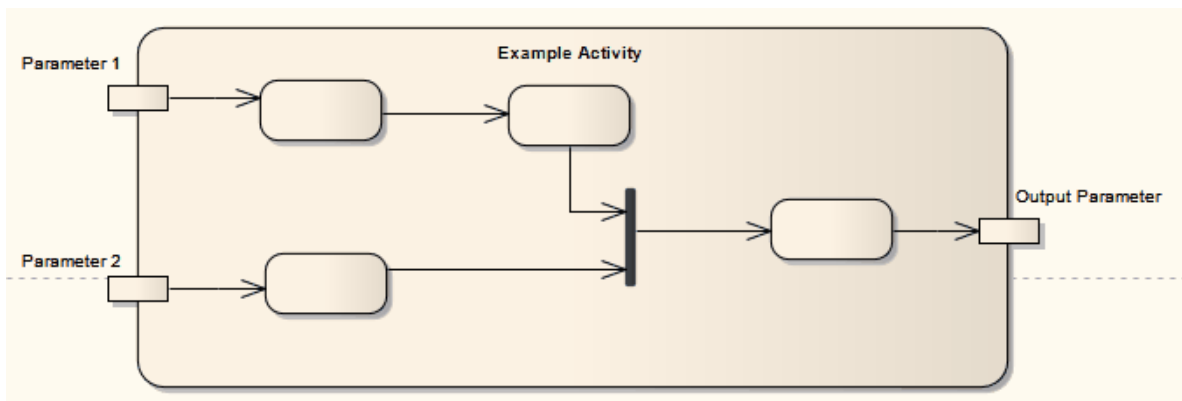

### 6.4.1.2 Activity

#### Description

An Activity organizes and specifies the participation of subordinate behaviors, such as sub-Activities or Actions, to reflect the control and data flow of a process. Activities are used in Activity diagrams for various modeling purposes, from procedural-type application development for system design, to business process modeling of organizational structures or work flow.

The following simple diagram of an Activity contains Action elements and includes input parameters and output parameters.

You can define an Activity as a composite element, either during creation or during later edits. When creating a composite Activity element, it is simpler to apply the mechanism for creating Structured Activity elements, which reduces the number of steps to work through. See the Structured Activity topic. If converting an existing Activity element, right-click on the element and select the **Advanced | Make Composite** context menu option.

Certain properties can be graphically depicted on an Activity. The Actions in an Activity can be further organized by Activity Partitions.

#### Toolbox Icon

## Activity

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 318*) states:

*An activity specifies the coordination of executions of subordinate behaviors, using a control and data flow model. The subordinate behaviors coordinated by these models may be initiated because other behaviors in the model finish executing, because objects and data become available, or because events occur external to the flow. The flow of execution is modeled as activity nodes connected by activity edges. A node can be the execution of a subordinate behavior, such as an arithmetic computation, a call to an operation, or manipulation of object contents. Activity nodes also include flow-of-control constructs, such as synchronization, decision, and concurrency control. Activities may form invocation hierarchies invoking other activities, ultimately resolving to individual actions. In an object-oriented model, activities are usually invoked indirectly as methods bound to operations that are directly invoked.*

*Activities may describe procedural computation. In this context, they are the methods corresponding to operations on classes. Activities may be applied to organizational modeling for business process engineering and workflow. In this context, events often originate from inside the system, such as the finishing of a task, but also from outside the system, such as a customer call. Activities can also be used for information system modeling to specify system level processes. Activities may contain actions of various kinds:*

- Occurrences of primitive functions, such as arithmetic functions.
- Invocations of behavior, such as activities.
- Communication actions, such as sending of signals.
- Manipulations of objects, such as reading or writing attributes or associations.

*Actions have no further decomposition in the activity containing them. However, the execution of a single action may induce the execution of many other actions. For example, a call action invokes an operation that is implemented by an activity containing actions that execute before the call action completes.*

#### 6.4.1.2.1 Activity Notation

Certain properties can be graphically depicted on an Activity element, as shown below.

To define these properties, right-click on the Activity and select the **Properties** context menu option, then select the Advanced page of the Properties dialog.

**See Also:**

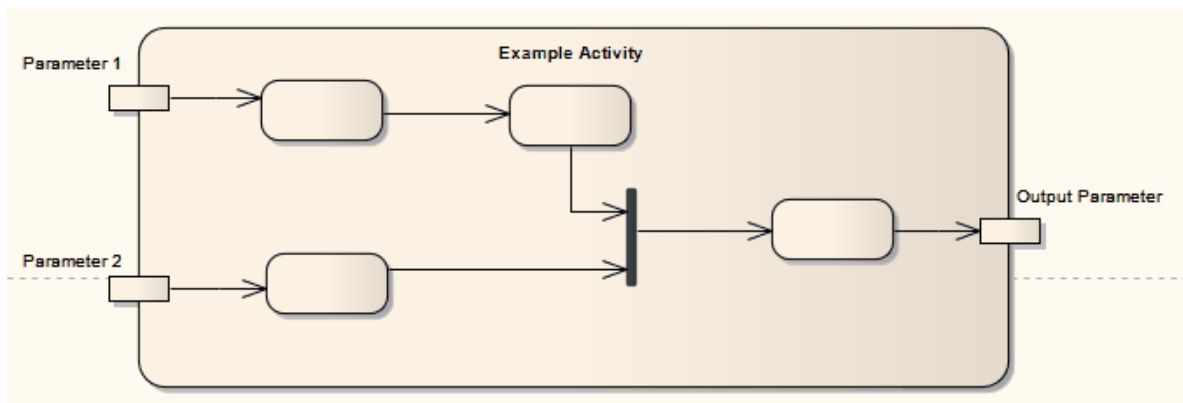

- [Activity](#)<sup>[875]</sup>

#### 6.4.1.2.2 Activity Parameter Nodes

**Description:**

An Activity Parameter Node accepts input to an Activity or provides output from an Activity.

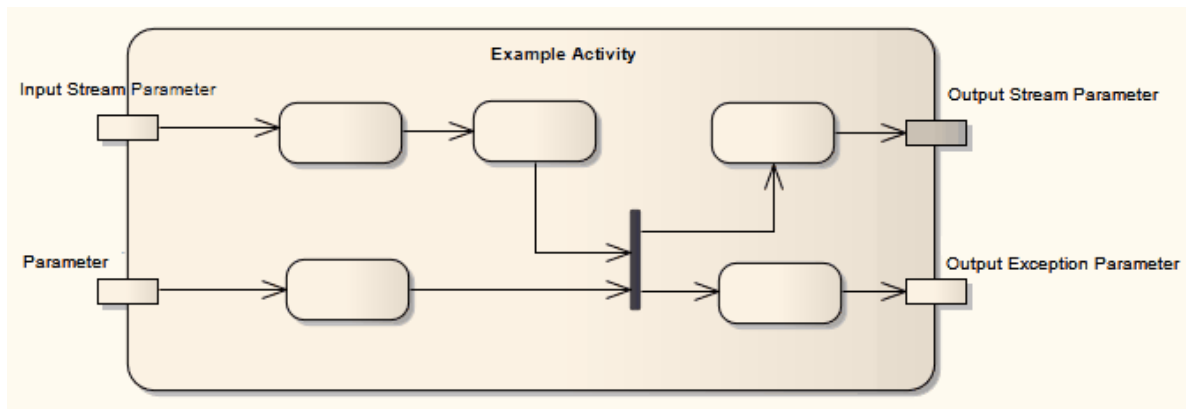

The following example depicts two entry parameters and one output parameter defined for the Activity.

**How to:**

To define an Activity Parameter Node for an Activity, follow the steps below:

Step	Action
1	Right-click on the element and select the <b>Embedded Elements   Add Activity Parameter</b> context menu option
2	The Properties dialog displays, which prompts for the <b>Name</b> and other properties of the embedded element
3	To further define the new Activity Parameter, select the Advanced page of the Properties dialog  Similar to characterizing Action Pins, Activity Parameter Nodes also have the <b>isException</b> and <b>isStream</b> options: <ul style="list-style-type: none"> <li>• <b>isException</b> indicates that a parameter can emit a value at the exclusion of other outputs, usually because of some error</li> <li>• <b>isStream</b> indicates whether or not a parameter can accept or post values during the execution of the Activity</li> </ul>

#### Learn More:

- [Activity Element](#)<sup>[875]</sup>
- [Action Pin](#)<sup>[871]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 338) states:

*An activity parameter node is an object node for inputs and outputs to activities.*

*... Activity parameter nodes are object nodes at the beginning and end of flows that provide a means to accept inputs to an activity and provide outputs from the activity, through the activity parameters.*

*Activity parameters inherit support for streaming and exceptions from Parameter.*

#### 6.4.1.2.3 Activity Partition

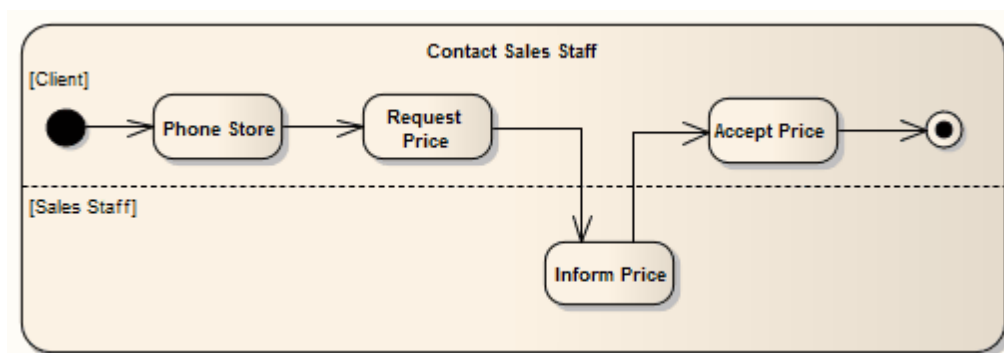

##### Description

Enterprise Architect supports two types of *Activity Partition*:

- The Activity Partition *feature*, described in this topic, which is used to logically organize an Activity *element*
- The Activity Partition *element*, which is used to logically organize an Activity *diagram*

In effect, these are the same. They partition the Actions of the Activity without affecting the token flow, helping to structure the view or parts of the Activity.

An example of a feature-partitioned Activity is shown below:

**How to:**

To define Partitions using the feature, follow the steps below:

Step	Action
1	Right-click on the Activity element The context menu displays
2	Select the <b>Advanced   Partition Activity</b> menu option The Activity Partitions dialog displays
3	In the <b>Name</b> field, type the name of a partition Click on the <b>Save</b> button
4	Repeat step 3 for each partition to be created

**Learn More:**

- [Activity Diagram](#)<sup>[813]</sup>
- [Activity Element](#)<sup>[875]</sup>
- [Activity Partition Element](#)<sup>[916]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) states:

*Partitions divide the nodes and edges to constrain and show a view of the contained nodes. Partitions can share contents. They often correspond to organizational units in a business model. They may be used to allocate characteristics or resources among the nodes of an activity.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) also states:

*An activity partition is a kind of activity group for identifying actions that have some characteristic in common.*

**6.4.1.3 Actor****Description**

An Actor is a user of the system; user can mean a human user, a machine, or even another system or subsystem in the model. Anything that interacts with the system from the outside or system boundary is termed an Actor. Actors are typically associated with Use Cases.

Actors can use the system through a graphical user interface, through a batch interface or through some other media. An Actor's interaction with a Use Case is documented in a Use Case scenario, which details the functions a system must provide to satisfy the user requirements.

Actors also represent the role of a user in Sequence Diagrams, where you can display them using rectangle notation. Enterprise Architect supports a stereotyped Actor element for business modeling. The business modeling elements also represent Actors as stereotyped Objects.

#### Toolbox Icon

#### Learn More:

- [Sequence Diagrams](#)<sup>[85]</sup>
- [Business Modeling](#)<sup>[1194]</sup>
- [Use Case](#)<sup>[937]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 584*) states:

*An actor models a type of role played by an entity that interacts with the subject (e.g. by exchanging signals and data), but which is external to the subject. ... Actors may represent roles played by human users, external hardware, or other subjects. Note that an actor does not necessarily represent a specific physical entity but merely a particular facet (i.e., "role") of some entity that is relevant to the specification of its associated Use Cases. Thus, a single physical instance may play the role of several different actors and, conversely, a given actor may be played by multiple different instances.*

### **6.4.1.4 Central Buffer Node**

#### Description

A Central Buffer Node is an object node for managing flows from multiple sources and destinations, represented in an Activity diagram. It acts as a buffer for multiple in-flows and out-flows from other object nodes, but does not connect directly to Actions.

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#)<sup>[813]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 352*) states:

A central buffer node is an object node for managing flows from multiple sources and destinations. ... A central buffer node accepts tokens from upstream object nodes and passes them along to downstream object nodes.

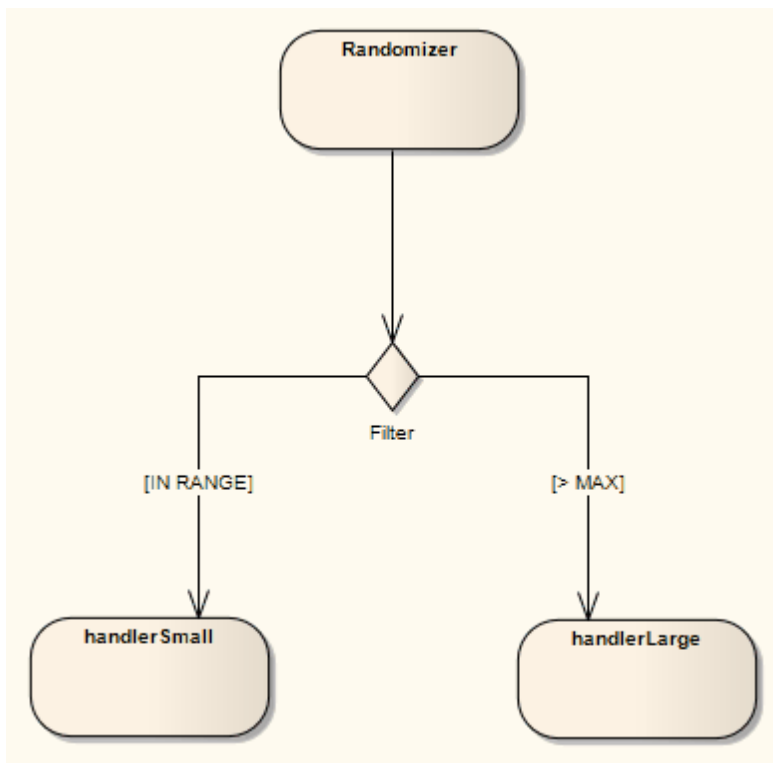

### 6.4.1.5 Choice

#### Description

The Choice pseudo-state is used to compose complex transitional paths in, for example, a State Machine diagram, where the outgoing transition path is decided by dynamic, run-time conditions. The run-time conditions are determined by the actions performed by the State Machine on the path leading to the choice.

The following example depicts the Choice element. Upon reaching the Filter pseudo-state, a transition fires to the appropriate state based on the run-time value passed to the Filter. Very similar in form to a Junction pseudo-state, the Choice pseudo-state's distinction is in deciding transition paths at run-time.

#### Toolbox Icon

#### Learn More:

- [State Machine Diagram](#)<sup>[817]</sup>
- [State Machine](#)<sup>[919]</sup>
- [Pseudo-states](#)<sup>[822]</sup>
- [Junction](#)<sup>[910]</sup>

### **OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*...choice vertices which, when reached, result in the dynamic evaluation of the guards of the triggers of its outgoing transitions. This realizes a dynamic conditional branch. It enables splitting of transitions into multiple outgoing paths such that the decision on which path to take may be a function of the results of prior actions performed in the same run-to-completion step. If more than one of the guards evaluates to true, an arbitrary one is selected. If none of the guards evaluates to true, then the model is considered ill-formed. (To avoid this, it is recommended to define one outgoing transition with the predefined "else" guard for every choice vertex.) Choice vertices should be distinguished from static branch points that are based on junction points.*

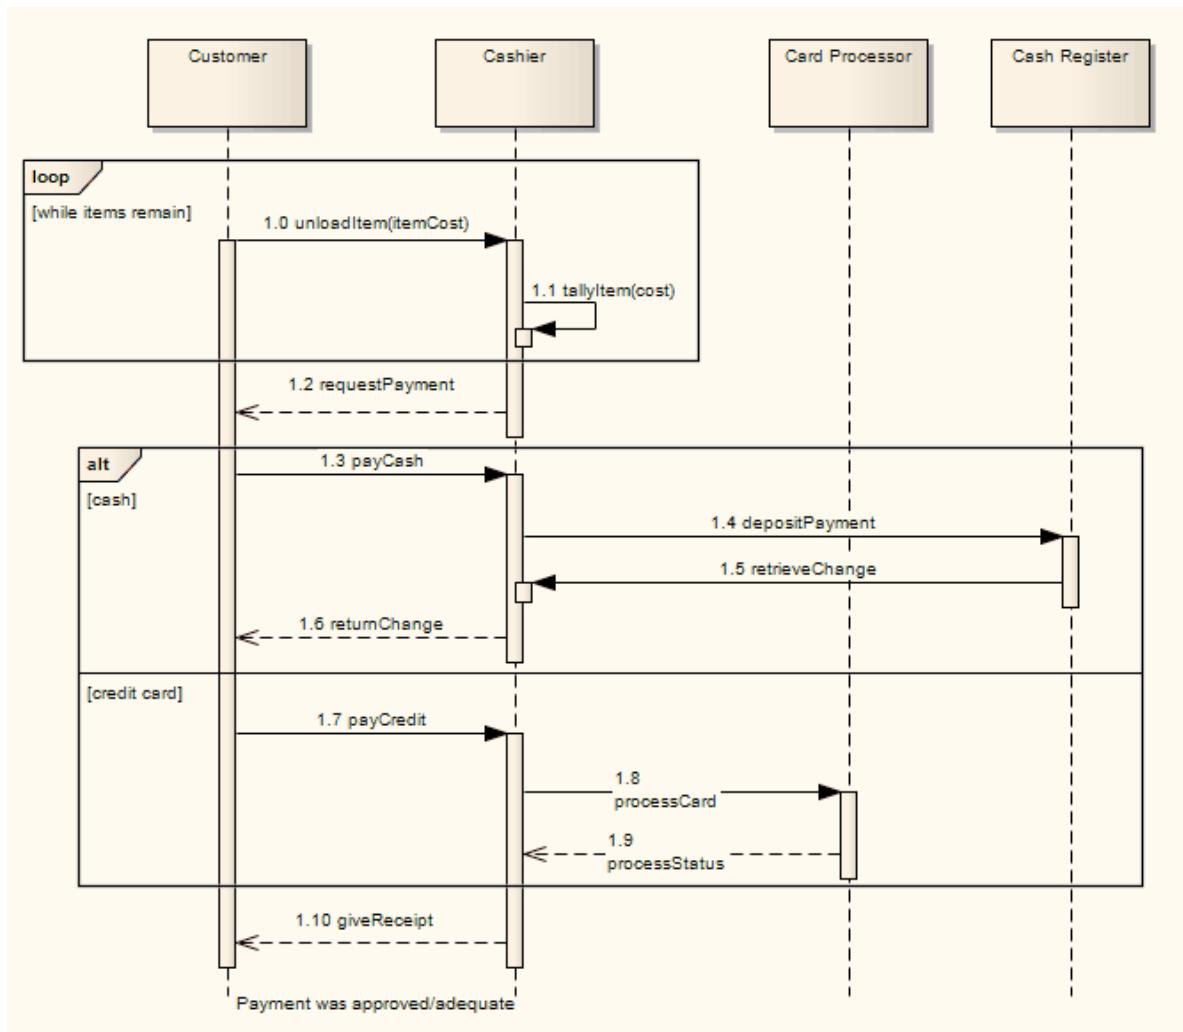

### **6.4.1.6 Combined Fragment**

#### **Description**

A Combined Fragment reflects a piece or pieces of interaction (called interaction operands) controlled by an interaction operator, whose corresponding boolean conditions are known as interaction constraints. It displays as a transparent window, divided by horizontal dashed lines for each operand.

The following diagram illustrates the use of Combined Fragments, with a Sequence diagram modeling a simplified purchasing process. A loop fragment is created to iterate through an unknown number of items for purchase, after which the cashier requests payment. At this point, two payment options are considered and an alternative fragment is created, divided to show the two operands: cash and credit card. After the fragment completes its trace, the cashier gives a receipt to the customer, under the fulfilled condition that payment requirements were met.

The order of interaction fragment conditions can be changed directly on the diagram. Select an interaction fragment with more than one condition defined. Up and down arrows appear on the right hand side of the each condition. Just click on the arrow to change the order.

**Notes:**

- In order to select an interaction fragment, you must click near the inside edge or drag a selection rectangle around the fragment; this prevents accidental selection when moving connectors inside the interaction fragment

- Press and hold ( **Alt** ) to move a combined fragment independently of its contents

#### Toolbox Icon:

#### Learn More:

- [Sequence Diagram](#) <sup>[851]</sup>
- [Create a Combined Fragment](#) <sup>[884]</sup>
- [Interaction Operator](#) <sup>[884]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 467*) states:

*A combined fragment defines an expression of interaction fragments. A combined fragment is defined by an interaction operator and corresponding interaction operands. Through the use of CombinedFragments the user will be able to describe a number of traces in a compact and concise manner.*

#### **6.4.1.6.1 Create a Combined Fragment**

##### How to:

To create a Combined Fragment in Enterprise Architect, follow the steps below:

Step	Action	See Also
1	Drag the <i>Fragment</i> element from the Interaction Elements page of the Toolbox	<a href="#">Combined Fragment</a> <sup>[882]</sup>
2	In the <b>Type</b> field, click on the drop-down arrow and select one of the various types of interaction operator	<a href="#">Interaction Operators</a> <sup>[884]</sup>
3	In the <b>Condition</b> field, specify a condition or interaction constraint for each operand	
4	A rectangular frame displays, partitioned by dashed lines into segments for each operand	
5	Adjust the frame to encompass the required event occurrences for each operand	

#### **6.4.1.6.2 Interaction Operators**

When creating Combined Fragments, you must apply an appropriate interaction operator to characterize the fragment. The following table provides guidance on the various operators, and their corresponding descriptions.

Interaction Operator	Action
alt	Divide up interaction fragments based on Boolean conditions.

Interaction Operator	Action
<b>opt</b>	Enclose an optional fragment of interaction.
<b>par</b>	Indicate that operands operate in parallel.
<b>loop</b>	Indicate that the operand repeats a number of times, as specified by interaction constraints.
<b>critical</b>	Indicate a sequence that cannot be interrupted by other processing.
<b>neg</b>	Assert that a fragment is invalid, and implies that all other interaction is valid.
<b>assert</b>	Specify the only valid fragment to occur. Often enclosed within a <i>consider</i> or <i>ignore</i> operand.
<b>strict</b>	Indicate that the behaviors of the operands must be processed in strict sequence.
<b>seq</b>	Indicate that the Combined Fragment is weakly sequenced. This means that the ordering within operands is maintained, but the ordering between operands is undefined, so long as an event occurrence of the first operand precedes that of the second operand, if the event occurrences are on the same lifeline.
<b>ignore</b>	Indicate which messages should be ignored during execution, or can appear anywhere in the execution trace.
<b>consider</b>	Specify which messages should be considered in the trace. This is often used to specify the resulting event occurrences with the use of an <b>assert</b> operator.
<b>ref</b>	Provide a reference to another diagram.  The ref fragment is not created using the method described in the <i>Create a Combined Fragment</i> topic. To create a ref fragment, simply drag an existing diagram from the Project Browser onto the current diagram.

- [Create a Combined Fragment](#)<sup>[884]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 468-471*) states:

*The semantics of a CombinedFragment is dependent upon the interactionOperator as explained below.*

### Alternatives

*The interactionOperator **alt** designates that the CombinedFragment represents a choice of behavior. At most one of the operands will be chosen. The chosen operand must have an explicit or implicit guard expression that evaluates to true at this point in the interaction. An implicit true guard is implied if the operand has no guard.*

*The set of traces that defines a choice is the union of the (guarded) traces of the operands.*

*An operand guarded by **else** designates a guard that is the negation of the disjunction of all other guards in the enclosing CombinedFragment.*

*If none of the operands has a guard that evaluates to true, none of the operands are executed and the remainder of the enclosing InteractionFragment is executed.*

### Option

The interactionOperator **opt** designates that the CombinedFragment represents a choice of behavior where either the (sole) operand happens or nothing happens. An option is semantically equivalent to an alternative CombinedFragment where there is one operand with non-empty content and the second operand is empty.

### Break

The interactionOperator **break** designates that the CombinedFragment represents a breaking scenario in the sense that the operand is a scenario that is performed instead of the remainder of the enclosing InteractionFragment. A **break** operator with a guard is chosen when the guard is true and the rest of the enclosing Interaction Fragment is ignored. When the guard of the **break** operand is false, the **break** operand is ignored and the rest of the enclosing InteractionFragment is chosen. The choice between a **break** operand without a guard and the rest of the enclosing InteractionFragment is done non-deterministically.

A CombinedFragment with interactionOperator **break** should cover all Lifelines of the enclosing InteractionFragment.

### Parallel

The interactionOperator **par** designates that the CombinedFragment represents a parallel merge between the behaviors of the operands. The OccurrenceSpecifications of the different operands can be interleaved in any way as long as the ordering imposed by each operand as such is preserved.

A parallel merge defines a set of traces that describes all the ways that OccurrenceSpecifications of the operands may be interleaved without obstructing the order of the OccurrenceSpecifications within the operand.

### Weak Sequencing

The interactionOperator **seq** designates that the CombinedFragment represents a weak sequencing between the behaviors of the operands.

Weak sequencing is defined by the set of traces with these properties:

1. The ordering of OccurrenceSpecifications within each of the operands is maintained in the result.
2. OccurrenceSpecifications on different lifelines from different operands may come in any order.
3. OccurrenceSpecifications on the same lifeline from different operands are ordered such that an OccurrenceSpecification of the first operand comes before that of the second operand.

Thus weak sequencing reduces to a parallel merge when the operands are on disjunct sets of participants. Weak sequencing reduces to strict sequencing when the operands work on only one participant.

### Strict Sequencing

The interactionOperator **strict** designates that the CombinedFragment represents a strict sequencing between the behaviors of the operands. The semantics of strict sequencing defines a strict ordering of the operands on the first level within the CombinedIFragment with interactionOperator **strict**. Therefore OccurrenceSpecifications within contained CombinedFragment will not directly be compared with other OccurrenceSpecifications of the enclosing CombinedFragment.

### Negative

The interactionOperator **neg** designates that the CombinedFragment represents traces that are defined to be invalid.

The set of traces that defined a CombinedFragment with interactionOperator negative is equal to the set of traces given by its (sole) operand, only that this set is a set of invalid rather than valid traces. All InteractionFragments that are different from Negative are considered positive meaning that they describe traces that are valid and should be possible.

### Critical Region

The interactionOperator **critical** designates that the CombinedFragment represents a critical region. A critical region means that the traces of the region cannot be interleaved by other OccurrenceSpecifications (on those Lifelines covered by the region). This means that the region is treated atomically by the enclosing

fragment when determining the set of valid traces. Even though enclosing CombinedFragments may imply that some OccurrenceSpecifications may interleave into the region, such as with **par**-operator, this is prevented by defining a region.

Thus the set of traces of enclosing constructs are restricted by critical regions.

### **Ignore / Consider**

(p. 473) The interactionOperator **ignore** designates that there are some message types that are not shown within this combined fragment. These message types can be considered insignificant and are implicitly ignored if they appear in a corresponding execution. Alternatively one can understand **ignore** to mean that the messages that are ignored can appear anywhere in the traces.

Conversely the interactionOperator **consider** designates which messages should be considered within this CombinedFragment. This is equivalent to defining every other message to be ignored.

### **Assertion**

The interactionOperator **assert** designates that the CombinedFragment represents an assertion. The sequences of the operand of the assertion are the only valid continuations. All other continuations result in an invalid trace. Assertions are often combined with Ignore or Consider.

### **Loop**

The interactionOperator **loop** designates that the CombinedFragment represents a loop. The **loop** operand will be repeated a number of times.

The Guard may include a lower and an upper number of iterations of the loop as well as a Boolean expression. The semantics is such that a loop will iterate minimum the 'minint' number of times (given by the iteration expression in the guard) and at most the 'maxint' number of times. After the minimum number of iterations have executed, and the boolean expression is false the loop will terminate. The loop construct represent a recursive application of the **seq** operator where the **loop** operand is sequenced after the result of earlier iterations.

### **The Semantics of Gates**

The gates of a CombinedFragment represent the syntactic interface between the CombinedFragment and its surroundings, which means the interface towards other InteractionFragments.

The only purpose of gates is to define the source and the target of messages.

## **6.4.1.7 Datastore**

### **Description**

A Datastore is an element used to define permanently stored data. A token of data that enters into a Datastore is stored permanently, updating tokens for data that already exists. A token of data that comes out of a Datastore is a copy of the original data.

Use Object Flow connectors to connect elements (such as Activities) to Datastores, as values and information are being passed between nodes. Selection and transformation behavior, together composing a sort of query, can be specified as to the nature of data access. For instance, selection behavior determines which objects are affected by the connection to the Datastore. Transformation behavior might then further specify the value of an attribute pertaining to a selected object.

To define the behavior of access to a Datastore, attach a note to the Object Flow connector. To do this, right-click on the Object Flow and select the Attach Note or Constraint context menu option. A dialog indicates

other flows in the Activity diagram, to which you can attach the note (if the behavior applies to multiple flows). To comply with UML 2, preface behavior with the notation «selection» or «transformation».

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 360*) states:

*A data store node is a central buffer node for non-transient information... A data store keeps all tokens that enter it, copying them when they are chosen to move downstream. Incoming tokens containing a particular object replace any tokens in the object node containing that object.*

## 6.4.1.8 Decision

### Description

A Decision is an element of an Activity diagram or Interaction Overview diagram that indicates a point of conditional progression: if a condition is true, then processing continues one way; if not, then another.

This can also be used as a Merge node in that multiple alternative flows can be merged (but not synchronized) to form one flow. The following examples show both of these modes of using the decision element.

#### *Used as a decision:*

See *UML Superstructure Specification, v2.1.1, figure 12.77, p. 363*.

Used as a merge:

See *UML Superstructure Specification, v2.1.1, figure 12.106, p. 388.*

#### Notes:

- Moving a diagram generally does not affect the location of elements in packages. If you move a diagram out of one package into another, all the elements in the diagram remain in the original package. However, Decision elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram. Therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram.

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#) <sup>[813]</sup>
- [Interaction Overview Diagram](#) <sup>[863]</sup>
- [Merge Node](#) <sup>[912]</sup>

#### OMG UML Specification

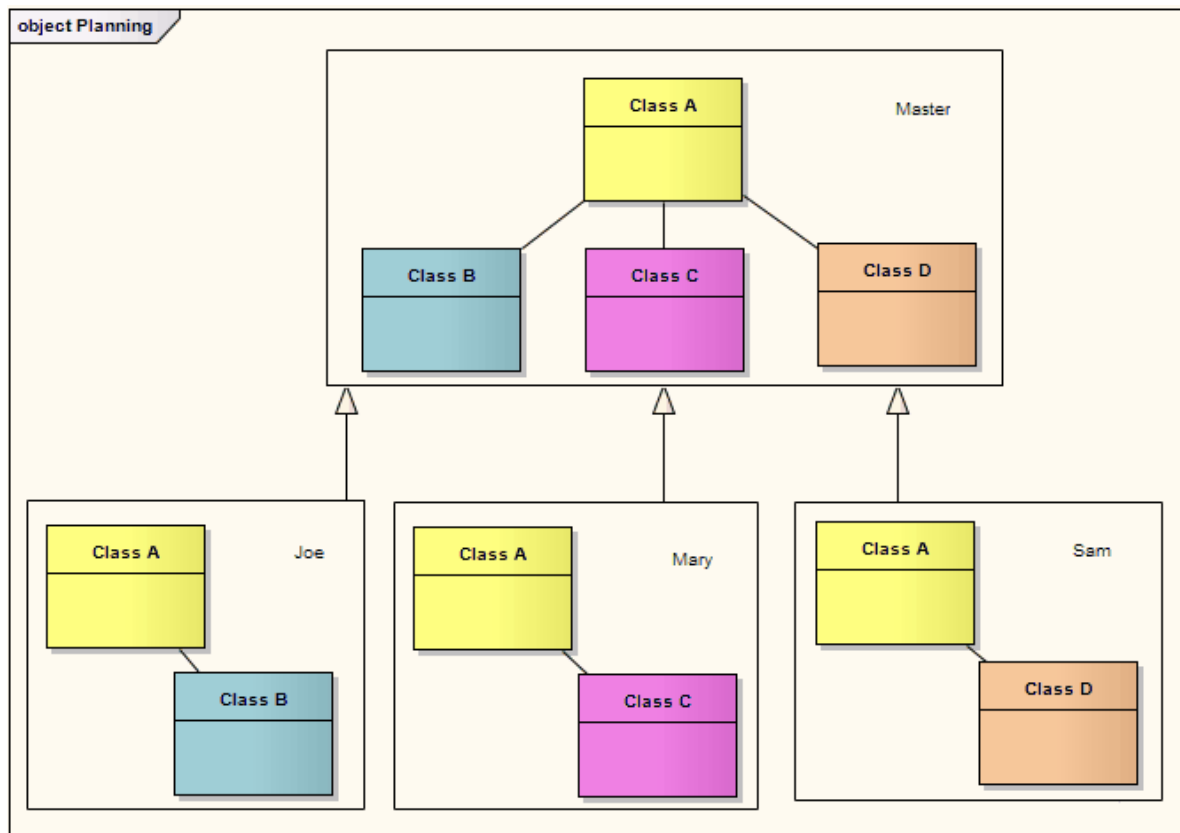

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 361 (Decision symbol)*) states:

*A decision node is a control node that chooses between outgoing flows. A decision node has one incoming edge and multiple outgoing activity edges.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 387 (Merge symbol)*) also states:

*A merge node is a control node that brings together multiple alternate flows. It is not used to synchronize concurrent flows but to accept one among several alternate flows... A merge node has multiple incoming edges and a single outgoing edge.*

### 6.4.1.9 Diagram Frame

#### Description

A Diagram Frame element is a rendition of a diagram dropped from the Project Browser into another diagram. It is a type of Combined Fragment with the Interaction Operator ref. However, it can be created on any type of diagram, and is not created in the same way as other Combined Fragments.

When you drop the diagram from the Project Browser onto the open diagram, a dialog shows providing the following options:

- Diagram Frame
- Diagram Reference
- Hyperlink

If you click on the Diagram Frame radio button, a Diagram Frame is inserted into the diagram, containing an image of the dropped diagram.

If you select the Diagram Reference option, an empty frame is inserted with the name of the dropped diagram in the frame label. If you select the Hyperlink radio button, a diagram icon is inserted with no frame, and with the parent package and diagram name next to it.

In all three cases, the object acts as a hyperlink to the real referenced diagram. You can also define properties for the objects, as for other elements, by right-clicking on the object and selecting the element Properties context menu option.

#### Notes:

- You can change the size of all three objects, but you cannot reduce a Diagram Frame to less than the size of the enclosed diagram.

- You cannot change the diagram within a Diagram Frame. To edit the diagram, double-click within the frame and edit the original diagram.
- The Diagram Frame element looks identical to but is not the same as a diagram frame border, which you can set automatically on new images of diagrams using the Tools | Options | Diagram option, and selecting the appropriate checkboxes in the Diagram Frames panel. These options set frames on print-outs of diagrams, images of diagrams copied to file, and images of diagrams copied to the clipboard. If you paste the image from the clipboard into another diagram, the image initially looks the same as the Diagram Frame element but it is actually a discreet unit that you manipulate using the Image Manager.

- [Interaction Operator: ref](#)<sup>[885]</sup>

### 6.4.1.10 Diagram Gate

#### Description

A Diagram Gate is a simple graphical way to indicate the point at which messages can be transmitted into and out of interaction fragments. A fragment might be required to receive or deliver a message; internally, an ordered message reflects this requirement, with a gate indicated on the boundary of the fragment's frame. Any external messages 'synching' with this internal message must correspond appropriately. Gates can appear on Interaction diagrams (Sequence, Timing, Communication or Interaction Overview), interaction occurrences and combined fragments (to specify the expression).

#### Toolbox Icon

**Learn More:**

- [Sequence Diagram](#) <sup>[851]</sup>
- [Timing Diagram](#) <sup>[832]</sup>
- [Communication Diagram](#) <sup>[861]</sup>
- [Interaction Overview Diagram](#) <sup>[863]</sup>
- [Interaction Occurrence](#) <sup>[908]</sup>
- [Combined Fragment](#) <sup>[882]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 480*) states:

*A Gate is a connection point for relating a Message outside an InteractionFragment with a Message inside the InteractionFragment ... Gates are connected through Messages. A Gate is actually a representative of an OccurrenceSpecification that is not in the same scope as the Gate. Gates play different roles: we have formal gates on Interactions, actual gates on InteractionUses, expression gates on CombinedFragments.*

**6.4.1.11 Endpoint****Description**

An Endpoint is used in Interaction diagrams (Sequence, Timing, Communication or Interaction Overview) to reflect a lost or found message in sequence. To model this, drag an Endpoint element onto the workspace.

With Sequence diagrams, drag a message from the appropriate lifeline to the Endpoint. With Timing diagrams, the message connecting the lifeline to the Endpoint requires some timing specifications to draw the connection.

The following example depicts a lost message in a Sequence diagram.

#### Toolbox Icon

#### Learn More:

- [Sequence Diagram](#) <sup>[851]</sup>
- [Timing Diagram](#) <sup>[832]</sup>
- [Communication Diagram](#) <sup>[861]</sup>
- [Interaction Overview Diagram](#) <sup>[863]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 492*) states:

*A lost message is a message where the sending event occurrence is known, but there is no receiving event occurrence. We interpret this to be because the message never reached its destination.*

*A found message is a message where the receiving event occurrence is known, but there is no (known) sending event occurrence. We interpret this to be because the origin of the message is outside the scope of the description. This may, for example, be noise or other activity that we do not want to describe in detail.*

#### 6.4.1.12 Entry Point

#### Description

Entry Point pseudo-states are used to define the beginning of a State Machine. An Entry Point exists for each

region, directing the initial concurrent state configuration.

#### Toolbox Icon

#### Learn More:

- [State Machine Diagram](#) <sup>[817]</sup>
- [Pseudo-states](#) <sup>[822]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 471*) states:

*An entry point pseudostate is an entry point of a state machine or composite state. In each region of the state machine or composite state it has a single transition to a vertex within the same region.*

### 6.4.1.13 Exception

#### Description

The Exception Handler element defines the group of operations to carry out when an exception occurs. In an Activity diagram, the protected element can contain a set of operations and is connected to the exception handler via an Interrupt Flow connector. Any defined error contained within an element's parts can trigger the flow to move to an exception.

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#) <sup>[813]</sup>
- [Interrupt Flow](#) <sup>[987]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 364*) states:

*An exception handler is an element that specifies a body to execute in case the specified exception occurs during the execution of the protected node.*

#### 6.4.1.14 Expansion Region

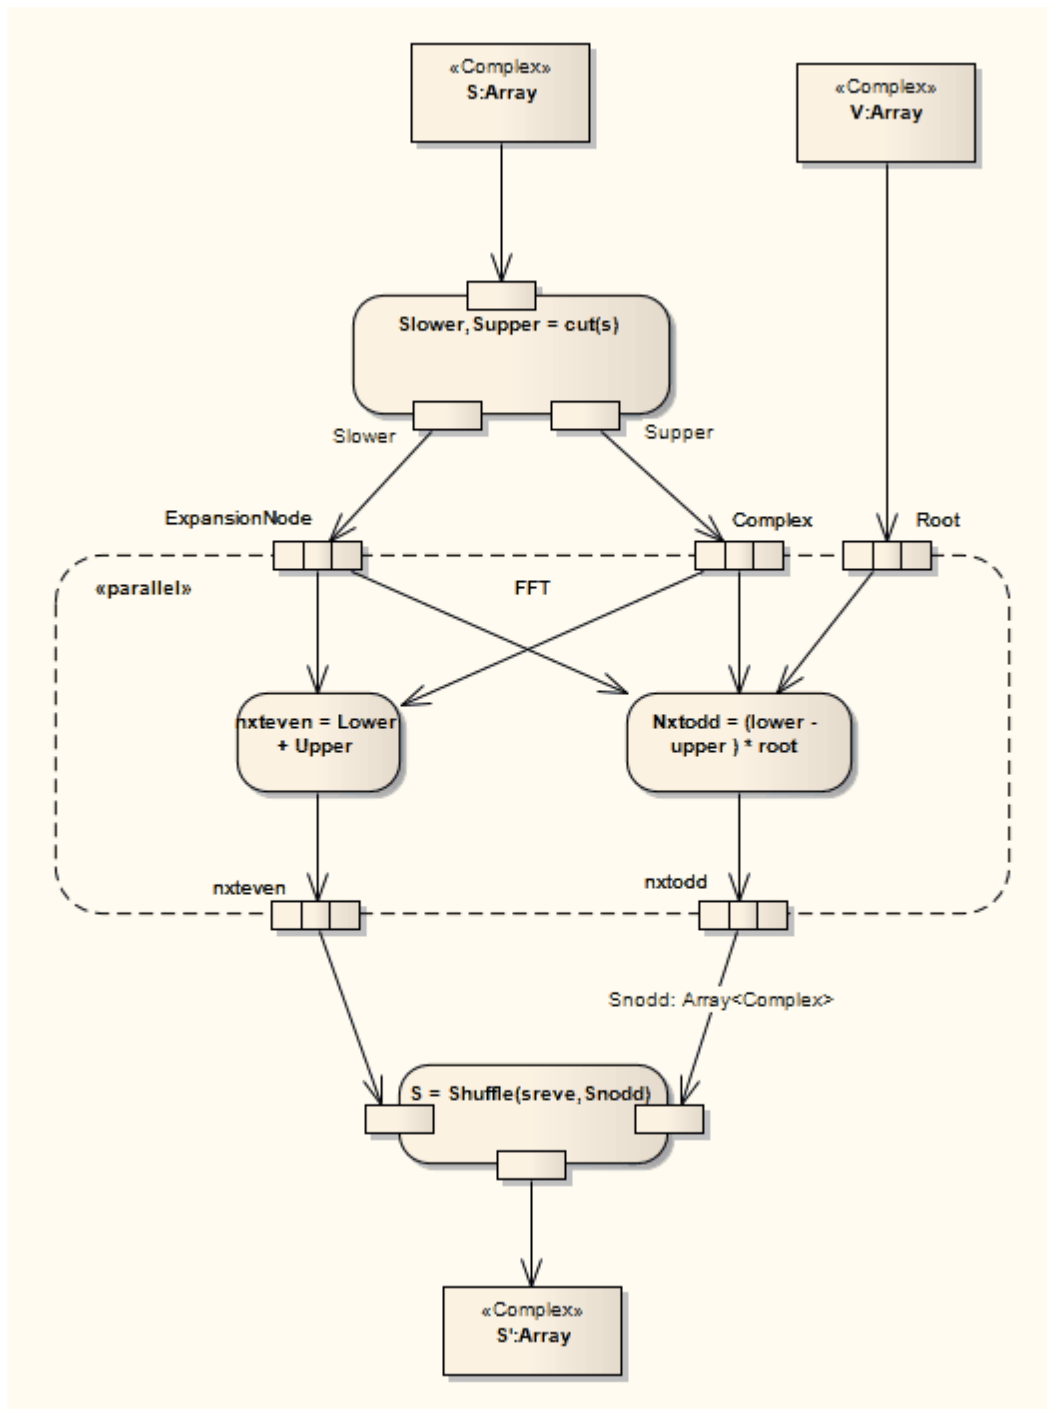

##### Description

You create an Expansion Region as one variant of a Region (the other is an Interruptible Activity Region).

On an Activity diagram, an Expansion Region surrounds a process to be imposed multiple times on the incoming data, once for every element in the input collection. If there are multiple inputs, the collection sizes must match, and the elements within each collection must be of the same type. Similarly, any outputs must be in the form of a collection matching the size of the inputs.

The concurrency of the Expansion Region's multiple executions can be specified as type parallel, iterative, or stream. Parallel reflects that the elements in the incoming collections can be processed at the same time or overlapping, whereas an iterative concurrency type specifies that execution must occur sequentially. A stream-type Expansion Region indicates that the input and output come in and exit as streams, and that the Expansion Region's process must have some method to support streams.

To modify the mode of an Expansion Region, right-click on it and select the **Properties** context menu option, then select the Advanced page.

See *UML Superstructure Specification, v2.1.1, figure 12.87, p. 372.*

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#) <sup>[813]</sup>
- [Region](#) <sup>[918]</sup>
- [Interruptible Activity Region](#) <sup>[909]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 367*) states:

*An expansion region is a structured activity region that executes multiple times corresponding to elements of an input collection.*

#### 6.4.1.15 Exit Point

### Description

Exit Points are used in Submachine states and State Machines to denote the point where the machine is exited and the transition sourcing this exit point, for Submachines, is triggered. Exit points are a type of pseudo-state used in the State Machine diagram.

### Toolbox Icon

### Learn More:

- [State Machine Diagram](#) <sup>[817]</sup>
- [State Element](#) <sup>[919]</sup>
- [Submachine State](#) <sup>[927]</sup>
- [Pseudo-state](#) <sup>[822]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1 p. 538*) states:

*An exit point pseudostate is an exit point of a state machine or composite state. Entering an exit point within any region of the composite state or state machine referenced by a submachine state implies the exit of this composite state or submachine state and the triggering of the transition that has this exit point as source in the state machine enclosing the submachine or composite state.*

#### 6.4.1.16 Final

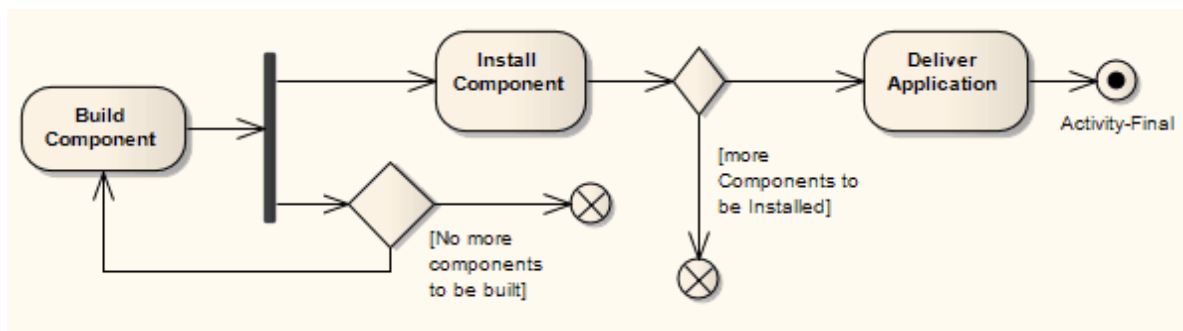

### Description

There are two nodes used to define a Final state in an Activity, both defined in UML 2.3 as of type Final Node. The Activity Final element, shown above, indicates the completion of an Activity; upon reaching the Final, all execution in the Activity diagram is aborted. The other type of final node, Flow Final, depicts an exit from the system that has no effect on other executing flows in the Activity.

The following example illustrates the development of an application. The process comes to a Flow Final node when there are no more components to be built; note that the Fork element indicates a concurrent process with the building of new components and installation of completed components. The Flow Final terminates only the sub-process building components. Similarly, only those tokens entering the decision branch for the installation of further components terminate with the connecting Flow Final (that is, stop installing this component, but keep on installing other components). It is only after the Deliver Application activity is completed, after the control flow reaches the Final node, that all flows stop.

The node that initiates a flow is the Initial node.

See *UML Superstructure Specification, v2.1.1, figure 12.91, p. 374.*

### Notes:

- Moving a diagram generally does not affect the location of elements in packages; if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Final elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

- [Activity Diagram](#) <sup>[813]</sup>
- [Activity](#) <sup>[875]</sup>
- [Flow Final](#) <sup>[899]</sup>
- [Fork](#) <sup>[902]</sup>
- [Initial](#) <sup>[905]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 332*) states:

*An activity may have more than one activity final node. The first one reached stops all flows in the activity.*

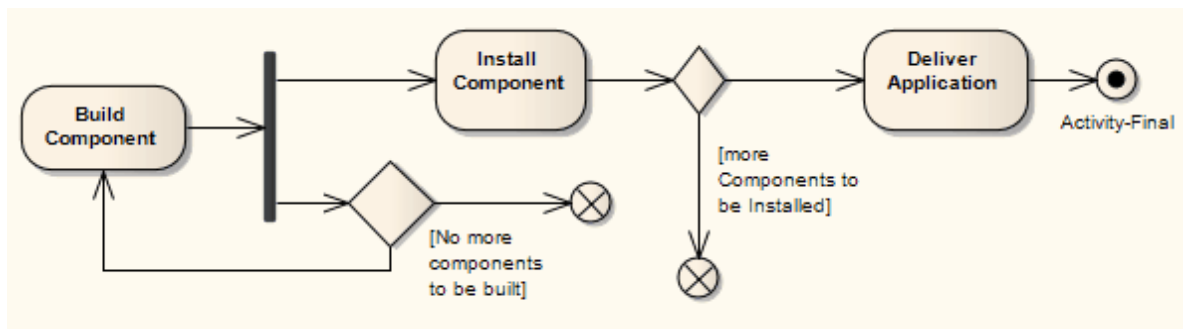

#### 6.4.1.17 Flow Final

### Description

There are two nodes used to define a final state in an Activity, both defined in UML 2.3 as of type Final Node. The Flow Final element depicts an exit from the system, as opposed to the Activity Final, which represents the completion of the Activity. Only the flow entering the Flow Final node exits the Activity; other flows continue undisturbed.

The following example Activity Diagram illustrates the development of an application. The process comes to a Flow Final node when there are no more components to be built; note that the Fork element indicates a concurrent process with the building of new components and installation of completed components. The Flow Final terminates only the sub-process building components. Similarly, only those tokens entering the decision branch for the installation of further components terminate with the connecting Flow Final (that is, stop installing this component, but keep on installing other components). It is only after the Deliver Application activity is completed, after the control flow reaches the Final node, that all flows stop.

See *UML Superstructure Specification, v2.1.1, figure 12.91, p. 374*.

### Notes:

- Moving a diagram generally does not affect the location of elements in packages: if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Flow Final elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

### Toolbox Icon

 Flow Final
**Learn More:**

- [Activity Diagram](#) <sup>[813]</sup>
- [Activity Final](#) <sup>[897]</sup>
- [Fork](#) <sup>[902]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 375*) states:

*A flow final destroys all tokens that arrive at it. It has no effect on other flows in the activity.*

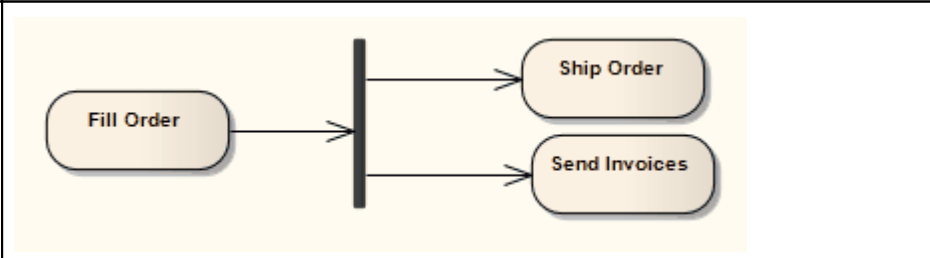

**6.4.1.18 Fork/Join****Description**

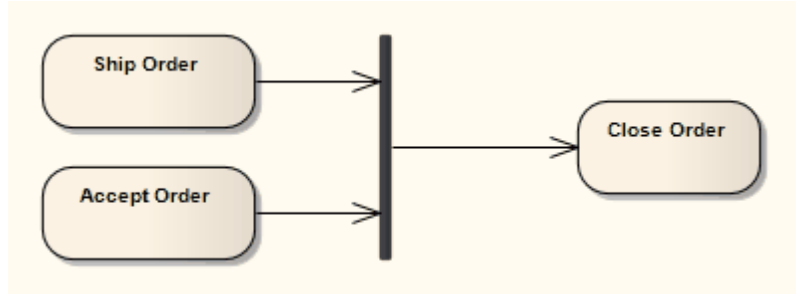

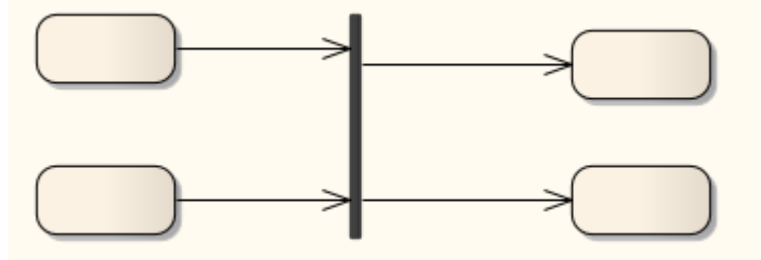

The *Fork/Join* elements have different modes of use, as follows:

- To fork or split the flow into a number of concurrent flows.
- To join the flow of a number of concurrent flows.
- To both join and fork a number of incoming flows to a number of outgoing flows.

These elements are used in both Activity and State Machine diagrams. With respect to State Machine diagrams, Forks and Joins are used as pseudo-states. Other pseudo-states include history states, entry points and exit points. Forks are used to split an incoming transition into concurrent multiple transitions leading to different target states. Joins are used to merge concurrent multiple transitions into a single transition leading to a single target. They are semantic inverses. To learn more about these individual elements see their specific topics.

**Example Diagrams:**

Description	Diagram
Fork or split the flow into a number of concurrent flows	

Description	Diagram
Join the flow of a number of concurrent flows	
Join and Fork a number of incoming flows to a number of outgoing flows

- [Pseudo-state](#) <sup>[822]</sup>

#### OMG UML Specification

##### Fork

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 376*) states:

*A fork node is a control node that splits a flow into multiple concurrent flows... A fork node has one incoming edge and multiple outgoing edges.*

##### Join

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 381-382*) states:

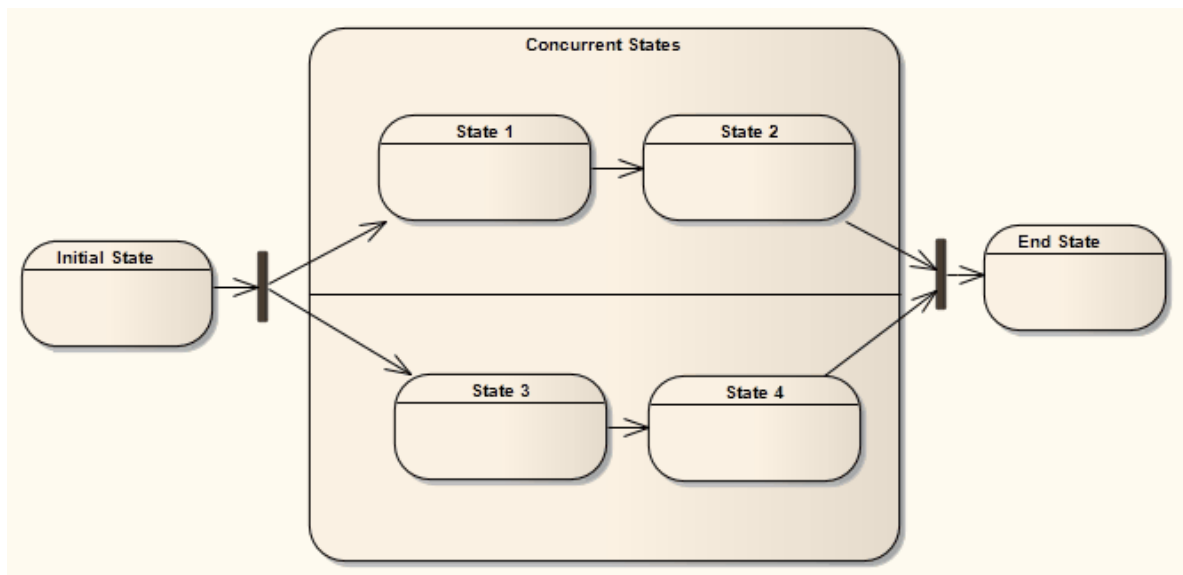

*A join node is a control node that synchronizes multiple flows... A join node has multiple incoming edges and one outgoing edge.*

### 6.4.1.18.1 Fork

#### Description:

The Fork element is used in both Activity and State Machine diagrams. With respect to State Machine diagrams, a Fork pseudo-state signifies that its incoming transition comes from a single state, and it has multiple outgoing transitions. These transitions must occur concurrently, requiring the use of concurrent regions, as depicted below in the Composite State. Unlike Choice or Junction pseudo-states, Forks must not have triggers or guards. The following diagram demonstrates a Fork pseudo-state dividing into two concurrent regions, which then return to the End State via the Join pseudo-state.

- [Choice](#) <sup>[887]</sup>
- [Junction](#) <sup>[910]</sup>
- [Join](#) <sup>[903]</sup>
- [Region](#) <sup>[918]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*Fork vertices serve to split an incoming transition into two or more transitions terminating on orthogonal target vertices (i.e. vertices in different regions of a composite state). The segments outgoing from a fork*

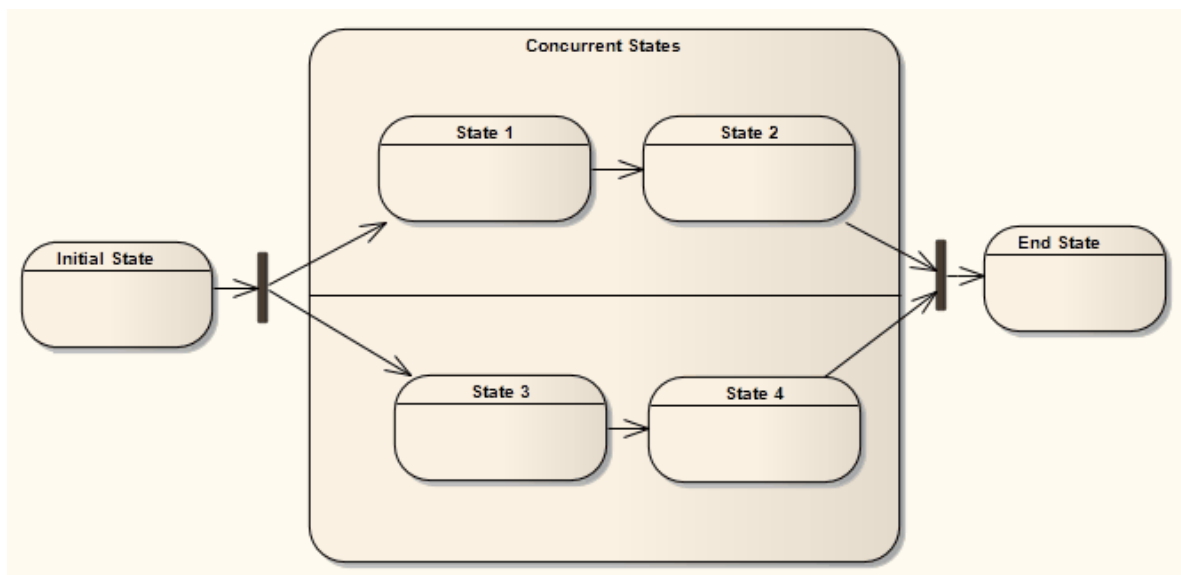

vertex must not have guards or triggers.

#### 6.4.1.18.2 Join

#### Description

The Join element is used by Activity and State Machine diagrams. The above example illustrates a Join transition between Activities. With respect to State Machine diagrams, a Join pseudo-state indicates multiple States concurrently transitioning into the Join and onto a single State. Unlike Choice or Junction pseudo-states, Joins must not have triggers or guards. The following diagram demonstrates a Fork pseudo-state dividing into two concurrent Regions, which then return to the End State via the Join.

#### Learn More:

- [Activity Diagram](#) <sup>[813]</sup>
- [State Machine Diagram](#) <sup>[817]</sup>

- [States](#) <sup>[919]</sup>
- [Choice](#) <sup>[881]</sup>
- [Junction](#) <sup>[910]</sup>
- [Fork](#) <sup>[902]</sup>
- [Region](#) <sup>[918]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*Join vertices serve to merge several transitions emanating from source vertices in different orthogonal*

regions. The transitions entering a join vertex cannot have guards or triggers.

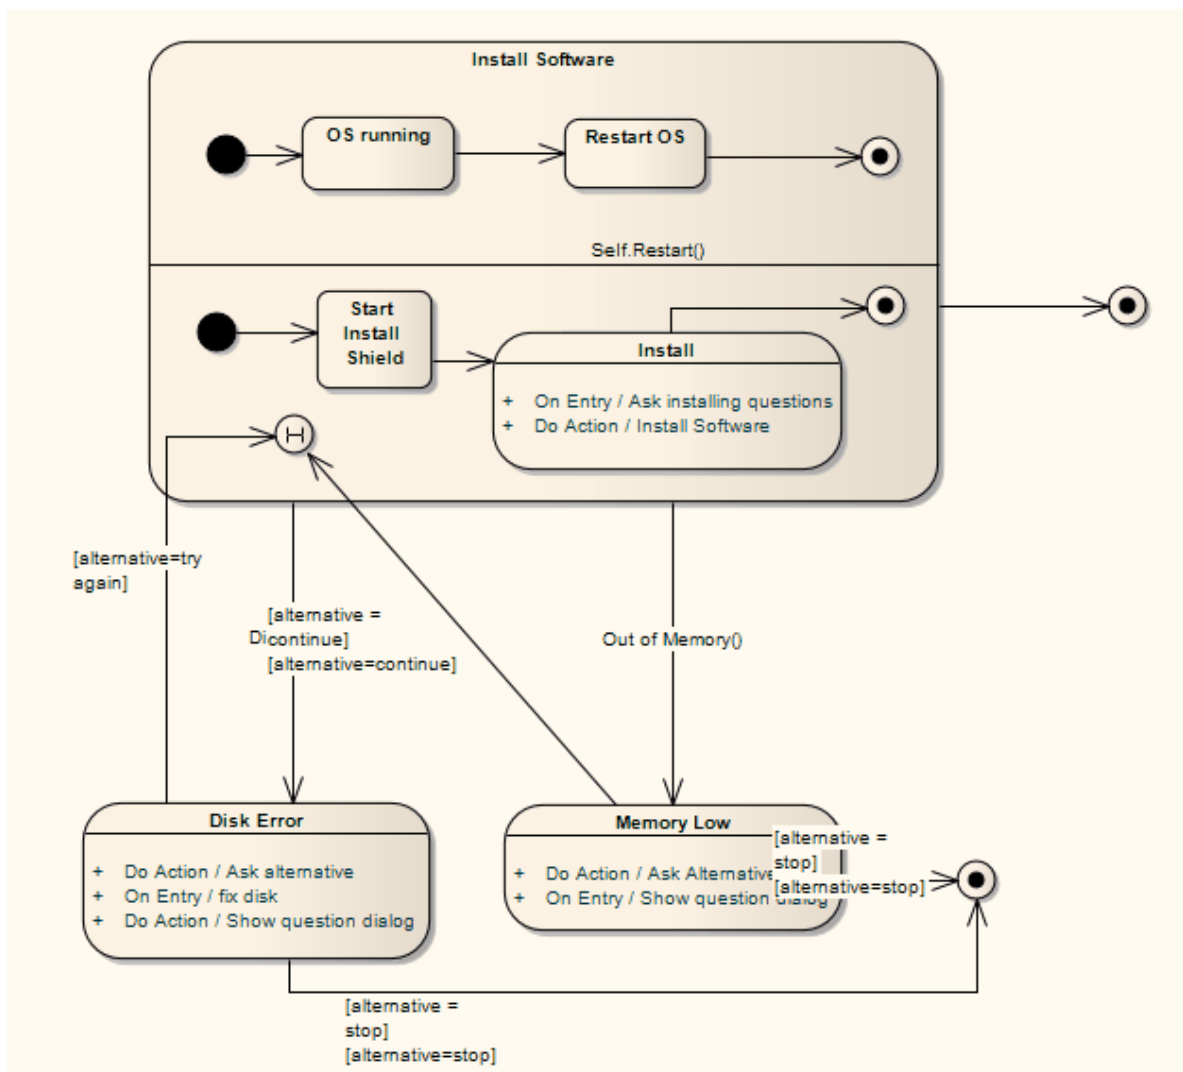

### 6.4.1.19 History

#### Description

There are two types of History pseudo-state defined in UML: shallow and deep history. A shallow History sub-state is used to represent the most recently active sub-state of a Composite State; this pseudo-state does not recurse into this sub-state's active configuration, should one exist. A single connector can be used to depict the default shallow History state, in case the Composite State has never been entered.

A deep History sub-state, in contrast, reflects the most recent active configuration of the Composite State. This includes active sub-states of all regions, and recurses into those sub-states' active sub-states, should they exist. At most one deep history and one shallow history can dwell within a composite state. You can reassign a shallow History substate as a deep History substate using the Advanced element context menu.

### Toolbox Icon

### Learn More:

- [Pseudo-state](#)<sup>[82]</sup>
- [Composite State](#)<sup>[92]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 537*) states:

... *deepHistory* represents the most recent active configuration of the composite state that directly contains this pseudostate (e.g., the state configuration that was active when the composite state was last exited). A composite state can have at most one deep history vertex. At most one transition may originate from the history connector to the default deep history state. This transition is taken in case the composite state had never been active before. Entry actions of states entered on the path to the state represented by a deep history are performed.

... *shallowHistory* represents the most recent active substate of its containing state (but not the substates of that sub state). A composite state can have at most one shallow history vertex. A transition coming into the shallow history vertex is equivalent to a transition coming into the most recent active substate of a state. At most one transition may originate from the history connector to the default shallow history state. This transition is taken in case the composite state had never been active before. Entry actions of states entered on the path to the state represented by a shallow history are performed.

### 6.4.1.20 Initial

### Description

The Initial element is used by Activity and State Machine diagrams. In Activity diagrams, it defines the start of a flow when an Activity is invoked. With State Machines, the Initial element is a pseudo-state used to denote the default state of a Composite State; there can be one Initial vertex in each Region of the Composite State.

This simple example shows the start of a flow to receive an order.

See *UML Superstructure Specification, v2.1.1, Figure 12.97, p. 378*.

The activity flow is completed by a Final or Flow Final node.

**Notes:**

- Moving a diagram generally does not affect the location of elements in packages; if you move a diagram out of one package into another, all the elements in the diagram remain in the original package

However, Initial elements are used only within one diagram, have no meaning outside that diagram, and are never re-used in any other diagram; therefore, if you move a diagram containing these elements, they are moved to the new parent package with the diagram

**Toolbox Icon****Learn More:**

- [Activity Diagram](#) <sup>[813]</sup>
- [State Machine Diagram](#) <sup>[817]</sup>

- [Composite State](#) <sup>[927]</sup>
- [Region](#) <sup>[918]</sup>
- [Final](#) <sup>[897]</sup>
- [Flow Final](#) <sup>[899]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 537*) states:

*An initial pseudostate represents a default vertex that is the source for a single transition to the default state of a composite state. There can be at most one initial vertex in a region. The outgoing transition from the initial vertex may have a behavior, but not a trigger or guard.*

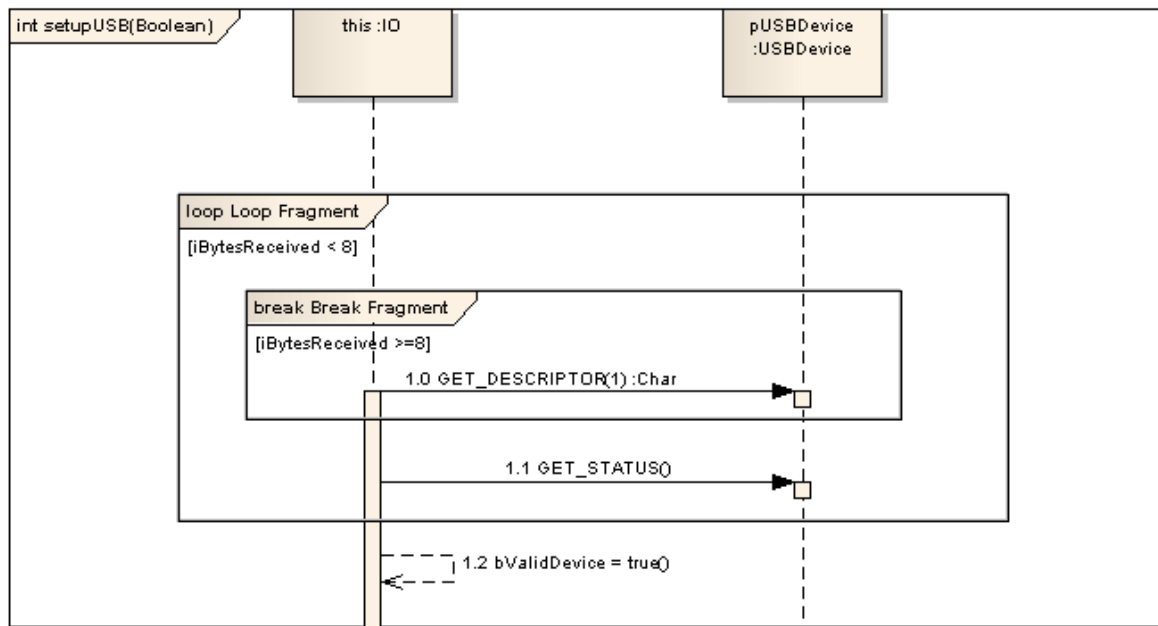

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 378*) also states:

*An initial node is a control node at which flow starts when the activity is invoked.*

**6.4.1.21 Interaction****Description**

An *Interaction* element is used to describe a system, representing its interactions at varying levels of detail, for review not only by design professionals but also by end users and stakeholders. An Interaction element can contain the following types of diagram:

- Sequence
- Interaction Overview
- Communication
- Timing.

An Interaction element in Enterprise Architect is treated as a behavior of the classifier it is encapsulated within. It can have parameters and return types, which are modeled using the **Behavior** tab of the Interaction element's **Properties** dialog. The element is interpreted as a method of the containing Class in the generated code (see the *Generate Code From Behavioral Model* topic).

An Interaction element can also be set as the classifier for an *Interaction Occurrence in a Sequence diagram*, or for a *Call Behavior Action in an Activity diagram*. Establishing such an association (between a behavior and a behavior call) facilitates adding arguments that can be individually mapped to the associated behavior's parameters.

#### Notes:

- The behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an Interaction element (such as `setupUSB` in the example below).

(The IO Class shown above is available in the EAExample model, under **Systems Engineering Model | Implementation Model | Software**.)

#### Learn More:

- [Sequence Diagram](#) <sup>[85]</sup>
- [Interaction Overview Diagram](#) <sup>[86]</sup>
- [Communication Diagram](#) <sup>[86]</sup>
- [Timing Diagram](#) <sup>[83]</sup>
- [Generate Code From Behavioral Model](#) <sup>[150]</sup>
- [Interaction Occurrence](#) <sup>[90]</sup>

- [Call Behavior Action](#) <sup>[868]</sup>
- [Associate with Different Behavior](#) <sup>[718]</sup>
- [Arguments](#) <sup>[718]</sup>

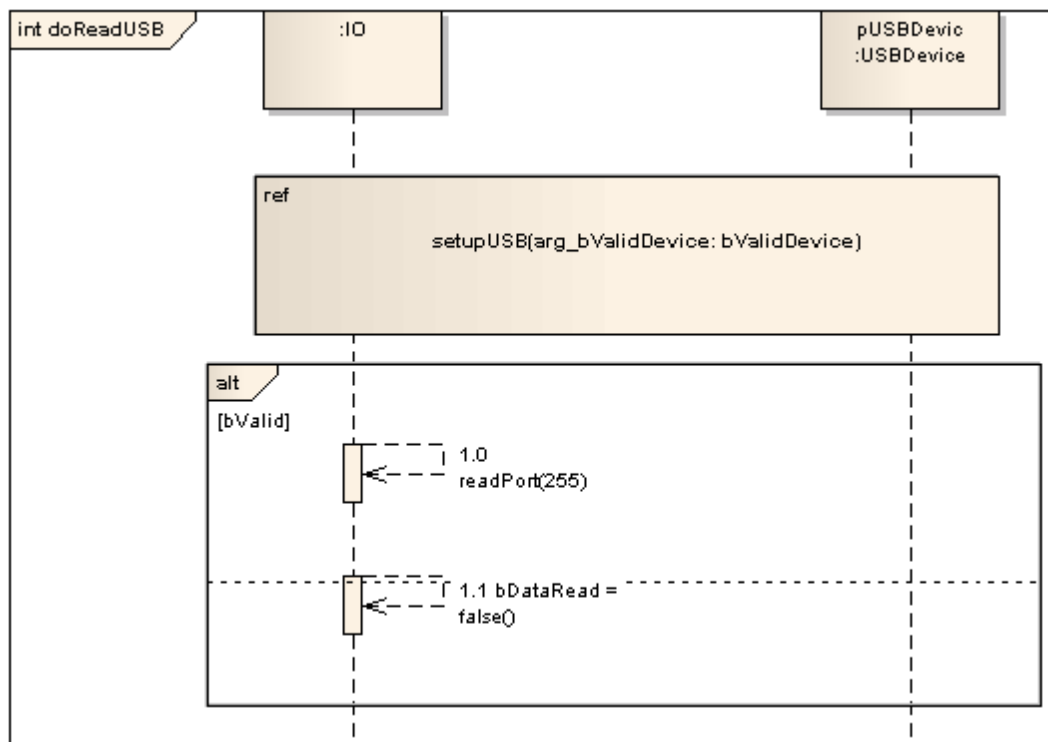

### 6.4.1.22 Interaction Occurrence

#### Description

An *Interaction Occurrence* (or *InteractionUse*) is a reference to an existing *Interaction* (Sequence) diagram. Interaction Occurrences are visually represented by a frame, with *ref* in the frame's title space. The diagram name is indicated in the frame contents. To create an Interaction Occurrence, simply open a Sequence diagram (preferably contained within an Interaction element) and drag another Sequence diagram (also preferably contained within an Interaction element) into its workspace. A dialog displays, providing configuration options. The resulting Interaction Occurrence acts as an invocation of the original Interaction. You use the Call tab of the element Properties dialog to set up the actual arguments of the Interaction and also to change to a different associated Interaction element.

The following figure illustrates the use of an Interaction Occurrence in another Interaction (Sequence) diagram. You can display the sequence represented by the Interaction Occurrence by double-clicking on the element.

#### Notes:

- The behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an Interaction element (such as *doReadUSB* in the example below).

#### Learn More:

- [Sequence Diagram](#) <sup>[85]</sup>
- [Interaction element](#) <sup>[90]</sup>
- [Behavior Calls Invocations](#) <sup>[71]</sup>
- [Arguments](#) <sup>[71]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 423*) refers to an Interaction Occurrence as an **InteractionUse**, and states:

*An InteractionUse refers to an Interaction. The InteractionUse is a shorthand for copying the contents of the referred Interaction where the InteractionUse is. To be accurate the copying must take into account substituting parameters with arguments and connect the formal gates with the actual ones.*

*It is common to want to share portions of an interaction between several other interactions. An InteractionUse allows multiple interactions to reference an interaction that represents a common portion of their specification.*

### 6.4.1.23 Interruptible Activity Region

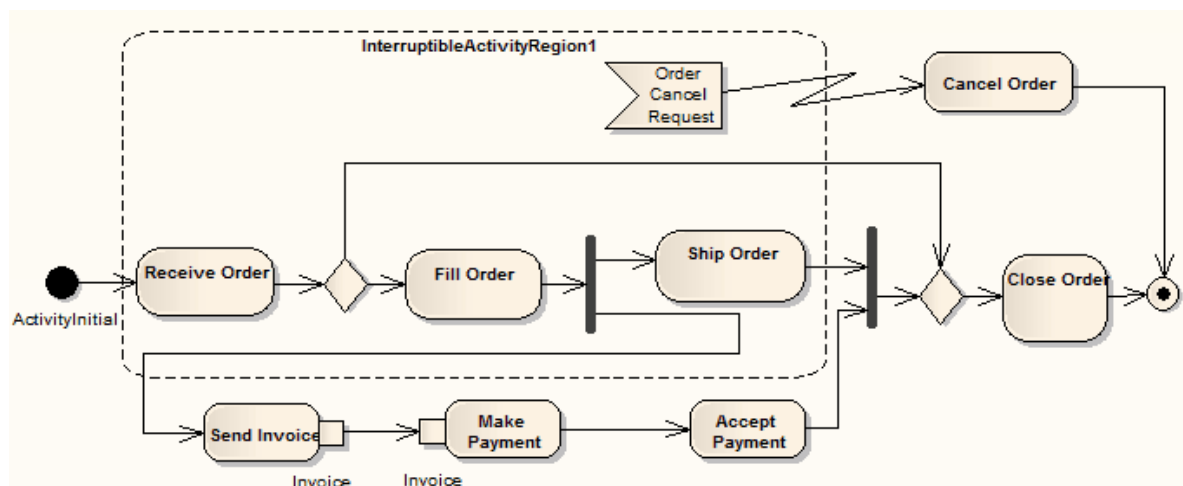

#### Description

You create an Interruptible Activity Region as one variant of a Region (the other is an Expansion Region).

In an Activity diagram, an Interruptible Activity Region surrounds a group of Activity elements, all affected by certain interrupts in such a way that all tokens passing within the region are terminated should the interruption(s) be raised. Any processing occurring within the bounds of an Interruptible Activity Region is terminated when a flow is instigated across an interrupt flow to an external element.

The example below illustrates that an order cancellation kills any processing of the order at the receipt, filling or shipping stage.

See *UML Superstructure Specification, v2.1.1, figure 12.100, p. 381.*

### Toolbox Icon

### Learn More:

- [Activity diagram](#) <sup>[813]</sup>
- [Activity](#) <sup>[875]</sup>
- [Region](#) <sup>[918]</sup>
- [Expansion Region](#) <sup>[895]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 380*) states:

*An interruptible region contains activity nodes. When a token leaves an interruptible region via edges designated by the region as interrupting edges, all tokens and behaviors in the region are terminated.*

### 6.4.1.24 Junction

### Description

Junction pseudo-states are used to design complex transitional paths in State Machine diagrams. A Junction can be used to combine or merge multiple paths into a shared transition path. Alternatively, a Junction can split an incoming path into multiple paths, similar to a Fork pseudostate. Unlike Forks or Joins, Junctions can apply guards to each incoming or outgoing transition, such that if the guard expression is false, the transition is disabled.

The following example illustrates how guards can be applied to transitions coming into or out of a Junction

pseudo-state.

#### Toolbox Icon

#### Learn More:

- [State Machine Diagram](#) <sup>[817]</sup>
- [Pseudo-states](#) <sup>[822]</sup>
- [Fork](#) <sup>[902]</sup>
- [Join](#) <sup>[903]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 538*) states:

*... junction vertices are semantic-free vertices that are used to chain together multiple transitions. They are used to construct compound transition paths between states. For example, a junction can be used to converge multiple incoming transitions into a single outgoing transition representing a shared transition path (this is known as a merge). Conversely, they can be used to split an incoming transition into multiple outgoing transition segments with different guard conditions. This realizes a static conditional branch. (In the latter case, outgoing transitions whose guard conditions evaluate to false are disabled. A predefined guard denoted "else" may be defined for at most one outgoing transition. This transition is enabled if all the guards labeling the other transitions are false.) Static conditional branches are distinct from dynamic conditional branches that are realized by choice vertices.*

### 6.4.1.25 Lifeline

#### Description

A Lifeline is an individual participant in an interaction (that is, Lifelines cannot have multiplicity). A Lifeline represents a distinct connectable element. To specify that representation within Enterprise Architect, right-click on the Lifeline and select the Advanced | Instance Classifier context menu option. The Select <Item> dialog displays which you use to locate the required project classifiers.

Lifelines are available in Sequence diagrams. There are different Lifeline elements for Timing diagrams (State Lifeline and Value Lifeline); however, although the representation differs between the two diagram types, the meaning of the Lifeline is the same.

#### Toolbox Icon

#### Learn More:

- [Instance Classifier](#) <sup>[692]</sup>
- [Sequence Diagram](#) <sup>[851]</sup>
- [Timing diagram](#) <sup>[832]</sup>
- [State Lifeline](#) <sup>[925]</sup>
- [Value Lifeline](#) <sup>[940]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p.489*) states:

*A lifeline represents an individual participant in the Interaction. While Parts and StructuralFeatures may have multiplicity greater than 1, Lifelines represent only one interacting entity.*

*Lifeline is a specialization of NamedElement.*

*If the referenced ConnectableElement is multivalued (i.e. has a multiplicity > 1), then the Lifeline may have an expression (the 'selector') that specifies which particular part is represented by this Lifeline. If the selector is omitted this means that an arbitrary representative of the multivalued ConnectableElement is chosen.*

### 6.4.1.26 Merge

### Description

A Merge Node brings together a number of alternative flow paths in Activity, Analysis and Interaction Overview diagrams. For example, if a Decision is used after a Fork, the two flows coming out of the Decision must be merged into one before going to a Join; otherwise, the Join waits for both flows, only one of which arrives.

A Merge Node has multiple incoming edges and a single outgoing edge. The edges coming into and out of a Merge Node must be either all object flows or all control flows.

### Toolbox Icon

### Learn More:

- [Activity Diagram](#) <sup>[813]</sup>
- [Analysis Diagram](#) <sup>[1190]</sup>
- [Interaction Overview Diagram](#) <sup>[863]</sup>
- [Decision](#) <sup>[888]</sup>
- [Fork](#) <sup>[902]</sup>
- [Join](#) <sup>[903]</sup>
- [Object flow](#) <sup>[1005]</sup>
- [Control flow](#) <sup>[979]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 387*) states:

*A merge node is a control node that brings together multiple alternate flows. It is not used to synchronize concurrent flows but to accept one among several alternate flows.*

## 6.4.1.27 Message Endpoint

### Description

A Message Endpoint element defines the termination of a State or Value Lifeline in a Timing diagram.

### Toolbox Icon

### Learn More:

- [Timing Diagram](#) <sup>[832]</sup>
- [State Lifeline](#) <sup>[925]</sup>

- [Value Lifeline](#)<sup>[940]</sup>

### 6.4.1.28 Message Label

#### Description

A Message Label is an alternative way of denoting Messages between Lifelines, which is useful for 'uncluttering' Timing diagrams strewn with messages. To indicate a Message between Lifelines, draw a connector from the source Lifeline into a Message Label. Next, draw a connector from another Message Label to the target Lifeline. Note that the label names must match to reflect that the message occurs between the two Message Labels.

The following diagram illustrates how Message Labels are used to construct a message between Lifelines.

#### Toolbox Icon

#### Learn More:

- [Timing diagram](#)<sup>[832]</sup>
- [Messages](#)<sup>[1007]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 518*) states:

*Labels are only notational shorthands used to prevent cluttering of the diagrams with a number of messages crisscrossing the diagram between Lifelines that are far apart. The labels denote that a Message may be disrupted by introducing labels with the same name.*

### 6.4.1.29 Note

#### Description

A Note element is a textual annotation that can be attached to a set of elements of any other type. The attachment is created separately, using a Notelink connector. Both Note and Notelink are available in any Enterprise Architect diagram, through the Common pages of the Toolbox.

A Note is also called a Comment.

A Constraint is a form of Note, identifying a constraint on other elements. As for a Note, you can connect the Constraint element to other elements using a Notelink connector. This element is just a means of documenting the fact that there are constraints; it has no impact on the other elements. You define the types of constraint in the project reference data, apply them to the element in the element Properties dialog, and manage them through the Scenarios & Requirements window.

#### Toolbox Icon

#### Learn More:

- [Notelink Connector](#)<sup>[1005]</sup>
- [Constraint Types](#)<sup>[786]</sup>
- [Scenarios & Requirements Window](#)<sup>[691]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 59*) states:

*A comment gives the ability to attach various remarks to elements. A comment carries no semantic force, but may contain information that is useful to a modeler.*

*A comment can be owned by any element.*

### 6.4.1.30 Partition

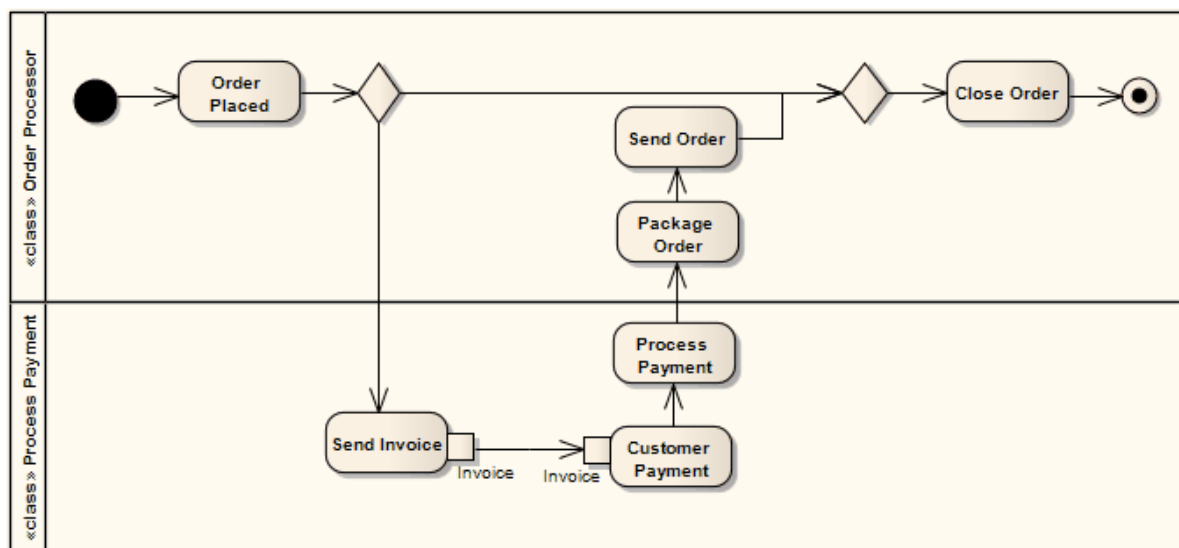

#### Description

Enterprise Architect supports two types of Activity Partition:

- The Activity Partition feature, which is used to logically organize an Activity element
- The Activity Partition element, described in this topic, which is used to logically organize an Activity diagram.

In effect, these are the same. They partition the Actions of the Activity without affecting the token flow, helping to structure the view or parts of the Activity.

The following example depicts the partitioning between the Classes Process Payment and Order Processor.

The Partition orientation defaults to horizontal. To turn it into a vertical Partition, right-click on it and select the Advanced | Vertical Partition context menu option.

You can neatly align and join the Activity Partitions on a diagram using the element context menu Dockable option. For Partitions, the option defaults to selected.

#### Toolbox Icon

**Learn More:**

- [Activity Diagram](#)<sup>[813]</sup>
- [Activity Element](#)<sup>[875]</sup>
- [Activity Partition Feature](#)<sup>[878]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) states:

*Partitions divide the nodes and edges to constrain and show a view of the contained nodes. Partitions can share contents. They often correspond to organizational units in a business model. They may be used to allocate characteristics or resources among the nodes of an activity.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 341*) also states:

*An activity partition is a kind of activity group for identifying actions that have some characteristic in common.*

**6.4.1.31 Receive****Description**

A Receive element is used to define the acceptance or receipt of a request, in an Activity diagram. Movement from a Receive element occurs only once receipt is fulfilled according to its specification. The Receive element comes in two forms:

- *Accept Event Action* element (pennant shape)
- *Accept Time Event Action* element (hourglass shape)

The following example reflects a payment process on an order. Upon receiving the payment (from Request Payments, a Send element), the payment is confirmed and the flow continues to ship the order.

See *UML Superstructure Specification, v2.1.1, figure 12.26, p. 312*.

To depict an Accept Time Event, use the standard Receive element from the **Toolbox**. Right-click on this element, and select the **Advanced | Accept Time Event context** menu option. The following example shows the hourglass-shaped Accept Time Event Action:

See *UML Superstructure Specification, v2.1.1, figure 12.27, p. 312.*

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#)<sup>[813]</sup>
- [Send Element](#)<sup>[919]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 239*) states:

*AcceptEventAction is an action that waits for the occurrence of an event meeting specified conditions.*

### 6.4.1.32 Region

#### Description

Enterprise Architect supports two types of *Region* element:

- Expansion Region
- Interruptible Activity Region

When you add a *Region* element to an Activity diagram, a dialog prompt appears. Use this to specify the *Region* type.

#### Toolbox Icon

#### Learn More:

- [Activity Diagram](#)<sup>[813]</sup>
- [Expansion Region](#)<sup>[895]</sup>

- [Interruptible Activity Region](#)<sup>[909]</sup>

### 6.4.1.33 Send

#### Description:

The Send element is used to depict the action of sending a signal, in an Activity diagram. It is the opposite of a Receive element.

The following example shows an order being processed, where a signal is sent to fill the processed order and, upon creation of the resulting invoice, a notification is sent to the customer.

See *UML Superstructure Specification, v2.1.1, figure 12.132, p. 408.*

#### Toolbox Icon:

#### Learn More:

- [Activity Diagram](#)<sup>[813]</sup>
- [Receive](#)<sup>[917]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 285*) states:

*SendObjectAction is an action that transmits an object to the target object, where it may invoke behavior such as the firing of state machine transitions or the execution of an activity. The value of the object is available to the execution of invoked behaviors. The requestor continues execution immediately. Any reply message is ignored and is not transmitted to the requestor.*

### 6.4.1.34 State

### Description

A *State* represents a situation where some invariant condition holds; this condition can be static (waiting for an event) or dynamic (performing a set of activities). State modeling is usually related to Classes, and describes the enableable states a Class or element can be in and the transitions that enable the element to move there. There are two types of State: *Simple States* and *Composite States*, both created from the State element from the **Toolbox**.

Furthermore, there are pseudo-states, resembling some aspect of a State but with a pre-defined implication. Pseudo-states model complex transitional paths, and classify common State Machine behavior.

You can define entry, internal and exit actions for a State using operations.

If a State element has features such as attributes or operations, the depiction of the element in a diagram has a line under the element name. This line persists if the features are hidden. The line also displays if the **Show State Compartment** checkbox is selected on the **Objects** page of the **Options** dialog (**Tools | Options | Objects**).

### Toolbox Icon

### See Also:

- [Composite State](#) <sup>[92]</sup>

### Learn More:

- [State Machine Diagram](#) <sup>[81]</sup>
- [Class](#) <sup>[94]</sup>
- [Pseudo-states](#) <sup>[82]</sup>
- [Operations](#) <sup>[71]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 546*) states:

*A state models a situation during which some (usually implicit) invariant condition holds. The invariant may represent a static situation such as an object waiting for some external event to occur. However, it can also model dynamic conditions such as the process of performing some activity (i.e., the model element under consideration enters the state when the activity commences and leaves it as soon as the activity is completed).*

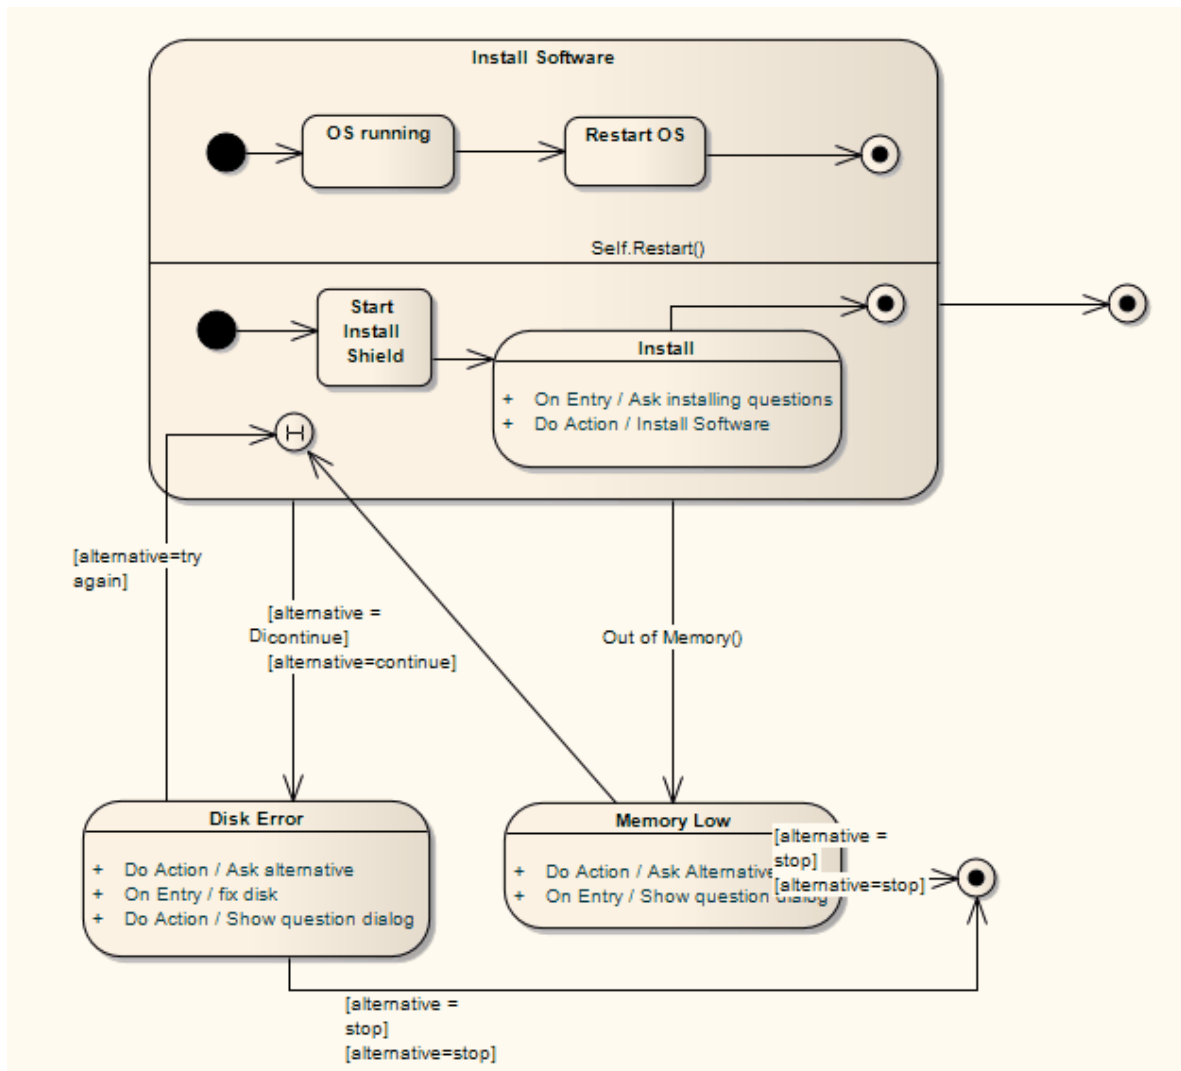

### 6.4.1.34.1 Composite State

#### Description

Composite States are composed within the State Machine diagram by expanding a State element, adding Regions if applicable, and dragging further State elements, related elements and connectors within its boundaries. The internal State elements are then referred to as Sub-states.

(You can also define a State element, as with many other types of element, as a composite element; this then has a hyperlink to a child diagram that can be another State Machine diagram or other type of diagram elsewhere in the model.)

Composite States can be orthogonal, if Regions are created. If a Composite State is orthogonal, its entry denotes that a single Sub-state is concurrently active in all Regions. The hierarchical nesting of Composite States, coupled with Region use, generates a situation of multiple States concurrently active; this situation is referred to as the active State configuration.

#### Learn More:

- [State Machine Diagram](#) <sup>[817]</sup>
- [State Element](#) <sup>[919]</sup>

- [Regions](#)<sup>[822]</sup>
- [Composite Element](#)<sup>[649]</sup>

### **OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 478*) states:

*A composite state either contains one region or is decomposed into two or more orthogonal regions. Each region has a set of mutually exclusive disjoint subvertices and a set of transitions. A given state may only be decomposed in one of these two ways.*

*Any state enclosed within a region of a composite state is called a substate of that composite state. It is called a direct substate when it is not contained by any other state; otherwise it is referred to as an indirect substate.*

*Each region of a composite state may have an initial pseudostate and a final state. A transition to the enclosing state represents a transition to the initial pseudostate in each region. A newly-created object takes its topmost default transitions, originating from the topmost initial pseudostates of each region.*

*A transition to a final state represents the completion of activity in the enclosing region. Completion of activity in all orthogonal regions represents completion of activity by the enclosing state and triggers a completion event on the enclosing state. Completion of the topmost regions of an object corresponds to its termination.*

### **6.4.1.35 State/Continuation**

#### **Description**

The State/Continuation element serves two different purposes for Interaction (Sequence) diagrams, as State Invariants and Continuations. Enterprise Architect prompts you to identify the purpose when you create the element.

#### **Toolbox Icon**

#### **See Also:**

- [Continuation](#)<sup>[923]</sup>
- [State Invariant](#)<sup>[924]</sup>

#### **Learn More:**

- [Sequence Diagram](#)<sup>[851]</sup>

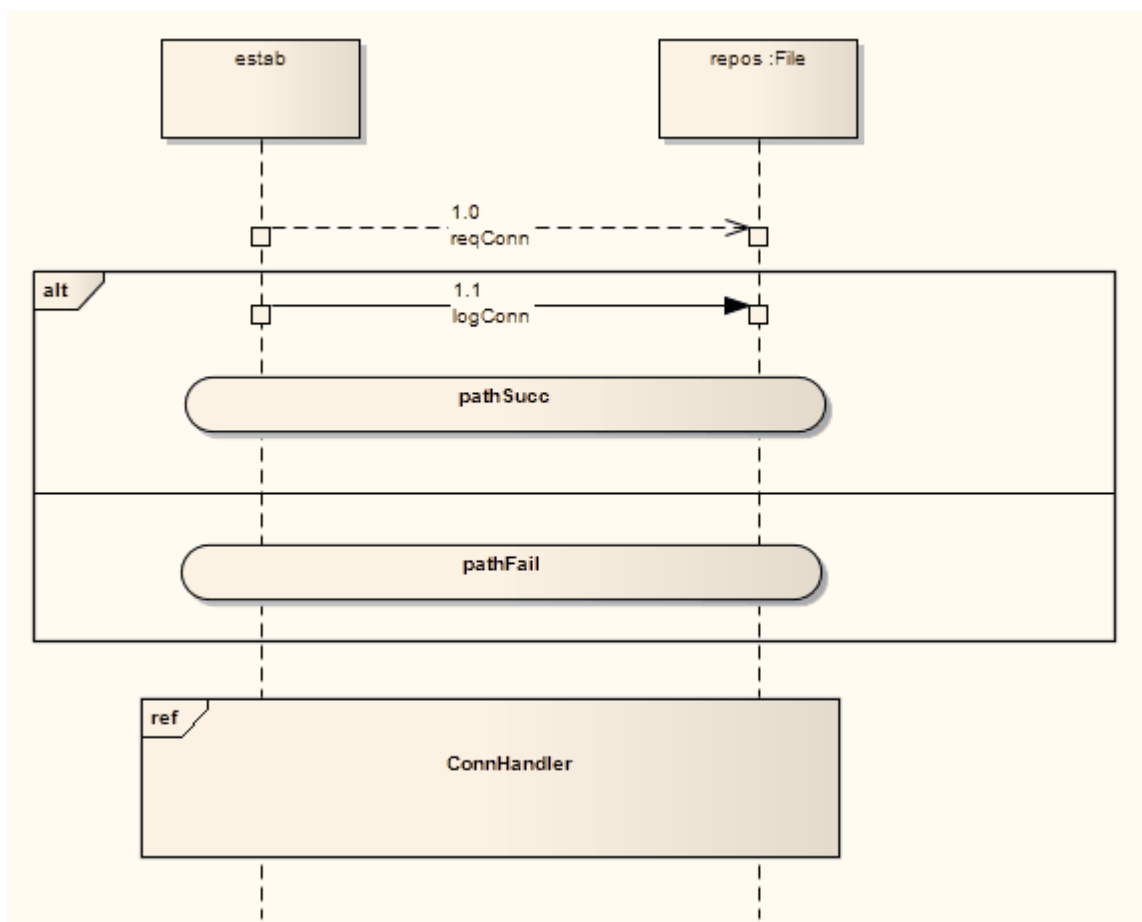

### 6.4.1.35.1 Continuation

#### Description

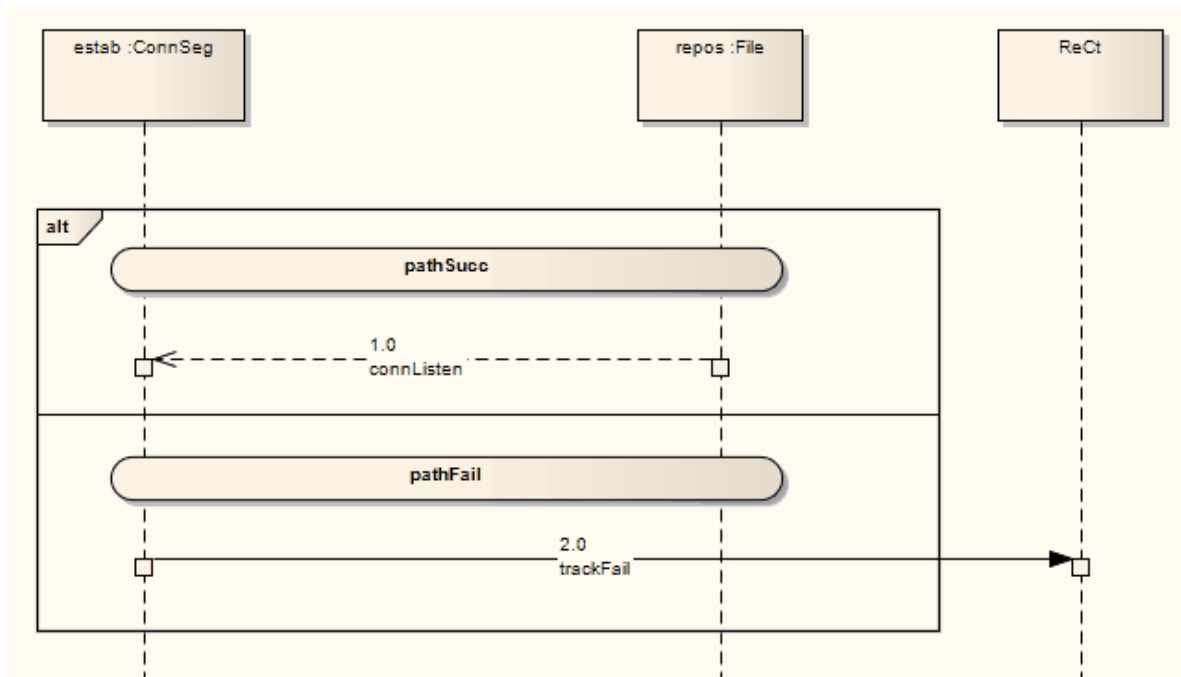

A Continuation is used in seq and alt Combined Fragments, to indicate the branches of continuation an operand follows. To indicate a continuation, end an operand with a Continuation, and indicate the continuation branch with a matching Continuation (same name) preceding the Interaction Fragment.

You create a Continuation by dragging the State/Continuation element onto the diagram from the **Interaction Elements** page of the **Toolbox**.

For the following continuation example, an alt Combined Fragment has Continuations pathSucc and pathFail. These Continuations are located within the Interaction Occurrence ConnHandler, which has subsequent events based on the continuation.

The following diagram shows the interaction referenced by the *Interaction Occurrence*.

**Learn More:**

- [Combined Fragments](#) <sup>[882]</sup>
- [State/Continuation Element](#) <sup>[922]</sup>
- [Interaction Occurrence](#) <sup>[908]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 474*) states:

*A Continuation is a syntactic way to define continuations of different branches of an Alternative CombinedFragment. Continuation is intuitively similar to labels representing intermediate points in a flow of control.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 474*) also states:

*Continuations have semantics only in connection with Alternative CombinedFragments and (weak) sequencing.*

*If an InteractionOperand of an Alternative CombinedFragment ends in a Continuation with name (say) X, only InteractionFragments starting with the Continuation X (or no continuation at all) can be appended.*

**6.4.1.35.2 State Invariant****Description**

A State Invariant is a condition applied to a Lifeline, which must be fulfilled for the Lifeline to exist. You create a State Invariant by dragging the State/Continuation element onto the diagram from the **Interaction Elements** page of the **Toolbox**.

The following diagram illustrates a State Invariant.

When a State Invariant is moved near to a Lifeline, it snaps to the center. If the sequence object is dragged left or right, the State Invariant moves with it.

#### Learn More:

- [Lifeline](#)<sup>[912]</sup>
- [State/Continuation](#)<sup>[922]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 502*) states:

*A StateInvariant is a runtime constraint on the participants of the interaction. It may be used to specify a variety of different kinds of constraints, such as values of attributes or variables, internal or external states, and so on.*

*A StateInvariant is an InteractionFragment and it is placed on a Lifeline.*

### 6.4.1.36 State Lifeline

#### Description

A Lifeline is the path an object takes across a measure of time, as indicated by the x-axis. There are two sorts: State Lifelines (defined here) and Value Lifelines, both used in Timing diagrams.

A State Lifeline follows discrete transitions between states, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations. An example of a State Lifeline is shown below:

See *UML Superstructure Specification, v2.1.1, figure 14.29, p. 519.*

A State Lifeline consists of a set of transition points. Each transition point can be defined with the following properties:

Property	Description
At time	Specifies the starting time for a change of state.
Transition to	Indicates the state to which the lifeline changes.
Event	Describes the occurring event.
Timing constraints	Refers to the time taken for a state to change within a lifeline, or the time taken to transmit a message (e.g. t..t+3).
Timing observations	Provides information on the time of a state change or sent message.
Duration constraints	Pertains to a lifeline's period at a particular state. The constraint could be instigated by a change of state within a lifeline, or that lifeline's receipt of a message.
Duration observations	Indicates the interval of a lifeline at a particular state, begun from a change in state or message receipt.

In the example diagram above, the **OK** transition point has these properties:

Property	Value
At Time	18 ms
Transition to	Idle
Event	OK
Timing constraints	t..t+3
Timing observations	–
Duration constraints	–
Duration observations	–

Toolbox Icon

 State Lifeline**Learn More:**

- [Timing Diagram](#) <sup>[832]</sup>
- [Value Lifelines](#) <sup>[940]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 518*) states:

*This is the state of the classifier or attribute, or some testable condition, such as an discrete enumerable value.*

*It is also permissible to let the state-dimension be continuous as well as discrete. This is illustrative for scenarios where certain entities undergo continuous state changes, such as temperature or density.*

**6.4.1.37 State Machine****Description**

A State Machine element is a container for groups of related State elements. You can create sections of a State Machine diagram, showing the organization of the inter-related State elements, and enclose each section in a State Machine element. You can also create Regions on a State Machine element.

**Toolbox Icon** State Machine**Learn More:**

- [Regions](#) <sup>[822]</sup>

### 6.4.1.38 Structured Activity

#### Description

*Structured Activity* elements are used in Activity diagrams. A Structured Activity is an activity node that can have subordinate nodes as an independent *Activity Group*. No other Activities or their side effects should interfere with this Activity's processing.

Enterprise Architect provides two forms of Structured Activity - basic and specialized. It also applies the mechanism for creating Structured Activities to creating composite Activity elements quickly and simply.

The two basic Structured Activities are:

- Structured Activity Node - represents an ordered arrangement of executable Activity nodes (Actions, Decisions, Merges and so on) that can include branched and nested nodes; this is the base element from which the other types of Structured Activity are derived
- Sequential Node - represents a sequential arrangement of executable Activity nodes.

The two specialized Structured Activities are used to effectively model discreet patterns within an activity graph, defined in Clauses or Partitions:

- Conditional node - represents an arrangement of Actions and Activities where choice determines which Activities are performed
- Loop node - represents a sequence of Actions and Activities that are - or can be - repeated on the same object.

All four kinds of Structured Activity node are created as composite elements. However, for the Loop Node and Conditional Node elements you must create the child element structure on the parent diagram within the node element itself, as for a Composite State. You cannot develop the partitioned structure of the nodes on a child diagram. For this reason, the **Show Composite Diagram** facility is not available for the Loop Node and Conditional Node. It is also not available on the Structured Activity Node, as this is the base element for the Loop and Conditional Nodes. You can, however, use the two basic nodes as composite elements, and display the child diagram structure on the parent Sequential node.

When you create a Structured Activity, by selecting the icon from the **Activity** page of the **Toolbox**, the following choices are offered in a context menu:

- Loop Node
- Conditional Node
- Other

The first two options specifically create a Loop or Conditional Node. The **Other** option displays the **New Structured Activity** dialog, on which you can select to create any of the four nodes, or a simple Composite Activity element.

#### Toolbox Icon

#### See Also:

- [Structured Node](#)<sup>[929]</sup>
- [Sequential Node](#)<sup>[929]</sup>

- [Activity Diagram](#) <sup>[813]</sup>
- [Activity](#) <sup>[875]</sup>
- [Composite Elements](#) <sup>[649]</sup>
- [Composite State](#) <sup>[921]</sup>

#### 6.4.1.38.1 Structured Node

##### Description:

On a diagram, *Structured* Activity Nodes have broken borders and composite diagram icons, as shown below:

To display the Activity diagram represented by a Structured Activity Node element, double-click on the element.

Structured Activity Node elements can point to child diagrams that themselves contain or consist of Structured Activity elements; that is, the Structured Activity elements are nested, as shown in the section of **Project Browser** below.

##### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 409*) states:

*A structured activity node is an executable activity node that may have an expansion into subordinate nodes as an ActivityGroup. The subordinate nodes must belong to only one structured activity node, although they may be nested.*

*A structured activity node represents a structured portion of the activity that is not shared with any other structured node, except for nesting.*

#### 6.4.1.38.2 Sequential Node

##### Description:

On a diagram, *Sequential* Activity Nodes have broken borders and composite diagram icons, as shown below:

To display the Activity diagram represented by a Sequential Activity Node element, double-click on the element.

### OMG UML Specification

#### **Sequential Node**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 408*) states:

*A sequence node is a structured activity node that executes its actions in order.*

#### **6.4.1.38.3 Loop Node**

##### Description:

A *Loop Structured Activity Node* by default has *Setup*, *Test* and *Body* partitions. The *Setup* partition is executed once on entry to the Loop, and the *Test* and *Body* partitions are executed repeatedly until the *Test* produces a false value. The results of the final execution of the *Test* or *Body* are available after execution of the Loop is complete.

They are depicted on an Activity diagram as shown below:

You define the Loop nodes by dragging other Activity diagram elements from the **Toolbox** page into the appropriate partition of the element, and linking and organizing the structure as required. The elements are aligned on the top left of the partition, so that resizing the node maintains the organization of the structure within and between the partitions. If you try to shrink the node below the structure size, the node automatically defaults to the 'best fit' size.

When you create a Loop Node, the element **Properties** dialog displays. Much of this you can complete as for any other element. However, for the Loop Node the dialog also has a **Loop** tab.

Add an Action Pin for each of the **Decider**, **Loop Variable Input**, **Loop Variable**, **Body Output** and **Result** fields for the node, in each case clicking on the **Browse** or **Add** button to display the **Select Pins** dialog (a version of the **Select <Item>** dialog). The **Select ActionPin** dialog reveals only Input pins (**Loop Variable Input**) or Output pins as appropriate to the context. If the required Action Pin does not already exist, you can

click on the **Add New** button on the dialog to automatically create the Input pin or an Output pin under the appropriate parent node.

You can also check on the exact location of an existing Action Pin by right-clicking on the pin name and selecting the **Find in Project Browser** context menu option.

The **Nodes** panel, by default, lists the Actions and Activities contained in the **Setup** partition. Click on the **Body** or **Test** radio buttons to list the elements contained in the corresponding partitions. An element must be completely contained in a partition to be listed there - if it overlaps with the partition above in any way, it is treated as being part of that partition.

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, pp. 384-385*) states:

*A loop node is a structured activity node that represents a loop with setup, test, and body sections.*

*Each section is a well-nested subregion of the activity whose nodes follow any predecessors of the loop and precede any successors of the loop. The test section may precede or follow the body section. The setup section is executed once on entry to the loop, and the test and body sections are executed repeatedly until the test produces a false value. The results of the final execution of the test or body are available after completion of execution of the loop.*

#### 6.4.1.38.4 Conditional Node

##### Description:

A *Conditional Structured Activity Node* has a default *Clause* containing *Test* and *Body* partitions. Further *Clauses* can be added if required.

They are depicted on an Activity diagram as shown below:

You define Conditional nodes by dragging other Activity diagram elements from the **Toolbox** page into the appropriate partition of the element, and linking and organizing the structure as required. The elements are aligned on the top left of the partition, so that resizing the node maintains the organization of the structure within and between the partitions. If you try to shrink the node below the structure size, the node automatically defaults to the 'best fit' size.

When you create a Conditional Node, the element **Properties** dialog displays. Much of this you can complete as for any other element. However, for the Conditional Node the dialog shows an additional page.

Add an Action Pin as the **Result** for the node, clicking on the **Add** button to display the **Select Pins** dialog (a version of the **Select <Item>** dialog).

On creation, the Conditional Node automatically has one *Clause* containing a **Decider** and **Body Output**, and a **Test** partition and a **Body** partition. You can add further *Clauses* as required. For each *Clause* you also add an Action Pin for the **Decider** and for the **Body Output**. Click on the **Save** button to save the *Clause* definition.

The **Select Pin** dialog reveals only Output pins as appropriate to the context. If the required Action Pin does not already exist, you can click on the **Add New** button on the dialog to automatically create an Output pin under the appropriate parent node.

For the **Result** and **Body Output** entries, you can check on the exact location of each Action Pin by right-clicking on the entry and selecting the **Find in Project Browser** context menu option.

The **Nodes** panel, by default, lists the Actions and Activities contained in the Test partition. Click on the **Body** radio button to list the elements contained in the Body partition. An element must be completely contained in the Body partition to be listed there - if it overlaps with the Test partition in any way, it is treated as being part of the Test partition.

### Add or Remove Clauses

To add another Clause, click on the **Add** button underneath the **Clause(s)** list. This inserts a new Clause in the list, and identifies which is the preceding, or Predecessor, Clause and (if appropriate) which is the following, or Successor, Clause. The remaining fields in the **Clause(s)** panel are cleared to enable you to add **Decider** and **Body Output** Action Pins. New Test and Body partitions are immediately added to the element on the diagram, and you can populate these partitions with Activity elements, which are then identified in the **Nodes** panel.

To remove a Clause, highlight it in the list and click on the **Delete** button. This immediately removes the Clause's corresponding partitions from the diagram, along with all their contained Activity elements. Removing a Clause from between two other Clauses adjusts the numerical order; for example, if Clause 2 is removed from between Clause 1 and Clause 3, Clause 3 is renamed as Clause 2, and any further Clauses are also moved up one place.

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p.355*) states:

*A conditional node is a structured activity node that represents an exclusive choice among some number of alternatives.*

*A conditional node consists of one or more clauses. Each clause consists of a test section and a body section. When the conditional node begins execution, the test sections of the clauses are executed. If one or more test sections yield a true value, one of the corresponding body sections will be executed. If more than one test section yields a true value, only one body section will be executed. The choice is nondeterministic unless the test sequence of clauses is specified. If no test section yields a true value, then no body section is executed; this may be a semantic error if output values are expected from the conditional node.*

### 6.4.1.39 Synch

#### Description

A Synch state is useful for indicating that concurrent paths of a State Machine are synchronized. After bringing the paths to a synch state, the emerging transition indicates unison.

#### Toolbox Icon

 Synchronisation

#### Learn More:

- [State Machine Diagram](#) <sup>817</sup>

### 6.4.1.40 System Boundary

#### Description

A *System Boundary* element is a non-UML element used to define *conceptual* boundaries. You can use System Boundaries to help group logically related elements (from a visual perspective, not as part of the UML model).

In the *UML Superstructure Specification, v2.1.1*, System Boundaries are described in the sections on Use Cases, because the System Boundary is often used to indicate the *application* of a Use Case to another entity. In this context, the System Boundary:

- encloses the Use Case, and
- is associated with a classifier such as a Class, Component or Sub-system (Actor) through the **Select <Item>** dialog.

By associating the System Boundary - and not the Use Case - with the classifier, the classifier is linked to the Use Case as a *user*, but not as an *owner*.

You can also define a Use Case as the classifier of a System Boundary element, to link the elements enclosed in the System Boundary (such as parts of an Activity diagram) to their representation in a logical Use Case. See [http://www.sparxsystems.com.au/resources/map\\_uc.html](http://www.sparxsystems.com.au/resources/map_uc.html).

The following properties of a System Boundary can be set: the name, the border style, and the number of horizontal or vertical swim lanes.

A System Boundary element can be marked as *Selectable*, using the element's context menu. When not

selectable, you can click within the System Boundary space without activating or selecting the Boundary itself. This is useful when you have many elements within the Boundary and the Boundary makes their selection difficult.

#### **Notes:**

- A System Boundary is the basis for the Image element, which enables you to add icons or backgrounds to a diagram, automatically displaying the Image Manager dialog from which to select the appropriate image.

#### **Toolbox Icon**

#### **Learn More:**

- [Use Cases](#)<sup>[937]</sup>
- [Instance Classifier](#)<sup>[692]</sup>
- [Boundary Element Settings](#)<sup>[934]</sup>

#### **OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 594*) states:

*If a subject (or system boundary) is displayed, the Use Case ellipse is visually located inside the system boundary rectangle. Note that this does not necessarily mean that the subject classifier owns the contained Use Cases, but merely that the Use Case applies to that classifier.*

### **6.4.1.40.1 Boundary Element Settings**

#### **Configure Boundary Elements**

Boundary elements can be configured to display in different ways. The main differences are:

- Solid border
- Dotted border
- With horizontal or vertical 'swim lanes'; swim lanes are used to group elements in a vertical or horizontal context (for example, Client, Application and Database tiers could be represented in swim lanes).

#### 6.4.1.41 Terminate

##### Description

The Terminate pseudo-state indicates that upon entry of its pseudo-state, the State Machine's execution ends.

##### Toolbox Icon

##### Learn More:

- [State Machine Diagram](#)<sup>[817]</sup>
- [Pseudo-state](#)<sup>[822]</sup>

### 6.4.1.42 Trigger

#### Description

A Trigger indicates an event that initiates an action (and might arise from completion of a previous action). You initially define a Trigger in one of four ways:

- As a property of a Transition relationship
- As a property of an Accept Event Action (on the **Triggers** tab of the element **Properties** dialog)
- As an event in a State Machine Table
- Directly, as a Trigger element, through the **New Element** dialog.

When you save the Trigger, it is added to the list of elements for the parent package in the **Project Browser**. You can then right-click on it and select the **Properties** context menu option to view and, if required, edit its properties as an element rather than as a property itself. Triggers created as events remain as Event elements, whilst Triggers created in other ways are Trigger elements, with a **Triggers** tab in the **Properties** dialog.

Field	Action	See also
<b>Type</b>	If necessary, edit the type of trigger: <ul style="list-style-type: none"> <li>• <b>Call</b> - specifies that the event is a CallEvent, which sends a message to the associated object by invoking an operation.</li> <li>• <b>Change</b> - specifies that the event is a ChangeEvent, which indicates that the transition is the result of a change in value of an attribute.</li> <li>• <b>Signal</b> - specifies that the event is a SignalEvent, which corresponds to the receipt of an asynchronous signal instance.</li> <li>• <b>Time</b> - corresponds to a TimeEvent; which specifies a moment in time.</li> </ul>	
<b>Specification</b>	Either type in the event instigating the Trigger, or click on the ( ... ) button and select the event (depending on the <b>Type</b> value).	
<b>Ports</b>	Click on the <b>Add</b> button and select the appropriate Port from the Select Port dialog. <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>• To create new Ports using the <b>Select Port</b> dialog, the Trigger should be created as a child of a Class or Component element.</li> <li>• To add several Ports at once, press ( <b>Ctrl</b> ) as you select each Port.</li> <li>• To check the exact location of a Port, right-click on the Port name and select the <b>Find in Project Browser</b> context menu option.</li> </ul>	<a href="#">Select Port Dialog</a> [692]

You can also drag the Trigger element onto another diagram, although there are limited uses for the element in that context.

This element is not the same as a Trigger Operation, which is an operation automatically executed as a

result of the modification of data in a database.

#### Learn More:

- [Action](#)<sup>[867]</sup>
- [Transition Relationship](#)<sup>[1015]</sup>
- [Insert Trigger](#)<sup>[827]</sup>
- [Trigger Operation](#)<sup>[1375]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 456*) states:

*Events may cause execution of behavior (e.g., the execution of the effect activity of a transition in a state machine). A trigger specifies the event that may trigger a behavior execution as well as any constraints on the event to filter out events not of interest.*

### 6.4.1.43 Use Case

#### Description

A *Use Case* is a UML modeling element that describes how a user of the proposed system interacts with the system to perform a discrete unit of work. It describes and signifies a single interaction over time that has meaning for the end user (person, machine or other system), and is required to leave the system in a complete state: the interaction either completed or rolled back to the initial state. A Use Case:

- Typically has requirements and constraints that describe the essential features and rules under which it operates
- Can have an associated Sequence diagram illustrating behavior over time; who does what to whom, and when
- Typically has scenarios associated with it that describe the work flow over time that produces the end result; alternative work flows (for example, to capture exceptions) are also enabled.

The following is an example Use Case model:

If extending a Use Case, you can specify the points of extension with Use Case Extension Points. To display the attributes, operations or constraints of a Use Case on a diagram, use Rectangle Notation.

Enterprise Architect also provides two stereotyped Use Cases - the Test Case and the Business Use Case.

#### Toolbox Icon

#### See Also:

- [Use Case Extension Points](#) <sup>[939]</sup>
- [Rectangle Notation](#) <sup>[940]</sup>

#### Learn More:

- [Sequence Diagram](#) <sup>[851]</sup>
- [Test Case](#) <sup>[1302]</sup>
- [Business Use Case](#) <sup>[1194]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 592*) states:

*A UseCase is a kind of behaved classifier that represents a declaration of an offered behavior. Each Use Case specifies some behavior, possibly including variants, that the subject can perform in collaboration with one or more actors.*

### 6.4.1.43.1 Use Case Extension Points

Use *extension points* to specify the point of an extended Use Case where an extending Use Case's behavior should be inserted. The specification text can be informal or precise to define the location of the extension point.

#### How to:

To work with extension points, follow the steps below:

Step	Action
1	Right-click on the Use Case element The context menu displays
2	Select the <b>Advanced   Edit Extension Points...</b> menu option The Use Case Extension Points dialog displays, listing defined points for that Use Case
3	Select an extension point in the list and click on the appropriate button to edit or remove the extension point, or to add a new one

#### Notes:

- Conditions to apply the extending Use Case, and the extension point to use, should be attached as a note to the extend relationship

#### Learn More:

- [Use Case](#)<sup>[937]</sup>

### 6.4.1.43.2 Rectangle Notation

You can display various shaped elements, such as an Interface, Use Case or Actor, using *rectangle notation*. This displays the element as a rectangle, with an icon of the 'normal' shape in the top right-hand corner. Any attributes, operations or constraints belonging to the element are shown, in the same style as a Class.

To show an element using rectangle notation, right-click on the element on the diagram and select the **Advanced | Use Rectangle Notation** context menu option. This setting only applies to the selected element, and can be toggled on and off either by deselecting the context menu option or by selecting the reciprocal option such as **Use Circle Notation** or **Use Actor Notation**.

### 6.4.1.44 Value Lifeline

#### Description

A Lifeline is the path an object takes across a measure of time, indicated by the x-axis. There are two sorts: Value Lifelines (defined here) and State Lifelines, both used in Timing diagrams.

A Value Lifeline shows the Lifeline's state across the diagram, with parallel lines indicating a steady state. A cross between the lines indicates a transition or change in state.

An example of a Value Lifeline is shown below:

See *UML Superstructure Specification, v2.1.1, Figure 14.30, p. 520*.

A Value Lifeline consists of a set of transition points. Each transition point can be defined with the following properties:

Property	Description
At time	Specifies the starting time for a change of state.
Transition to	Indicates the state to which the Lifeline is to change.
Event	Describes the occurring event.
Timing constraints	Refers to the time taken for a state to change within a Lifeline, or the time taken to transmit a message.
Timing observations	Provides information on the time of a state change or sent message.
Duration constraints	Pertains to a Lifeline's period at a particular state. The constraint could be instigated by a change of state within a Lifeline, or that Lifeline's receipt of a message.
Duration observations	Indicates the interval of a Lifeline at a particular state, begun from a change in state or message receipt.

In the example diagram above, the **10ms** transition point has these properties:

Property	Text
At Time	10ms
Transition to	Waitcard
Event	Switch
Timing constraints	–
Timing observations	–
Duration constraints	d..3*d
Duration observations	–

#### Toolbox Icon

#### Learn More:

- [Timing Diagrams](#)<sup>[832]</sup>
- [State Lifelines](#)<sup>[925]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 518*) states:

*Shows the value of the connectable element as a function of time. Value is explicitly denoted as text. Crossing reflects the event where the value changed.*

## 6.4.2 Structural Diagram Elements

The following elements are used in UML Structural Diagrams. For more information on using each element, click on the element name in this list:

- [Actor](#)<sup>[879]</sup>, [Artifact](#)<sup>[942]</sup>
- [Class](#)<sup>[943]</sup>, [Collaboration](#)<sup>[947]</sup>, [Collaboration Use](#)<sup>[948]</sup>, [Component](#)<sup>[950]</sup>

### Learn More:

- [Structural Diagrams](#)<sup>[798]</sup>

### 6.4.2.1 Artifact

#### Description

An *Artifact* is any physical piece of information used or produced by a system, represented in a Deployment Diagram.

Artifacts can have associated properties or operations, and can be instantiated or associated with other Artifacts. Examples of Artifacts include model files, source files, database tables, development deliverables or support documents. The files represented by the Artifact are listed on the **Files** tab of the element **Properties** dialog.

To open the files represented by the Artifact, click on the element on the diagram and press **(Ctrl+E)**. Each file is opened either on a separate tab in the **Diagram View** workspace (if the file can be opened within Enterprise Architect) or in the default Windows viewer/editor for the file type (if the file cannot be opened within Enterprise Architect).

Files can also be launched individually from the **Files** tab (opening in the Windows default editor), as for elements of any other type that have associated files.

#### Toolbox Icon

#### See Also:

- [Create Artifact For External File](#)<sup>[943]</sup>

### Learn More:

- [Deployment Diagram](#) <sup>[806]</sup>
- [Associated Files](#) <sup>[689]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 201*) states:

*An Artifact defined by the user represents a concrete element in the physical world. A particular instance (or 'copy') of an artifact is deployed to a node instance. Artifacts may have composition associations to other artifacts that are nested within it. For instance, a deployment descriptor artifact for a component may be contained within the artifact that implements that component. In that way, the component and its descriptor are deployed to a node instance as one artifact instance.*

#### 6.4.2.1.1 Create Artifact For External File

You can create an Artifact element on a diagram for an external file, by clicking on the file in a file list (such as Windows Explorer) or on your Desktop and dragging it onto the diagram. A short context menu displays with two options - **Hyperlink** and **Artifact**.

Click on the **Artifact** option to create the element on the diagram. The **Properties** dialog displays, and you can define the name or other properties as required. Click on the **OK** button, and then open the **Properties** dialog again and click on the **Files** tab. The file pathname is listed in the **Files** panel.

#### 6.4.2.2 Class

### Description

A Class is a representation of objects that reflects their structure and behavior within the system. It is a template from which actual running instances are created, although a Class can be defined either to control its own execution or as a template or parameterized Class that specifies parameters that must be defined by any binding Class.

A Class can have *attributes* (data) and *methods* (*operations* or behavior). Classes can inherit characteristics from parent Classes and delegate behavior to other Classes. Class models usually describe the logical structure of the system and are the building blocks from which components are built.

The top section of a Class, as illustrated below, shows the attributes (or data elements) associated with the Class. These hold the 'state' of an object at run-time. If the information is saved to a data store and can be reloaded, it is termed 'persistent'. The lower section contains the Class operations (or methods at run-time). Operations describe the behavior a Class offers to other Classes, and the internal behavior it has (private methods).

Class elements are generally used in Class diagrams and Composite Structure diagrams.

Enterprise Architect also supports a number of stereotyped Class elements to represent various entities in web-page modeling. A Class can also be integrated with an Associate connector to form an Association Class, to allow the Associate connector to have operations and attributes that define certain types of UML

relationship.

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, pp. 52-53*) states:

*The purpose of a class is to specify a classification of objects and to specify the features that characterize the structure and behavior of those objects.*

*Objects of a class must contain values for each attribute that is a member of that class, in accordance with the characteristics of the attribute, for example its type and multiplicity.*

*When an object is instantiated in a class, for every attribute of the class that has a specified default, if an initial value of the attribute is not specified explicitly for the instantiation, then the default value specification is evaluated to set the initial value of the attribute for the object.*

*Operations of a class can be invoked on an object, given a particular set of substitutions for the parameters of the operation. An operation invocation may cause changes to the values of the attributes of that object. It may also return a value as a result, where a result type for the operation has been defined. Operation invocations may also cause changes in value to the attributes of other objects that can be navigated to, directly or indirectly, from the object on which the operation is invoked, to its output parameters, to objects navigable from its parameters, or to other objects in the scope of the operation's execution. Operation invocations may also cause the creation and deletion of objects.*

### 6.4.2.2.1 Active Classes

#### Description:

An *Active Class* indicates that, when instantiated, the Class controls its own execution. Rather than being invoked or activated by other objects, it can operate standalone and define its own thread of behavior.

#### How to:

To define an Active Class in Enterprise Architect, follow the steps below:

Step	Action
1	Highlight a Class, and display its Properties dialog
2	Click on the <b>Advanced</b> button
3	Select the <b>Is Active</b> checkbox
4	Click on the <b>OK</b> button to save the details

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 438*) states:

*An active object is an object that, as a direct consequence of its creation, commences to execute its classifier behavior, and does not cease until either the complete behavior is executed or the object is terminated by some external object. (This is sometimes referred to as "the object having its own thread of control.") The points at which an active object responds to communications from other objects is determined solely by the behavior of the active object and not by the invoking object. If the classifier behavior of an active object completes, the object is terminated.*

### 6.4.2.2.2 Parameterized Classes (Templates)

#### Description:

Enterprise Architect supports *template* or *parameterized Classes*, which specify parameters that must be defined by any binding Class.

Parameterized Classes are commonly implemented in C++; Enterprise Architect imports and generates templated Classes for C++.

A template Class enables its functionality to be reused by any bound Class. If a default value is specified for a parameter, and a binding Class doesn't provide a value for that parameter, the default is used.

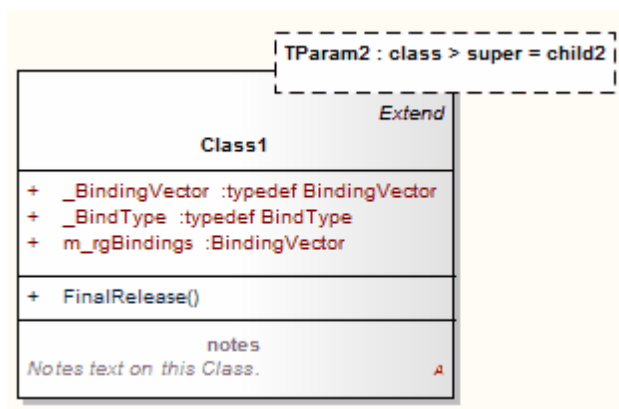

**How to:**

To create a parameterized Class, follow the steps below:

Step	Action
1	Display the Properties dialog for the required Class
2	Select the Templates page
3	In the Template Parameter(s) panel, click on the <b>Add</b> button The Template Parameter dialog displays
4	Type in the name and type of the parameter and, if required, click on the ( ... ) buttons after the <b>Constraints</b> and <b>Default</b> fields to select the required constraining and default Classes from the Select <Item> dialog The default Class can be either the constraining classifier or any Class that derives from the constraining classifier

**Notation Example:**

On a diagram, template Classes are shown with the parameters in a dashed outline box in the upper right corner of the Class.

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 622*) states:

*A template is a parameterized element that can be used to generate other model elements using TemplateBinding relationships. The template parameters for the template signature specify the formal parameters that will be substituted by actual parameters (or the default) in a binding.*

### 6.4.2.3 Collaboration

#### Description:

A *Collaboration* defines a set of cooperating roles and their connectors. These are used to collectively illustrate a specific functionality, in a Composite Structure diagram. A Collaboration should specify only the roles and attributes required to accomplish a specific task or function. Although in practice a behavior and its roles could involve many tangential attributes and properties, isolating the primary roles and their requisites simplifies and clarifies the behavior, as well as providing for reuse. A Collaboration often implements a pattern to apply to various situations.

The following example illustrates an *Install* Collaboration, with three roles (Objects) connected as shown. The process for this Collaboration can be demonstrated by attaching an Interaction diagram (Sequence, Timing, Communication or Interaction Overview).

To understand referencing a Collaboration in a specific situation, see the *Collaboration Use* topic.

Enterprise Architect supports a stereotyped Collaboration to represent a Business Use Case Realization in business modeling.

- [Collaboration Use](#) <sup>[948]</sup>
- [Object Element](#) <sup>[959]</sup>
- [Business Use Case Realization](#) <sup>[1194]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 171*) states:

*A collaboration describes a structure of collaborating elements (roles), each performing a specialized function, which collectively accomplish some desired functionality. Its primary purpose is to explain how a system works and, therefore, it typically only incorporates those aspects of reality that are deemed relevant to the explanation.*

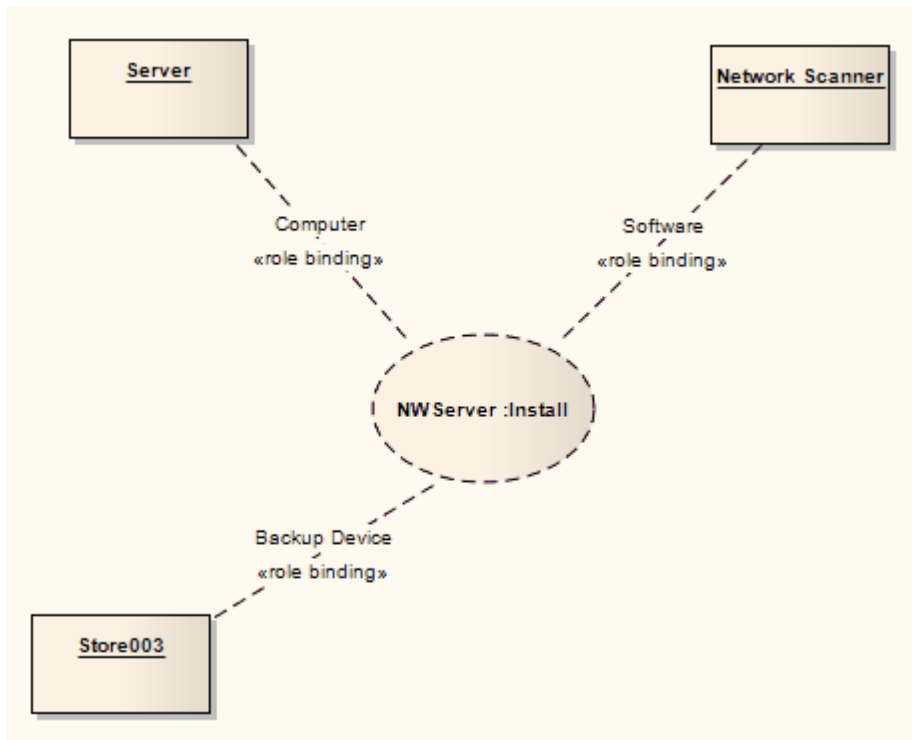

#### **6.4.2.4 Collaboration Use**

#### **Description:**

Use a *Collaboration Use* to apply a pattern defined by a Collaboration to a specific situation, in a Composite Structure diagram.

The following example shows a Use, *NWServer*, of the Collaboration *Install*, to define the installation process of a network scanner. This process can be defined by an interaction attached to the Collaboration. (See the *Collaboration* topic for a representation of the *Install* Collaboration.)

To create a Collaboration Use, drag the icon from the Toolbox onto the diagram.

#### **Toolbox Icon:**

#### **Learn More:**

- [Composite Structure Diagram](#) <sup>[803]</sup>
- [Collaboration Element](#) <sup>[947]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 173*) states:

*A collaboration use represents one particular use of a collaboration to explain the relationships between the properties of a classifier. A collaboration use shows how the pattern described by a collaboration is applied in a given context, by binding specific entities from that context to the roles of the collaboration. Depending on the context, these entities could be structural features of a classifier, instance specifications, or even roles in some containing collaboration. There may be multiple occurrences of a given collaboration within a classifier, each involving a different set of roles and connectors. A given role or connector may be involved in multiple occurrences of the same or different collaborations.*

### 6.4.2.5 Component

#### Description

A Component is a modular part of a system, whose behavior is defined by its provided and required interfaces; the internal workings of the Component should be invisible and its usage environment-independent. Source code files, DLLs, Java beans and other artifacts defining the system can be manifested in Components.

A Component can be composed of multiple Classes, or Components pieced together. As smaller Components come together to create bigger Components, the eventual system can be modeled, building-block style, in Component diagrams. By building the system in discrete Components, localization of data and behavior enables decreased dependency between Classes and Objects, providing a more robust and maintainable design.

#### Toolbox Icon

#### Learn More:

- [Component Diagram](#)<sup>[809]</sup>
- [Class Element](#)<sup>[943]</sup>
- [Object Element](#)<sup>[959]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 148*) states:

*A component represents a modular part of a system that encapsulates its contents and whose manifestation is replaceable within its environment.*

*A component defines its behavior in terms of provided and required interfaces. As such, a component serves as a type whose conformance is defined by these provided and required interfaces (encompassing both their static as well as dynamic semantics).*

### 6.4.2.6 Data Type

#### Description

A Data Type is a specific kind of classifier, similar to a Class except that a Data Type cannot own sub Data Types, and instances of a Data Type are identified only by their value. For example, an instance of a Person Class is a Helen object, but an instance of an Integer Data Type is 12.

All copies of an instance of a Data Type, and any instances of that Data Type with the same value, are considered to be the same instance. That is, instances of Helen are not necessarily the same Helen, but all 12s are the same 12. For example, the 12 on a watch face is exactly the same integer as the number of months in a year.

Instances of a Data Type that have attributes (that is, are instances of a structured Data Type) are considered to be the same if the structure is the same and the values of the corresponding attributes are the same. If a Data Type has attributes, instances of that Data Type contain attribute values matching the attributes.

A typical use of Data Types would be to represent programming language primitive types or CORBA basic types. For example, integer and string types are often treated as Data Types.

A Data Type is denoted by a rectangle with the keyword «dataType», as above or, when it is referenced by (for example) an attribute, by a string containing the name of the Data Type, as below:

### 6.4.2.7 Deployment Spec

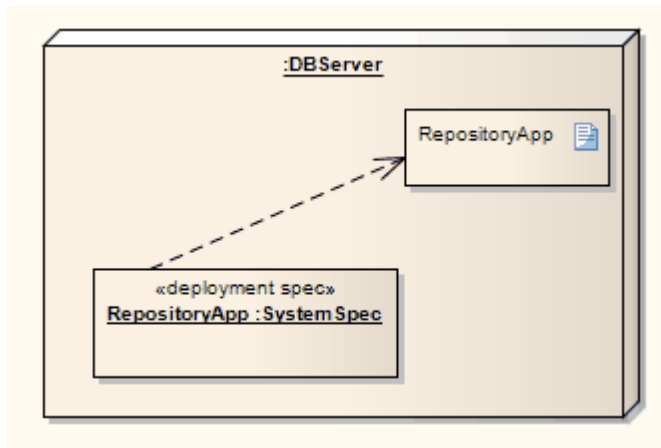

#### Description

A Deployment Specification (spec) specifies parameters guiding deployment of an artifact, as is necessary with most hardware and software technologies. A specification lists those properties that must be defined for deployment to occur, as represented in a Deployment diagram. An instance of this specification specifies the values for the parameters; a single specification can be instantiated for multiple artifacts.

These specifications can be extended by certain component profiles. Examples of standard Tagged Values

that a profile might add to a Deployment Specification are «concurrencyMode» with Tagged Values {thread, process, none} or «transactionMode» with Tagged Values {transaction, nestedTransaction, none}.

The following example depicts the artifact RepositoryApp deployed on the server node, as per the specifications of RepositoryApp, instantiated from the Deployment Specification SystemSpec.

#### Toolbox Icon

#### Learn More:

- [Deployment Diagram](#) <sup>[806]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 206*) states:

*A deployment specification specifies a set of properties that determine execution parameters of a component artifact that is deployed on a node. A deployment specification can be aimed at a specific type of container. An artifact that reifies or implements deployment specification properties is a deployment descriptor.*

### 6.4.2.8 Device

#### Description

A Device is a physical electronic resource with processing capability upon which Artifacts can be deployed for execution, as represented in a Deployment diagram. Complex Devices can consist of other devices; that is, a Device can be a nested element, where a physical machine is decomposed into its elements either

through namespace ownership or through attributes that are typed by Devices.

#### Toolbox Icon

#### Learn More:

- [Deployment Diagram](#)<sup>[806]</sup>
- [Artifact Element](#)<sup>[942]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, 10.3.7, v2.1.1, p. 207*) states:

*In the metamodel, a Device is a subclass of Node.*

### **6.4.2.9 Document Artifact**

#### Description

A Document Artifact is an artifact having a stereotype of «document». You create the Document Artifact on a Component, Documentation or Deployment diagram, and associate it with an RTF document. Double-click on the element to display the Linked Document Editor. See the Linked Documents topic. When you have created the linked document, the Document Artifact element on the diagram shows an **A** symbol in the bottom right corner.

#### Toolbox Icon

#### Learn More:

- [Linked Documents](#)<sup>[731]</sup>
- [Artifact Element](#)<sup>[942]</sup>

### 6.4.2.10 Enumeration

#### Description

An *Enumeration* is a data type, whose instances can be any of a number of user-defined enumeration literals. It is possible to extend the set of applicable enumeration literals in other packages or profiles. You create Enumerations in Class or Package diagrams, and in diagrams developed from the Metamodel and Profile pages of the **Toolbox**.

#### Toolbox Icon

#### Learn More:

- [Class Diagram](#) <sup>[800]</sup>
- [Package Diagram](#) <sup>[798]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 69*) states:

*An enumeration is a data type whose values are enumerated in the model as enumeration literals.*

### 6.4.2.11 Execution Environment

#### Description

An Execution Environment is a node that offers an execution environment for specific types of components that are deployed on it in the form of executable artifacts. This is depicted in a Deployment diagram.

Execution Environments can be nested; for example, a database Execution Environment can be nested in an operating system Execution Environment. Components of the appropriate type are then deployed to specific Execution Environment nodes.

### Toolbox Icon

### Learn More:

- [Deployment Diagram](#)<sup>[806]</sup>
- [Node Element](#)<sup>[958]</sup>
- [Component Element](#)<sup>[950]</sup>
- [Artifact Element](#)<sup>[942]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 210*) states:

*... an ExecutionEnvironment is ... usually part of a general Node, representing the physical hardware environment on which the ExecutionEnvironment resides. In that environment, the ExecutionEnvironment implements a standard set of services that Components require at execution time (at the modeling level these services are usually implicit). For each component Deployment, aspects of these services may be determined by properties in a DeploymentSpecification for a particular kind of ExecutionEnvironment.*

### 6.4.2.12 Expose Interface

### Description

The Expose Interface element is a graphical method of depicting the required or supplied interfaces of a Component, Class or Part, in a Component or Composite Structure diagram. It just identifies the fact that the element provides or requires an interface; to depict the fact that the provided interface is used, or the required interface provided, by another element use the Assembly connector.

The Expose Interface element must be attached to the Class or Component element, and it becomes a child element of that Class or Component; it cannot exist independently. You can attach more than one Expose Element to another element.

When you create the Expose Interface element, a dialog displays in which you enter a name for the element

and specify whether it represents a required interface or a provided interface.

### 6.4.2.13 Information Item

#### Description

An Information Item represents an abstraction of data. It is used in Activity, Analysis and Object diagrams. An Information Item is also represented by an Information Flow connector.

#### Toolbox Icon

#### Learn More:

- [Information Flow](#) <sup>[983]</sup>
- [Activity Diagram](#) <sup>[813]</sup>
- [Analysis Diagram](#) <sup>[1190]</sup>
- [Object Diagram](#) <sup>[801]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 608*) states:

*An information item is an abstraction of all kinds of information that can be exchanged between objects. It is a kind of classifier intended for representing information at a very abstract way, one which cannot be instantiated.*

*One purpose of information items is to be able to define preliminary models, before having made detailed modeling decisions on types or structures. One other purpose of information items and information flows is to abstract complex models by a less precise but more general representation of the information exchanged*

between entities of a system.

#### 6.4.2.14 Interface

##### Description

An *Interface* is a specification of behavior (or contract) that implementers agree to meet. By implementing an Interface, *Classes* are guaranteed to support a required behavior, which enables the system to treat non-related elements in the same way; that is, through the common interface. You also use Interfaces in a Composite Structure diagram.

Interfaces are drawn in a similar way to a Class, with operations specified, as shown below. They can also be drawn as a circle with no explicit operations detailed. Right-click on the element and select the **Use Circle Notation** context menu option to switch between styles. Realize connectors to an Interface drawn as a circle are drawn as a solid line without target arrows.

An Interface cannot be instantiated (that is, you cannot create an object from an Interface). You must create a Class that 'implements' the Interface specification, and in the Class body place operations for each of the Interface operations. You can then instantiate the Class.

##### Toolbox Icon

##### Learn More:

- [Class Diagram](#) <sup>[800]</sup>
- [Composite Structure Diagram](#) <sup>[803]</sup>
- [Realization](#) <sup>[1009]</sup>

##### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 88*) states:

*An interface is a kind of classifier that represents a declaration of a set of coherent public features and obligations. An interface specifies a contract; any instance of a classifier that realizes the interface must fulfill that contract. The obligations that may be associated with an interface are in the form of various kinds of constraints (such as pre- and post-conditions) or protocol specifications, which may impose ordering*

restrictions on interactions through the interface.

Since interfaces are declarations, they are not instantiable. Instead, an interface specification is implemented by an instance of an instantiable classifier, which means that the instantiable classifier presents a public facade that conforms to the interface specification. Note that a given classifier may implement more than one interface and that an interface may be implemented by a number of different classifiers.

### 6.4.2.15 Node

#### Description
