A Node is a physical piece of equipment on which the system is deployed, such as a workgroup server or workstation. A Node usually hosts components and other executable pieces of code, which again can be connected to particular processes or execution spaces. Typical Nodes are client workstations, application servers, mainframes, routers and terminal servers.

Nodes are used in Deployment diagrams to model the deployment of a system, and to illustrate the physical allocation of implemented artifacts. They are also used in web modeling, from dedicated web modeling pages in the Toolbox.

#### Toolbox Icon

#### Learn More:

- [Deployment Diagram](#) <sup>[806]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 213*) states:

*In the metamodel, a Node is a subclass of Class. It is associated with a Deployment of an Artifact. It is also associated with a set of Elements that are deployed on it. This is a derived association in that these PackageableElements are involved in a Manifestation of an Artifact that is deployed on the Node. Nodes may have an internal structure defined in terms of parts and connectors associated with them for advanced modeling applications.*

### 6.4.2.16 Object

#### Description

An Object is a particular instance of a Class at run time. For example a car with the license plate AAA-001 is an instance of the general class of cars with a license plate number attribute. Objects are often used in analysis to represent the numerous artifacts and items that exist in any business, such as pieces of paper, faxes and information. To model the varying behavior of Objects at run-time, use run-time states.

Early in analysis, Objects can be used to quickly capture all the things that are of relevance within the system domain, in an Object, Composite Structure or Communication diagram. As the model progresses these analysis Objects are refined into generic Classes from which instances can be derived to represent common business items. Once Classes are defined, Objects can be typed; that is they can have a classifier set that indicates their base type. See the Object Classifiers topic.

Enterprise Architect also supports a number of stereotyped Object elements to represent various entities in business modeling.

#### Toolbox Icon

- [Business Interaction Objects](#)<sup>[1194]</sup>

### 6.4.2.16.1 Run-time State

At run-time, an Object instance can have specific values for its attributes, or exist in a particular state. To model the varying behavior of Objects at run-time, use instance values selected from the Select <Item> dialog and run-time states or run-states.

Typically there is interest in the run-time behavior of Objects that already have a classifier set. You can select from the classifier's attribute list and apply specific values for your Object instance. If the classifier has a child State Machine, its States propagate to a list where the run-time state for the Object can be defined.

#### Example

The following example defines run-time values for the listed variables, which are attributes of the instances' classifier *AccountItem*.

#### See Also:

- [Define a Run-Time Variable](#)<sup>[960]</sup>
- [Remove a Defined Variable](#)<sup>[961]</sup>

#### Learn More:

- [Object](#)<sup>[959]</sup>
- [Object State](#)<sup>[961]</sup>

### 6.4.2.16.1.1 Define a Run-time Variable

#### How to:

To add run-time state instance variables to an Object, follow the steps below:

Step	Action
1	Right-click on the Object The context menu displays
2	If Instance Variables are supported, select the <b>Advanced   Set Run State</b> menu option (or press ( <b>Ctrl+Shift+R</b> ) ) The Set Run State dialog displays
3	In the <b>Variable</b> field, click on the drop-down arrow and select the variable, or type in the new variable name

Step	Action
4	Set the <b>Operator</b> , the <b>Value</b> and optionally type in a <b>Note</b>
5	Click on the <b>OK</b> button to save the variable

#### 6.4.2.16.1.2 Remove a Defined Variable

##### How to:

To delete a run-time state variable for an Object, follow the steps below:

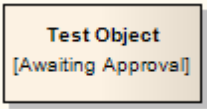

Step	Action
1	Right-click on the required Object The context menu displays
2	Select the <b>Set Run State</b> option The <b>Run State</b> dialog displays
3	In the <b>Variable</b> field, click on the drop-down arrow and select the variable to delete
4	Clear the <b>Value</b> field
5	Click on the <b>OK</b> button

#### 6.4.2.16.2 Object State

##### How to:

To set the Object state for a Class instance, follow the steps below:

Step	Action
1	Right-click on the required Object and select the <b>Advanced   Set Object State</b> context menu option The Set Instance State dialog displays
2	In the <b>State</b> field, either type the required State (such as <b>Awaiting Approval</b> ) or select a State from the drop-down list The drop-down list for the State field is populated with: <ol style="list-style-type: none"> <li>1. Any States owned by the object's classifier</li> <li>2. Any States owned by any superclasses of the object's classifier</li> <li>3. Any States owned by State Machines owned by the object's classifier</li> <li>4. Any States owned by State Machines owned by any superclasses of the object's classifier</li> </ol>
3	Click on the <b>OK</b> button to apply the State The object now shows the run-time state in square brackets below the object name

Step	Action
	

### 6.4.2.17 Package

#### Description

A *Package* is a namespace as well as an element that can be contained in other Package's namespaces. A Package can own or merge with other Packages, and its elements can be imported into a Package's namespace. In addition to using Packages in the **Project Browser** to organize your project contents, you can drag these Packages onto a diagram workspace (most diagram types, both standard and extended) for structural or relational depictions, including Package imports or merges.

#### Toolbox Icon

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 109*) states:

*A package is a namespace for its members, and may contain other packages. Only packageable elements can be owned members of a package. By virtue of being a namespace, a package can import either individual members of other packages, or all the members of other packages. In addition a package can be merged with other packages.*

### 6.4.2.18 Part

#### Description

*Parts* are run-time instances of Classes or Interfaces. Multiplicity can be specified for a Part, using the notation:

( x{...y} )

where  $x$  specifies the initial or set amount of instances when the composite structure is created, and  $y$  indicates the maximum amount of instances at any time.

Parts are used to express composite structures, or modeling patterns that can be invoked by various objects to accomplish a specific purpose. When illustrating the composition of structures, Parts can be embedded as properties of other Parts. When embedded as properties, Parts can be bordered by a solid outline, indicating the surrounding Part owns the Part by composition. Alternatively, a dashed outline indicates that the property is referenced and used by the surrounding Part, but is not composed within it.

#### Toolbox Icon

#### Learn More:

- [Composite Structure Diagram](#) <sup>[803]</sup>
- [Class](#) <sup>[943]</sup>
- [Interface](#) <sup>[957]</sup>
- [Properties](#) <sup>[805]</sup>
- [Add Property Value](#) <sup>[963]</sup>

#### 6.4.2.18.1 Add Property Value

##### How to:

To add property value variables to a Part, follow the steps below:

Step	Action
1	Right-click on the Part The context menu displays
2	Select the <b>Advanced   Set Property Values</b> menu option (or press ( <b>Ctrl+Shift+R</b> ) ) The Set Property Values dialog displays
3	In the <b>Variable</b> field, click on the drop-down arrow and select the variable, or type in the new variable name
4	Set the <b>Operator</b> , the <b>Value</b> and optionally type in a <b>Note</b>
5	Click on the <b>OK</b> button to save the variable

A Part with a property value resembles the following figure.

### 6.4.2.19 Port

#### Description

Ports define the interaction between a classifier and its environment. Interfaces controlling this interaction can be depicted using the Interface element. Any connector to a Port must provide the required interface, if defined. Ports can appear on a contained Part, a Class, or the boundary of a Composite element.

A Port is a *typed* structural feature or property of its containing classifier. Ports are typically created in Class diagrams, Object diagrams and Composite Structure diagrams.

#### Toolbox Icon

#### Learn More:

- [Add a Port to an Element](#) <sup>[964]</sup>
- [Inherited and Redefined Ports](#) <sup>[965]</sup>
- [The Property Tab](#) <sup>[965]</sup>
- [Composite Structure Diagram](#) <sup>[803]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 182*) states:

*A port is a property of a classifier that specifies a distinct interaction point between that classifier and its environment or between the (behavior of the) classifier and its internal parts. Ports are connected to properties of the classifier by connectors through which requests can be made to invoke the behavioral features of a classifier. A Port may specify the services a classifier provides (offers) to its environment as well as the services that a classifier expects (requires) of its environment.*

#### 6.4.2.19.1 Add a Port to an Element

##### How to:

To add a new Port to an element, use one of the following steps:

Step	Action
1	Click on the Port symbol in the Composite Elements page of the Toolbox, and drag the symbol to (or click on) the target host element This creates an untyped, simple Port on the boundary, near the cursor position

Step	Action
2	On the context menu of a suitable Class, Part or Composite element, select the <b>Embedded Elements   Add Port</b> menu option to add a new Port at the cursor position
3	Drag a suitable classifier from the Project Browser onto a Class or Part Enterprise Architect prompts you to add a typed Port or Part at the cursor position The new Port is typed by the original dragged classifier
4	Use the Embedded Elements window to add a new Port to the currently selected element

#### Learn More:

- [Composite Elements](#) <sup>[649]</sup>
- [Inherited and Redefined Ports](#) <sup>[965]</sup>

#### 6.4.2.19.2 *Inherited and Redefined Ports*

A Port is a *redefinable* and *re-useable* property of a composite classifier such as a Component. A Component can inherit Ports from its parent; if a Component's parent owns Ports, when you open the Embedded Elements dialog for the Component and select the **Show Owned/Inherited** checkbox the inherited Ports and their named owners are listed.

If you want to show an inherited Port on a Component, the Embedded Elements dialog provides two options:

- Expose an inherited Port - tick the checkbox next to the Port's name, to create a read-only copy of the Port; this is convenient for modeling Port interactions in child elements where the Ports are defined in the parent elements
- Redefine an inherited Port - select the row for the Port and click on the **Redefine** button, to create an editable copy of the Port; this is useful where a child element places additional restrictions or behavior on the Port

The above is also true for Components that inherit Ports from realized Interfaces, and for Component instances that inherit Ports from their classifying Component.

#### 6.4.2.19.3 *The Property Page*

The element Properties dialog for Ports and Parts has a Property page in place of the Class element Details page.

This page defines the type, initial value, Qualifiers, multiplicity, and redefined and subsetted properties of the Port or Part.

You set the Qualifiers by clicking on the **Qualifiers** button, to display the Qualifiers dialog.

You add **Redefined** and **Subsetted Properties** by clicking on the appropriate **Add** button, to display the Select Property dialog.

#### Learn More:

- [Qualifiers Dialog](#) <sup>[974]</sup>
- [Select Property Dialog](#) <sup>[694]</sup>
- [Inherited and Redefined Ports](#) <sup>[965]</sup>

### 6.4.2.20 Primitive

#### Description:

A Primitive element identifies a predefined data type, without any relevant substructure (that is, it has no parts in the context of UML). It could be regarded as a conceptual Data Type.

#### Toolbox Icon:

#### Learn More:

- [Data Type Element](#)<sup>[950]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 124*) states:

*A primitive data type may have an algebra and operations defined outside of UML, for example, mathematically ... The run-time instances of a primitive type are data values. The values are in many-to-one correspondence to mathematical elements defined outside of UML (for example, the various integers). Instances of primitive types do not have identity. If two instances have the same representation, then they are indistinguishable.*

### 6.4.2.21 Signal

#### Description:

A Signal is a specification of Send request instances communicated between objects, typically in a Class or Package diagram. The receiving object handles the Received request instances as specified by its receptions. The data carried by a Send request is represented as attributes of the Signal. A Signal is defined independently of the classifiers handling the signal occurrence.

To define a reception, create an operation in the receiving object and assign the stereotype <<signal>> to it. The reception has the same name as the signal that the object can receive.

**Toolbox Icon:****Learn More:**

- [Class Diagram](#)<sup>[800]</sup>
- [Package Diagram](#)<sup>[798]</sup>
- [Send Element](#)<sup>[919]</sup>
- [Receive Element](#)<sup>[917]</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 450*) states:

*A signal triggers a reaction in the receiver in an asynchronous way and without a reply. The sender of a signal will not block waiting for a reply but continue execution immediately. By declaring a reception associated to a given signal, a classifier specifies that its instances will be able to receive that signal, or a subtype thereof, and will respond to it with the designated behavior.*

And (*UML Superstructure Specification, v2.1.1, p. 447 - 448*):

*A reception is a declaration stating that a classifier is prepared to react to the receipt of a signal. A reception designates a signal and specifies the expected behavioral response. The details of handling a signal are specified by the behavior associated with the reception or the classifier itself. ...Receptions are shown using the same notation as for operations with the keyword <signal>*

## 6.5 UML Connectors

A *connector* is a logical or functional relationship between model elements. There are several different connector types, each having a particular purpose and syntax. Enterprise Architect supports all of the UML connectors as well as various custom connectors. Together with the UML Elements, these form the basis of UML models.

For more information on using these connectors, consult the appropriate topic by clicking on the required connector icon in the table below.

Behavioral Diagram Connectors	Structural Diagram Connectors	Inbuilt and Extended Connectors
<b>Activity Diagrams</b> <ul style="list-style-type: none"> <li> Control Flow</li> <li> Object Flow</li> <li> Interrupt Flow</li> </ul>	<b>Composite Structure Diagrams</b> <ul style="list-style-type: none"> <li> Connector</li> <li> Assembly</li> <li> Delegate</li> <li> Role Binding</li> <li> Represents</li> <li> Occurrence</li> </ul>	<b>Analysis Diagrams</b> <ul style="list-style-type: none"> <li> Information Flow</li> <li> Object Flow</li> <li> Associate</li> <li> Realize</li> <li> Representation</li> </ul>

Behavioral Diagram Connectors	Structural Diagram Connectors	Inbuilt and Extended Connectors
Data Modeling	 Associate	
 Associate	 Dependency	

**Notes:**

- Invokes and Precedes relationships are defined by the Open Modeling Language (OML). They are stereotyped Dependency relationships; Invokes indicates that Use Case A, at some point, causes Use Case B to happen, whilst Precedes indicates that Use Case C must complete before Use Case D can begin.
- An Extension relationship shows that a stereotype extends one or more metaclasses. All stereotypes must extend either one or more Metaclasses, or another stereotype that extends a stereotype (that itself extends a stereotype, and so on).
- A Tagged Value relationship defines a reference-type (that is, RefGUID) Tagged Value owned by the source stereotype. The Tagged Value is named for the target role of this association, and is limited to referencing elements with the stereotype by the association target element.
- The Application and Redefinition relationships are **deprecated**.

### 6.5.1 Aggregation

**Description:**

An Aggregation connector is a type of association that shows that an element contains or is composed of other elements. It is used in Class models, Package models and Object models to show how more complex elements (aggregates) are built from a collection of simpler elements (component parts; for example, a car from wheels, tires, motor and so on).

A stronger form of aggregation, known as Composite Aggregation, is used to indicate ownership of the whole over its parts. The part can belong to only one Composite Aggregation at a time. If the composite is deleted, all of its parts are deleted with it.

**Toolbox Icon:****Learn More**

- [Class Diagram](#) <sup>[800]</sup>
- [Package Diagram](#) <sup>[798]</sup>
- [Object Diagram](#) <sup>[801]</sup>
- [Change Aggregation Connector Form](#) <sup>[971]</sup>

### 6.5.1.1 Change Aggregation Connector Form

In Enterprise Architect, the default Aggregation relationship is the weak form of the relationship, represented by a hollow diamond.

To change the form of an Aggregation connector from weak to strong, follow the steps below:

Step	Action
1	Right-click on an Aggregation connector to display the context menu
2	Select <b>Set Aggregation to Composite</b> The diamond is shown as filled

#### Notes:

- If the connector is already a Strong (Composition) connector, the context menu option changes to **Set Aggregation to Shared**

#### Learn More:

- [Aggregation](#) <sup>[970]</sup>

### 6.5.2 Assembly

#### Description:

An Assembly connector bridges a component's required interface (Component1) with the provided interface of another component (Component2), typically in a Component diagram.

#### Toolbox Icon

#### Learn More:

- [Component Diagram](#) <sup>[809]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 156*) states:

*An assembly connector is a connector between two components that defines that one component provides the services that another component requires. An assembly connector is a connector that is defined from a required interface or port to a provided interface or port.*

### 6.5.3 Association

#### Description:

An Association implies two model elements have a relationship, usually implemented as an instance variable in one Class. This connector can include named roles at each end, multiplicity, direction and constraints. Association is the general relationship type between elements. To connect more than two elements in an association, you can use the N-Ary Association element.

When code is generated for Class diagrams, Associations become instance variables in the target Class. The relationship is also used in Package, Object, Communication, Data Modeling and Deployment diagrams.

An Associate connector can also be integrated with a Class element to form an Association Class, to allow the Associate connector to have operations and attributes that define certain types of UML relationship.

You can also define template binding parameters for an Associate connector between a binding Class and a parameterized Class.

#### Toolbox Icon:

#### Learn More

- [N-Ary Association](#)<sup>[1299]</sup>
- [Association Class](#)<sup>[973]</sup>
- [Class Diagrams](#)<sup>[800]</sup>
- [Template Binding](#)<sup>[1012]</sup>
- [Qualifiers](#)<sup>[973]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 41*) states:

*An association specifies a semantic relationship that can occur between typed instances. It has at least two ends represented by properties, each of which is connected to the type of the end. More than one end of the association may have the same type.*

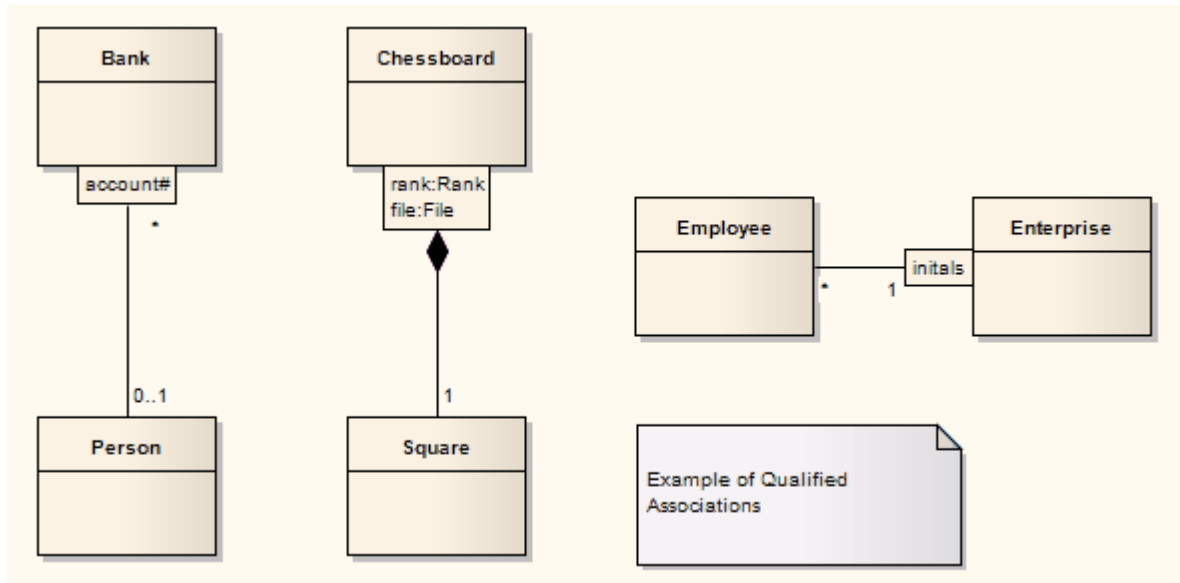

*An end property of an association that is owned by an end class or that is a navigable owned end of the association indicates that the association is navigable from the opposite ends; otherwise, the association is*

not navigable from the opposite ends.

### 6.5.3.1 Qualifiers

Qualifiers are ordered sets of properties of an Association end point, a Part, a Port, or an Attribute, that limit the nature of the relationship between two classifiers or objects. You define a qualifier on the **Qualifiers** dialog, which you display by clicking on the ( ... ) button at the end of the **Qualifiers** field on the Association, Part, Port or Attribute **Properties** dialog.

#### Examples

#### Notes:

- When typing multiple Qualifiers into the **Qualifier(s)** field on a **Properties** dialog, separate them with a semi-colon; each Qualifier then displays on a separate line. For example, in the diagram the Qualifier 'rank:Rank;file:File' has been rendered in two lines, with a line break at the ; character.
- You can enable or disable Qualifier rectangles in the **Diagram** page of the **Options** dialog (select the **Tools | Options | Diagram** menu option). If disabled, the old style text Qualifiers are used. It is not recommended that you disable Qualifiers as they are an integral part of the UML.
- You can enable or disable a mild shading on the Qualifier rectangles in the **Links** page of the **Options** dialog.

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 129*) states:

*A qualifier declares a partition of the set of associated instances with respect to an instance at the qualified end (the qualified instance is at the end to which the qualifier is attached). A qualifier instance comprises one value for each qualifier attribute. Given a qualified object and a qualifier instance, the number of objects at the other end of the association is constrained by the declared multiplicity. In the common case in which the multiplicity is 0..1, the qualifier value is unique with respect to the qualified object, and designates at most one associated object. In the general case of multiplicity 0..\*, the set of associated instances is partitioned into subsets, each selected by a given qualifier instance. In the case of multiplicity 1 or 0..1, the qualifier has both semantic and implementation consequences. In the case of multiplicity 0..\*, it has no real semantic consequences but suggests an implementation that facilitates easy access of sets of associated instances linked by a given qualifier value.*

### 6.5.3.1.1 Qualifiers Dialog

The **Qualifiers** dialog is used to define the [Qualifiers](#) [973] of an [Association connector end](#) [760], [Port](#) [964], [Part](#) [962] or [Attribute](#) [697].

#### General Tab

Review, edit or complete the fields as indicated in the following table.

Field	Action	See also
<b>Name</b>	Display the name of the Qualifier. For a new Qualifier, type the name (with no spaces).	
<b>Alias</b>	Display an optional alias for the Qualifier. If necessary, type in a new alias.	
<b>Type</b>	<p>Display the Qualifier type.</p> <p>The type can be defined by the code language (data type) or by a classifier element. When you click on the drop-down arrow, the set of values in the list provides the appropriate data types.</p> <p>To select or define possible classifiers, either click on the <b>Select Type</b> option in the list, or click on the ( ... ) (Select) button to display the Select &lt;Item&gt; dialog.</p> <p>To add new code language data types that can be displayed in this list, see the Data Types topic.</p>	<a href="#">Select &lt;Item&gt;</a> [692] dialog <a href="#">Data Types</a> [779]
<b>Scope</b>	Define the Qualifier as <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> . If necessary, click on the drop-down arrow and select a different scope.	
<b>Stereotype</b>	Define the optional stereotype of the Qualifier. If necessary, either type a different stereotype name or click on the drop-down arrow and select a stereotype.	
<b>Derived</b>	Indicate that the Qualifier is a calculated value. If you select this checkbox, the Qualifier name on the element has the derived symbol ( <i>f</i> ) as a prefix.	
<b>Static</b>	Indicate that the Qualifier is a static member.	
<b>Const</b>	Indicate that the Qualifier is a constant.	
<b>Initial</b>	Display an optional initial value. If necessary, type in a new initial value.	
<b>Notes</b>	Enter any free text notes associated with the Qualifier. You can format the notes text using the Notes toolbar at the top of the field.	<a href="#">Notes</a> [772] toolbar

To change the position of a Qualifier in the list in the **Qualifiers** panel, click on the **Scroll Up** or **Scroll Down** (hand) buttons.

#### Detail Tab

Use the **Detail** tab to model additional properties of a selected Qualifier, such as its multiplicity, redefined properties and subsetted properties.

Select a Qualifier on the **General** tab, then review, edit or complete the **Detail** tab fields as indicated in the following table.

Field	Action	See also
<b>Multiplicity</b>		
<b>Lower bound</b>	Define a lower limit to the number of elements allowed in the collection.	
<b>Upper bound</b>	Define an upper limit to the number of elements allowed in the collection.	
<b>Allow Duplicates</b>	Indicate that duplicates are allowed. Maps to the UML property <i>isUnique</i> , value <i>FALSE</i> ).	
<b>Multiplicity is Ordered</b>	Indicate that the collection is ordered.	
<b>Redefined Property</b>	Review the redefined properties for the Qualifier. Add redefined properties by clicking on the <b>Add</b> button to display the Select Property dialog.	<a href="#">Select Property</a> <sup>[694]</sup> dialog
<b>Subsetted Property</b>	Review the subsetted properties for the qualifier. Add subsetted properties by clicking on the <b>Add</b> button to display the Select Property dialog.	<a href="#">Select Property</a> <sup>[694]</sup> dialog

## 6.5.4 Association Class

### Description

An *Association Class* is a UML construct that enables an Association to have *attributes* and *operations* (*features*). This results in a hybrid relation with the characteristics of an Association and a Class.

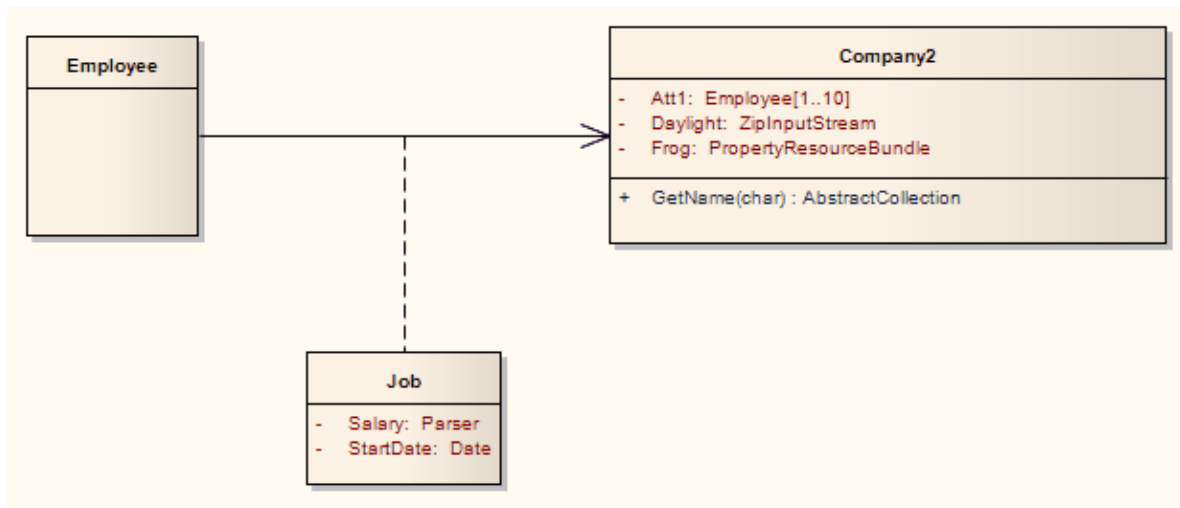

When you add an Association Class connection, Enterprise Architect also creates a Class that is automatically connected to the Association. When you hide or delete the Association, the Class is also hidden or deleted.

To add an Association Class to a Class or Deployment diagram, click on the *Association Class* icon in the **Toolbox**. Click and hold on the source object in the diagram while you drag the line to the target element, then release the mouse button. Enterprise Architect draws the connector and adds the Class, then prompts you to add the Class name. Note that the names of the Class and the connector are the same. You can also connect a new Class to an existing Association.

You can highlight the Class part of an Association Class in the **Project Browser**, by selecting the **Find Association Class** context menu option on the Association connector.

### Example

The following diagram illustrates an Association Class between model elements. Note the dotted line from the Class to the Association. You cannot move or delete this line.

### Notes:

- If you are applying a stereotype with a Shape Script to an Association Class, be aware that the Shape Script is applied to both the Class part and the Association part. Therefore, you might have to include logic in the shape main that tests the type of the element so that you can give separate drawing instructions for Class and for Association. Such logic is not necessary in the:
  - shape source or shape target, which are ignored by Classes, or the
  - decoration shapes, which are ignored by Association connectors.
 If you dissociate the Class from the Association connector, both parts keep their Shape Scripts until the stereotypes are removed.

### Toolbox Icon

### Learn More:

- [Class Diagram](#) <sup>[800]</sup>
- [Connect New Class to Association](#) <sup>[977]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 49*) states:

*A model element that has both association and class properties. An AssociationClass can be seen as an association that also has class properties, or as a class that also has association properties. It not only connects a set of classifiers but also defines a set of features that belong to the relationship itself and not to*

any of the classifiers.

### 6.5.4.1 Connect New Class to Association

#### How to:

To connect a new Class to an existing Association, follow the steps below:

Step	Action
1	Create a Class in the diagram containing the Association to connect
2	Right-click on the new Class The context menu displays
3	Select the <b>Advanced   Association Class</b> menu option The Create Association Class dialog displays
4	Select the connector to connect to
5	Click on the <b>OK</b> button

#### Learn More:

- [Association Class](#)<sup>[975]</sup>

### 6.5.5 Communication Path

#### Description

A Communication Path defines the path through which two DeploymentTargets are able to exchange signals and messages. Communication Path is a specialization of Association. A DeploymentTarget is the target for a deployed Artifact and can be a Node, Property or InstanceSpecification in a Deployment diagram.

#### Toolbox Icon

#### Learn More:

- [Deployment Diagram](#)<sup>[806]</sup>
- [Association](#)<sup>[972]</sup>

## 6.5.6 Composition

### Direction

A Composition is used to depict an element that is made up of smaller components, typically in a Class or Package diagram. A component - or part instance - can be included in a maximum of one composition at a time. If a composition is deleted, usually all of its parts are deleted with it; however, a part can be individually removed from a composition without having to delete the entire composition. Compositions are transitive, asymmetric relationships and can be recursive.

### Example

### Toolbox Icon

### Learn More

- [Aggregation](#) <sup>[970]</sup>
- [Class Diagram](#) <sup>[800]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 43*) states:

*Composite aggregation is a strong form of aggregation that requires a part instance be included in at most one composite at a time. If a composite is deleted, all of its parts are normally deleted with it.*

## 6.5.7 Connector

### Description

*Connectors* illustrate communication links between parts to fulfill the structure's purpose, typically in a Composite Structure diagram. Each Connector end is distinct, controlling the communication pertaining to its connecting element. These elements can define constraints specifying this behavior. Connectors can have multiplicity.

### Toolbox Icon

### Learn More

- [Composite Structure Diagram](#) <sup>[803]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 177*) states:

*Specifies a link that enables communication between two or more instances. This link may be an instance of an association, or it may represent the possibility of the instances being able to communicate because their identities are known by virtue of being passed in as parameters, held in variables or slots, or because the communicating instances are the same instance. The link may be realized by something as simple as a pointer or by something as complex as a network connection. In contrast to associations, which specify links between any instance of the associated classifiers, connectors specify links between instances playing the connected parts only.*

## 6.5.8 Control Flow

### Description

The *Control Flow* is a connector connecting two nodes in an Activity diagram. Control Flow connectors bridge the flow between Activity nodes, by directing the flow to the target node once the source node's activity is completed.

Control Flows and Object Flows can define a **Guard** and a **Weight** condition.

A **Guard** defines a condition that must be true before control passes along that activity edge. A practical example of this is where two or more activity edges (Control Flows) exit from a Decision element. Each flow should have a Guard condition that is exclusive of the other and defines which edge is taken under what conditions. The Control Flow **Properties** dialog enables you to set up Guard conditions on Control Flows

and on Object Flows.

A **Weight** defines the number of tokens that can flow along a Control or Object Flow connection when that edge is traversed. Weight can also be defined on the Control Flow and Object Flow **Properties** dialogs.

#### Toolbox Icon

- [Object Flow](#) [1005]
- [Decision Node](#) [888]

#### OMG UML specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 356*) states:

*A control flow is an edge that starts an activity node after the previous one is finished.*

## 6.5.9 Delegate

#### Description

A Delegate connector defines the internal assembly of a component's external Ports and Interfaces, on a Component diagram. Using a Delegate connector wires the internal workings of the system to the outside world, by a delegation of the external interfaces' connections.

#### Toolbox Icon

#### Learn More:

- [Component Diagram](#) [809]

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 156*) states:

*A delegation connector is a connector that links the external contract of a component (as specified by its ports) to the internal realization of that behavior by the component's parts. It represents the forwarding of signals (operation requests and events): a signal that arrives at a port that has a delegation connector to a part or to another port will be passed on to that target for handling.*

### 6.5.10 Dependency

#### Description

*Dependency* relationships are used to model a wide range of dependent relationships between model elements in Use Case, Activity and Structural diagrams, and even between models themselves. You can create the Dependency from the **Common** page of the **Toolbox**. The Dependencies package as defined in UML 2.3 has many derivatives, such as Realize, Deployment and Use. Once you create a Dependency you can further refine its meaning by applying a specialized stereotype.

#### Toolbox Icon

#### See Also:

- [Apply a Stereotype](#)<sup>[981]</sup>

#### Learn More:

- [Realization](#)<sup>[1009]</sup>
- [Deployment](#)<sup>[982]</sup>
- [Use](#)<sup>[1016]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 64*) states:

*A dependency is a relationship that signifies that a single or a set of model elements requires other model elements for their specification or implementation. This means that the complete semantics of the depending elements is either semantically or structurally dependent on the definition of the supplier element(s).*

#### 6.5.10.1 Apply a Stereotype

##### How to:

To apply a stereotype to a Dependency relationship, follow the steps below:

Step	Action
1	Select the Dependency relationship to change
2	Right-click on the connector and, from the context menu, select the <b>Dependency Properties</b> option The Dependency Properties dialog displays
3	In the <b>Stereotype</b> field, either type in the required stereotype name or click on the drop-down arrow and select the stereotype from the list
4	Click on the <b>OK</b> button

Alternatively, you can right-click on the Dependency relationship and select the **Advanced | Dependency Stereotypes** context menu option, then select from a shorter list of standard stereotypes.

### 6.5.11 Deployment

#### Description

A Deployment is a type of Dependency relationship that indicates the deployment of an artifact onto a node or executable target, typically in a Deployment diagram. A Deployment can be made at type and instance levels. At the type level, a Deployment would be made for every instance of the node. Deployment can also be specified for an instance of a node, so that a node's instances can have varied deployed artifacts. With composite structures modeled with nodes defined as Parts, Parts can also serve as targets of a Deployment relationship.

#### Learn More:

- [Deployment Diagram](#) <sup>[806]</sup>

#### Toolbox Icon

### 6.5.12 Extend

#### Description

An *Extend* connection is used to indicate that an element extends the behavior of another. Extensions are used in Use Case models to indicate that one Use Case (optionally) extends the behavior of another. An extending Use Case often expresses alternative flows.

### Toolbox Icon

### Learn More:

- [Use Case Diagram](#) <sup>815</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification*, v2.1.1, p. 587) states:

*This relationship specifies that the behavior of a Use Case may be extended by the behavior of another (usually supplementary) Use Case. The extension takes place at one or more specific extension points defined in the extended Use Case. Note, however, that the extended Use Case is defined independently of the extending Use Case and is meaningful independently of the extending Use Case. On the other hand, the extending Use Case typically defines behavior that may not necessarily be meaningful by itself. Instead, the extending Use Case defines a set of modular behavior increments that augment an execution of the extended Use Case under specific conditions.*

*Note that the same extending Use Case can extend more than one Use Case. Furthermore, an extending Use Case may itself be extended.*

## 6.5.13 Generalization

### Description

A Generalization is used to indicate inheritance. Drawn from the specific classifier to a general classifier, the generalization's implication is that the source inherits the target's characteristics. It is used typically in Class, Component, Object, Package, Use Case and Requirements diagrams.

You can also define template binding parameters for a Generalize connector between a binding Class and a parameterized Class.

### Toolbox Icon

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 73*) states:

*A generalization is a taxonomic relationship between a more general classifier and a more specific classifier. Each instance of the specific classifier is also an indirect instance of the general classifier. Thus, the specific classifier inherits the features of the more general classifier.*

## 6.5.14 Include

### Description

An Include connection indicates that the source element includes the functionality of the target element. Include connections are used in Use Case models to reflect that one Use Case includes the behavior of another. Use an Include relationship to avoid having the same subset of behavior in many Use Cases; this is similar to delegation used in Class models.

### Toolbox Icon

### Learn More

- [Use Case Diagram](#) <sup>8151</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 591*) states:

*Include is a DirectedRelationship between two Use Cases, implying that the behavior of the included Use Case is inserted into the behavior of the including Use Case. It is also a kind of NamedElement so that it can have a name in the context of its owning Use Case. The including Use Case may only depend on the result (value) of the included Use Case. This value is obtained as a result of the execution of the included Use Case.*

### 6.5.15 Information Flow

#### Description

An Information Flow represents information items or classifiers flowing between two elements in any diagram. The connector is available from the Common page of the Toolbox and from every Quick Link menu.

You can have more than one Information Flow connector between the same two elements, identifying which items flow between the two under differing conditions.

#### Toolbox Icon

#### See Also

- [Using Information Flows](#) <sup>[985]</sup>
- [Conveying Information on a Flow](#) <sup>[986]</sup>
- [Realizing an Information Flow](#) <sup>[987]</sup>

#### Learn More

- [Information Item](#) <sup>[956]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 606*) states:

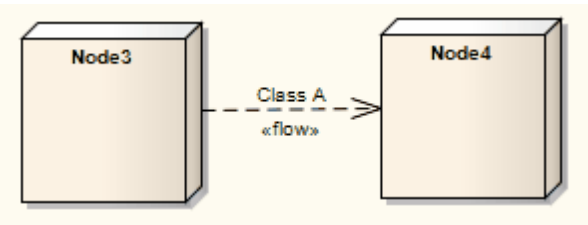

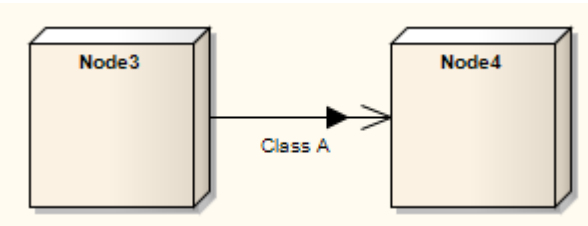

*An InformationFlow specifies that one or more information items circulates from its sources to its targets.*

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 607*) also states:

*An information flow is an abstraction of the communication of an information item from its sources to its targets. It is used to abstract the communication of information between entities of a system. Sources or targets of an information flow designate sets of objects that can send or receive the conveyed information item.*

#### 6.5.15.1 Using Information Flows

Step	Action
1	Open a diagram and add two elements (for example, Nodes on a Deployment diagram)
2	Click on the <i>Information Flow</i> connector in the Common page of the Toolbox and drag between the two elements  The Information Items Conveyed dialog displays

Step	Action
3	<p>Add the classifier or information item element(s) to the Information Flow</p> <p>The diagram now resembles the following</p> 
4	<p>Add another connector between the same two elements (for example, a <i>Communication Path</i> connector)</p>
5	<p>Right-click the connector and select the <b>Advanced   Information Flows Realized</b> context menu option</p> <p>The Information Flows Realized dialog displays</p>
6	<p>Tick the checkbox against the required classifier element and click on the <b>OK</b> button</p> <p>The combined connector now resembles the following:</p> 

**Notes:**

- Once the connectors are combined, you cannot access the Information Items Conveyed dialog directly; you add or delete information items on the connector using the Information Items Realized dialog
- If you have more than one Information Flow connector between the elements, they form part of the same combined connector; you can again work on them separately through the Information Items Realized dialog
- If you have information flows in a diagram that you use as the source for a Pattern, the Information Items Conveyed and Information Flows Realized data is not copied into the Pattern
- You can locate, in the Project Browser, the classifier or information item element(s) conveyed on the Information Flow connector, using the **Find Information Item** context menu option on the connector

### 6.5.15.2 Convey Information on a Flow

As you create an Information Flow connector between two elements, you can specify which Information Items or classifiers are conveyed on this flow.

To specify these Information Items or classifiers, right-click on the connection and select the **Advanced | Information Item Conveyed** context menu option. The **Information Items Conveyed** dialog displays.

Button	Action
<b>Add</b>	Display the Select <Item> dialog, from which you select the required Information or Classifier element(s).

Button	Action
Remove	Remove the selected item.

**Notes:**

- If you select more than one element, they are listed in one entry for the Information Flow connector.

**Learn More**

- [Information Flow](#)<sup>[985]</sup>
- [Information Item](#)<sup>[956]</sup>

**6.5.15.3 Realize an Information Flow**

The **Information Flows Realized** dialog displays all flows that can be realized on the selected connector. To realize an Information Flow on this connector, select the corresponding checkbox and click on the **OK** button.

If you want to change the information items conveyed on an information flow, click on the flow *text* and click on the **Items** button. The Information Items Conveyed dialog displays, and you can add or remove items as required. When you click on the **OK** button, the **Information Items Realized** dialog redisplay and you can realize the selected flow or flows as above.

**Learn More:**

- [Information Flow](#)<sup>[985]</sup>

**6.5.16 Interrupt Flow****Description**

The *Interrupt Flow* is a connection used to define the two UML concepts of connectors for Exception Handler and Interruptible Activity Region. An Interrupt Flow is a type of activity edge. It is typically used in an Activity diagram.

**Toolbox Icon****Learn More**

- [Exception Handler](#)<sup>[894]</sup>
- [Interruptible Activity Region](#)<sup>[909]</sup>
- [Activity diagram](#)<sup>[813]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 327*) states:

*An activity edge is an abstract class for directed connections between two activity nodes.*

## 6.5.17 Manifest

### Description

A Manifest relationship indicates that the Artifact source embodies the target model element, typically in Component and Deployment diagrams. Stereotypes can be added to Enterprise Architect to classify the type of manifestation of the model element.

### Toolbox Icon

### Learn More

- [Artifact Element](#) <sup>[942]</sup>
- [Component Diagram](#) <sup>[809]</sup>
- [Deployment Diagram](#) <sup>[806]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 212*) states:

*An artifact embodies or manifests a number of model elements. The artifact owns the manifestations, each representing the utilization of a packageable element.*

*Specific profiles are expected to stereotype the manifestation relationship to indicate particular forms of manifestation, e.g. «tool generated» and «custom code» might be two manifestations for different classes embodied in an artifact.*

## 6.5.18 Message

Messages indicate a flow of information or transition of control between elements. Messages can be used by Timing Diagrams, Sequence Diagrams and Communication Diagrams (but not Interaction Overview diagrams) to reflect system behavior. If between Classes or classifier instances, the associated list of operations is available to specify the event.

Moving a Message can disrupt the organization of other features on the diagram. To avoid this, and move *only* the Message, press **( Alt )** while you move the Message.

### Toolbox Icon

 Message**See Also**

**Learn More**

- [Timing Diagram](#)<sup>[1001]</sup>
- [Sequence Diagram](#)<sup>[988]</sup>
- [Communication Diagram](#)<sup>[998]</sup>

**OMG UML Specification**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 491*) states:

*A Message defines a particular communication between Lifelines of an Interaction.*

*A Message is a NamedElement that defines one specific kind of communication in an Interaction. A communication can be, for example, raising a signal, invoking an Operation, creating or destroying an Instance. The Message specifies not only the kind of communication given by the dispatching ExecutionSpecification, but also the sender and the receiver.*

*A Message associates normally two OccurrenceSpecifications - one sending OccurrenceSpecification and one receiving OccurrenceSpecification.*

**6.5.18.1 Message (Sequence Diagram)**

Sequence diagrams depict work flow or activity over time using Messages passed from element to element. These Messages correspond in the software model to Class operations and behavior.

**How to:**

To create a Message on a Sequence diagram, follow the steps below:

Step	Action	See Also
1	<p>Access the Sequence diagram</p> <p>The Interaction pages of the Toolbox display.</p>	
2	<p>In the Interaction Relationships page, click on the <b>Message</b> icon, click on the source object and drag the cursor to the destination (target) object</p> <p>The Message Properties dialog displays (if not, right-click on the Message and select the <b>Message Properties</b> context menu option)</p>	
3	<p>In the <b>Message</b> field, type the Message name:</p> <ul style="list-style-type: none"> <li>• If the Message flow is <i>towards</i> a Class element (dropped in from a Class diagram) or a Lifeline element having a classifier, and the <i>destination</i> Class has defined <i>operations</i>, you can click on the drop-down arrow and select an appropriate operation name; the Message then reflects the destination Class operations</li> <li>• If the available operations are not appropriate, you can click on the <b>Operations</b> button and define a new operation in the target element, using the Operations dialog</li> <li>• If you create a Message without making reference to the target Class operations, no new operation is added to the target Class</li> </ul>	<p><a href="#">Class Element</a><sup>[943]</sup></p> <p><a href="#">Lifeline</a><sup>[912]</sup></p> <p><a href="#">Operations Dialog</a><sup>[710]</sup></p>
4	<p>In the <b>Parameters</b> field, type any parameters that the Message has, as a comma-separated list</p> <p>If required, in the <b>Parameter Values</b> field type the actual value for each parameter, again as a comma-separated list</p>	
5	<p>If the Message is a return message, in the <b>Return Value</b> field enter the returned value or type</p> <p>It is possible to depict returns from a Self Message; simply create a second Self Message at the end of execution and select the <b>Is Return</b> checkbox in the Control Flow Type panel</p>	<p><a href="#">Self-Message</a><sup>[991]</sup></p>
6	<p>If the Message flow is <i>from</i> a Class element or Lifeline element with classifier that has defined <i>attributes</i>, click on the drop-down arrow in the <b>Assign to</b> field and select an appropriate attribute name</p> <p>The Message reflects the attributes from the <i>source</i> Class; you cannot add further attributes to the source Class here - if no appropriate attribute is listed, open the element Properties dialog and add the required attribute</p> <p>Otherwise, if required, type the name of the object to assign the message flow to</p>	
7	<p>In the <b>Stereotype</b> field, type or select an optional stereotype for the connector (this is displayed on the diagram, if entered)</p>	
8	<p>If required, in the <b>Alias</b> field type an alias for the name of the Message</p> <p>On the diagram, the alias displays if the <b>Use Alias if Available</b> checkbox is selected on the Diagram tab of the Diagram Properties dialog</p> <p>The Alias displays instead of or as well as the Message name, depending on the setting selected in the Alias Usage panel of the Diagram Behavior page of</p>	<p><a href="#">Diagram Behavior Options</a><sup>[432]</sup></p>

Step	Action	See Also
	the Options dialog	
9	In the <b>Condition</b> field, type any conditions that must be true in order for the message to be sent	
10	In the <b>Synch:</b> field in the Control Flow Type panel, select <b>Synchronous</b> or <b>Asynchronous</b> as appropriate	<a href="#">Asynchronous Signal Message</a> [998]
11	In the <b>Lifecycle</b> field, select <b>New</b> to create a new element at the end of the Message, or <b>Delete</b> to terminate the message flow at the end of the Message If neither case applies, leave the field at the default of <b>&lt;none&gt;</b>	
12	If required, in the <b>Notes</b> field type any explanatory notes You can format the notes using the Notes toolbar at the top of the field	
13	Click on the <b>OK</b> button to save the Message definition <ul style="list-style-type: none"> <li>You can change the timing details of a message on the Timing Details dialog, and emphasize the sequence of closely-ordered messages using General Ordering</li> <li>To toggle the numbering of messages on a Sequence diagram, select or deselect the <b>Show Sequence Numbering</b> checkbox on the Options dialog</li> </ul>	<a href="#">Change the Timing Details</a> [995] <a href="#">General Ordering</a> [996] <a href="#">Sequence diagrams</a> [851]

#### Toolbox Icon:

#### Learn More:

- [Call](#) [993]
- [Message Examples](#) [994]
- [Co-Region Notation](#) [998]

#### 6.5.18.1.1 Self-Message

A Self-Message reflects a new process or method invoked within the calling lifeline's operation. It is a specification of a Message, typically in a Sequence diagram.

#### Self-Message as Return:

It is possible to depict a return from a Self Message call.

**How to:**

To create a Self Message return, follow the steps below:

Step	Action
1	Create a second Self Message at the end of execution
2	Double-click on the Message name to open the Message Properties dialog
3	Select the <b>Is Return</b> checkbox
4	Raise the Activation level of the return

Self-Message Calls indicate a nested invocation; new activation levels are added with each Call.

**Toolbox Icon:****Learn More**

- [Sequence Diagram](#) <sup>[857]</sup>
- [Message](#) <sup>[988]</sup>
- [Raise the Activation Level](#) <sup>[858]</sup>
- [Call](#) <sup>[993]</sup>

### 6.5.18.1.2 Call

A Call is a type of Message connector that extends the level of activation from the previous Message. All Self-Messages create a new activation level, but this focus of control usually ends with the next Message (unless activation levels are manually adjusted). Self-Message Calls, as depicted above by the first Call, indicate a nested invocation; new activation levels are added with each Call. Unlike a regular Message between elements, a Call between elements continues the existing activation in the source element, implying that the Call was initiated within the previous Message's activation scope.

#### Toolbox Icon

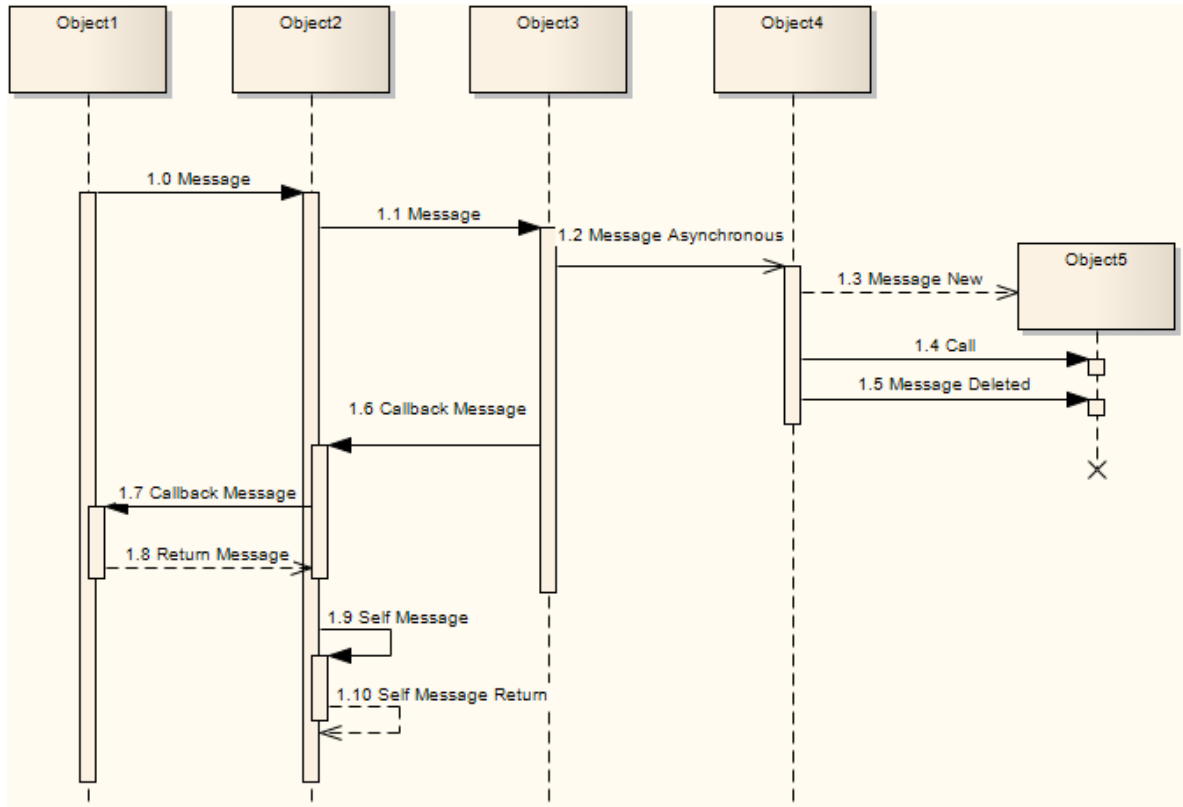

#### Learn More

- [Sequence Message](#)<sup>[989]</sup>
- [Self-Message](#)<sup>[997]</sup>

### 6.5.18.1.3 Message Examples

The following are different types of Messages available on Sequence Diagrams. Note that Messages on Sequence diagrams can also be modified with Shape Scripts.

#### Other Sequence Messages

The following are examples of Messages that are not part of the sequence described by the diagram.

**Learn More**

- [Messages](#) <sup>[989]</sup>
- [Sequence Diagrams](#) <sup>[851]</sup>
- [Shape Scripts](#) <sup>[1091]</sup>

**6.5.18.1.4 Change the Timing Details**

It is possible to change the timing details of a Message in a Sequence diagram by right-clicking on the Message connector and selecting the **Timing Details** context menu option. The **Timing Details** dialog displays.

Option	Action
<b>Duration Constraint</b>	Indicate the minimum and maximum limits on how long a message can last.
<b>Duration Constraint Between Messages</b>	Indicate the minimum and maximum interval between sending or receipt of the previous message at the current message's source Lifeline, and sending the current message.
<b>Duration Observation</b>	Capture the duration of a message.
<b>Timing Constraint</b>	Indicate the minimum and maximum time at which the message should arrive at the target.
<b>Timing Observation</b>	Capture the point at which the message was sent.

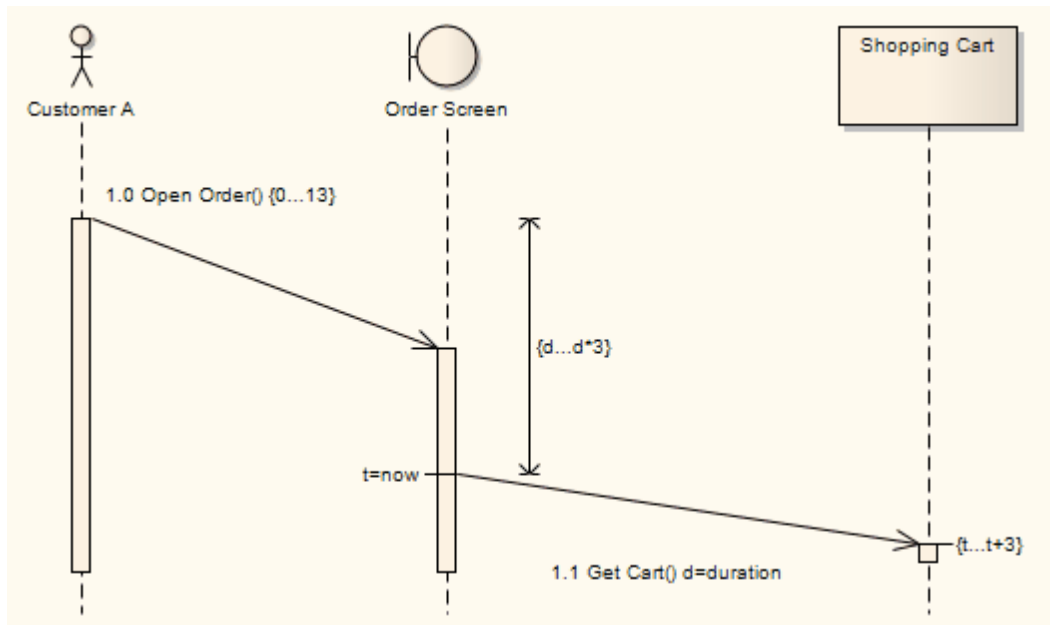

See the OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 511*).

In the diagram below, on the *Open Order Message*:

- **Duration Constraint** has been set to **0...13**.

On the *Get Cart* Message:

- **Duration Constraint Between Messages** has been set to **d...d\*3**
- **Duration Observation** has been set to **d=duration**
- **Timing Constraint** has been set to **t...t+3**
- **Timing Observation** has been set to **t=now**

By typing a value in the **Duration Constraint** field, you enable the Message angle to be adjusted. After clicking on the **OK** button on the **Timing Details** dialog, click on the head of the Message connector and drag the connector up or down to change the angle. You cannot extend the angle beyond the life line of the connecting sequence object or create an angle of less than 5 degrees.

You can also create the **Duration Constraint Between Messages** line by dragging the General Ordering arrow up to the point at which the previous message joins the source Lifeline for the current message. A dialog displays on which you enter the value for the constraint. Having created the line, you can move it to any point within half way along the current message and half way along the previous message, to avoid overlap with other message timing details. You can edit or delete the value either through the **Timing Details** dialog or by right-clicking on the line itself and selecting the appropriate context menu option.

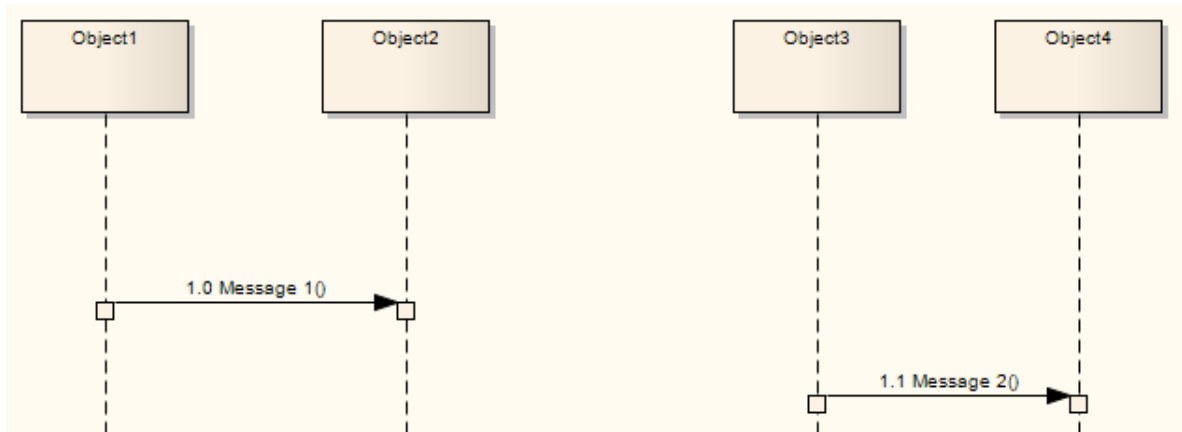

#### Learn More

- [Sequence Diagram](#) <sup>851</sup>
- [Message](#) <sup>988</sup>
- [General Ordering](#) <sup>996</sup>

#### 6.5.18.1.5 General Ordering

In a Sequence diagram, the workflow is represented by the sequence of Messages down the diagram. Messages near the top of the diagram are passed before Messages lower down the diagram.

Consider the following diagram.

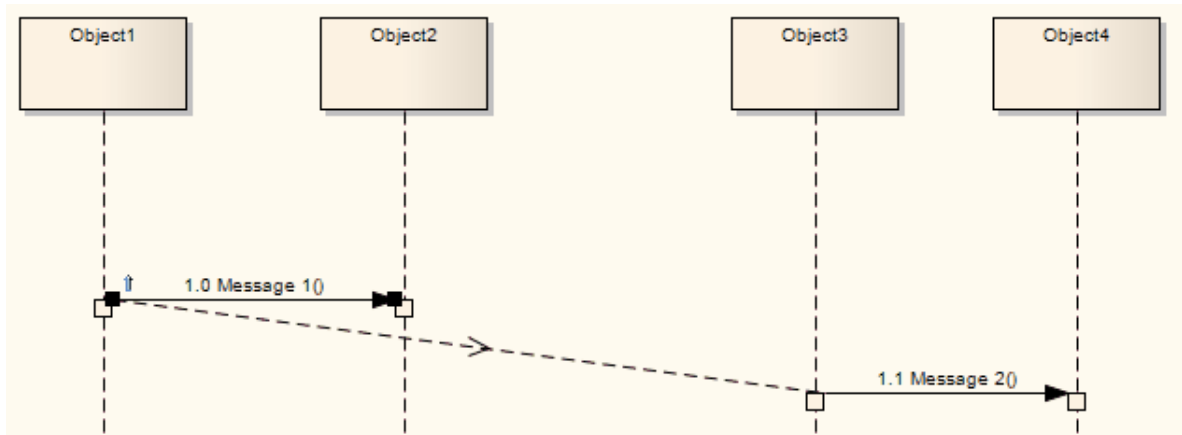

Message 1 is earlier than Message 2. However, in a complex diagram, or when representing finely timed operations or parallel processing, this might not be apparent. You can reinforce the sequence using a General Ordering arrow.

Click on the Message arrow. A small arrow displays at the source anchor point.

Click on this arrow and drag it to the start of the next Message in sequence (Message 2 in the example). The General Ordering arrow displays, indicating that the second Message follows the first.

The General Ordering arrow is exaggerated in the above figure. You would normally have the arrow running almost horizontal across the diagram.

You can have more than one General Ordering arrow issuing from or targeting a Message, if necessary.

### 6.5.18.1.6 Asynchronous Signal Message

You define a Message as an asynchronous signal message by displaying the **Message Properties** dialog and setting the **Synch** field to **Asynchronous** and the **Kind** field to **Signal**. A *synchronous* message cannot be used to convey signals, so setting the **Synch** field to **Synchronous** disables the **Kind** field.

**Return Value**, **Assign To** and the **Operations** button, which are not applicable to asynchronous *signals*, are disabled.

The **Operations** button changes to a **Signal** button, which you click on to associate the asynchronous signal message with a Signal element in the model. You can type the arguments corresponding to the Signal attributes into the **Argument(s)** field.

When you click on the **Signal** button, the **Select \*Signal** dialog displays, through which you locate and select the required Signal element. (The **Select \*Signal** dialog is a variation of the **Select <Item>** dialog.)

#### Learn More

- [Message Properties Dialog](#)<sup>[989]</sup>

### 6.5.18.1.7 Co-Region Notation

*Co-Region notation* can be used as a short hand for parallel combined fragments. To access the **Co-Region** submenu, right-click on a connector in a Sequence diagram and select the **Co-Region** context menu option. There are four sub-options available:

- **Start at head**
- **End at head**
- **Start at tail**
- **End at tail.**

## 6.5.18.2 Message (Communication Diagram)

A Message in a Communication diagram is equivalent in meaning to a Message in a Sequence diagram. It implies that one object uses the services of another object, or sends a message to that object. Communication Messages in Enterprise Architect are always associated with an Association connector between object instances. Always create the Association first, then add a Message to the connector.

Messages can be dragged into a suitable position by clicking and dragging on the message text.

Communication Messages are ordered to reflect the sequencing of the diagram. The numbering scheme should reflect the nesting of each event. A sequencing scheme could be:

```
1
2, 2.1, 2.2, 2.3
3.
```

This would indicate the single sequence of events 2.1, 2.2 and 2.3 occurs within an operation initiated by event 2. This is the default pattern applied by Enterprise architect

Alternatively, the sequence could be:

```
1
2, 2.1, 2.1.1, 2.1.1.1
   2.2, 2.2.1, 2.2.1.1
3
```

This would indicate that two sequences of events can be initiated by event 2, and 2.1 and 2.2 are separate

sequences, not consecutive events in one sequence. You can set the sequence pattern and order using the **Message Properties** dialog and the **Sequence Communications** dialog.

If the target object is a Class or has its instance classifier set, the drop-down list of possible message names includes the exposed operations for the base type.

#### Learn More:

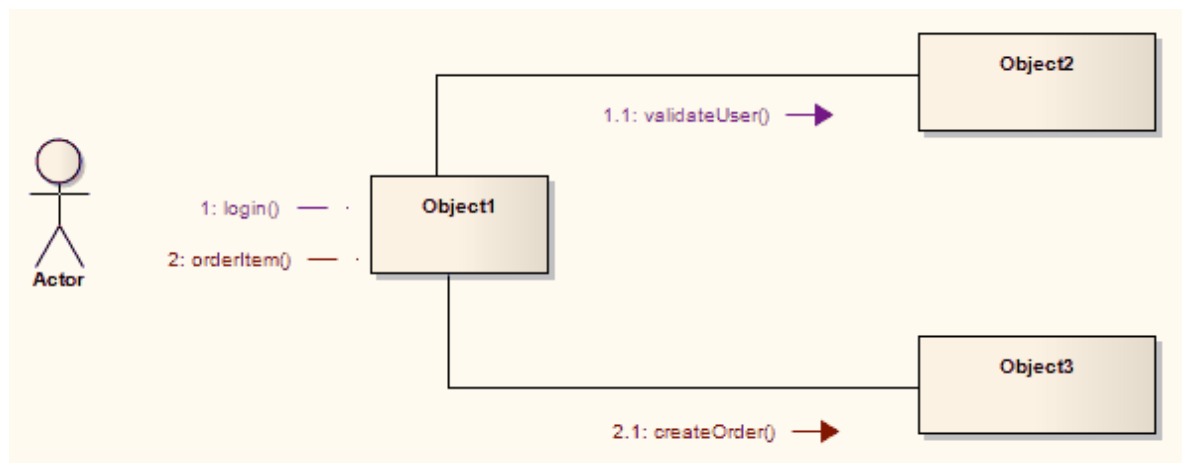

- [Communication Diagram](#) <sup>[867]</sup>
- [Create a Communication Message](#) <sup>[999]</sup>
- [Re-Order Messages](#) <sup>[1000]</sup>

#### 6.5.18.2.1 Create a Communication Message

##### How to:

To create a Communication Message, follow the steps below

Step	Action
1	Open a diagram (one of: Communication, Analysis, Interaction Overview, Object, Activity or State Machine)
2	Add the required objects
3	Add an Association relationship between each pair of objects that communicate
4	Right-click on an Associate to display the context menu
5	Select the option to add a Message from one object to the other
6	When the Message Properties dialog displays, type in a name and any other required details
7	Click on the <b>OK</b> button The Message is added, connected to the Association and Object instances
8	Move the Message to the required position

**Learn More:**

- [Communication Message](#)<sup>[998]</sup>
- [Message Properties Dialog](#)<sup>[989]</sup>

**6.5.18.2.2 Re-Order Messages**

When constructing your Communication diagram, it is frequently necessary to create or delete Message 'groups' and to re-order the sequence of Messages. There are two dialogs that help you perform these tasks: the Message Properties dialog and the Sequence Communications dialog.

**Organize Message Groups:**

If you have several Messages in the form 1.1, 1.2, 1.3, 1.4, for example, but would like to start a new numbering group on, say, the third Message (that is, 1.1, 1.2, **2.1**, 2.2, 2.3 ), you can change a Message in the series to a *Start Group* message.

**How to:**

To reorganize message groups, follow the steps below:

Step	Action
1	Double-click on a Message <i>name</i> The Message Properties dialog displays
2	To make the selected Message the start of a new group, select the <b>Start New Group</b> checkbox
3	If required, in the <b>Notes</b> field, type an explanatory note You can format the text using the Notes toolbar at the top of the field
4	Click on the <b>OK</b> button to save changes

**Sequence Messages:**

In larger and more complex diagrams, you might have to use deeper levels of Messages in a group; for example, 1, 1.2, 1.2.1, 1.2.1.1. You might also have to change the sequence of Messages, making Message 1.3, for example, into Message 1.1.

**How to:**

To change the sequence or level of Messages, follow the steps below:

Step	Action
1	Either: <ul style="list-style-type: none"> <li>• Select the <b>Diagram   Advanced   Sequence Messages</b> menu option</li> <li>• Click on the diagram background and select the <b>Sequence Communication Messages</b> context menu option or</li> <li>• Right-click on a Message and select the <b>Sequence Communication Messages</b></li> </ul>

Step	Action
	context menu option The Communication Messages dialog displays
2	Click on the Message to adjust and, at the bottom of the dialog, click on the: <ul style="list-style-type: none"> <li>'Up Hand' or 'Down Hand' buttons to move the Message up or down the sequence (e.g. Message 1.2 to Message 1.1 or 1.3)</li> <li>'Left Hand' or 'Right Hand' buttons to move the Message up or down a level (e.g. Message 1.2.1 to Message 1.2 or Message 1.2.1.1)</li> </ul>
3	Repeat step 2 until the Message sequence and levels match your requirements You might have to adjust other Message numbers (in group, sequence or level) to accommodate the changes you have made
4	Click on the <b>OK</b> button to save changes

### 6.5.18.3 Message (Timing Diagram)

Messages are the communication links between Lifelines in a Timing diagram. In the case of a Timeline, a Message is a connection between two Timeline objects.

See *UML Superstructure Specification, v2.1.1, figures 14.30 and 14.31, p. 520.*

### Toolbox Icon

### Learn More

- [Timing Diagram](#)<sup>[832]</sup>
- [Lifeline](#)<sup>[912]</sup>
- [Create a Timing Message](#)<sup>[1002]</sup>

#### 6.5.18.3.1 Create a Timing Message

To create a Message in a Timing diagram, at least two Lifeline objects (State or Value) must be created first, each with existing transition points.

#### How to:

To create a Message between Lifelines, follow the steps below:

Step	Action
1	Click on one of the Lifelines in the Timing diagram
2	Select the Message icon from the Timing Relationships page of the Toolbox ( <b>More tools   Timing</b> )
3	Drag the cursor onto the Lifeline at the point at which the Message originates

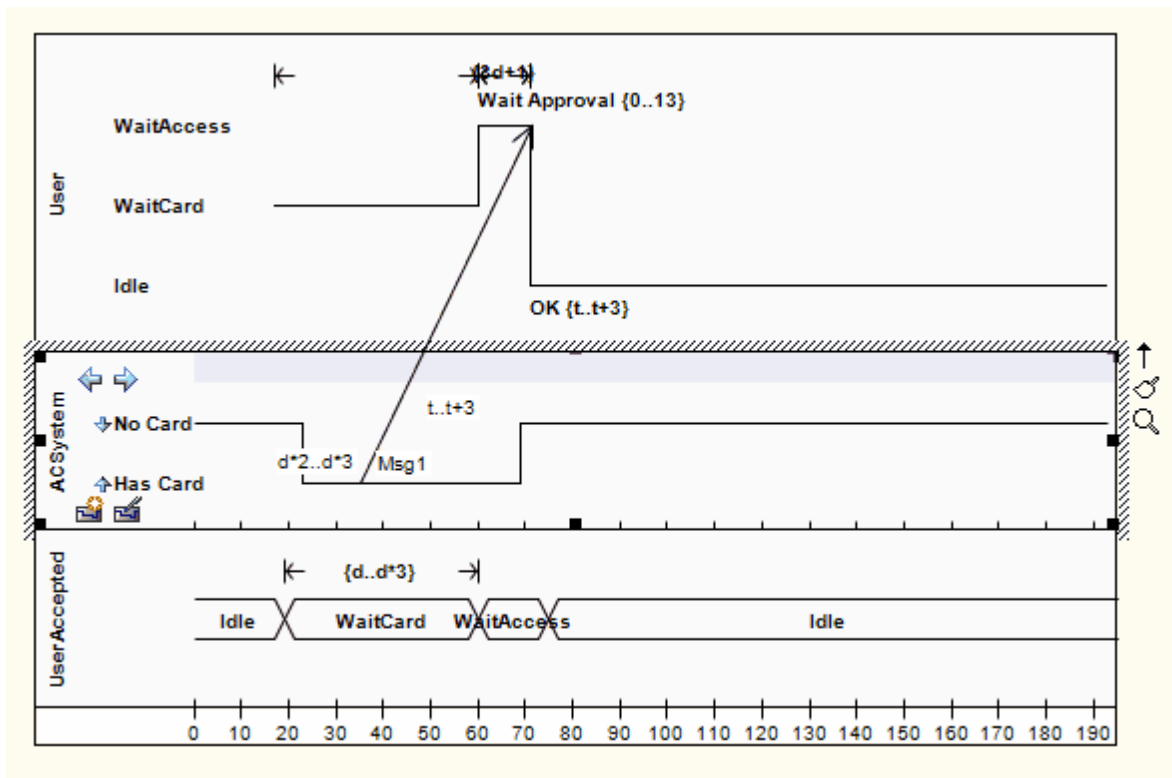

Step	Action
	The Timing Message dialog displays (if not, double-click on the Message)
4	The dialog consists of a set of transition points Each transition point can be defined with the properties listed in the following table

Property	Description
<b>Start</b>	Defines the lifeline where the message originates
<b>End</b>	Defines the lifeline where the message terminates

The following properties are set by default when a Message is created by dragging the cursor between two Lifelines.

Property	Description
<b>Start Time</b>	Specifies the start time for a message
<b>End Time</b>	Specifies the end time for a message
<b>Name</b>	The name of the message
<b>Time Observation</b>	Provides information on the time of a sent message
<b>Duration Observation</b>	Indicates the interval of a Lifeline at a particular state, begun from a message receipt
<b>Transition To</b>	The state in the target Lifeline that the Message points to
<b>Event</b>	The occurring event
<b>Time Constraint</b>	The time taken to transmit a message
<b>Duration Constraint</b>	Pertains to a lifeline's period at a particular state The constraint could be instigated by that Lifeline's receipt of a message

The following diagram shows an example of a configured Message:

See *UML Superstructure Specification, v2.1.1, figures 14.30 and 14.31, p. 520.*

#### Notes:

- You can move the source end of the Message freely along the source timeline; however, the target end (arrow head) must attach to a transition
- If you create a new Message and do not give it a target transition, it automatically finds and attaches to the nearest transition; if you move the target end, it drags the transition with it

#### Learn More

### 6.5.19 Nesting

#### Description:

The Nesting Connector is an alternative graphical notation for expressing containment or nesting of elements within other elements. It is most appropriately used for displaying Package nesting in a Package diagram.

#### Toolbox Icon:

#### Learn More:

- [Package Diagram](#) <sup>17981</sup>

### 6.5.20 Notelink

#### Description

A Notelink connector connects a Note to one or more other elements of any other type.

Both Note and Notelink are available in any category of the **Toolbox**, in the **Common** page. You can also select them from the **UML Elements** toolbar.

#### Toolbox Icon

### 6.5.21 Object Flow

#### Description

*Object Flows* are used in Activity diagrams and State Machine diagrams. When used in an Activity diagram, an Object Flow connects two elements, with specific data passing through it. To view sample Activity diagrams using Object Flows, see the Object Flows in Activity Diagrams topic.

In State Machine diagrams, an Object Flow is a specification of a state flow or transition. It implies the passing of an Object instance between elements at run-time.

You can insert an Object Flow from the **State** or **Activity** pages of the **Toolbox**, or from the drop-down list of all relationships located in the header toolbar. You can also modify a transition connection to an Object Flow by selecting the **ObjectFlow** checkbox on the connection **Properties** dialog.

See the Control Flow topic for information on setting up Guards and Weights on Object Flows.

### Toolbox Icon

### See Also

- [Object Flows in Activity Diagrams](#) <sup>[1006]</sup>

### Learn More

- [Activity Diagram](#) <sup>[813]</sup>
- [Control Flow](#) <sup>[979]</sup>

### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 389*) states:

*An object flow is an activity edge that only passes object and data tokens.*

#### 6.5.21.1 Object Flows in Activity Diagrams

In Activity diagrams, there are several ways to define the flow of data between objects.

The following diagram depicts a simple Object Flow between two actions, Fill Order and Ship Order, both accessing order information.

See *UML Superstructure Specification, v2.1.1, figure 12.110, p. 391*.

This explicit portrayal of the data object *Order*, connected to the Activities by two Object Flows, can be refined by using the following format. Here, Action Pins are used to reflect the order.

See *UML Superstructure Specification, v2.1.1, figure 12.110, p. 391*.

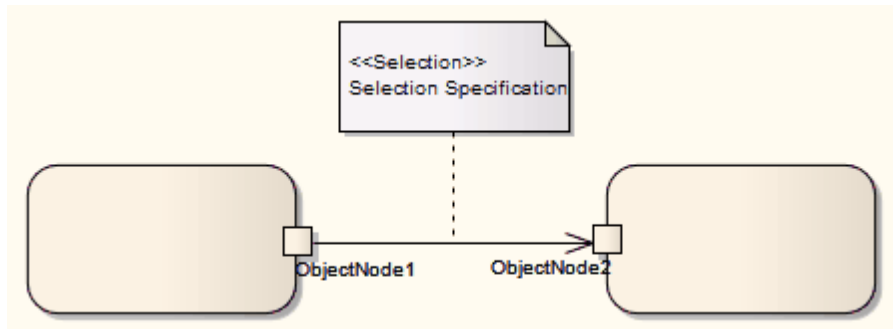

The following diagram is an example of multiple Object Flows exchanging data between two actions.

See *UML Superstructure Specification, v2.1.1, figure 12.111, p. 391.*

Selection and transformation behavior, together composing a sort of query, can specify the nature of the Object Flow's data access. Selection behavior determines which objects are affected by the connection. Transformation behavior might then further specify the value of an attribute pertaining to a selected object.

Selection and transformation behaviors can be defined by attaching a note to the Object Flow. To do this, right-click on the Object Flow and select the **Attach Note or Constraint** context menu option. A dialog lists other flows in the diagram, to which you can select to attach the note, if the behavior applies to multiple flows. To comply with UML 2, preface the behavior with the notation «selection» or «transformation».

See *UML Superstructure Specification, v2.1.1, figure 12.112, p. 392.*

## 6.5.22 Occurrence

### Description

An *Occurrence* relationship indicates that a Collaboration represents a classifier, in a Composite Structure diagram. An Occurrence connector is drawn from the Collaboration to the classifier.

### Toolbox Icon

### Learn More

- [Collaboration](#)<sup>[94]</sup>
- [Composite Structure Diagram](#)<sup>[803]</sup>

### 6.5.23 Package Import

#### Description

A Package Import relationship is drawn from a source Package to a Package whose contents are to be imported. Private members of a target Package cannot be imported. The relationship is typically used in a Package diagram.

#### Toolbox Icon

#### Learn More

- [Package](#)<sup>[962]</sup>
- [Package Diagram](#)<sup>[798]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 112*) states:

*A package import is a relationship between an importing namespace and a package, indicating that the importing namespace adds the names of the members of the package to its own namespace. Conceptually, a package import is equivalent to having an element import to each individual member of the imported namespace, unless there is already a separately-defined element import.*

### 6.5.24 Package Merge

#### Description

In a Package diagram, a Package Merge indicates a relationship between two Packages whereby the contents of the target Package are merged with those of the source Package. Private contents of a target Package are not merged. The applicability of a Package Merge addresses any situation where multiple packages contain identically-named elements, representing the same thing. A Package Merge merges all matching elements across its merged Packages, along with their relationships and behaviors. Note that a Package Merge essentially performs generalizations and redefinitions of all matching elements, but the merged Packages and their independent element representations still exist and are not affected.

The Package Merge serves a graphical purpose in Enterprise Architect, but creates an ordered Package relationship applied to related Packages (which can be seen under the **Link** tab in the Package's **Properties** dialog). Such relationships can be reflected in XML exports or Enterprise Architect Automation Interface scripts for code generation or other Model Driven Architecture (MDA) interests.

Package Merge relationships are useful to reflect situations where existing architectures contain functionalities involving like elements, which are merged in a developing architecture. Merging doesn't affect the merged objects, and supports the common situation of product progression.

#### Toolbox Icon

#### Learn More

- [Package Diagram](#)<sup>[798]</sup>
- [Package](#)<sup>[962]</sup>

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 113-114*) states:

*A package merge is a directed relationship between two packages that indicates that the contents of the two packages are to be combined. It is very similar to Generalization in the sense that the source element conceptually adds the characteristics of the target element to its own characteristics resulting in an element that combines the characteristics of both.*

*This mechanism should be used when elements defined in different packages have the same name and are intended to represent the same concept. Most often it is used to provide different definitions of a given concept for different purposes, starting from a common base definition. A given base concept is extended in increments, with each increment defined in a separate merged package. By selecting which increments to merge, it is possible to obtain a custom definition of a concept for a specific end. Package merge is particularly useful in meta-modeling and is extensively used in the definition of the UML metamodel.*

*Conceptually, a package merge can be viewed as an operation that takes the contents of two packages and produces a new package that combines the contents of the packages involved in the merge. In terms of model semantics, there is no difference between a model with explicit package merges, and a model in which all the merges have been performed.*

### 6.5.25 Realization

#### Description

A source object implements or Realizes its destination object. Realize connectors are used in a Use Case, Component or Requirements diagram to express traceability and completeness in the model. A business process or Requirement is realized by one or more Use Cases, which in turn are realized by some Classes, which in turn are realized by a Component, and so on. Mapping Requirements, Classes and such across the design of your system, up through the levels of modeling abstraction, ensures the big picture of your system remembers and reflects all the little pictures and details that constrain and define it.

You can also define template binding parameters for a Realize connector between a binding Class and a parameterized Class.

#### Toolbox Icon

#### OMG UML Specification

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 131*) states:

*A Realization signifies that the client set of elements are an implementation of the supplier set, which serves as the specification. The meaning of 'implementation' is not strictly defined, but rather implies a more refined or elaborate form in respect to a certain modeling context. It is possible to specify a mapping between the specification and implementation elements, although it is not necessarily computable.*

### 6.5.26 Recursion

#### Description

A Recursion is a type of Message used in Sequence diagrams to indicate a recursive function.

#### Toolbox Icon

#### Learn More

- [Message](#) <sup>[989]</sup>
- [Sequence Diagram](#) <sup>[851]</sup>

### 6.5.27 Role Binding

#### Description:

Role Binding is the mapping between a Collaboration Use's internal roles and the respective Parts required to implement a specific situation, typically in a Composite Structure diagram. The associated Parts can have properties defined to enable the binding to occur, and the Collaboration to take place.

A Role Binding connector is drawn between a Collaboration and the classifier's fulfilling roles, with the Collaboration's internal binding roles labeled on the classifier end of the connector.

#### Toolbox Icon:

#### Learn More:

- [Collaboration Use](#) <sup>[948]</sup>
- [Composite Structure Diagram](#) <sup>[803]</sup>
- [Collaboration](#) <sup>[947]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 174*) states:

*A mapping between features of the collaboration type and features of the classifier or operation. This mapping indicates which connectable element of the classifier or operation plays which role(s) in the collaboration. A connectable element may be bound to multiple roles in the same collaboration use (that is, it may play multiple roles).*

## 6.5.28 Represents

#### Description:

The Represents connector indicates that a Collaboration is used in a classifier, typically in a Composite Structure diagram. The connector is drawn from the Collaboration to its owning classifier.

#### Toolbox Icon:

#### Learn More:

- [Collaboration](#) <sup>[947]</sup>
- [Composite Structure Diagram](#) <sup>[803]</sup>

### 6.5.29 Representation

#### Description:

The Representation relationship is a specialization of a Dependency, connecting Information Item elements that represent the same idea across models, typically in an Analysis diagram. For example, Bonus and Salary are both a representation of the Information Item Wage.

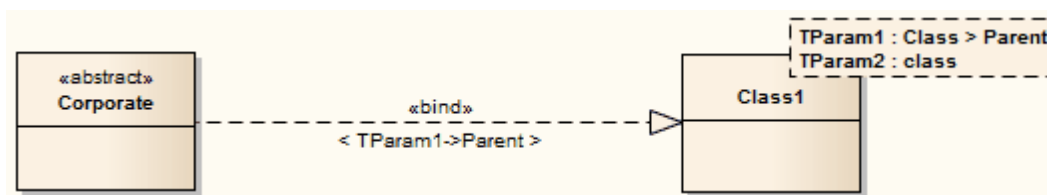

#### Toolbox Icon:

#### Learn More:

- [Dependency](#) <sup>[98]</sup>
- [Information Item](#) <sup>[956]</sup>
- [Analysis diagram](#) <sup>[1190]</sup>

### 6.5.30 Template Binding

#### Description:

You create a Template Binding connector between a binding Class and a parameterized Class. You then define a binding expression on that connector. However, if the binding Class requires a Generalization, Realization or Association relationship with the parameterized Class, you can define the binding expression on that relationship instead.

You can create a Template Binding connector using:

- The **Template Binding** icon on the Class Relationships page of the Diagram Toolbox
- The Quicklinker arrow next to the source Class element
- The Templates tab of the binding Class element Properties dialog; here, you create the Template Binding relationship by clicking the **Add** button under the Binding(s) panel, specifying the connector type, and selecting the target parameterized Class from the Select <Item> dialog

Each of these methods creates the connector itself. For the first two methods you then double-click on the connector to display the connector Properties dialog, on which you select the Binding tab to define *parameter substitutions* as the binding expression. The third method takes you to this dialog and tab automatically.

#### Toolbox Icon:

#### Learn More:

- [Parameterized Class](#) <sup>[945]</sup>
- [Parameter Substitution](#) <sup>[1013]</sup>

#### OMG UML Specification:

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 622*) states:

*A template is a parameterized element ... used to generate other model elements using TemplateBinding relationships. The template parameters for the template signature specify the formal parameters that will be substituted by actual parameters (or the default) in a binding.*

### 6.5.30.1 Parameter Substitution

Once a Template Binding (or other binding) relationship exists, you can add parameter substitutions to identify the formal parameters that are replaced, and the actual parameters that replace them, in the binding expression.

#### How to:

To define a parameter substitution, follow the steps below:

Step	Action
1	Display the Binding tab, in the Template Binding connector Properties dialog The <b>Target</b> field identifies the target parameterized Class
2	Click on the <b>Add</b> button below the Parameter Substitution(s) panel The next available row in the panel is enabled for editing, and the word <i>&lt;none&gt;</i> is displayed in the <b>Formal</b> column
3	Click on the field and on the drop-down arrow that is now displayed A list of the template parameters from the target Class displays; click on the required parameter

Step	Action
4	Click on the ( ... ) button in the corresponding <b>Actual</b> field for the parameter If the template parameter: <ul style="list-style-type: none"> <li>Does not have a constraint, a short context menu displays offering the choice of typing a free-text value into the <b>Actual</b> field, or selecting a classifier from the Select Classifier dialog</li> <li>Has a constraint defined, the Select Classifier dialog displays automatically, showing the available classifiers</li> </ul>
5	Locate and select the required classifier to replace the parameter in the binding expression If you do not define an <b>Actual</b> classifier <i>and</i> the template parameter has a default value defined, that default is used in the expression
6	To edit existing parameter substitutions, click on them and make the required changes as indicated in steps 3 and 4
7	Click on the <b>Apply</b> and/or <b>OK</b> button The parameter substitutions display as a label underneath the connector

**Learn More:**

- [Template Binding](#)<sup>[1012]</sup>

**6.5.31 Trace****Description:**

The Trace relationship is a specialization of a Dependency, connecting model elements or sets of elements that represent the same concept across models. Traces are often used to track requirements and model changes, typically in a Traceability diagram, or in a Class, Use Case, Object or Composite Structure diagram.

As changes can occur in both directions, the order of this Dependency is usually ignored. The relationship's properties can specify the trace mapping, but the trace is usually bi-directional, informal and rarely computable.

**Toolbox Icon:****Learn More:**

- [Dependency](#)<sup>[981]</sup>
- [Traceability Diagram](#)<sup>[507]</sup>

### 6.5.32 Transition

#### Description:

A *Transition* defines the logical movement from one State to another, in a State Machine diagram. The Transition can be controlled through the following connector Properties dialog fields:

Field	Action	See also
<b>Guard</b>	Type in the expression that is to be evaluated after an Event is dispatched, but before the corresponding Transition is triggered  If the guard is true at that time, the Transition is enabled; otherwise, it is disabled	
<b>Effect is a Behavior</b>	Convert the <b>Effect</b> field from a free-text field to the definition of a specific Activity or behavior  Enterprise Architect displays the Select <Item> dialog to prompt you to select the Activity or behavior element from the model	<a href="#">Select &lt;Item&gt; Dialog</a> <sup>[692]</sup>
<b>Effect</b>	Either: <ul style="list-style-type: none"> <li>Type a description of the effect of the Transition, or</li> <li>If you have selected the <b>Effect is a Behavior</b> check box, select an Activity or behavior to be performed during the Transition (to change this subsequently, click on the ( ... ) button to redisplay the Select &lt;Item&gt; dialog)</li> </ul>	
<b>Trigger</b>		
<b>Name</b>	Specify the name of the trigger; either: <ul style="list-style-type: none"> <li>Type the name, or</li> <li>Select an existing trigger in the model using the Select &lt;Item&gt; dialog, which you display by clicking on the ( ... ) button</li> </ul>	
<b>Type</b>	Specify the type of trigger: <b>Call</b> , <b>Change</b> , <b>Signal</b> or <b>Time</b> : <ul style="list-style-type: none"> <li><b>Call</b> - specifies that the event is a CallEvent, which sends a message to the associated object by invoking an operation</li> <li><b>Change</b> - specifies that the event is a ChangeEvent, which indicates that the transition is the result of a change in value of an attribute</li> <li><b>Signal</b> - specifies that the event is a SignalEvent, which corresponds to the receipt of an asynchronous signal instance</li> <li><b>Time</b> - corresponds to a TimeEvent; which specifies a moment in time</li> </ul> Code generation for State Machines currently supports Change and Time trigger events only, and expects a specification value	
<b>Specification</b>	Specify the event instigating the Transition; either:	

Field	Action	See also
	<ul style="list-style-type: none"> <li>Type the event (time or change), or</li> <li>Select an existing specification in the model using the Select &lt;Item&gt; dialog, which you display by clicking on the ( ... ) button</li> </ul>	
<b>New</b>	Clear the fields ready to begin defining a new trigger	
<b>Save</b>	Save the newly created or edited trigger	
<b>Delete</b>	Remove the selected trigger from the list	
<b>&lt;trigger list&gt;</b>	List the existing triggers, which might or might not have names and types, and which can include Call and Signal triggers created in older models	

**Notes:**

- Fork and Join segments can have neither triggers nor guards
- You can identify hidden triggers and locate triggers in the Project Browser, using the **Find Triggers Associated** option on the Transition connector context menu - if one trigger exists for the Transition, it is immediately highlighted in the Project Browser; if more than one trigger exists, the Element Usage dialog displays; select the required trigger and click on the **Open** button to highlight the trigger in the Project Browser

**Toolbox Icon:****Learn More:**

- [State Machine Diagrams](#) <sup>817</sup>

**OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 568*) states:

*A transition is a directed relationship between a source vertex and a target vertex. It may be part of a compound transition, which takes the state machine from one state configuration to another, representing the complete response of the state machine to an occurrence of an event of a particular type.*

**6.5.33 Use****Description:**

A Use relationship indicates that one element requires another to perform some interaction. The Use (or

Usage) relationship does not specify how the target supplier is used, other than that the source client uses it in definition or implementation. A Use relationship is a sub-typed Dependency relationship.

You typically use the Use relationship in Use Case diagrams to model how Actors use system functionality (Use Cases), or to illustrate usage dependencies between Classes or Components.

#### **Notes:**

- It is more usual (and correct UML) to have an Association between an Actor and a Use Case
- To depict a usage dependency on a Class or Component diagram, draw a Dependency connector; right-click on the Dependency, and select the **Dependency Stereotypes | Use** context menu option

#### **Toolbox Icon:**

#### **Learn More:**

- [Use Case Diagram](#) <sup>[815]</sup>
- [Association](#) <sup>[972]</sup>

#### **OMG UML Specification:**

The OMG UML specification (*UML Superstructure Specification, v2.1.1, p. 138*) states:

*A usage is a relationship in which one element requires another element (or set of elements) for its full implementation or operation. In the metamodel, a Usage is a Dependency in which the client requires the presence of the supplier.*

## 6.6 UML Stereotypes

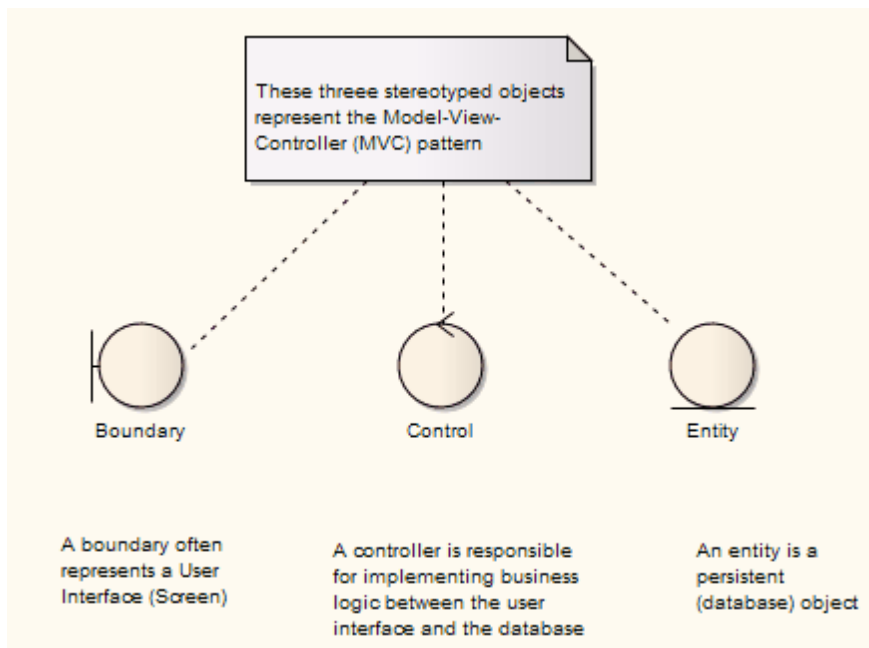

UML supports a large number of *stereotypes*, which are an inbuilt mechanism for logically extending or altering the meaning, display and syntax of a model element. Different model elements have different standard stereotypes associated with them.

For further definition of stereotypes, see the OMG UML specification (*UML Superstructure Specification, v2.1.1, section 18.3.8, pp. 667-672*).

A stereotype is generally displayed as in the example below (where «myStereotype2» is the stereotype).

In some cases the stereotype causes the element to be drawn differently, as below:

New, or customized, stereotypes can be created. Stereotypes can also be associated with new shapes, using either metafiles (image files) and colors or Shape Scripts, to apply non-UML shapes to elements and connectors. For further information on customizing stereotypes and applying Shape Scripts, see the MDG Technology SDK topic.

### Learn More:

- [Apply Stereotypes](#) <sup>[1019]</sup>
- [Stereotype Selector](#) <sup>[1019]</sup>
- [Stereotype Visibility](#) <sup>[1020]</sup>
- [Standard Stereotypes](#) <sup>[1021]</sup>
- [Stereotypes with Alternative Images](#) <sup>[1022]</sup>

- [MDG Technology SDK](#)<sup>[1040]</sup>
- [Customizing Stereotypes](#)<sup>[1041]</sup>
- [Shape Scripts](#)<sup>[1091]</sup>

### 6.6.1 Apply Stereotypes

Enterprise Architect enables you to apply one or more stereotypes to any UML construct, including:

- Elements (such as Classes and Objects)
- Relationships (such as Dependencies and Associations)
- Association Ends
- Attributes and Operations
- Operation Parameters

#### How to:

To apply a stereotype to any UML construct, using the Properties *dialog*, select any one of the following steps

Step	Action
1	In the <b>Stereotype</b> field, type the stereotype(s) to apply as a comma-separated list
2	Click on the drop-down arrow and select the required stereotype from the list
3	Click on the ( ... ) button to use the Stereotype Selector dialog  

To apply a stereotype to an element using the Properties *window*, select any of the following steps

Step	Action
1	In the <b>Stereotype</b> field, type the stereotype(s) to apply as a comma-separated list
2	Click on the drop-down arrow and select the required stereotype from the list
3	Select the <b>browse other stereotypes...</b> option in the drop-down list to use the <b>Stereotype Selector</b> dialog

### 6.6.2 Stereotype Selector

The Stereotype Selector dialog enables you to apply one or more stereotypes to a UML construct, from multiple stereotype sources such as Profiles or the Custom Stereotypes list. The appearance of the stereotype is influenced by the stereotype visibility settings on the Diagram Properties dialog.

#### How to:

To select stereotypes to apply/remove, follow the steps below:

Step	Action
1	On the element or connector Properties dialog, click on the ( ... ) button near the <b>Stereotype</b> field

Step	Action
	The Stereotype for:<object type> dialog displays
2	Click on the <b>Profile</b> drop-down arrow and choose the required stereotype source
3	In the Stereotypes list, enable or disable the required stereotype by selecting or deselecting the checkbox against it
4	Click on the <b>OK</b> button to apply the selection

You can also define a new stereotype to apply to the required construct by clicking on the **New...** button and entering the name of the new stereotype when prompted

#### Learn More:

- [Applying Stereotypes](#)<sup>[1019]</sup>
- [Stereotype Visibility](#)<sup>[1020]</sup>

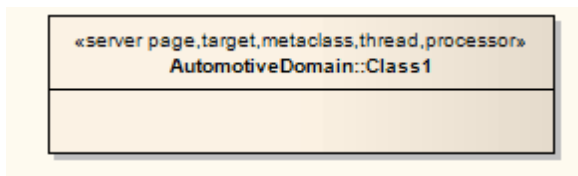

### 6.6.3 Stereotype Visibility

You control the visibility of applied stereotypes using three options in the diagram **Properties** dialog. Select:

- The **Show Element Stereotypes** checkbox (on the **Elements** page) to show or hide all element stereotypes in the current diagram
- The **Show Stereotypes** checkbox (for features, on the **Features** page) to show or hide all attribute and operation stereotypes in the current diagram
- The **Use Stereotype Icons** checkbox (on the **Elements** page) to display icons, instead of strings, for those stereotypes that have icons defined.

The example below shows how a Class would appear having multiple stereotypes applied to it:

**Use Stereotype Icons** disabled: displays all the applied stereotypes in a comma-separated string within «guillemets».

**Use Stereotype Icons** enabled: displays icons for those stereotypes with icons defined. Stereotypes without icons defined are still displayed in the comma-separated string.

### 6.6.4 Standard Stereotypes

Below is a list of standard element stereotypes (as provided in the *EABase.eap* base model), each enclosed by guillemets (« »):

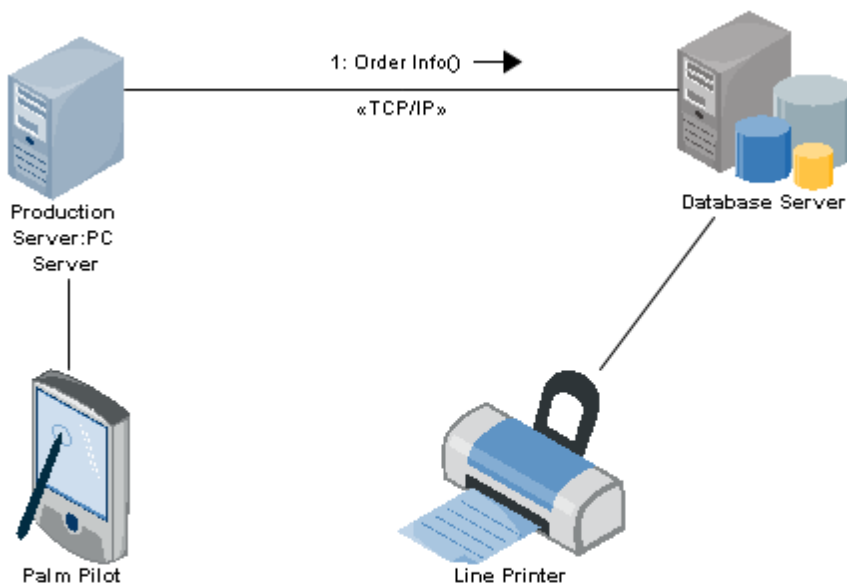

Stereotype	Base Class
«access»	Dependency
«become»	Flow
«call»	Usage
«copy»	Flow
«create»	Message
«derive»	Abstraction
«destroy»	Message
«document»	Abstraction
«executable»	Abstraction
«facade»	Package
«file»	Abstraction
«framework»	Package
«friend»	Dependency
«global»	AssociationEnd
«implementation»	Class
«implementation»	Generalization
«import»	Dependency
«instantiate»	Usage
«invariant»	Constraint
«library»	Abstraction
«local»	AssociationEnd
«metaclass»	Class
«parameter»	AssociationEnd
«postcondition»	Constraint
«powertype»	Class
«precondition»	Constraint
«process»	Classifier
«refine»	Abstraction
«requirement»	Comment

Stereotype	Base Class
«responsibility»	Comment
«self»	AssociationEnd
«send»	Usage
«stub»	Package
«table»	Abstraction
«thread»	Classifier
«trace»	Abstraction
«type»	Class
«utility»	Classifier

### 6.6.5 Stereotypes with Alternative Images

You can alter the appearance of elements using stereotypes. This does not apply to elements that include Lifelines, such as those in Sequence diagrams.

If the stereotype has an associated metafile, when the stereotype is applied to a Class or other element that supports alternative graphical format, Enterprise Architect then draws the alternative image instead of the standard one.

Metafiles let you specify physical diagrams in recognisable images - use the Reference/Stereotype dialog to associate metafiles with stereotypes

## 6.7 UML Patterns

Patterns are a group of collaborating Objects/Classes that can be abstracted from a general set of modeling scenarios. They are also known as parameterized collaborations.

Patterns are an excellent means of achieving re-use and building in robustness. As patterns are discovered in any new project, the basic pattern template from previous engagements can be re-used with the appropriate variable names modified for the current project.

Patterns generally describe how to solve an abstract problem, and it is the task of the pattern user to modify the pattern elements to meet the demands of the current engagement.

Before using a pattern it must first be created as a standard UML diagram and then saved as an XML pattern file. This XML file can then be imported as a UML resource that can be used in any model.

### Sparx-Created GoF Patterns

To get you started with design patterns in Enterprise Architect, Sparx Systems provides you with an MDG technology for the patterns described in the book *Design Patterns - Elements of Reusable Object-Oriented Software* by Gamma et al., referred to as the 'Gang of Four' or GoF. These patterns are made available through a set of Toolbox pages.

The pattern elements are drawn from the EABase.eap file, through the **Resources** window hierarchy. Therefore, if you are developing your model in a DBMS repository (or you inadvertently delete the GoF patterns from your .eap file) you can download them as a 'zip' file from [www.sparxsystems.com/uml\\_patterns.html](http://www.sparxsystems.com/uml_patterns.html).

Because the patterns are drawn from the **Resources** window, if you delete a pattern in the **Resources** window the equivalent **Toolbox** item cannot work. Therefore, if you cannot drop a pattern element from the **Toolbox**, check that it is still available in the **Resources** window.

### See Also

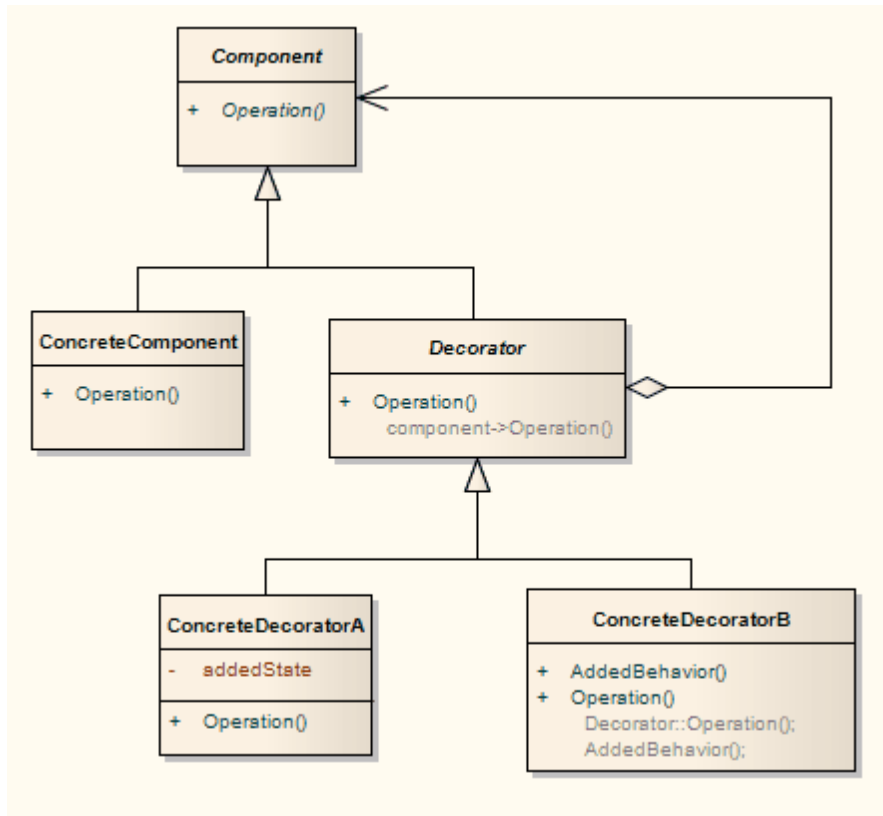

- [Create a Pattern](#)<sup>[1024]</sup>

### 6.7.1 Create a Pattern

To create a Pattern you first must model the Pattern as a standard UML diagram within Enterprise Architect. The following diagram was created from an example in the GoF book *Design Patterns - Elements of Reusable Object-Oriented Software* by Gamma et al.

#### How to:

To save a diagram as a Pattern, follow the steps below:

Step	Action	See Also
1	Select the <b>Diagram   Advanced   Save UML Pattern</b> menu option The Save Diagram as UML Pattern dialog displays	
2	In the <b>Pattern Name</b> field, type the Pattern name	
3	In the <b>Filename</b> field, type a directory path and .XML filename into which to save the Pattern	
4	In the <b>Category</b> field, type the Category under which the Pattern should be listed in <b>UML Patterns</b> (required)	
5	In the <b>Version</b> field, type the Pattern version number, and in the <b>Notes</b> field type any notes on the Pattern	
6	Select the actions for the elements that are contained in the Pattern by selecting the appropriate checkboxes; these actions are performed when the Pattern is used	<a href="#">Use a Pattern</a> 1026

Step	Action	See Also
	<p>The available actions are:</p> <ul style="list-style-type: none"> <li>• <b>Create</b>: Creates the Pattern element directly without modification</li> <li>• <b>Merge</b>: Merges the Pattern element with an existing element, enabling the existing element to take on the role of the selected Pattern element</li> <li>• <b>Instance</b>: Creates the Pattern element as an instance of an existing element</li> <li>• <b>Type</b>: Creates the Pattern element types as an existing element</li> </ul> <p>If your Pattern includes an Object element, you would use <b>Instance</b> to set the classifier of the Object to one of the Classes in the diagram onto which you are dropping the Pattern</p> <p>If your Pattern includes a Property (Port or Part) you would use <b>Type</b> to set the type of the Property to one of the Classes in the diagram onto which you are dropping the Pattern</p>	
7	<p>To change the name of one of the elements, double-click on the element to display the Edit dialog</p> <p>From this dialog you can also add comments detailing the element's purpose</p>	
8	<p>Click on the <b>OK</b> button twice to save the Pattern</p> <p>Once saved you can load it into Enterprise Architect as a Pattern in the Resources window</p>	<a href="#">Import a Pattern</a> <small>[1025]</small>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Diagrams** permission to save a diagram as a Pattern
- If your source diagram contains information flows, the Information Items Conveyed and Information Flows Realized data is not copied into the Pattern

**6.7.2 Import a Pattern**

Before using a previously created Pattern file in a UML model, you must first import it into the model; it is then available from the Resources window and optionally from the Toolbox

**How to:**

To import a UML Pattern you have previously saved, follow the steps below:

Step	Action
1	Select the Resources window
2	<p>Right-click on the <i>UML Patterns</i> node</p> <p>The context menu displays</p>
3	<p>Select the <b>Import UML Pattern</b> menu option</p> <p>The Select UML Pattern Import Filename dialog displays</p>
4	Locate the XML file to import
5	Click on the <b>Open</b> button to import the Pattern

Step	Action
	The imported Pattern is placed in the appropriate category as defined in the XML file; if the category does not already exist under UML Patterns, a new one is created

Gang of Four patterns are integrated with Enterprise Architect in the *EABase.eap* file; however, if you create your model in a DBMS repository (or you inadvertently delete the patterns from your model .eap file) you can use the above procedure to download examples of the Gang of Four patterns from the GoF Patterns zip file on the Sparx Systems website.

**Learn More:**

- [Create a Pattern](#)<sup>[1024]</sup>
- [GoF Patterns zip file](#)

### 6.7.3 Use a Pattern

Using a Pattern enables you to rapidly create template solutions for code structures that perform the same type of task in other situations, and to use items defined in the Pattern with the UML model

**How to:**

To use a Pattern that you have previously imported into the model, follow the steps below:

Step	Action	See Also
1	Open the diagram into which to add the UML Pattern	
2	Select the Resources window	
3	Expand the <i>UML Pattern</i> folder and find the Pattern to add	
4	Either: <ul style="list-style-type: none"> <li>• Right-click on the Pattern and select the <b>Add Pattern to Diagram</b> context menu option or</li> <li>• Drag and drop the Pattern from the Resources window onto the diagram</li> </ul> You can also view the Pattern details in read-only mode by selecting the <b>View Pattern Details</b> context menu option	<a href="#">Add Pattern Dialog</a> <sup>[1027]</sup>
5	Once the appropriate selections have been made, click on the <b>OK</b> button to import the Pattern into the model, recreating the original diagram with new GUIDs	

To change the default of the Pattern element, follow the steps below:

Step	Action	See Also
1	From the Add Pattern dialog select the individual element in the Pattern Element panel	
2	Click on the ( ... ) button to display the Edit dialog The specific method for changing the element name is dependant upon the entry	

Step	Action	See Also
	in the <b>Action</b> column of the Pattern Elements panel	
3	If the <b>Action</b> entry is <b>Create</b> , then in the <b>Default</b> field in the Edit dialog delete the existing value and type your own, user-defined value Click on the <b>OK</b> button The element default is updated on the Add Pattern dialog	
4	If the <b>Action</b> entry for the element is <b>Merge</b> , in the Edit dialog click on the ( ... ) button to browse to an existing element classifier The Select <Item> dialog displays	
5	Locate and select an existing element classifier You can restrict the number of choices by selecting the elements from a specific namespace; to do this, click on the <b>In Namespace</b> drop-down arrow and select a namespace	<a href="#">Using Classifiers</a> <sup>[708]</sup>

**Learn More:**

- [Import a Pattern](#)<sup>[1025]</sup>

**6.7.4 Add Pattern Dialog**

The Add Pattern dialog displays when you are using or editing a Pattern element.

Panel	Action
<b>Preview</b>	Display a preview of the Pattern; click on the <b>Preview</b> link to open a view of the Pattern and drag the sides into as large a picture as you require
<b>Pattern Elements</b>	Access the individual elements contained in the Pattern From here you can: <ul style="list-style-type: none"> <li>• Select the action for the individual element (<i>Create</i>, <i>Merge</i>, <i>Instance</i> or <i>Type</i>, as applicable for each element) by clicking on the drop-down arrow, or</li> <li>• Modify the default of the Pattern element or - for a merged element - choose the namespace, by clicking on the ( ... ) button on the right of the <b>Default</b> entry</li> </ul>
<b>Element Notes</b>	Display the comments that describe the element in the Pattern Highlight an element in the Pattern Elements panel to view the notes

## 6.8 UML Profiles

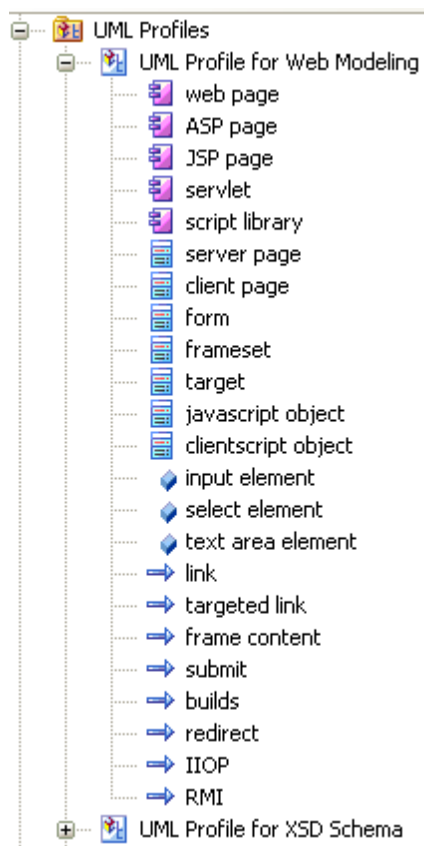

UML Profiles provide a means of extending UML, which enables you to build UML models in particular domains. They are based on additional stereotypes and Tagged Values that are applied to elements, attributes, methods, connectors, connector ends and so on. A Profile is a collection of such extensions that together describe some particular modeling problem and facilitate modeling constructs in that domain. For example, the UML Profile for XML describes a set of extensions to basic UML model elements to enable accurate modeling of XSD Schemas (see *Modeling XML Applications with UML*, David Carlson, p. 310).

Enterprise Architect has a generic UML Profile mechanism for loading and working with different Profiles. UML Profiles for Enterprise Architect are specified in XML files, with a specific format. You can reference these XML files in Enterprise Architect as part of an MDG Technology or import them through the Resources window. Once imported, you can drag and drop Profile elements onto the current diagram. Enterprise Architect attaches the stereotype, Tagged Values and default values, notes and metafile if one is specified, to the new element. You can also drag and drop attributes and operations onto existing Classes and have them immediately added with the specified stereotype and values.

The imported Profile also automatically generates a page of elements and relationships in the Toolbox.

### Profiles in the Resources Window:

The Resources window contains a tree structure with entries for items such as MDG Technologies, Documents, Stylesheets, Matrix profiles and UML Profiles. The *UML Profiles* node initially contains no entries; to be able to use Profiles you must import them into Enterprise Architect from supplied XML files.

Items in the Profile represent stereotypes. These can be applied to UML elements in the following ways:

- Stereotypes that apply to elements such as *Classes* and *interfaces* can be dragged directly from the Resources window to the current diagram, automatically creating a stereotyped element; alternatively, they can be dragged onto existing elements, automatically applying them to the element

- Stereotypes that apply to *attributes* can be drag-and-dropped onto a host element (such as a Class); a stereotyped attribute is automatically added to the element's feature list
- Stereotypes that apply to *operations* are like those that apply to attributes; drag-and-drop onto a host element to add the stereotyped operation
- Stereotypes that apply to *connectors* such as *associations*, *generalizations*, *messages* and *dependencies* are added by selecting them in the Project Browser, then clicking on the start element in a diagram and dragging to the end element (in the same manner as adding normal connectors); a stereotyped connector is added
- Stereotypes that apply to *association ends* can be added by dragging the connector end element over the end of an Association in the diagram

To get you started, some Profiles are supplied on the Sparx Systems website. You can download these and import them into Enterprise Architect. Over time Sparx Systems intend to expand the range of Profiles, the content of each Profile and the degree of customization possible in each Profile.

You can also create your own Profiles to describe modeling scenarios specific to your development environment.

#### Learn More:

- [MDG Technology](#)<sup>[1033]</sup>
- [MDG Technology SDK](#)<sup>[1040]</sup>
- [Import a UML Profile](#)<sup>[1029]</sup>
- [Add Profile Objects to a Diagram](#)<sup>[1030]</sup>
- [Tagged Values in Profiles](#)<sup>[1030]</sup>
- [Synchronize Tagged Values and Constraints](#)<sup>[1031]</sup>
- [Profiles webpage](#)

### 6.8.1 Import a UML Profile

To import a Profile you must have a suitable Profile XML file, such as the Profiles supplied on the Sparx Systems website. If the Profile includes references to any metafiles, they should be in the same directory as the Profile XML file.

#### How to:

To import a Profile, follow the steps below:

Step	Action
1	Open the Resources window
2	Right-click on the <i>UML Profiles</i> tree node and select the <b>Import Profile</b> context menu option The Import UML Profile dialog displays
3	Locate the XML Profile file to import using the ( ... ) (Browse) button
4	Set the required import option checkboxes for all stereotypes defined in the Profile; you can select: <ul style="list-style-type: none"> <li>• <b>Element Size</b> - to import the element size attributes</li> <li>• <b>Color and Appearance</b> - to import the color (background, border and font) and appearance (border thickness) attributes</li> <li>• <b>Alternate Image</b> - to import the metafile image</li> <li>• <b>Code Templates</b> - to import the code templates if they exist</li> <li>• <b>Overwrite Existing Templates</b> - to overwrite any existing code templates defined in the current project</li> </ul>

Step	Action
5	Click on the <b>Import</b> button The Profile is added to the <i>UML Profiles</i> folder

**Notes:**

- If the Profile already exists, Enterprise Architect prompts you to overwrite the existing version and import the new one (or cancel); once the import is complete, the Profile is ready to use
- This topic describes importing a stand-alone Profile; you can also embed Profiles in an MDG Technology and import the Technology file into the Enterprise Architect installation directory

**Learn More**

- [Profiles webpage](#)
- [Add Profile Objects and Features to a Diagram](#) <sup>[1030]</sup>
- [Creating MDG Technologies](#) <sup>[1068]</sup>
- [Deploying MDG Technologies](#) <sup>[1090]</sup>

**6.8.2 Add Profile Objects to a Diagram**

After you have imported a Profile into the Resources window, the profiled objects (elements and connectors) and features (attributes and operations) are available from the expanded *Profile* folder in the window and from the appropriate pages of the Toolbox (click on the **More tools** option at the top of the Toolbox).

Similarly, when you import an MDG Technology, it adds the appropriate pages of profiled elements and connectors to the Toolbox.

Action	Description
<b>Add a Profile-based element to a diagram</b>	Click on the element in the Toolbox page or the Resources window, and drag it onto the diagram
<b>Add a Profile-based connector to a diagram</b>	Click on the connector in the Toolbox page or Resources window, then click on the source element in the diagram and drag it to the target  You can also drag the connector from the Resources window to the source, which automatically displays a list box of target elements; select a target from the list to create the connector to that target
<b>Add a profile-based attribute or operation to a diagram</b>	Click on the attribute or operation in either the Toolbox page or the Resources window, and drag it onto the host element on the diagram  The system prompts you to enter a name for the feature

**Learn More:**

- [Toolbox](#) <sup>[548]</sup>
- [MDG Technology](#) <sup>[1033]</sup>

**6.8.3 Tagged Values in Profiles**

Stereotypes within a UML Profile can have one or more associated Tagged Values. When you create an element based on a UML Profile Stereotype by dragging from the Resources window to a diagram, any associated Tagged Values are added to the element as well. Tagged Values and Profiles are an excellent way to extend the use of Enterprise Architect and the power of UML modeling.

For example, in the UML Profile for XSD, there is an *XSDComplexType* stereotype, which has the following Tagged Value declaration:

```
<TaggedValues>
  <Tag name="mixed" description="Determines whether this element can
  contain mixed element and character content. See the W3C XML Schema
  recommendation" />
  <Tag name="modelGroup" description="Overrides the package-level
  default model group" values="all | sequence | choice"
  default="sequence" />
  <Tag name="memberNames" description="Overrides the package-level
  default for naming complexType definitions" />
</TaggedValues>
```

When you create an element from the *XSDComplexType* stereotype (by dragging from the Profile Elements page of the Toolbox onto a diagram), the Tagged Values are added automatically.

Tagged Values that have default values are automatically set and displayed in the element *tags* section, if applicable. When you select the element, the Tagged Values window displays all the associated tags, including ones that have no value set. Also note that Tagged Values in the Profile that have a *Values* section (for example, *values="element | attribute | both" default="both"*) enable you to select the non-default values from a drop-down list. Where no *Value* list exists, the tag accepts free text.

#### Learn More:

- [Predefined Structured Types](#)

### 6.8.4 Synchronize Tagged Values and Constraints

When you create an element, attribute, operation or link from a UML Profile item, you add the Tagged Values and constraints from the Profile. Over time you might modify the constraints or the notes and tags of the Tagged Values of a particular profiled item, so the items already created might be missing additional Tagged Value tags and notes, or constraints.

Similarly, you might have manually set the stereotype on a set of elements and now want them to receive the Tagged Values and constraints associated with that stereotype.

To make sure you have all the related Tagged Values and constraints, use the Synchronize Stereotype function. This operates on both:

- Profiles created in an MDG Technology File and not held in the Resources window - either an in-house customized Add-In, an imported external technology or an integrated technology provided with Enterprise Architect such as BPMN 1.1
- Profiles imported to the Resources window

When a Profile or MDG Technology file is deployed in Enterprise Architect, the Profile can be accessed through a set of Toolbox pages for that Profile or Technology. The profiled elements in these Toolbox pages automatically trigger an additional context menu option, **Synchronize Stereotype**.

#### How to:

To synchronize elements using the Profile or Technology pages of the *Toolbox*, follow the steps below:

Step	Action
1	Ensure that the Toolbox displays pages containing the stereotyped Profile elements
2	Right-click on the element profile in the Toolbox (for example, the BPMN 1.1 <i>Activity</i> element) The Toolbox context menu displays
3	Click on the <b>Synchronize Stereotype</b> menu option The Synch Profiled Elements dialog displays
4	Click on the <b>OK</b> button to proceed The Actions list is populated with the items that have been modified and the changes that were made

*Alternatively:*

You can quickly synchronize the tags and constraints of a *single* element in a diagram by dragging the updated profile element from the Toolbox page onto the element in the diagram, then selecting the **Apply «stereotype»** context menu option.

**Notes:**

- You can review any changes by displaying the element Properties dialog and by opening the Tagged Values window and clicking on an appropriate profiled element

## 6.9 MDG Technologies

The Model Driven Generation (MDG) Technologies enable you to access and use resources pertaining to a specific technology in Enterprise Architect. You have various options for bringing MDG Technologies into use with Enterprise Architect:

Source of Technology	See Also
Core technologies - Enterprise Architect consists of a: <ul style="list-style-type: none"> <li>• Basic UML 2 technology as an implementation of UML 2.3 structural and behavioral modeling, and</li> <li>• Core Extensions technology that applies profiles and stereotypes to provide extended modeling of aspects such as Requirements, User interface and Data Modeling</li> </ul>	
Sparx Systems already provides some added technologies in the Enterprise Architect Install directory, <i>MDGTechnologies</i> subfolder	<a href="#">MDG Technologies</a> <sup>[1038]</sup>
You can import technologies into the APPDATA folder (%APPDATA%\Sparx Systems\EAMDGTechnologies)	<a href="#">Import MDG Technologies</a> <sup>[1037]</sup>
You can transfer technologies into the MDGTechnologies subfolder; these technologies are available when you restart Enterprise Architect (on Vista/Windows 7 systems you might have to increase your access permissions to do this)	
You can access and activate MDG Technologies in remote system folders or web sites, from Enterprise Architect	<a href="#">Access Remote Technologies</a> <sup>[1036]</sup>
Technology Developers can create new MDG Technologies and deploy them to the project team either through the MDGTechnologies subfolder or from any other remote folder or website	<a href="#">Create New Technologies</a> <sup>[1040]</sup>

To see which technologies are available within Enterprise Architect, and activate the ones you require, use the MDG Technologies dialog.

Having made the MDG Technologies available to Enterprise Architect, you can manage their availability to users and you can work with them.

You also have the facility to turn off or disable the Enterprise Architect Basic UML 2 and Core Extensions Toolbox pages and facilities, so that you can apply the Enterprise Architect facilities and features exclusively to one or more selected MDG Technologies.

### Learn More:

- [Work with MDG Technologies](#) <sup>[1039]</sup>
- [Manage MDG Technologies](#) <sup>[1035]</sup>

### 6.9.1 Work with MDG Technologies

Any MDG Technology listed on the MDG Technologies dialog can be enabled, which makes their interface profiles and Toolbox pages available for your use.

Topic	Detail	See Also
<b>MDG Technology Toolbox Pages</b>	When you enable an MDG Technology, any Technology-specific diagram types are added to the New Diagram dialog lists, and the Technology's Toolbox pages are added	<a href="#">Create New Diagrams</a> <sup>[570]</sup>

Topic	Detail	See Also
	<p>to those available through the <b>More tools</b> menus in the Toolbox</p> <p>If you set the MDG Technology to <i>Active</i>, its Toolbox pages override any parallel Enterprise Architect Toolbox pages; for example, the ICONIX <i>Class</i> pages would override the Enterprise Architect <i>Class</i> pages</p> <p>You create Technology-specific diagrams and populate them with elements and connectors in the same way as for standard Enterprise Architect diagrams</p>	
<b>The Resources Window</b>	<p>A method of importing MDG Technologies into the Resources window is available (click on the <i>MDG Technologies</i> folder and select the <b>Import Technology</b> option) but this method is <b>Not Recommended</b></p> <p>If you use this method, the MDG Technology is available only in the model it was imported into, and the Toolbox pages, Learning Center, Project Browser icons and model templates are not available</p> <p>It is recommended that you instead create or download new technologies into the %APPDATA% folder or the Enterprise Architect installation directory, or use new technologies from remote file locations and web sites</p> <p>However, you might previously have imported technologies into the Resources window, and these are still available until you specifically delete them (right-click on the technology and select the <b>Delete Technology</b> context menu option)</p>	<p><a href="#">Import MDG Technologies</a> </p> <p><a href="#">Access Remote MDG Technologies</a> </p>

*The following information is provided to support implementations where technologies have been previously imported via the Resources window.*

The Resources window (**View | More Project Tools | Project Resources**) displays a tree structure containing nodes such as imported MDG Technologies, Templates, Documents, Stylesheets, Matrix profiles and UML Profiles.

MDG Technologies can bundle the functionality provided by UML Profiles, UML Patterns, Code Templates and Model Types.

*Profiles* contained in MDG Technologies are applied to:

- Elements such as Classes and Interfaces, which are dragged directly from the Toolbox or the Resources window to the current diagram
- Attributes, which are dragged over a host element (such as a Class) to be automatically added to the element feature list
- Operations which, like Attributes, are dragged over a host element to add the operation
- Connectors such as Association, Generalization, and Dependency, which are added by selecting them in the Toolbox or Resources window, then clicking on the source element in a diagram and dragging to the target element (in the same way as adding normal connectors); the connector is added with the new stereotype and Tagged Value information
- Association Ends, which are added by dragging the connector end element over the end of an Association in the diagram

*Patterns* contained in MDG Technologies are used to:

- Enable reuse in a model
- Build in robustness

*Code Templates* are used to:

- Specify the transformation from UML elements into various parts of a given programming language

*Model Types* are used to:

- Define the data types for the model

## 6.9.2 Manage MDG Technologies

You use the MDG Technologies dialog to manage the MDG Technologies available and accessible to Enterprise Architect users.

**Access:** [Settings](#) | [MDG Technologies](#)

Topic	Detail	See Also
<b>MDG Technologies Dialog</b>	The MDG Technologies dialog lists the technologies held in the APPDATA folder (marked by the text <i>Location: Technology.xml</i> ) and Enterprise Architect Install directory, in alphabetical order	<a href="#">Import MDG Technologies</a> 
<b>Enable and Disable MDG Technologies</b>	<p>All MDG Technologies listed can be made available (enabled) or removed from use (disabled); to enable or disable a Technology, click on its <b>Enabled</b> checkbox</p> <p>When an MDG Technology is enabled, three things happen:</p> <ul style="list-style-type: none"> <li>• The MDG Technology is added to the list of available options in the profile field of the Default Tools toolbar, so that you can apply the interface profiles of the MDG Technology</li> <li>• At least one set of Toolbox pages for the MDG Technology is automatically added to the Toolbox; you can access the added Toolbox pages through the <b>More Tools</b> menu</li> <li>• Any MDG Technology-specific diagram templates are added to the New Diagram dialog for selection; when selected, these display the diagram-specific Toolbox pages</li> </ul> <p>You can quickly enable or disable all the listed MDG Technologies by clicking on the <b>All</b> or <b>None</b> buttons; however, if you click on the <b>None</b> button, you should scroll to the top of the list and select the <b>Basic UML 2 Technology</b> and <b>Core Extensions</b> checkboxes to re-enable the UML and Extended Toolbox pages and diagram types</p>	
<b>Set as Default</b>	<p>You can make an MDG Technology the default interface to Enterprise Architect. Depending on the MDG Technology selected, this can change the way Enterprise Architect windows are displayed and override the Toolbox pages with pages specific to that Technology.</p> <p>To set an MDG Technology as the default interface, click on it in the Technology panel and click on the <b>Set Active</b> button.</p> <p>This displays an asterisk against the MDG Technology name in the Technology panel, and selects the MDG Technology in the profile field of the Default Tools toolbar. If</p>	

Topic	Detail	See Also
	the MDG Technology has not been enabled, this also enables it.	
<b>Basic UML 2 Technology</b>	You can also enable one or more of the MDG Technologies (and likely make one of them the default) and then <i>deselect</i> the <b>Basic UML 2 Technology</b> checkbox (and, if necessary, the <b>Core Extensions</b> checkbox), to work exclusively in the selected technologies. The UML Toolbox pages, diagram types and quicklinks are excluded from the Toolbox, <b>More tools</b> menu, diagrams and New Diagram dialog in the user interface.	
<b>MDG Technologies Outside Enterprise Architect</b>	The <b>MDG Technologies</b> dialog lists technologies that have been loaded into the APPDATA folder and Enterprise Architect install directory. You can also add MDG Technologies in folders and websites remote from Enterprise Architect. To do this, click on the <b>Advanced</b> button.	<a href="#">Access Remote MDG Technologies</a> <small>[1036]</small>

### 6.9.3 Access Remote MDG Technologies

You can access MDG Technologies in folders and websites remote from Enterprise Architect.

If you have not already identified the location of the MDG Technology, you must first do this.

Later, if you have no further use for the MDG Technology, you can remove it from the list of identified MDG Technologies.

If you add or remove remote MDG Technologies, you must *restart* Enterprise Architect to show them on or remove them from the list on the MDG Technologies dialog, and to use them.

**Access:** **Settings | MDG Technologies**

**How to:**

To specify the location of a remote MDG technology, follow the steps below:

Step	Action	See Also
1	Select the <b>MDG Technologies</b> menu option The MDG Technologies dialog displays	<a href="#">Manage MDG Technologies</a> <small>[1035]</small>
2	Click on the <b>Advanced</b> button The MDG Technologies - Advanced dialog displays	
3	Click on the <b>Add</b> button A short context menu displays, offering the options: <ul style="list-style-type: none"> <li>• <b>Add Path</b></li> <li>• <b>Add URL</b></li> </ul>	
4	To specify an MDG Technology <i>in a directory folder</i> , select the <b>Add Path</b> option	

Step	Action	See Also
	The Browse for Folder dialog displays Browse for the MDG Technology folder, click on it, and click on the <b>OK</b> button; go to step 6	
5	To specify an MDG Technology <i>on a web site</i> , select the <b>Add URL</b> option The Input dialog displays In the <b>Enter Value</b> field, type or copy-and-paste the MDG Technology URL and click on the <b>OK</b> button	
6	The folder path or URL for the MDG Technology displays in the Path panel	

To remove an MDG Technology listed in the MDG Technologies - Advanced dialog, click on the folder path or URL and click on the **Remove** button; the path or URL is deleted

#### 6.9.4 Import MDG Technologies to APPDATA

The preferred method of making an MDG Technology available to your project team members is to import the technology into the %APPDATA%\Sparx Systems\EA\MDGTechnologies folder. To import an MDG Technology you must have a suitable MDG Technology XML file. If the MDG Technology includes references to any metafiles, they should be in the same directory as the MDG Technology XML file.

On startup, Enterprise Architect scans the APPDATA folder (as well as the Enterprise Architect Install directory *MDGTechnologies* subfolder) for technology files, to make them available through the MDG Technologies dialog. Technologies imported to the APPDATA folder are indicated by the text *Location: Technology.xml*.

**Access:** [Tools | MDG Technology Import](#)

##### **How to:**

To import a technology, follow the steps below:

Step	Action
1	Select the <b>MDG Technology Import</b> menu option The Copy Technology to Application Data dialog displays
2	In the <b>Filename</b> field, type the path and filename of the MDG Technology file to import, or browse for it using the ( ... ) button When you enter the filename, the MDG Technology name and version display in the <b>Technology</b> and <b>Version</b> fields
3	Click on the <b>OK</b> button <ul style="list-style-type: none"> <li>• If the APPDATA folder does not yet exist, Enterprise Architect creates it</li> <li>• If the MDG Technology already exists, Enterprise Architect displays a prompt to overwrite the existing version and import the new one</li> </ul> Once the import is complete, you must restart Enterprise Architect; the MDG

Step	Action
	Technology is then listed in the MDG Technologies dialog

**Notes:**

- This feature is not available in the Desktop edition of Enterprise Architect

**Learn More:**

- [Manage MDG Technologies](#) <sup>[1035]</sup>

## 6.9.5 Extensions - MDG Technologies

Enterprise Architect is the core for a range of Model Driven Generation (MDG) extensions to its modeling capabilities, using more specialized, niche frameworks and profiles.

Topic	See Also
A number of technologies are already integrated with the Enterprise Architect installer	<a href="#">ArchiMate</a> <sup>[1275]</sup> <a href="#">BPEL</a> <sup>[1238]</sup> <a href="#">BPMN</a> <sup>[1222]</sup> <a href="#">Data Flow Diagrams</a> <sup>[1187]</sup> <a href="#">Eriksson-Penker Extensions</a> <sup>[1276]</sup> <a href="#">ICONIX</a> <sup>[1551]</sup> <a href="#">Mind Mapping</a> <sup>[1185]</sup> <a href="#">SoaML</a> <sup>[1633]</sup> <a href="#">SOME</a> <sup>[1637]</sup> <a href="#">Strategic Modeling</a> <a href="#">Systems Modeling Language (SysML)</a> <sup>[1561]</sup>
Enterprise Architect provides support for: <ul style="list-style-type: none"> <li>• Downloading MDG Technologies from external system files or websites, or</li> <li>• Creating your own easily with the Enterprise Architect MDG Technology Wizard</li> </ul>	<a href="#">Access Remote MDG Technologies</a> <sup>[1036]</sup> <a href="#">MDG Technology SDK</a> <sup>[1040]</sup>
Sparx Systems also market a number of MDG products, as follows: <ul style="list-style-type: none"> <li>• MDG Technology For: <ul style="list-style-type: none"> <li>• Zachman Framework</li> <li>• The Open Group Architecture Framework (TOGAF)</li> <li>• Unified Profile for DoDAF and MODAF (UPDM)</li> <li>• Data Distribution Service (DDS)</li> <li>• Python (for Enterprise Architect versions 4.5 to 5.0, integrated in later versions) (<b>* free product! *</b>)</li> <li>• CORBA (<b>* free product! *</b>)</li> <li>• Java Beans (<b>* free product! *</b>)</li> <li>• Testing (<b>* free product! *</b>)</li> </ul> </li> <li>• MDG Integration For: <ul style="list-style-type: none"> <li>• Eclipse 3.3</li> </ul> </li> </ul>

## 6.10 Define a Modeling Language

Enterprise Architect enables you to create models using UML. However, it also enables you to go much further, extending the scope both of your modeling and of the UML components you use, as outlined below.

Topic	Description	See Also
<b>UML Stereotypes</b>	Stereotypes are an inbuilt mechanism for logically extending or altering the meaning, display and syntax of a model element. Different model elements have different standard stereotypes associated with them. You can also define your own stereotypes.	<a href="#">UML Stereotypes</a> <sup>[1018]</sup>
<b>UML Profiles</b>	UML Profiles are a means of extending UML, which enables you to build models in particular domains. A Profile is a collection of additional stereotypes and Tagged Values applied to elements, attributes, methods and connectors, which together describe some particular modeling problem and facilitate modeling constructs in that domain.	<a href="#">UML Profiles</a> <sup>[1028]</sup>
<b>UML Patterns</b>	Patterns are groups of collaborating Objects/Classes that can be abstracted from a general set of modeling scenarios (that is, parameterized collaborations). They generally describe how to solve an abstract problem, and are an excellent means of achieving re-use and building in robustness.	<a href="#">UML Patterns</a> <sup>[1023]</sup>
<b>MDG Technologies</b>	The Model Driven Generation (MDG) Technologies enable you to access and use the resources of a specific technology within Enterprise Architect. Interfaces to some technologies, such as BPMN and ICONIX, are integrated with Enterprise Architect, whilst interfaces to others such as Eclipse and Visual Studio can be added separately. You can also link to technologies that you have created yourself.	<a href="#">MDG Technologies</a> <sup>[1033]</sup>

### 6.10.1 MDG Technology SDK

#### Introduction:

In describing aspects of developing technologies to use in conjunction with Enterprise Architect, it is expected that you are familiar with the concepts introduced in the main body of the *Enterprise Architect User Guide*. Wherever appropriate, cross-references to these concepts are provided in the text.

#### Contents:

- [Developing Profiles](#) <sup>[1041]</sup> (incorporating [Custom Stereotypes](#) <sup>[1041]</sup>)
- [MDG Technologies](#) <sup>[1068]</sup>
- [Shape Scripts](#) <sup>[1091]</sup>
- [Tagged Value Types](#) <sup>[1111]</sup>
- [Code Template Framework](#) <sup>[1117]</sup>

### 6.10.1.1 Developing Profiles

#### Introduction:

Profiles provide a means of extending the UML, which enables you to build models in particular domains. They are based on additional stereotypes and Tagged Values that are applied to UML elements, connectors and their components. A Profile is a collection of such extensions that together describe some particular modeling problem and facilitate modeling constructs in that domain. UML Profiles for Enterprise Architect are specified in XML files, with a specific format. These XML files can be imported into Enterprise Architect through the Resources window.

The imported Profile also automatically generates a page of elements and relationships in the Toolbox.

The Resources window contains a tree structure with entries for items such as MDG Technologies, Documents, Stylesheets, Matrix profiles and UML Profiles. The *UML Profiles* node initially contains no entries; to be able to use Profiles you must import them into Enterprise Architect from supplied XML files.

Items in the Profile represent stereotypes. UML supports a large number of stereotypes, which are an inbuilt mechanism for logically extending or altering the meaning, display, appearance and syntax of a model element. Different model elements have different stereotypes associated with them.

#### Learn More:

- [Custom Stereotypes](#) <sup>[1041]</sup>
- [Create Profiles](#) <sup>[1043]</sup>
- [Quick Linker](#) <sup>[1060]</sup>
- [Customize Toolbox Profiles](#) <sup>[1076]</sup>
- [Create Diagram Profiles](#) <sup>[1082]</sup>
- [Create Learning Center Profiles](#) <sup>[1085]</sup>
- [Tagged Value Types](#) <sup>[1111]</sup>
- [UML Profiles](#) <sup>[1028]</sup> (for more information on the use of Profiles in Enterprise Architect)

#### 6.10.1.1.1 Custom Stereotypes

UML supports a large number of *stereotypes*, which are an inbuilt mechanism for logically extending or altering the meaning, physical appearance and syntax of a model element. Different model elements have different stereotypes associated with them.

In Enterprise Architect you can create new stereotypes with their own custom appearance. The stereotypes can be altered to make use of metafiles (image files) and customized colors, or you can make use of an Enterprise Architect Shape Script to make new element shapes to determine the shape and dimensions of the element.

Access: **Settings | UML Types > Stereotypes**

#### How to:

To add your own custom stereotypes, follow the steps below:

Step	Action
1	On the Stereotypes tab, type or select a <b>Stereotype</b> name
2	Select a <b>Base Class</b> from the drop-down list

Step	Action
3	Associate a Metafile with this stereotype - click on the <b>Metafile</b> radio button and the <b>Assign</b> button, and locate the required .emf or .wmf file
4	Enter optional <b>Notes</b> and select <b>Default Colors</b> for this stereotype
5	Click on the <b>Save</b> button to save the stereotype

The table below describes the functions of the Stereotypes tab.

Field	Usage	See also
<b>Stereotype</b>	Specify the name of the stereotype	
<b>Group name</b>	Enable grouping of stereotype features by a plural name, for attributes and operations, which is shown on diagrams in the attribute and operations compartments	
<b>Base Class</b>	Enable the stereotyped element to inherit the base characteristics from a pre-existing element type	
<b>Notes</b>	Type any notes concerning the stereotype (not the elements to which the stereotype is to be applied)	
<b>Override Appearance</b>		
<b>None</b>	Switch to the default element appearance	
<b>Metafile</b>	Enable an image file to be used for the appearance of the stereotype	
<b>Shape Script</b>	Specify custom shapes for the stereotype using the Enterprise Architect Shape Scripting language	<a href="#">Shape Scripts</a> 1091
<b>Assign</b>	Add the associated metafile or Shape Script from the stereotyped element	
<b>Remove</b>	Remove the associated metafile or Shape Script from the stereotyped element	
<b>Default Colors</b>		
<b>Fill</b>	Set the default background color of the element	
<b>Border</b>	Control the border color	
<b>Font</b>	Control the color of the stereotype font	
<b>Reset</b>	Reset the appearance of the element to the default element appearance	

**Notes:**

- You can transport custom stereotype definitions between models, using the Export Reference Data and Import Reference Data options

**Learn More:**

- [UML Stereotypes](#) <sup>[1018]</sup>
- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

### 6.10.1.1.2 Create Profiles

This topic describes how to create profiles and profile items. These creation tasks include creating the profile stereotypes, defining the metaclasses they apply to, and defining Tagged Values and constraints. The topic also describes how to export a profile for use in modeling.

#### How to:

To create a Profile, follow the steps below:

Step	Description	See Also
1	Create a Profile package	<a href="#">Create Profile</a> <sup>[1043]</sup>
2	Add stereotypes and metaclasses to the profile	<a href="#">Add Stereotypes and Metaclasses</a> <sup>[1044]</sup>
3	Define Tagged Values for the stereotypes	<a href="#">Define Stereotype Tags</a> <sup>[1046]</sup>
4	Define constraints for the stereotypes	<a href="#">Define Stereotype Constraints</a> <sup>[1048]</sup>
5	Add enumeration elements to define values for the Tagged Values for the stereotypes	<a href="#">Add Enumeration Elements</a> <sup>[1049]</sup>
6	Add shape scripts for the stereotypes	<a href="#">Add Shape Scripts</a> <sup>[1050]</sup>
7	Set the default appearance for the stereotypes	<a href="#">Set Default Appearance</a> <sup>[1051]</sup>
8	Export the profile	<a href="#">Export Profile</a> <sup>[1052]</sup>

#### 6.10.1.1.2.1 Create a Profile Package

In Enterprise Architect, you must create a Profile in a Package that has the stereotype «*profile*».

#### How to:

To create a Profile Package, follow the steps below:

Step	Description	See
1	Open or create a Package diagram	
2	Open the Profile page of the Toolbox ( <b>More tools   Profile</b> )	<a href="#">Profile Group</a> <sup>[562]</sup>
3	Drag the <i>Profile</i> item onto the Class diagram The New Model Package dialog displays	
4	In the <b>Package Name</b> field, type a name for the Profile	
5	Select the <b>Automatically add new diagram</b> checkbox	
6	Click on the <b>OK</b> button The New Diagram dialog displays	<a href="#">New Diagram Dialog</a> <sup>[570]</sup>

Step	Description	See
7	Provide the required diagram name, and select the diagram group <b>UML Structural</b> and diagram type <b>Class</b>	
8	Click on the <b>OK</b> button Enterprise Architect creates a package with the stereotype « <i>profile</i> » and with a child Class diagram	
9	In the Project Browser, double-click on the Profile Package on the diagram to open the child diagram You now use this child diagram to add stereotypes to the Profile	

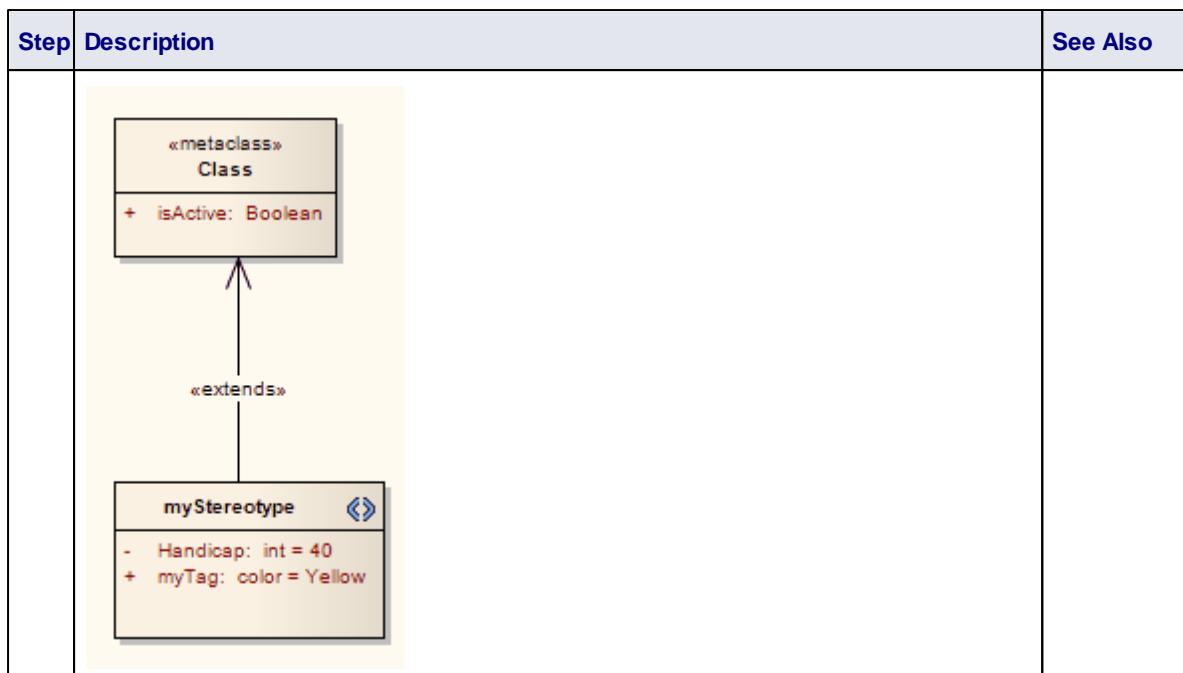

**Learn More:**

- [Add Stereotypes and Metaclasses](#) <sup>[1044]</sup>

**6.10.1.1.2.2 Add Stereotypes and Metaclasses****How to:**

To add metaclasses and stereotypes to a Profile, for as many stereotypes and metaclasses as you require, follow the steps below:

Step	Description	See Also
1	Open the child diagram of the Profile Package	
2	Drag the <i>Metaclass</i> element from the Profile page of the Toolbox onto the diagram The Create New Metaclass dialog displays, in which you can tick multiple metaclasses for dropping onto the diagram	
3	Scroll down the Element list and select the checkbox for <b>Class</b>	
4	Click on the <b>OK</b> button The Class Properties dialog displays	
5	In the <b>Name</b> field type a name for the element Click on the <b>OK</b> button	
6	Drag a <i>Stereotype</i> element from the Toolbox onto the diagram If the Properties dialog does not display, double-click on the element on the diagram	
7	In the <b>Name</b> field, type a name for the stereotype	
8	Click on the <b>OK</b> button	
9	Click on the <i>Extension</i> relationship in the Toolbox and drag the connection from the stereotype element to the metaclass element	
10	Your diagram should now resemble the one below:	

**Notes:**

- If you want to have a stereotype extending more than one metaclass, do not create two stereotype Classes with the same name

You cannot have two stereotypes with the same name in the same profile, one is discarded when you save the profile; therefore, create one stereotype Class with an Extension connector to each of several Metaclass elements, as shown below.

You can now add stereotype Tags, Constraints, Enumerations, and/or Shape Scripts to your Profile, and define the default appearance of the elements or connectors as required

**Learn More:**

- [Define Stereotype Tags](#) <sup>[1046]</sup>
- [Define Stereotype Constraints](#) <sup>[1048]</sup>
- [Adding Enumeration Elements](#) <sup>[1049]</sup>
- [Adding Shape Scripts to UML Profiles](#) <sup>[1050]</sup>
- [Setting Default Appearance in UML Profiles](#) <sup>[1051]</sup>

### 6.10.1.1.2.3 Define Stereotype Tagged Values

Stereotypes within a UML Profile can have one or more associated Tagged Values. When creating a UML Profile, you define these Tagged Values as attributes of the stereotyped Class.

#### How to:

To define Tagged Values for a stereotype, follow the steps below:

Step	Description	See Also
1	Open the Attributes dialog for the stereotyped element	
2	Click on the <b>New</b> button to create a new attribute	
3	In the <b>Name</b> field, type the name of the stereotype tag	
4	In the <b>Type</b> field, click on the drop-down arrow and select the attribute type	
5	In the <b>Initial</b> field, type the initial value of the tag	<a href="#">Add Enumeration Elements</a> <sup>[1046]</sup> (for creating enumerated types for Tagged Values)
6	In the <b>Notes</b> field, type a description of the tag	
7	Click on the <b>Save</b> button and <b>Close</b> button	

#### Learn More:

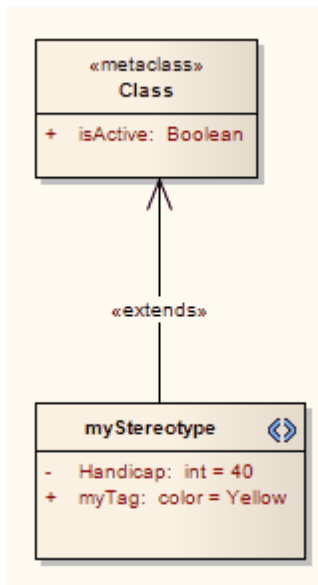

- [Define Stereotype Tags with Predefined Tag Types](#) <sup>[1046]</sup>
- [Define Stereotype Tags with Supported Attributes](#) <sup>[1047]</sup>
- [Use the Tagged Value Connector](#) <sup>[1047]</sup>

#### Define Predefined Tag Types:

To define a stereotype tag with a predefined Tagged Value Type, you must first create the predefined Tagged Value Type. For full instructions on how to do this, see the *Create Structured Tagged Values* topic.

#### Assign Predefined Tag Types to Stereotypes:

To assign a predefined tag type to a stereotype, just create an attribute with the same name. For example, to make the Tagged Value *Handicap* appear in a stereotype, create an attribute named *Handicap*. You can set the default value for the Tagged Value by giving the attribute an *Initial* value.

**Learn More:**

- [Create Structured Tagged Values](#)<sup>[1114]</sup>

Supported stereotype attribute tags are special tags that set the default behavior of stereotyped elements, such as the initial size of the element and the default location of any image files associated with the stereotype.

**How to:**

To define tags for a stereotype with supported attributes, follow the steps below:

Step	Description	See Also
1	Open the Attributes dialog for the stereotyped element	
2	In the <b>Name</b> field, type the name of the stereotype tag	
3	In the <b>Initial</b> field, type the initial value of the tag	
4	For supported attributes you set only the <b>Name</b> (which must match the attributes listed in the supported attributes section) and the <b>Initial</b> value; do not set the other values  Click on the <b>Save</b> button and <b>Close</b> button	

**Learn More:**

- [Supported Attributes](#)<sup>[1053]</sup>

In a Profile, you can use the *Tagged Value* connector to define a Tagged Value that has as its value the name of an element containing the stereotype pointed to. You select the Tagged Value connector from the Profile pages of the Toolbox.

The following diagram demonstrates how you might use the connector. It shows a (*saved* and *imported*) profile that defines two stereotypes: «*Collection*» and «*Node*». The «*Collection*» stereotype has a Tagged

Value connector with the target role named *rootNode*, pointing to the «Node» stereotype.

In the Tagged Values window for the connector, against *rootNode*, you click on the selection button (( ... )). This displays the Select <Item> dialog, through which you locate the elements in the current model with the «Node» stereotype. You can then select one of these elements as the value of the tag.

#### 6.10.1.1.2.4 Define Stereotype Constraints

Defining constraints for stereotypes uses the same procedure as defining constraints for any Class.

##### How to:

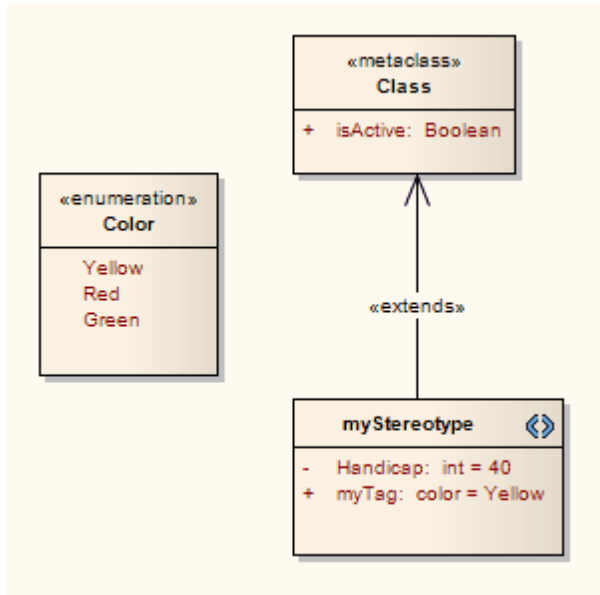

To define constraints for a stereotype, follow the steps below:

Step	Description	See Also
1	Open the Class Properties dialog of the stereotype element in a diagram	
2	Click on the Constraints tab and click on the <b>New</b> button to create a new constraint	
3	In the <b>Constraint</b> field, type the value of the constraint	
4	In the <b>Type</b> field, click on the drop-down arrow and select the appropriate type	
5	In the <b>Status</b> field, click on the drop-down arrow and select the appropriate status	
6	In the <b>Notes</b> field, type any additional information required	
7	Click on the <b>Save</b> button, and on the <b>OK</b> button to close the dialog	

### 6.10.1.1.2.5 Add Enumeration Elements

Enumerations can be used to restrict the values available to stereotype tags.

#### How to:

To add an Enumeration element, follow the steps below:

Step	Description	See Also
1	Open your Profile Package child Class diagram	
2	In the Toolbox, select <b>More tools   Profile</b> The contents of the Profile page of the Toolbox display	
3	Drag an <i>Enumeration</i> item from the toolbox onto the diagram If the Properties dialog does not display, double-click on the element on the diagram	
4	In the <b>Name</b> field, type the name of the new Enumeration	
5	Click on the Details tab and on the <b>Attributes</b> button The Attributes Properties dialog displays	
6	In the <b>Name</b> field, type the name of the Enumeration attribute	
7	In the <b>Type</b> field, click on the drop-down arrow and select the appropriate type	
8	In the <b>Initial</b> field, type the initial value of the attribute	
9	Click on the <b>Save</b> button, and repeat steps 6 to 9 for additional attributes	
10	When you are finished, click on the <b>Close</b> button	
11	Right-click on the <i>Stereotype</i> element and select the <b>Attributes</b> context menu option The Attribute Properties dialog displays for the <i>stereotype</i>	

Step	Description	See Also
12	In the <b>Name</b> field type a name for the attribute	
13	In the <b>Type</b> field click on the ( ... ) button and select the name of the enumeration element from the Select <Item> dialog	
14	In the <b>Initial</b> field type the name of the required enumeration attribute as the default value	
15	Click on the <b>Save</b> and <b>Close</b> buttons You have now generated a drop-down list for setting the value of the tag in the Tagged Values window	

#### 6.10.1.1.2.6 Add Shape Scripts

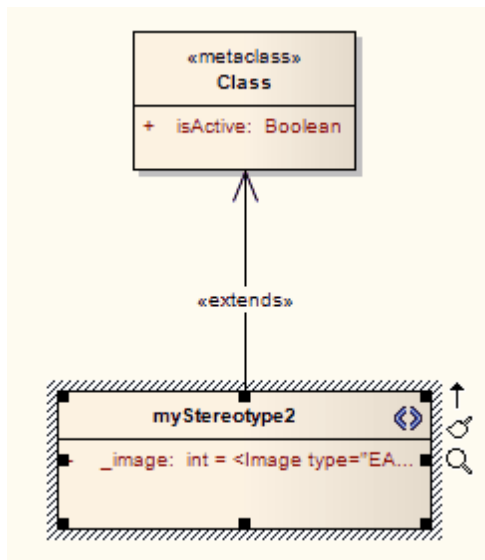

##### How to:

To add a Shape Script to a stereotype in a UML Profile (such as an MDG Technology Stereotype Profile), follow the steps below:

Step	Description	See Also
1	On the Profile Package child diagram, select a <i>Stereotype</i> element	
2	Right-click on the element and select the <b>Attributes</b> context menu option	
3	In the Attributes Properties dialog, in the <b>Name</b> field, type <b>_image</b>	
4	Click on the ( ... ) button next to the <b>Initial</b> field The Shape Editor dialog displays	<a href="#">Shape Editor</a> 
5	Enter the Shape Script in the Shape Editor dialog Click on the <b>OK</b> and <b>Close</b> buttons	

In some cases, particularly MDG Technology Stereotype Profiles, your Shape Script might include externally-defined images. In this case the Shape Script would include the image method, specifying the image file name prefixed with the technology name.

The Stereotype element now resembles the example below:

**Notes:**

- If you are creating a Shape Script for an Association Class, be aware that the Shape Script is applied to both the Class part and the Association part; therefore, you might have to include logic in the shape main that tests the type of the element so that you can give separate drawing instructions for Class and for Association

Such logic is not necessary in the:

- shape source or shape target, which are ignored by Classes, or the
- decoration shapes which are ignored by Associations

**Learn More:**

- [MDG Technology Stereotype Profiles](#) <sup>[1060]</sup>
- [Shape Scripts](#) <sup>[1097]</sup>
- [Drawing Methods](#) <sup>[1095]</sup>

**6.10.1.1.2.7 Set Default Appearance**

You can define the appearance of stereotyped elements and connectors as you create or edit the stereotypes, using the Override Appearance and Default Colors panels of the UML Types dialog. However, an easier way is to review your completed profile diagram and set the default appearance of the elements and connectors in place.

Simply click on the required element or connector and press **( F4 )**, then define the background, font and border colors and border thickness as appropriate, on the Default Appearance dialog.

When you save the profile containing the stereotyped elements and connectors, make sure that you select the **Color and Appearance** checkbox on the Save UML Profile dialog.

**Learn More:**

- [Creating Custom Stereotypes](#) <sup>[1047]</sup>
- [Configure Default Appearance](#) <sup>[643]</sup>
- [Saving Profiles](#) <sup>[1052]</sup>

### 6.10.1.1.2.8 Export a Profile

Once you have created a Profile and defined the elements and metaclasses, you can save (export) the Profile to disk for future models.

#### How to:

To save a Profile, follow the steps below:

Step	Description	See Also
1	<p>If your profile is:</p> <ul style="list-style-type: none"> <li>a single profile spread over multiple diagrams within the same Profile package, find the Profile package in the Project Browser window, right-click on it and select the <b>Save Package as UML Profile</b> context menu option</li> <li>one of multiple profiles within the same Profile package, right-click anywhere in the background of the Profile diagram and select the <b>Save as Profile</b> context menu option</li> <li>a single diagram within the Profile package, choose either the <b>Save Package as UML Profile</b> context menu option or the <b>Save as Profile</b> context menu option</li> </ul> <p>The Save UML Profile dialog displays</p>	<a href="#">Save Profile Options</a> <small>1052</small>
2	<p>Click on the ( ... ) (Browse) button, and select the export destination for the XML Profile file</p> <p>If necessary, edit the profile filename, but do not delete the .xml extension</p>	
3	<p>In the <b>Profile Type</b> field, use the default value <b>EA (UML)2.X</b> (or, if necessary, click on the drop-down arrow and select this value)</p>	
4	<p>Set the required export options for all stereotypes defined in the profile:</p> <ul style="list-style-type: none"> <li><b>Element Size</b> - select the checkbox to export the element size attributes</li> <li><b>Color and Appearance</b> - select the checkbox to export the color (background, border and font) and appearance (border thickness) attributes</li> <li><b>Alternate Image</b> - select the checkbox to export the metafile images</li> <li><b>Code Templates</b> - select the checkbox to export the code templates, if they exist</li> </ul>	<a href="#">Color and Appearance</a> <small>1051</small>
5	<p>Click on the <b>Save</b> button to save the profile to disk</p>	

#### Learn More:

- For information on importing and using the profile in modeling, see the [UML Profiles](#)1028 topic.

When you save a UML Profile, you can save it either from the package or from the diagram, depending on whether the Profile is:

- a single profile spread over multiple diagrams within the same Profile package (find the Profile *package* in the Project Browser, right-click on it and select the **Save Package as UML Profile** context menu option), which is typically the case for a stereotypes profile
- one of multiple profiles within the same Profile package (right-click anywhere in the background of the Profile *diagram* and select the **Save as Profile** context menu option); for example, when creating multiple toolbox profiles
- a single diagram within the Profile Package (choose *either* the **Save Package as UML Profile** context

menu option or the **Save as Profile** context menu option).

The two context menu options produce slightly different results. You should take these into consideration, especially in the third instance where you could choose either option.

Save From Diagram	Save From Package	Notes
The profile takes the diagram name	The profile takes the package name	Package and diagram names are not necessarily the same, although you can save a lot of confusion if you make them the same or very similar  For example: package <i>GL</i> with diagrams <i>GL1</i> , <i>GL2</i> , <i>GL3</i>
The profile takes the diagram's notes	The profile takes the package's notes	
You can take the default size and appearance (including alternate image) from the diagram object	You cannot take the default size and appearance from the diagram object  You can use the <i>_sizeX</i> , <i>_sizeY</i> and <i>_image</i> properties, but there is no equivalent for default colors	
Can be much faster	Can be much slower	The difference arises because diagram objects are kept in memory and Project Browser elements aren't  This is only likely to be an issue if the profile is a large one and you are using a slow network connection to a remote repository

#### 6.10.1.1.2.9 Supported Attributes

##### Supported Stereotype Attributes:

The following attributes can be applied to stereotypes in UML Profiles:

Attribute	Meaning	See Also
<b>icon</b>	Contains the path to a bitmap file to be used as the Project Browser icon for all elements other than <i>Package</i> , with the given stereotype  The bitmap must be 16x16 pixels  For a transparent background, use light grey - RGB(192,192,192)  For this attribute to work correctly, the <i>_metatype</i> attribute must also be used (see below)	
<b>_image</b>	Shape script definition	
<b>_instanceMode</b>	Used for defining behavior on creating an instance	<a href="#">Defining Behavior on Creating an Instance</a> <small>1057</small>
<b>_instanceOwner</b>		

Attribute	Meaning	See Also
<b>_instanceType</b>		
<b>_metatype</b>	Used for defining stereotypes as metatypes	<a href="#">Defining Stereotypes as Metatypes</a> <sup>[1056]</sup>
<b>_sizeY</b>	Initial height of the element, in pixels at 100% zoom	
<b>_sizeX</b>	Initial width of the element, in pixels at 100% zoom	
<b>_strictness</b>	Used for restricting application of multiple stereotypes	<a href="#">Restricting Application of Multiple Stereotypes</a> <sup>[1056]</sup>

#### Supported Metaclass Attributes:

The following attributes can be applied to metaclass Classes in UML Profiles, and refer to the stereotypes that extend them:

Attribute	Meaning	See Also
<b>_AttInh</b>	If set to <b>1</b> , switches on the <i>Inherited Features: Show Attributes</i> setting	
<b>_AttPkg</b>	If set to <b>1</b> , switches on the <i>Attribute Visibility: Package</i> setting	
<b>_AttPri</b>	If set to <b>1</b> , switches on the <i>Attribute Visibility: Private</i> setting	
<b>_AttPro</b>	If set to <b>1</b> , switches on the <i>Attribute Visibility: Protected</i> setting	
<b>_AttPub</b>	If set to <b>1</b> , switches on the <i>Attribute Visibility: Public</i> setting	
<b>_ConInh</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Inherited Constraints</i> setting	
<b>_Constraint</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Constraints</i> setting	
<b>_DefaultDiagramType</b>	Used for defining child diagram types	<a href="#">Defining Child Diagram Types</a> <sup>[1059]</sup>
<b>_HideStyle</b>	If set to a comma-separated list of stereotypes, sets the <i>Hide Stereotyped Features</i> filter	
<b>_isVertical</b>	If set to <b>True</b> for an ActivityPartition stereotype, creates a vertical ActivityPartition by default	
<b>_lineStyle</b>	Sets the line style of a connector; the value of the attribute can be one of: <ul style="list-style-type: none"> <li>• <b>direct</b></li> <li>• <b>auto</b></li> <li>• <b>custom</b></li> <li>• <b>bezier</b></li> <li>• <b>treeH</b> (horizontal)</li> <li>• <b>treeV</b> (vertical)</li> <li>• <b>treeLH</b> (lateral horizontal)</li> </ul>	

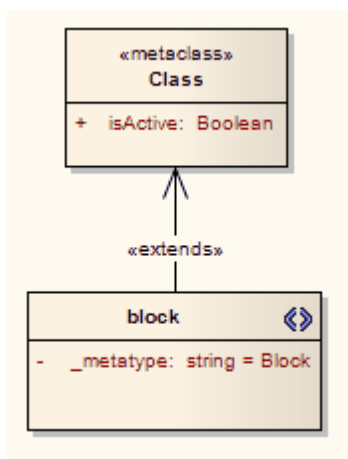

Attribute	Meaning	See Also
	<ul style="list-style-type: none"> <li>• <b>treeLV</b> (lateral vertical)</li> <li>• <b>orthogonalS</b> (orthogonal, square corners)</li> <li>• <b>orthogonalR</b> (orthogonal, rounded corners)</li> </ul>	
<b>_MakeComposite</b>	Used for creating composite elements	<a href="#">Creating Composite Elements</a> <sup>[1058]</sup>
<b>_OpInh</b>	If set to <b>1</b> , switches on the <i>Inherited Features: Show Operations</i> setting	
<b>_OpPkg</b>	If set to <b>1</b> , switches on the <i>Operation Visibility: Package</i> setting	
<b>_OpPri</b>	If set to <b>1</b> , switches on the <i>Operation Visibility: Private</i> setting	
<b>_OpPro</b>	If set to <b>1</b> , switches on the <i>Operation Visibility: Protected</i> setting	
<b>_OpPub</b>	If set to <b>1</b> , switches on the <i>Operation Visibility: Public</i> setting	
<b>_PType</b>	If set to <b>1</b> , switches on the <i>Show element type (Port or Part only)</i> setting	
<b>_ResInh</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Inherited Responsibilities</i> setting	
<b>_Responsibility</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Responsibilities</i> setting	
<b>_Runstate</b>	If set to <b>1</b> , switches on the <i>Hide Object Runstate in current diagram</i> setting	
<b>_SourceAggregation</b>	Used to set the aggregation type at the end of a connector; do not set <i>both</i> <b>_SourceAggregation</b> and <b>_TargetAggregation</b> Set to <b>1</b> for shared, <b>2</b> for composite	
<b>_SourceMultiplicity</b>	Used to set the multiplicity of the source element, such as <b>1..*</b> or <b>0..1</b>	
<b>_SourceNavigability</b>	If the connector is non-navigable, set this attribute to <b>Non-Navigable</b> ; for other values, set the direction attribute	<a href="#">Direction Attribute</a> <sup>[1926]</sup>
<b>_SubtypeProperty</b>	Used to specify the fully qualified name of a Tagged Value that acts as a subtype for the element, and that must be set when created  This Tagged Value must be created on the stereotype using an Association to an Enumeration element	
<b>_Tag</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Tags</i> setting	
<b>_tagGroupings</b>	Maps the Tagged Values into the <b>_tagGroups</b> (below) displayed in the Tagged Values window in the form: <i>tagName1=groupName1;tagName2=groupName2;</i>	
<b>_tagGroups</b>	A comma-separated list of required groups in the order in which they are to be displayed in the Tagged Values window	
<b>_tagGroupStates</b>	Maps <b>_tagGroups</b> displayed in the Tagged Values window to the state of <b>open</b> or <b>closed</b> , in the form: <i>group1=open;group2=closed;</i>	
<b>_TagInh</b>	If set to <b>1</b> , switches on the <i>Show Element Compartments: Inherited Tags</i> setting	
<b>_TargetAggregation</b>	Used to set the aggregation type at the end of a connector; do not	

Attribute	Meaning	See Also
tion	set <i>both</i> <b>_SourceAggregation</b> and <b>_TargetAggregation</b> Set to <b>1</b> for shared, <b>2</b> for composite	
<b>_TargetMultiplicity</b>	Used to set the multiplicity of the target element, such as <b>1..*</b> or <b>0..1</b>	
<b>_TargetNavigability</b>	If the connector is non-navigable, set this attribute to <b>Non-Navigable</b> ; for other values, set the <b>Direction</b> attribute	<a href="#">Direction Attribute</a> <sup>[1926]</sup>

The *\_metatype* attribute is applied to a stereotype element. This is used where users want to hide the identity of an element as a stereotyped UML element. It is also a method of getting custom types to appear in contexts where only Enterprise Architect's inbuilt types would normally appear; for example in the lists of element types in the Relationship Matrix.

The **Strict UML Syntax check** is not performed for stereotyped elements that have had the *\_metatype* attribute set.

In the following example from SysML, *block* is defined as a stereotype that extends a UML Class.

However, a SysML user isn't interested in UML Classes, only in SysML Blocks. An element created from a stereotype defined this way, while behaving like a stereotyped Class in most contexts:

- Shows *Block Properties* rather than *Class Properties* as the title of its Properties dialog
- Is auto-numbered as *Block 1* not *Class 1* on creation, and
- Appears as *Block* not *Class* in many other contexts throughout Enterprise Architect

#### Learn more:

- [Diagram](#) <sup>[428]</sup> (Strict UML Syntax Check)

The **\_strictness** attribute is applied to a stereotype element. It defines to what level multiple stereotypes can be applied to an element. The type of the attribute is *StereotypeStrictnessKind* and it can have one of four values:

- *profile*, which states that an element of this type cannot be given more than one different stereotype from the same profile
- *technology*, which states that an element of this type cannot be given more than one different stereotype from the same technology
- *all*, which states that an element of this type cannot have multiple stereotypes at all, or
- *none*, which is the default Enterprise Architect behaviour and states that there are no restrictions on the use of multiple stereotypes

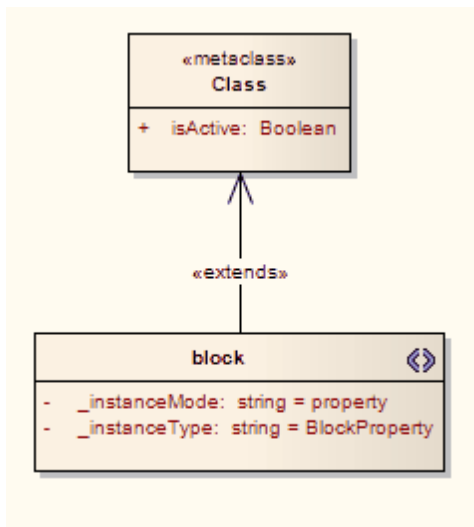

The following example is from SysML and shows that a «flowPort» cannot have any other stereotype applied to it.

#### Reference:

Attribute	Meaning	See Also
<b>_instanceType</b>	Applied to a stereotype element, defining what kind of element is created as an instance of this element type  The value corresponds to the metatype given to a stereotype using the <b>_metatype</b> attribute  It is shown on the Paste Element dialog and is translated if it matches an Enterprise Architect element type	
<b>_instanceMode</b>	Applied to a stereotype element, controlling the text in the Paste Element dialog after being translated  Valid values are <b>instance</b> and <b>property</b> , with the default being <b>instance</b>	
<b>_instanceOwner</b>	Applied to a stereotype element, controlling the text in the Paste Element dialog  It is translated if it matches an Enterprise Architect element type; the default value is <b>Element</b>	

The following example from SysML shows that when an instance of a Block is created, it is created as a **BlockProperty** element.

### Learn More:

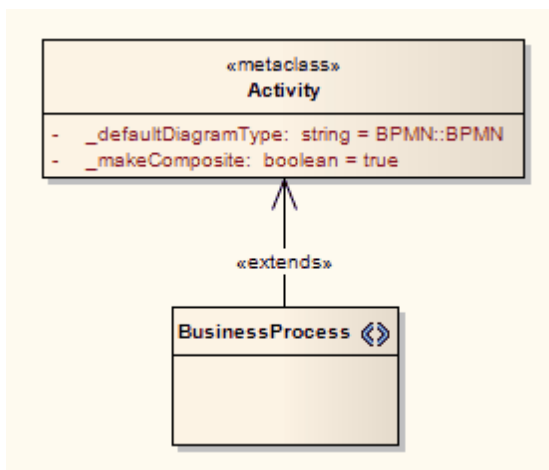

- [Paste Element from the Project Browser](#)<sup>[578]</sup>

The **\_makeComposite** attribute is applied to a metaclass element, not a stereotype element. It defines whether an element is always made composite when created.

Unless you also use the **\_defaultDiagramType** attribute to define the child diagram type, the child diagram created is the usual default diagram type for the metaclass.

A stereotyped package is not by default created with a child diagram, so you should use the **\_makeComposite** attribute to ensure the child diagram is created.

The following example from BPMN shows that a *BusinessProcess* element is always created as a Composite element with a BPMN custom child diagram.

### Learn More:

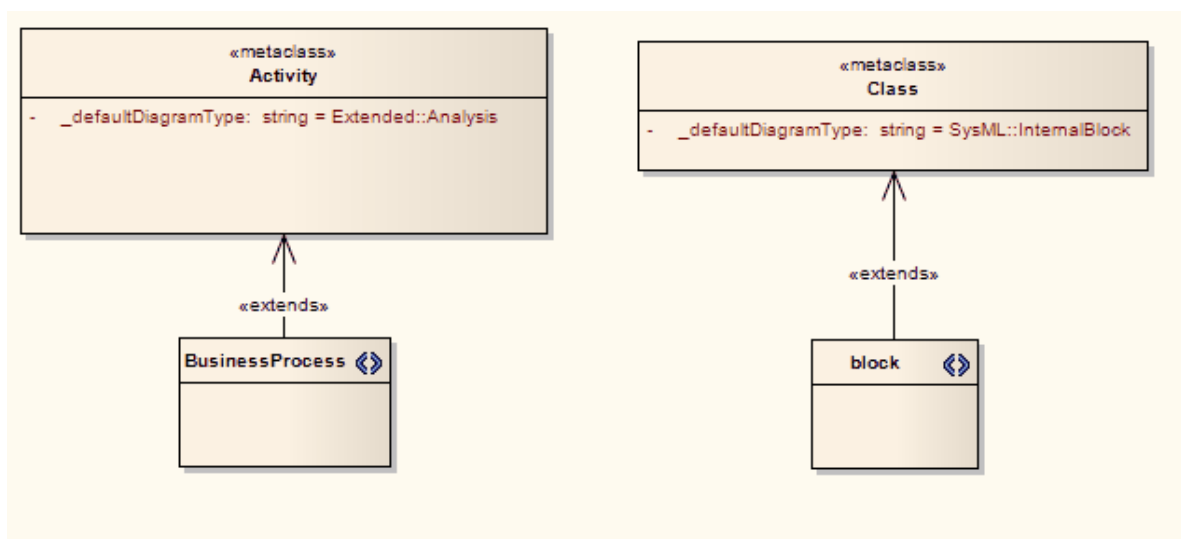

- [Defining Child Diagram Types](#)<sup>[1059]</sup>

The `_defaultDiagramType` attribute is applied to a metaclass element, not a stereotype element. It defines the type of diagram created when an element is made composite.

This attribute can take as its name any of the inbuilt diagram types of Enterprise Architect as listed below.

Alternatively, if a custom diagram type is required, it should be prefixed with the *diagram profile name* and ':'. The *diagram profile name* is the name given to the profile when you save it, which by default is the name of the profile package or profile diagram. If you follow the recommendation in Create Diagram Profiles, the diagram profile name is based on the technology name, but be aware that the attribute prefix is **not a direct** reference to the technology name.

The following examples show a `«BusinessProcess»Activity` that, when made a composite element, automatically creates an Analysis diagram, and a `«block»` stereotype that creates a SysML *InternalBlock* custom diagram.

You can also use the `_defaultDiagramType` attribute for packages, extending the Package metaclass.

### Initial Values:

The following initial values for `_defaultDiagramType` should be used to refer to Enterprise Architect's inbuilt diagram types:

- UML Behavioral::Use Case
- UML Behavioral::Activity
- UML Behavioral::State Machine
- UML Behavioral::Communication
- UML Behavioral::Sequence
- UML Behavioral::Timing
- UML Behavioral::Interaction Overview
- UML Structural::Package
- UML Structural::Class
- UML Structural::Object
- UML Structural::Composite Structure
- UML Structural::Component
- UML Structural::Deployment
- Extended::Custom
- Extended::Requirements
- Extended::Maintenance

- Extended::Analysis
- Extended::User Interface
- Extended::Data Modeling
- Extended::ModelDocument.

#### 6.10.1.1.2.10 Stereotype Profiles

Customized stereotypes should be contained in one or more profiles. The stereotypes within each profile use the profile name as the namespace. You then add the profiles into an MDG Technology.

Create one or more packages with the «*profile*» stereotype, each package name being the namespace. Within each package create profile diagrams defining all the stereotypes in the namespace. You can use multiple diagrams to do this, but do not use nested packages.

Give the «*profile*» package a description in the **Notes** field, such as *MDG Technology for BPMN*. When all of the stereotypes are defined (make sure that every stereotype extends at least one *Metaclass*) right-click on the profile package in the Project Browser and select the **Save Package as UML Profile** context menu option, then proceed as usual.

To define an MDG technology's Toolbox pages, you create a separate profile.

#### Learn More:

<b>Introduction</b>	<p>The Quick Linker provides a fast and simple way to create new elements and connectors on a diagram</p> <p>When an element is selected in a diagram, the Quick Linker arrow is displayed in the upper right corner of a element; simply clicking and dragging the arrow enables you to create new connectors and elements</p> <p>The philosophy behind the built-in Quick Linker definitions is to provide, not a complete list of valid or legal connections, but a short and convenient list of the commonest connections for the given context</p> <p>As part of a UML Profile, you can add to or replace the built-in Quick Linker definitions</p>	<p><a href="#">Quick Linker Definition Format</a> <sup>[1061]</sup></p> <p><a href="#">Quick Linker Example</a> <sup>[1063]</sup></p> <p><a href="#">Hide Default Quick Linker Settings</a> <sup>[1064]</sup></p> <p><a href="#">Quick Linker Object Names</a> <sup>[1064]</sup></p>
<b>Customized Quick Linker Settings</b>	<p>A Quick Linker definition is a Comma Separated Value (CSV) format file; it is best manipulated in a spreadsheet, which should be set up to save the CSV file as comma-separated text without quotation marks around text fields</p>	

Topic	Discussion	See Also
	<p>To add a Quick Linker definition file to a profile or technology, simply place a <i>DocumentArtifact</i> element onto the Profile diagram, give it the name <i>QuickLink</i>, then double-click on it</p> <p>Open your CSV file in a text editor such as Notepad and copy and paste the contents into the <i>DocumentArtifact</i> element; the definitions are saved with the profile and are processed and applied when the profile is imported</p> <p>The same applies if a profile is included within a technology, with the proviso that the QuickLink element must be in the same profile as the link stereotype definitions; this means that a technology could have a set of Quick Link definitions for each profile</p>	

#### 6.10.1.1.3.1 Quick Linker Definition Format

A Quick Linker definition is a text file consisting of records terminated by new-line characters. Each record must consist of 23 comma-separated fields, as defined by the table below. The values of each field must not be in quotes (" ").

A Quick Linker definition can include comments: all lines that begin with // are ignored by Enterprise Architect.

Each record of the Quick Linker definition represents a single entry on the Quick Linker menu. Some fields define the menu command; some fields can be thought of as filters, with the entry being ignored if the filter condition isn't met.

A Quick Linker definition has the following fields.

Column	Field	Description
A	Source Element Type	The row is ignored unless a connector is being dragged away from this type of element
B	Source Stereotype Filter	If set, the row is ignored unless a connector is being dragged away from an element with this stereotype
C	Target Element Type	If set, the row is ignored unless a connector is being dragged onto this type of element If blank, the row is ignored unless a connector is being dragged onto an empty piece of diagram
D	Target Stereotype Filter	If set and <b>Target Element Type</b> is also set, the row is ignored unless a connector is being dragged onto an element with this stereotype
E	Diagram Filter	Contains either an inclusive or exclusive list of <a href="#">built-in diagrams</a> <sup>[1083]</sup> , which limits the diagrams the given kind of connector can be included on Each diagram name is terminated by a semi-colon; excluded diagram names are preceded by an exclamation mark Example of an inclusive list: <i>Collaboration;Object;Custom;</i> Example of an Exclusive list: <i>!Sequence;</i>
F	New Element Type	If set and <b>Create Element</b> is also set, results in the creation of an element of this type
G	New Element	If set and <b>Create Element</b> is also set, results in the creation of an

Column	Field	Description
	<b>Stereotype</b>	element with this stereotype
<b>H</b>	<b>New Link Type</b>	If set and <b>Create Link</b> is also set, results in the creation of a connector of this type
<b>I</b>	<b>New Link Stereotype</b>	If set and <b>Create Link</b> is also set, results in the creation of a connector with this stereotype
<b>J</b>	<b>New Link Direction</b>	Can be: <ul style="list-style-type: none"> <li>• directed (always creates an association from source to target)</li> <li>• from (always creates an association from target to source)</li> <li>• undirected (always creates an association with unspecified direction)</li> <li>• bidirectional (always creates a bi-directional association), or</li> <li>• to (creates either a directed or undirected association, depending on the value of the <b>Association Direction</b> option)</li> </ul> <p>Not all of these work with all connector types; for example, you cannot create a bi-directional Generalization</p>
<b>K</b>	<b>New Link Caption</b>	If a new connector is being created but not a new element, then this is the text that appears on the context menu
<b>L</b>	<b>New Link &amp; Element Caption</b>	If a new connector AND a new element are being created, then this is the text that appears on the context menu
<b>M</b>	<b>Create Link</b>	If set to <b>TRUE</b> , results in creation of a new connector; otherwise should be left blank
<b>N</b>	<b>Create Element</b>	If set to <b>TRUE</b> the row is ignored unless a connector is being dragged onto an empty piece of diagram and results in creation of a new element; otherwise should be left blank  This overrides the values of <b>Target Element Type</b> and <b>Target Stereotype Filter</b>
<b>O</b>	<b>Disallow Self connector</b>	Should be set to <b>TRUE</b> if self connectors are invalid for this kind of connector; otherwise should be left blank
<b>P</b>	<b>Exclusive to ST Filter + No inherit from Metatype</b>	If set to <b>TRUE</b> , indicates that elements of type <i>Source Element Type</i> with the stereotype <i>Source Stereotype Filter</i> do not display the Quick Linker definitions of the equivalent unsteretyped element
<b>Q</b>	<b>Menu Group</b>	If set, indicates the name of a sub-menu in which a menu item is created
<b>R</b>	<b>Complexity Level</b>	Not implemented, always set to <b>0</b>
<b>S</b>	<b>Target Must Be Parent</b>	If set to <b>TRUE</b> this menu item only appears when dragging from a child element to its parent; for example from a port to its containing Class
<b>T</b>	<b>Embed element</b>	If set to <b>TRUE</b> the element being created is embedded in the target element; otherwise should be left blank
<b>U</b>	<b>Precedes Separator LEAF</b>	If set to <b>TRUE</b> results in a menu separator being added to the Quick Linker menu; otherwise should be left blank
<b>V</b>	<b>Precedes Separator GROUP</b>	If set to <b>TRUE</b> results in a menu separator being added to the Quick Linker sub-menu; otherwise should be left blank
<b>W</b>	<b>Dummy Column</b>	Depending on which spreadsheet application you use, this column

Column	Field	Description
		might require a value in every cell to force CSV export to work correctly with trailing blank values

**6.10.1.1.3.2 Quick Linker Example**

This example uses a Class element with the stereotype «quick». The example scenario is this: when you drag a connector away from one of these elements, you want to create a Dependency either to or from a component element. When you drag a connector onto an existing Port or component element, you want a Dependency either to or from the component or, in the case of a component, you want to be able to create an embedded Port element.

This results in 8 records in the [Quick Linker definition](#) file.

1. Dependency to new Component
2. Dependency from new Component
3. Dependency to existing Component
4. Dependency from existing Component
5. Dependency to existing Port
6. Dependency from existing Port
7. Dependency to existing Component, create new Port
8. Dependency from existing Component, create new Port

In the spreadsheet, this is implemented by the following values:

	A	B	C	E	F	H	J	K
1	//Source Element Type	Source ST filter	Target Element Type	Diagram Filter	New Element Type	New Link Type	New Link Direction	New Link Caption
2	Class	quick			Component	Dependency	to	
3	Class	quick			Component	Dependency	from	
4	Class	quick	Component			Dependency	to	Dependency to
5	Class	quick	Component			Dependency	from	Dependency from
6	Class	quick	Port			Dependency	to	Dependency to
7	Class	quick	Port			Dependency	from	Dependency from
8	Class	quick	Component		Port	Dependency	to	
9	Class	quick	Component		Port	Dependency	from	

	L	M	N	O	P	Q	R	S	T	U	V
1	New Link & Element Caption	Create Link	Create Element	Disallow Self connector	No inherit from metatype	Menu Group	Complexity Level	Target Must Be Parent	Embed element	Preceeds Separator LEAF	Preceeds Separator GROUP
2	Dependency to	TRUE	TRUE	TRUE	TRUE	Component	0				
3	Dependency from	TRUE	TRUE	TRUE	TRUE	Component	0			TRUE	
4		TRUE		TRUE	TRUE		0				
5		TRUE		TRUE	TRUE		0			TRUE	
6		TRUE		TRUE	TRUE		0				
7		TRUE		TRUE	TRUE		0			TRUE	
8	Dependency to	TRUE	TRUE	TRUE	TRUE	Port	0		TRUE		
9	Dependency from	TRUE	TRUE	TRUE	TRUE	Port	0		TRUE	TRUE	

This saves to the following CSV:

```

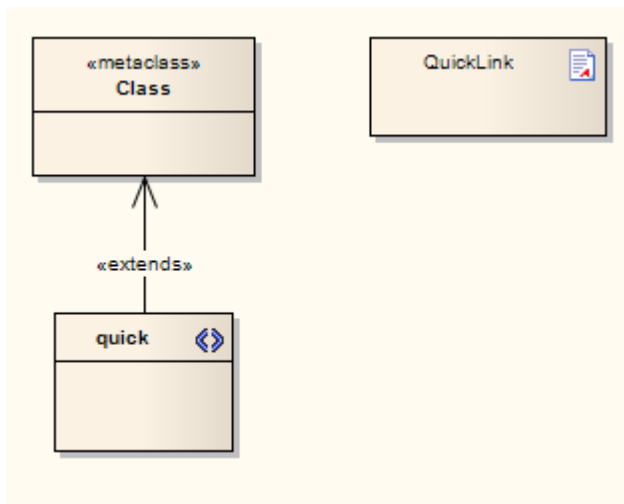

Class,quick,,,,Component,,Dependency,,to,,Dependency to,TRUE,TRUE,TRUE,
TRUE,Component,0,,,,,
Class,quick,,,,Component,,Dependency,,from,,Dependency from,TRUE,TRUE,
TRUE,TRUE,Component,0,,,TRUE,,
Class,quick,Component,,,,,Dependency,,to,Dependency to,,TRUE,,TRUE,
    
```

```

TRUE, , 0, , , , ,
Cl ass, qui ck, Component, , , , , Dependency, , from, Dependency from, , TRUE, , TRUE,
TRUE, , 0, , , TRUE, ,
Cl ass, qui ck, Port, , , , , Dependency, , to, Dependency to, , TRUE, , TRUE,
TRUE, , 0, , , , ,
Cl ass, qui ck, Port, , , , , Dependency, , from, Dependency from, , TRUE, , TRUE,
TRUE, , 0, , , TRUE, ,
Cl ass, qui ck, Component, , , Port, , Dependency, , to, , Dependency to, TRUE, TRUE,
TRUE, TRUE, Port, 0, , TRUE, , ,
Cl ass, qui ck, Component, , , Port, , Dependency, , from, , Dependency from, TRUE,
TRUE, TRUE, TRUE, Port, 0, , TRUE, TRUE, ,

```

You can create the following profile and cut and paste the CSV data into the document artifact to test the effect.

#### 6.10.1.1.3.3 Hide Default Quick Linker Settings

If you have a Quick Linker definition with the *Exclusive to stereotype* flag (column P) set to **TRUE**, then the default Quick Linker definitions between the given source and target are overridden. However, you might want to override the defaults without actually having a Quick Linker definition. For example, if you don't define any Quick Links for a «quick» Class to another «quick» Class, Enterprise Architect displays the default Quick Links for a Class to another Class. To override this behaviour, create a Quick Linker definition that has the source element type, source stereotype filter, target element type and target stereotype filter fields (columns A, B, C and D) all set, with the **Exclusive to stereotype** flag (column P) set to **TRUE**, and with the new link type field (column H) set to **<none>**.

For example, add this line to the example in [Quick Linker Example](#) <sup>[1063]</sup>:

```
Cl ass, qui ck, I n t e r f a c e, , , , , <none>, , , , , , TRUE, , 0, , , , ,
```

This overrides the default Class-to-Interface Quick Links when a Quick Link is dragged from a «quick» Class to an Interface element.

This technique does not affect the automatic appearance of Dependency, Trace, Information Flow and Help items on the Quick Linker menu.

#### 6.10.1.1.3.4 Quick Linker Object Names

##### List of Element Types:

The following element names can be used in Quick Linker definitions:

Action	ExecutionEnvironment	Package
ActionPin	ExitPoint	Part
Activity	ExitState	Port
ActivityParameter	ExpansionNode	PrimitiveType
ActivityPartition	ExpansionRegion	ProvidedInterface
Actor	Feature	Receive
Artifact	GUIElement	RequiredInterface
Boundary	HistoryState	Requirement
CentralBufferNode	InformationItem	Screen
Change	InitialActivity	Send
ChoiceState	InitialState	Sequence
Class	InteractionOccurrence	Signal
Collaboration	Interface	State
Component	Issue	StateLifeline
Data Type	InterruptableActivityRegion	StateMachine
Decision	JunctionState	Synchronization_H
DeepHistoryState	MergeNode	Synchronization_V
Deployment Specification	MessageEndpoint	SynchState
Device	n-ary Association	UMLDiagram
DiagramGate	Node	UseCase
EntryPoint	Object	ValueLifeline
EntryState	ObjectNode	

#### **List of Connector Types:**

The following connector names can be used in Quick Linker definitions:

Aggregation	Deployment	PackageMerge
Association	Extension	Realization
AssociationClass	Generalization	Redefinition
CommunicationPath	InformationFlow	Sequence
Composition	InterfaceLink	StateFlow
ConnectorLink	Manifest	TemplateBinding
ControlFlow	Nesting	UCExtends
DelegateLink	ObjectFlow	UCIncludes
Dependency	PackageImport	UseCase

### 6.10.1.2 MDG Technologies - Creating

The Model Driven Generation (MDG) Technologies enable Enterprise Architect users to access and use resources pertaining to a specific technology in Enterprise Architect. There are various options for an administrator or individual user to bring MDG Technologies into use with Enterprise Architect. You should read the first two MDG Technology topics (below) to understand how MDG Technologies are accessed and used within Enterprise Architect.

A further option is that Technology Developers can develop new MDG Technologies and deploy them to the project team as appropriate, as described in the remaining topics listed below.

#### Learn More:

- [MDG Technologies](#) <sup>[1033]</sup>
- [Manage MDG Technologies](#) <sup>[1035]</sup>
- [Create MDG Technologies](#) <sup>[1066]</sup>
- [Working With MTS Files](#) <sup>[1075]</sup>
- [Customize Toolbox Profiles](#) <sup>[1076]</sup>
- [Create Diagram Profiles](#) <sup>[1082]</sup>
- [Create Learning Center Profiles](#) <sup>[1085]</sup>
- [Define Validation Configuration](#) <sup>[1089]</sup>
- [Incorporate Model Templates](#) <sup>[1089]</sup>
- [Deploy an MDG Technology](#) <sup>[1090]</sup>

An example of creating an MDG Technology for an Enterprise Architecture framework is provided in: [Enterprise Architecture Framework Design with Sparx Systems Enterprise Architect](#).

[Set Up Technology Element Images](#) <sup>[1089]</sup> describes the process of ensuring that a technology element is represented by a specific image on a diagram, when the technology is deployed in a model.

#### 6.10.1.2.1 Create MDG Technologies

Using the MDG Technology Wizard, you can create MDG Technology files that can include UML Profiles, code modules, Patterns, images, Tagged Value Types, RTF report templates, linked document templates, Toolbox pages and Learning Center pages.

This facility is not available in the Enterprise Architect Desktop edition.

**Access:** **Tools | Generate MDG Technology File**

#### How To:

To create an MDG Technology file, follow the steps below:

Step	Description	See Also
1	Select the <b>Generate MDG Technology File</b> menu option The MDG Technology Creation Wizard screen displays	
2	Click on the <b>Next</b> button The MDG Technology Wizard prompts you to either: <ul style="list-style-type: none"> <li>• Create an MDG Technology File by creating a new MDG Technology Selection (MTS) file</li> </ul>	

Step	Description	See Also																				
	<ul style="list-style-type: none"> <li>• Create an MDG Technology File using an existing MTS file, or</li> <li>• Not use any MTS file</li> </ul> <p>(An MTS file stores the selected options that you define during the creation of an MDG Technology File; if you use an MTS file, you can later modify it to add or remove specific items in the MDG Technology File, which is the recommended process)</p>																					
3	<p>Select the appropriate MTS file option</p> <p>Click on the <b>Next</b> button</p> <p>If you selected an MTS file, the MDG Technology Wizard prompts you to save the changes in the existing MTS file or into a new MTS file; this enables you to create a modification based on the existing MTS file, while preserving the original file</p>																					
4	<p>If necessary, type in or browse for the required file path and name</p> <p>Click on the <b>Next</b> button</p> <p>The MDG Technology Wizard - Create screen displays</p>																					
5	<p>Complete the fields on this screen as follows:</p> <table border="1" data-bbox="384 947 1182 1910"> <thead> <tr> <th data-bbox="384 947 555 1003">Option</th> <th data-bbox="555 947 1182 1003">Action</th> </tr> </thead> <tbody> <tr> <td data-bbox="384 1003 555 1059"><b>Technology</b></td> <td data-bbox="555 1003 1182 1059">Type the name of the MDG Technology</td> </tr> <tr> <td data-bbox="384 1059 555 1171"><b>Filename</b></td> <td data-bbox="555 1059 1182 1171">Type or select the path and filename of the MDG Technology File The file extension for this file is .xml</td> </tr> <tr> <td data-bbox="384 1171 555 1249"><b>ID</b></td> <td data-bbox="555 1171 1182 1249">Type a reference for the MDG Technology File, up to 12 characters long</td> </tr> <tr> <td data-bbox="384 1249 555 1305"><b>Version</b></td> <td data-bbox="555 1249 1182 1305">Type the version number of the MDG Technology File</td> </tr> <tr> <td data-bbox="384 1305 555 1462"><b>Icon</b></td> <td data-bbox="555 1305 1182 1462">(Optional) Type or select the path and file name of the graphic containing the technology icon The icon is a 16x16 bitmap image that is shown in the list of technologies on the left of the MDG Technologies dialog</td> </tr> <tr> <td data-bbox="384 1462 555 1619"><b>Logo</b></td> <td data-bbox="555 1462 1182 1619">(Optional) Type or select the path and file name of the graphic containing the technology logo The logo is a 64x64 bitmap image that is shown in the dialog on the top-right corner of the MDG Technologies dialog</td> </tr> <tr> <td data-bbox="384 1619 555 1731"><b>URL</b></td> <td data-bbox="555 1619 1182 1731">(Optional) If you have any website product information that is helpful for users of this Technology, type or paste the URL in this field</td> </tr> <tr> <td data-bbox="384 1731 555 1843"><b>Support</b></td> <td data-bbox="555 1731 1182 1843">(Optional) If you have any web-based or other support contact information that might be helpful for users of this Technology, type or paste the contact address in this field</td> </tr> <tr> <td data-bbox="384 1843 555 1910"><b>Notes</b></td> <td data-bbox="555 1843 1182 1910">Type a short explanation of the functionality of the MDG Technology</td> </tr> </tbody> </table>	Option	Action	<b>Technology</b>	Type the name of the MDG Technology	<b>Filename</b>	Type or select the path and filename of the MDG Technology File The file extension for this file is .xml	<b>ID</b>	Type a reference for the MDG Technology File, up to 12 characters long	<b>Version</b>	Type the version number of the MDG Technology File	<b>Icon</b>	(Optional) Type or select the path and file name of the graphic containing the technology icon The icon is a 16x16 bitmap image that is shown in the list of technologies on the left of the MDG Technologies dialog	<b>Logo</b>	(Optional) Type or select the path and file name of the graphic containing the technology logo The logo is a 64x64 bitmap image that is shown in the dialog on the top-right corner of the MDG Technologies dialog	<b>URL</b>	(Optional) If you have any website product information that is helpful for users of this Technology, type or paste the URL in this field	<b>Support</b>	(Optional) If you have any web-based or other support contact information that might be helpful for users of this Technology, type or paste the contact address in this field	<b>Notes</b>	Type a short explanation of the functionality of the MDG Technology

Step	Description	See Also
7	<p>Select the checkbox for each item to be included in the MDG Technology file</p> <p>Each selection runs specific dialogs to enable definition of the specific items to be included in the MDG Technology, as described in the following topics:</p> <ul style="list-style-type: none"> <li>• <a href="#">Add a Profile</a> <sup>[1069]</sup></li> <li>• <a href="#">Add a Pattern</a> <sup>[1069]</sup></li> <li>• <a href="#">Add a Diagram Profile</a> <sup>[1070]</sup></li> <li>• <a href="#">Add a Toolbox Profile</a> <sup>[1070]</sup></li> <li>• <a href="#">Add Learning Center Pages</a> <sup>[1071]</sup></li> <li>• <a href="#">Add Tagged Value Types</a> <sup>[1071]</sup></li> <li>• <a href="#">Add Code Modules</a> <sup>[1072]</sup></li> <li>• <a href="#">Add MDA Transformations</a> <sup>[1073]</sup></li> <li>• <a href="#">RTF Report Templates</a> <sup>[1074]</sup></li> <li>• <a href="#">Linked Document Templates</a> <sup>[1075]</sup></li> <li>• <a href="#">Add Images</a> <sup>[1073]</sup></li> <li>• <a href="#">Add Scripts</a> <sup>[1074]</sup> (Corporate and 'Suite' editions).</li> </ul>	
8	<p>Work through the dialogs displayed in response to your choices, and when all are complete, click on the <b>Next</b> button</p> <p>The MDG Technology Wizard - Finish screen displays, providing information on the items included in the MDG Technology File</p>	
9	<p>If you have used an MTS file and want to update it, select the <b>Save to MTS</b> checkbox</p>	
10	<p>If you are satisfied with the selection of items, click on the <b>Finish</b> button</p> <p>You can now edit the MTS file, if required, to add further items such as:</p> <ul style="list-style-type: none"> <li>• Model Search definitions</li> <li>• Model Views</li> <li>• Model Validation configurations</li> <li>• Model Templates</li> </ul> <p>To make the MDG Technology File accessible to an Enterprise Architect model, you must <i>add</i> the technology file path to the MDG Technologies - Advanced dialog</p>	<p><a href="#">Working with MTS Files</a> <sup>[1075]</sup></p> <p><a href="#">Access Remote MDG Technologies</a> <sup>[1036]</sup></p>

#### 6.10.1.2.1 Add a Profile

When creating an MDG Technology file, you can include UML 2.3-compliant profiles that you have defined.

To use the Profiles section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	<p>Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Profiles</b> checkbox</p>	<p><a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup></p>

Step	Description	See Also
	The MDG Technology Wizard - Profile files selection dialog displays	
2	In the <b>Directory</b> field, navigate to the directory containing the required Profile or Profiles The Profile files are automatically listed in the Available Files panel	
3	To select each required Profile individually, highlight the Profile in the Available Files list and click on the --> button The file name displays in the Selected Files list Alternatively: To select all available Profiles, click on the -->> button <ul style="list-style-type: none"> <li>• DO NOT select diagram profiles or toolbox profiles on this dialog; this would generate conflicting commands in the .MTS file</li> <li>• Make sure you do include your stereotype profile</li> </ul>	<a href="#">Stereotype Profile</a> <sup>[1060]</sup>
4	Click on the <b>Next</b> button to proceed	

Learn More:

- [Working With Profiles](#) <sup>[1043]</sup>

**6.10.1.2.1.2 Add a Pattern**

When creating an MDG Technology file, you can include patterns.

To use the Patterns section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Patterns</b> checkbox. The <b>MDG Technology Wizard - Pattern files selection</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	In the <b>Directory</b> field, navigate to the directory containing the required pattern or patterns. The pattern files are automatically listed in the <b>Available Files</b> panel.	
3	To select each required pattern individually, highlight the pattern in the <b>Available Files</b> list and click on the --> button. The file name displays in the <b>Selected Files</b> list. Alternatively, to select all available patterns, click on the -->> button.	
4	Click on the <b>Next</b> button to proceed.	

Learn More:

- [Creating Patterns](#) <sup>[1024]</sup>

### 6.10.1.2.1.3 Add a Diagram Profile

When creating an MDG Technology file, you can include a diagram profile that you have defined.

To use the diagram profiles section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Diagram Types</b> checkbox. The <b>MDG Technology Wizard - Diagram Types</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <small>[1067]</small>
2	In the <b>Directory</b> field, navigate to the directory containing the required diagram profiles. The profiles in the directory are automatically listed in the <b>Available Files</b> panel.	
3	To select each required diagram profile individually, highlight the file name in the <b>Available Files</b> list and click on the --> button. The file name displays in the <b>Selected Files</b> list. Alternatively, to select all available profiles (assuming they are all diagram profiles), click on the -->> button.	
4	Click on the <b>Next</b> button to proceed.	

#### Learn More:

- [Custom Diagram Types](#)  
[1082]

### 6.10.1.2.1.4 Add a Toolbox Profile

When creating an MDG Technology file, you can include Enterprise Architect **Toolbox** page definitions that you have created.

To use the Toolboxes section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Toolboxes</b> checkbox. The <b>MDG Technology Wizard - Toolboxes</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <small>[1067]</small>
2	In the <b>Directory</b> field, navigate to the directory containing the required toolbox profiles. The profile files are automatically listed in the <b>Available Files</b> panel.	
3	To select each required toolbox profile individually, highlight the file name in the <b>Available Files</b> list and click on the --> button. The file name displays in the <b>Selected Files</b> list. Alternatively, to select all available profiles (assuming they are all toolbox profiles), click on the -->> button.	
4	Click on the <b>Next</b> button to proceed.	

#### Learn More:

- [Custom Toolboxes](#)  
[1076]

### 6.10.1.2.1.5 Add Learning Center Pages

When creating an MDG Technology file, you can include Enterprise Architect Learning Center profiles that you have created.

#### How to:

To use the Taskpages section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Taskpages</b> checkbox The MDG Technology Wizard - Learning Center dialog displays	<a href="#">Creating MDG Technologies, Step 6</a> <small>[1067]</small>
2	In the <b>Directory</b> field, navigate to the directory containing the required taskpage profiles The profile files are automatically listed in the Available Files panel	
3	To select each required Learning Center profile individually, highlight the file name in the Available Files list and click on the --> button The file name displays in the Selected Files list Alternatively, to select all available profiles (assuming they are all Learning Center profiles), click on the -->> button	
4	Click on the <b>Next</b> button to proceed	

#### Learn More:

- [Custom Learning Center](#)  
[1085]

### 6.10.1.2.1.6 Add Tagged Value Types

When creating an MDG Technology file, you can include Tagged Value Types.

To use the Tagged Value Types section of the MDG Technology Types Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Tagged Value Types</b> checkbox. The <b>MDG Technology Wizard - Tagged Value Types</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <small>[1067]</small>
2	To select each required Tagged Value Type individually, highlight the file name in the <b>Available Files</b> list and click on the --> button. The file name displays in the <b>Selected Files</b> list. Alternatively, to select all available Tagged Value Types, click on the -->> button.	
3	Click on the <b>Next</b> button to proceed.	

#### Learn More:

- [Tagged Value Types](#)  
[1111]

### 6.10.1.2.1.7 Add Code Modules

When creating an MDG Technology file, you can include code modules.

To use the code modules section of the MDG Technology Types Wizard, follow the steps below:

Step	Description	See Also																				
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Code Modules</b> checkbox. The <b>MDG Technology Wizard - Code Modules</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>																				
2	Click on the checkboxes ( <b>Product</b> , <b>Data Types</b> , and <b>Code Templates</b> ) for each of the required Code Modules.  The code modules listed are those defined in your current project. These could be the Enterprise Architect default languages, or those you have defined yourself using code templates and the Code Template Editor. Before you can set up a code template for the new language in the editor, you must define at least one data type for the language. Once the MDG Technology file is created it can be loaded into your current model and into other models.	<a href="#">Code Templates Overview</a> <sup>[1491]</sup> <a href="#">Code Template Editor</a> <sup>[1494]</sup> <a href="#">Data Types</a> <sup>[779]</sup>																				
3	To select any code options for a module, click on the ( ... ) button in the <b>Code Options</b> column for that module. This enables you to select an XML document that provides additional settings for the language that are not covered by the data types or code templates.  The root node of the XML document should be <code>CodeOptions</code> . The child nodes should be called <code>CodeOption</code> and should contain a <i>name</i> attribute. The supported code options are as follows:	<a href="#">Field Substitution Macros</a> <sup>[1119]</sup>																				
	<table border="1"> <thead> <tr> <th>Code Option</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>ConstructorName</td> <td>The name of a function used as a constructor. Used with <code>classHasConstructor</code> code template macro.</td> </tr> <tr> <td>CopyConstructorName</td> <td>The name of a function used as a copy constructor. Used with <code>classHasCopyConstructor</code> code template macro.</td> </tr> <tr> <td>DefaultExtension</td> <td>The default extension when generating code.</td> </tr> <tr> <td>DefaultSourceDirectory</td> <td>The default path to which Enterprise Architect generates code.</td> </tr> <tr> <td>DestructorName</td> <td>The name of a function used as a destructor. Used with <code>classHasDestructor</code> code template macro.</td> </tr> <tr> <td>Editor</td> <td>The external editor used for editing source of this language.</td> </tr> <tr> <td>ImplementationExtension</td> <td>The extension used by Enterprise Architect to generate implementation file.</td> </tr> <tr> <td>ImplementationPath</td> <td>The relative path from the source file to generate the implementation file.</td> </tr> <tr> <td>PackagePathSeparator</td> <td>The delimiter used to separate package names with the <code>packagePath</code> macro from the code templates.</td> </tr> </tbody> </table>	Code Option	Description	ConstructorName	The name of a function used as a constructor. Used with <code>classHasConstructor</code> code template macro.	CopyConstructorName	The name of a function used as a copy constructor. Used with <code>classHasCopyConstructor</code> code template macro.	DefaultExtension	The default extension when generating code.	DefaultSourceDirectory	The default path to which Enterprise Architect generates code.	DestructorName	The name of a function used as a destructor. Used with <code>classHasDestructor</code> code template macro.	Editor	The external editor used for editing source of this language.	ImplementationExtension	The extension used by Enterprise Architect to generate implementation file.	ImplementationPath	The relative path from the source file to generate the implementation file.	PackagePathSeparator	The delimiter used to separate package names with the <code>packagePath</code> macro from the code templates.	
Code Option	Description																					
ConstructorName	The name of a function used as a constructor. Used with <code>classHasConstructor</code> code template macro.																					
CopyConstructorName	The name of a function used as a copy constructor. Used with <code>classHasCopyConstructor</code> code template macro.																					
DefaultExtension	The default extension when generating code.																					
DefaultSourceDirectory	The default path to which Enterprise Architect generates code.																					
DestructorName	The name of a function used as a destructor. Used with <code>classHasDestructor</code> code template macro.																					
Editor	The external editor used for editing source of this language.																					
ImplementationExtension	The extension used by Enterprise Architect to generate implementation file.																					
ImplementationPath	The relative path from the source file to generate the implementation file.																					
PackagePathSeparator	The delimiter used to separate package names with the <code>packagePath</code> macro from the code templates.																					
	<p>An example of a valid code options file is shown below.</p> <pre>&lt;CodeOptions&gt;   &lt;CodeOption name="DefaultExtension"&gt;.ext&lt;/CodeOption&gt;</pre>																					

Step	Description	See Also
	<pre>&lt;CodeOption name=" Editor " &gt;C:\Windows\notepad.exe&lt;/ CodeOption&gt; &lt;/ CodeOptions&gt;</pre>	
4	<p>Click on the <b>Next</b> button to proceed.</p> <p>You can edit the code option values for source code engineering and for each required language using the <b>appropriate Language Options</b> page of the <b>Options</b> dialog.</p>	<a href="#">Code Engineering Settings</a> <sup>[1525]</sup> <a href="#">Language Options</a> <sup>[1538]</sup>

#### 6.10.1.2.1.8 Add MDA Transforms

When creating an MDG Technology file, you can include the MDA Transformations that have been modified in the model.

To use the Transform Modules section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>MDA Transforms</b> checkbox. The <b>MDG Technology Wizard - Transform Modules</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	Click the checkbox against the template name of each required template that is present in the current model.	
3	Click on the <b>Next</b> button to proceed.	

#### 6.10.1.2.1.9 Add Images

When creating an MDG Technology file, you incorporate images to be used in all models in which the technology is *deployed*. These images must already be available in the model in which the technology is being *developed*; you can import the images into this model using the **Add New** button on the Image Manager.

##### How to:

To use the Image Selection section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Images</b> checkbox The MDG Technology Wizard - Image Selection dialog displays	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	For each required model image available in the current model, select the checkbox next to the image name A preview of each image displays on the right of the dialog as you select the checkbox	
3	Click on the <b>Next</b> button to proceed	

**Learn More:**

- [Image Manager](#)<sup>[595]</sup>

**6.10.1.2.1.10 Add Scripts**

When creating an MDG Technology file, you can include scripts that you have created in the model.

To use the Script Selection section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Scripts</b> checkbox The MDG Technology Wizard - Scripts dialog displays	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	For each required script available in the current model, select the checkbox next to the script name	
3	Click on the <b>Next</b> button to proceed	

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

**Learn More:**

- [The Scriptor Window](#)<sup>[1832]</sup>

**6.10.1.2.1.11 Add RTF Report Templates**

When creating an MDG Technology file, you can include user-defined RTF Report templates.

To use the report templates section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>RTF Templates</b> checkbox The MDG Technology Wizard - RTF Report Templates dialog displays	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	For each required user-defined report template available in the current model, select the checkbox next to the template name	
3	Click on the <b>Next</b> button to proceed	

### 6.10.1.2.1.12 Add Linked Document Templates

When creating an MDG Technology file, you can include Linked Document templates.

To use the Linked Document templates section of the MDG Technology Wizard, follow the steps below:

Step	Description	See Also
1	Follow the steps in the <i>Create MDG Technologies</i> topic up to and including Step 6, where you select the <b>Linked Document Templates</b> checkbox. The <b>MDG Technology Wizard - Linked Document Templates</b> dialog displays.	<a href="#">Creating MDG Technologies, Step 6</a> <sup>[1067]</sup>
2	For each required document template available in the current model, select the checkbox next to the template name.	
3	Click on the <b>Next</b> button to proceed.	

### 6.10.1.2.2 Working with MTS Files

An MDG Technology Selection (.MTS) file stores the selected options that you define when creating an MDG Technology File using the MDG Technology Wizard. If you use a .MTS file, you can edit it to change the features selected when you generated the file, and to add or remove the advanced features described in this topic.

Action	Description	See also
<b>Create an .MTS File</b>	To create a .MTS file, select the <b>Tools   Generate MDG Technology File</b> menu option to launch the MDG Technology Wizard, and work through the screens as described in the <i>Create MDG Technologies</i> topic. On the second page, select the <b>Create a new MTS file</b> option.	<a href="#">Create MDG Technologies</a> <sup>[1066]</sup>
<b>Advanced Options For Your .MTS File</b>	<p>Once you have created the .MTS file, you can add:</p> <ul style="list-style-type: none"> <li>• Model Search definitions. If you use a custom SQL search, the SQL must include <i>ea_guid AS CLASSGUID</i> and the <i>object type</i>.</li> <li>• Model Views. Technology views do not store Favorite packages, only Views. If your exported views run searches that you have defined you must also include those searches in your MDG Technology.</li> <li>• Model Validation configurations</li> <li>• Model Templates.</li> </ul> <p>Open the .MTS file in a text editor. To make it easier for you, you can copy the following lines and paste them into the file before the last line of the file (that is, just before the <code>&lt;/ MDG. Sel ect i ons &gt;</code> lines:</p> <pre>&lt;Model Searches file=" " / &gt; &lt;Model Views file=" " / &gt;</pre> <p>(The code for the model validation configurations and model templates is provided in the corresponding sections, accessed via the links in the list above.)</p> <p>You can, if necessary, have more than one line for each inclusion; for example, more than one <i>ModelSearch</i>. For each inserted line:</p>	<a href="#">Model Search Definitions</a> <sup>[484]</sup> <a href="#">Model Views</a> <sup>[471]</sup> <a href="#">Model Validation Configurations</a> <sup>[1088]</sup> <a href="#">Model Templates</a> <sup>[1089]</sup>

Action	Description	See also
	<ul style="list-style-type: none"> <li>In the <code>file</code> attribute, enter the filename of the Model Search XML file or Model View XML file.</li> </ul> Save the .MTS file.	
<b>Update the MDG Technology</b>	Again select the <b>Tools   Generate MDG Technology File</b> menu option, but this time on the second page select <b>Open an Existing MTS file</b> and specify the file path of the .MTS file you have updated. Click on <b>&lt;Next&gt;</b> until the wizard is finished. Your MDG Technology file is updated.	

### 6.10.1.2.3 Customize Toolbox Profiles

The following is a road map of how to create a set of custom toolboxes for Enterprise Architect.

Step	Action	See also
1	Create a set of Toolbox Profiles that contain the definitions that Enterprise Architect requires to create the toolboxes	<a href="#">Toolbox Profiles</a> <sup>[1076]</sup>
2	Create a .MTS file containing instructions on how to build your MDG Technology; use this .MTS file to build your MDG Technology	<a href="#">Creating MDG Technologies</a> <sup>[1066]</sup>
3	Add some finishing touches: <ul style="list-style-type: none"> <li>Create hidden sub-menus</li> <li>Override Enterprise Architect's default toolboxes</li> <li>Change the default icons for toolbox items</li> </ul>	<a href="#">Hidden Sub-menus</a> <sup>[1078]</sup> <a href="#">Overriding Default Toolboxes</a> <sup>[1078]</sup> <a href="#">Icons for Toolbox Items</a> <sup>[1079]</sup>

#### 6.10.1.2.3.1 Create Toolbox Profiles

You can create multiple toolbox profiles within an MDG Technology. Each toolbox profile contains definitions that determine what appears in the **Toolbox** when a specific **Toolbox** page is open, either by selecting from the **More tools...** option in the **Toolbox** window, or by opening or creating a diagram of the type that is linked to the toolbox profile.

To create a toolbox profile, follow the steps below

Step	Action	See also
1	Create a diagram in a profile package, and give it a name by which you can refer to it later, such as <i>MyClassDiagram</i>	
	In the <b>Notes</b> field, give the diagram an alias and a description in the following format: <pre>Alias=MyClass; Notes=Structural elements for class diagrams;</pre>	
2	On the diagram, create a Class, name it <i>ToolboxPage</i> and give it the «metaclass» stereotype	
3	Create a «stereotype» element for each of the toolbox pages to create within your toolbox, such as <i>MyClassElements</i> and <i>MyClassRelationships</i>	<a href="#">Toolbox Page Attributes</a> <sup>[1077]</sup>

Step	Action	See also
	<p>Set their Alias to the text to display in the title bar of each toolbox page, such as <i>My Class Elements</i> and <i>My Class Relationships</i> respectively</p> <p>Use the <b>Notes</b> field to define the tool-tip for each toolbox page; that is, <b>Elements for Class Diagrams</b> and <b>Relationships for Class Diagrams</b></p> <p>Use the «<i>extends</i>» connector to set the stereotype elements to extend <i>ToolboxPage</i></p>	
4	<p>In the «<i>stereotype</i>» elements, create an attribute for each toolbox item</p> <p>The name of the attribute should be the name of the element or connector to be dropped, including namespace; for example, <i>UML::Package</i>, <i>UML::Class</i> and <i>UML::Interface</i></p> <p>The toolbox items display in the same order as the attributes in the Class, so make use of the attribute ordering buttons to define the order of your toolbox</p> <p>To name an attribute for an item from your own technology, precede it with your profile name as the namespace, and then follow it in brackets with the element or connector type that you are extending (so that Enterprise Architect knows what object to create); for example, a SysML block element would appear as <i>SysML::Block(UML::Class)</i></p> <p>Click on the links on the right for a complete list of elements and connectors that can be extended</p> <p>To define a toolbox item that allows a pattern to be dropped onto a diagram, name the attribute <i>My Technology::MyPattern(UMLPattern)</i> where <i>MyTechnology</i> is the ID of the technology and <i>MyPattern</i> is the name of the pattern to drop; for example, <i>BusFramework::Builder(UMLPattern)</i></p> <p>You can replace (<i>UMLPattern</i>) with (<i>UMLPatternSilent</i>) to avoid displaying the Add Pattern dialog</p> <p>To define a model-based pattern in a custom toolbox (such as the GoF patterns) create an attribute with a name of the format <i>PatternCategory::PatternName(UMLPattern)</i>; for example: <i>GoF Behavioral Patterns:: Mediator(UML Pattern)</i></p> <p>You might not want to use names such as <i>UML::Package</i> or <i>UML::Class</i> in your toolbox, so give the attributes an <b>Initial Value</b> of, for example, <i>Package</i> or <i>Class</i></p>	<p><a href="#">Elements Used in Toolboxes</a> <sup>[1080]</sup></p> <p><a href="#">Connectors Used in Toolboxes</a> <sup>[1081]</sup></p>
5	<p>To save the toolbox profile, right-click on the diagram and select the <b>Save as Profile</b> context menu option</p>	

**Notes:**

- Each profile element incorporated into an MDG Toolbox page enables synchronization of the Tagged Values and Constraints of all elements created from them

**Learn More:**

- [Synchronize Tags and Constraints](#) <sup>[1031]</sup>

The following attributes can be added to a stereotype Class that extends the *ToolboxPage* metaclass:

- **ImagesOnly**: if you give a toolbox page an attribute named *imagesOnly* with **Initial Value** set to **true**, the toolbox page displays without the text labels next to the icons
- **isCommon**: if you give a toolbox page an attribute named *IsCommon* with **Initial Value** set to **true**, the toolbox page is common to all defined toolboxes while your technology is active; the page is initially displayed as collapsed
- **isCollapsed**: if you give a toolbox page an attribute named *IsCollapsed* with **Initial Value** set to **true**, the

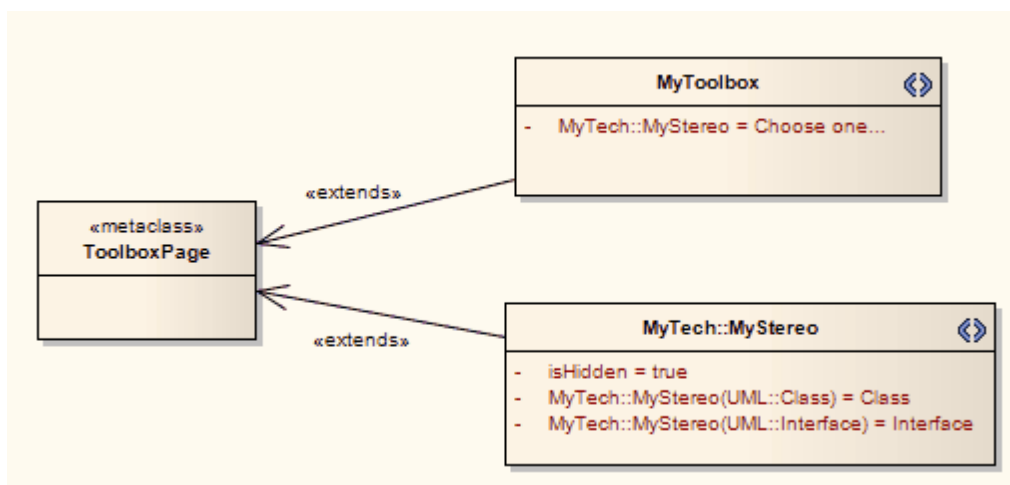

toolbox page is initially minimized.

- **Icon:** see [Assign Icons for Toolbox Items](#)<sup>[1079]</sup>
- **isHidden:** see [Create Hidden Sub-Menus](#)<sup>[1078]</sup>.

#### 6.10.1.2.3.2 Create Hidden Sub-Menus

To create a sub-menu, create an additional «*stereotype*» element in the same toolbox profile and give it an attribute named *isHidden* with **Initial Value** of **true**. Define the toolbox item attributes as before. In the parent «*stereotype*» element, create an attribute with the identical name to the sub-menu element. The sub-menu element can have an alias.

This technique is very useful for 'disambiguating' stereotypes that can be applied to multiple metaclasses. In the example below, the «*MyStereo*» stereotype can be applied to either a Class or an Interface. On dragging and dropping one from the toolbox, a hidden menu displays giving the choice of Class or Interface, then the appropriate element is dropped:

#### 6.10.1.2.3.3 Override Default Toolboxes

Enterprise Architect has many default Toolbox Profiles, one for each of its inbuilt diagram types. These define the Toolbox pages that are displayed, by default, every time a diagram of a specific type is opened or brought into view.

To replace one of Enterprise Architect's default toolboxes with one of your own (for example, if you have your own version of the UML::Class toolbox that you want to be opened every time a Class diagram is opened - as long as your technology is active) then include a *RedefinedToolbox* clause in the **Notes** field for the diagram properties of your Toolbox Profile diagram. For example, the profile diagram's **Notes** field could resemble the following:

```
RedefinedToolbox=UML::Class; Alias=Class; Notes=Structural elements for Class diagrams;
```

This states that the toolbox defined by this profile replaces the Enterprise Architect toolbox *UML::Class* as the default toolbox for all UML Class diagrams. For a list of inbuilt toolboxes, see the [List of Enterprise Architect Toolboxes](#)<sup>[1079]</sup> topic.

#### 6.10.1.2.3.4 Assign Icons To Toolbox Items

To assign an icon to a toolbox item, follow the steps below

Step	Action	See also
1	Create a new « <i>stereotype</i> » element in the same toolbox profile as the toolbox item.	
2	Give the « <i>stereotype</i> » element the same name as the attribute that it is assigning an image to (for example, MyTech::MyStereotype(UML::Class) in the diagram below)	
3	Give the « <i>stereotype</i> » element an attribute named <i>Icon</i> with <b>Initial Value</b> set to the full path and file name of the image to be used.  The icon image is a 16x16 pixel bitmap file; for a transparent background, use light grey - RGB(192,192,192).	
4	Create an Extends association from the « <i>stereotype</i> » element to a « <i>metaclass</i> » element named <i>ToolboxItemImage</i> .	

#### 6.10.1.2.3.5 List of Enterprise Architect Toolboxes

The following is a list of the **Toolbox** pages that can be overridden:

- UML::Activity
- UML::Class
- UML::Communication
- UML::Component
- UML::Composite
- UML::Deployment
- UML::Interaction
- UML::Metamodel
- UML::Object
- UML::Profile
- UML::State
- UML::Timing
- Extended::Analysis
- Extended::Custom
- Extended::DataModeling
- Extended::Maintenance
- Extended::Requirements
- Extended::UserInterface
- Extended::WSDL
- Extended::XMLSchema

- UML::UseCase

#### 6.10.1.2.3.6 Elements Used in Toolboxes

The following elements (all preceded with the namespace **UML::**) can be extended or redefined in Enterprise Architect Toolbox pages. The text in red indicates the label name displayed in the default Enterprise Architect Toolbox pages, where this differs in any way from the **UML::** statement text.

When these profile elements are incorporated into an MDG Toolbox page, they enable [synchronization](#)<sup>[1031]</sup> of the Tagged Values and Constraints of all elements created from them.

You can also extend [connectors](#)<sup>[1081]</sup>.

- Action
- Activity
- ActivityFinal (**Final**)
- ActivityInitial (**Initial**)
- ActivityParameter
- ActivityPartition (**Partition**)
- ActivityRegion (**Region**)
- Actor
- Artifact
- AssociationElement (**Association**)
- Boundary (for Use Cases)

#### 6.10.1.2.3.7 Connectors Used In Toolboxes

The following connectors (all preceded with the namespace **UML::**) can be extended or redefined in Enterprise Architect toolboxes. The text in red indicates the label name displayed in the default Enterprise Architect Toolbox pages, where this differs in any way from the **UML::** statement text.

You can also extend [elements](#) <sup>[1080]</sup>.

#### 6.10.1.2.4 Create Custom Diagram Profiles

You can create extended diagram types in Enterprise Architect and include them in MDG Technologies. To create extended diagram types, follow the steps below:

Step	Action	See also
1	Create a profile with the same name as the MDG Technology in which it is to be included; for example, <i>SysML</i> . (However, check the Note in <i>Define Child Diagram Types</i> .)	<a href="#">Defining Child Diagram Types</a> <sup>[1059]</sup>
2	Create a « <i>stereotype</i> » Class element that is named as the custom diagram, for example, <i>BlockDefinition</i> .	
3	Create a Class element and name it as one of the Built-In Diagram Types prefixed with <i>Diagram_</i> , for example <i>Diagram_Logical</i> for Class diagrams or <i>Diagram_Use Case</i> for Use Case diagrams.	<a href="#">Built-In Diagram Types</a> <sup>[1083]</sup>
4	Give the <i>Diagram_x</i> Class the « <i>metaclass</i> » stereotype and draw an « <i>extends</i> » connector from the stereotype to the metaclass.	
5	In the <b>Notes</b> field, give the stereotype Class a brief description of what the diagram is used for. This description displays in the bottom right-hand corner of the <b>New Diagram</b> dialog.	
6	Give the <i>Diagram_x</i> Class the following attributes as required: <ul style="list-style-type: none"> <li>• <i>alias</i>: <i>string = Type</i> (where <i>Type</i> appears before the word 'Diagram' on the diagram title bar)</li> <li>• <i>diagramID</i>: <i>string = abc</i> (where <i>abc</i> is the diagram type that appears in the diagram frame label)</li> <li>• <i>toolbox</i>: <i>string = ToolboxName</i> (where <i>ToolboxName</i> is the name of the toolbox profile for the toolbox that opens automatically each time a diagram is opened)</li> <li>• <i>frameString</i>: <i>string = FrameFormatString</i> (where <i>FrameFormatString</i> is a string containing substitution macros for defining the frame title, with or without additional delimiters such as ( ) ; macros that can be used are: <ul style="list-style-type: none"> <li>• #DGMSTEREO#</li> <li>• #DGMID#</li> <li>• #DGMTYPE#</li> <li>• #DGMALIAS#</li> <li>• #DGMOWNERNAME#</li> <li>• #DGMOWNERNAMEFULL#</li> <li>• #DGMNAME#</li> <li>• #DGMNAMEFULL#</li> </ul> </li> <li>• <i>swimlanes</i>: <i>string = Lanes=2;Orientation=Horizontal;Lane 1=Title 1; Lane 2=Title 2;</i> (where <i>Lanes</i> can be any value, but the number of</li> </ul>	<a href="#">Diagram Frame</a> <sup>[890]</sup> <a href="#">Attribute Values - StyleEx &amp; pdata</a> <sup>[1084]</sup>

Step	Action	See also
	<p><i>Lane</i>&lt;<i>n</i>&gt; values must equal the value of <i>Lanes</i>; <i>Orientation</i> can be omitted, in which case the swimlanes default to vertical)</p> <ul style="list-style-type: none"> <li>• <i>StyleEx: string</i> = one or more of a range of values; see <b>Attribute Values - StyleEx &amp; pdata</b></li> <li>• <i>pdata: string</i> = one or more of a range of values; see <b>Attribute Values - StyleEx &amp; pdata</b>.</li> </ul>	
7	Save the diagram as a profile in the usual manner.	
8	Add the diagram profile to the .MTS file used in the MDG Technology.	<a href="#">Add Diagram Types</a> <small>[1070]</small>

The following example shows the DFD diagram profile which defines a DFD diagram as an extension of the Enterprise Architect Analysis diagram.

#### 6.10.1.2.4.1 Built-In Diagram Types

The following is a full list of built-in diagram types provided by Enterprise Architect.

- Activity
- Analysis
- Collaboration
- Component
- CompositeStructure
- Custom
- Deployment
- InteractionOverview
- Logical
- Object
- Package
- Sequence
- Statechart
- Timing
- Use Case

Note the use of *Logical* for Class diagrams and also notice the space in the middle of *Use Case*. These names are used in [Defining Child Diagram Types](#)<sup>[1059]</sup>, or prefixed by *Diagram\_* in creating [Diagram Profiles](#)<sup>[1082]</sup>.

#### 6.10.1.2.4.2 Attribute Values - *StyleEx* & *pdata*

When creating a diagram profile, you can use the *pdata* and *StyleEx* attributes to define a range of characteristics of the diagrams created with the profile. If the attribute is defining several characteristics at once, put the values in a single string separated by semicolons. For example:

*StyleEx: string = HideQuals=0;AdvanceElementProps=1;ShowNotes=1;*

##### **StyleEx: string =**

- *AdvancedConnectorProps=1*; (to show connector property strings)
- *AdvancedElementProps=1*; (to show the element property string)
- *AdvancedFeatureProps=1*; (to show the feature property string)
- *AttPkg=1*; (to show package visible Class members)
- *DefaultLang=Language*; (to set the default language for the diagram; *Language* can be one of Enterprise Architect's built-in languages such as C++ or Java, or it can be a custom language)
- *HandDrawn=1*; (to apply hand drawn mode)
- *HideQuals=0*; (to show qualifiers and visibility indicators)
- *SeqTopMargin=50*; (to set the height of the top margin on sequence diagrams)
- *ShowAsList=1*; (to make the diagram open directly into the [Diagram List](#)<sup>[464]</sup>)
- *ShowMaint=1*; (to show the element Maintenance compartment)
- *ShowNotes=1*; (to show the element Notes compartment)
- *ShowOpRetType=1*; (to show the operation return type)
- *ShowTests=1*; (to show the element Testing compartment)
- *SuppConnectorLabels=1*; (to suppress all connector labels)
- *SuppressBrackets=1*; (to suppress brackets on operations without parameters)
- *TConnectorNotation=Option*; (where *Option* is one of **UML 2.1**, **IDEF1X**, or **Information Engineering**)
- *TExplicitNavigability=1*; (to show non-navigable connector ends)
- *VisibleAttributeDetail=1*; (to show attribute details on the diagram)
- *Whiteboard=1*; (to apply whiteboard mode)

##### **pdata: string =**

- *HideAtts=0*; (to show the element Attributes compartment)
- *HideEStereo=0*; (to show element stereotypes in the diagram)
- *HideOps=0*; (to show the element Operations compartment)
- *HideParents=0*; (to show additional parents of elements in the diagram)
- *HideProps=0*; (to show property methods)
- *HideRel=0*; (to show relationships)
- *HideStereo=0*; (to show attribute and operation stereotypes)
- *OpParams=3*; (to show operation parameters)
- *ShowCons=1*; (to show the element Constraints compartment)
- *ShowIcons=1*; (to use stereotype icons)
- *ShowReqs=1*; (to show the element Requirements compartment)
- *ShowSN=1*; (to show sequence notes)
- *ShowTags=1*; (to show the element Tagged values compartment)
- *SuppCN=0*; (to show collaboration numbers)
- *UseAlias=1*; (to use the aliases or elements in the diagram, if available).

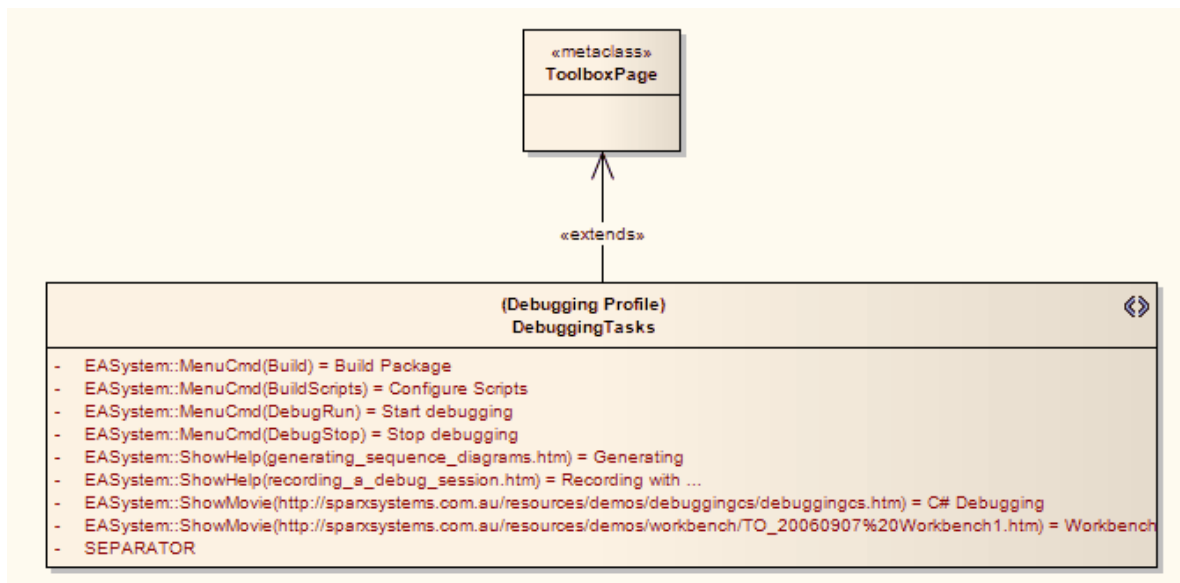

### 6.10.1.2.5 Create Learning Center Profiles

Defining Learning Center profiles is a two-part process:

Step	Action	See also
1	Define toolboxes; create any number of stereotype elements that each define a Learning Center Toolbox page	<a href="#">Define Learning Center Toolboxes</a> <sup>[1085]</sup>
2	Create the profile and incorporate it into your Technology	<a href="#">Save Learning Center Profile</a> <sup>[1088]</sup> <a href="#">Add Learning Center Pages</a> <sup>[1071]</sup>

#### 6.10.1.2.5.1 Define Learning Center Toolboxes

A Learning Center toolbox is defined by a «stereotype» Class that extends a «metaclass» ToolboxPage element. These elements must be owned by a «profile» package. Each «stereotype» Class represents the contents of a Learning Center topic and each attribute of the «stereotype» Class defines a command button in the Learning Center. The following diagram shows an example of a Learning Center toolbox.

The title bar of the Learning Center toolbox is defined by the Alias of the «stereotype» Class; in the above diagram, *Debugging Profile*.

The content of the Learning Center page is defined by the following standard attribute types:

- **EASystem::ShowDoc(folder\filename.rtf)** - these entries provide access to RTF documents (or any other text/document files), where *folder* is relative to the install folder and *filename* is the name of the (RTF) text file; this is a very significant attribute in creating Learning Center topics
- **EASystem::MenuCmd** - these entries name an Enterprise Architect main menu command inside round brackets - see the complete list of built-in Learning Center commands; type the text to appear in the Learning Center into the **Initial Value** field
- **EASystem::ShowHelp** - these entries name a page from the *Enterprise Architect User Guide* inside round brackets - to find out the names of pages in the *Enterprise Architect User Guide*, right-click on the page and select the **Properties** context menu option; type the text to appear in the Learning Center into the **Initial Value** field
- **EASystem::ShowMovie** - these entries give the URL of a movie inside round brackets - type the text to

appear in the Learning Center into the **Initial Value** field

- **EASystem::ShowView(command)** - these entries open an Enterprise Architect window, where *command* is one of the View commands from the second list of built-in Learning Center commands
- **EASystem::ShowURL** - this entry gives the URL of a web page inside round brackets; type the text to appear in the Learning Center into the **Initial Value** field
- **isCommon**: - a boolean attribute with **Initial Value** set to **True**, defines a Learning Center toolbox as common
- **SEPARATOR** - this entry indicates that a separator should be placed in the Learning Center toolbox; if it is necessary to place multiple separators in a single toolbox, note that Enterprise Architect does not allow identically named attributes for a Class: simply change the case of one or more letters to get around the problem

You can also run Add-In functions from the Learning Center

#### Next Step:

The next step is to save the Learning Center Profile.

#### Learn more:

- [Define Links To Documents](#) <sup>[1086]</sup>
- [Built-In Learning Center Commands](#) <sup>[1086]</sup>
- [Run Add-In Functions](#) <sup>[1087]</sup>
- [Save a Learning Center Profile](#) <sup>[1088]</sup>

The primary purpose of the Learning Center is to provide information on specific topics, processes and actions, and the easiest way to present this information is in the form of one or more structured documents.

Therefore, within your Learning Center profile, you would probably have «*stereotype*» Classes containing several instances of the *ShowDoc* attribute; that is:

- **EASystem::ShowDoc(folder\filename.rtf)**

These attributes identify buttons that provide access to text or document files, where *folder* is relative to the install folder and *filename* is the name of the (RTF) text file containing your structured document. For example:

The following Enterprise Architect commands can all be used in user-defined Learning Center profiles.

Learning Center pages that call functions have attributes named in the form *EASystem::MenuCmd* (<CommandName>) where <CommandName> is the name chosen from the following list:

- |                       |                         |                       |
|-----------------------|-------------------------|-----------------------|
| • AddDiagram          | • ElementUsage          | • RunHTMLReport       |
| • AddElement          | • ExportXML             | • RunRTFReport        |
| • AddPackage          | • FileNew               | • SetClassifier       |
| • AutoRecordThread    | • FileOpen              | • ShowHideExecution   |
| • AddModelFromPattern | • GenerateDDL           | • StartDebugRecording |
| • Build               | • GenerateWSDL          | • StepInto            |
| • BuildScripts        | • GenerateXMLSchema     | • StepOut             |
| • ConfigureCSV        | • ImplementationDetails | • StepOver            |
| • ConfigureValidation | • ImportBinary          | • StopDebugRecording  |

- CreateBaseLine
- CreateSequenceDiagram
- DebugPause
- DebugRun
- DebugStop
- Deploy
- DiagramsOnlyReport
- ImportExportCSV
- ImportSchema
- ImportSourceDirectory
- ImportWSDL
- ImportXML
- ImportXMLSchema
- Run
- Test
- TestingReport
- ToggleLevelNumbering
- TransformPackage
- TransformSelectedElements
- ValidateModel

Learning Center pages that call Enterprise Architect windows have attributes named in the form *EASystem:: ShowView(<Command>)* where *<Command>* is the name chosen from the following list:

- ViewAuditing
- ViewBreakpoints
- ViewCallstack
- ViewDebug
- ViewDiagramAsList
- ViewDiagramLayout
- ViewDiagramToolBox
- ViewElementList
- ViewFileSearch
- ViewForum
- ViewGapAnalysis
- ViewHierarchy
- ViewLocals
- ViewMaintenance
- ViewMemory
- ViewModelViews
- ViewModules
- ViewNotes
- ViewOutput
- ViewPackageScripts
- ViewPanAndZoom
- ViewProfiler
- ViewProjectBrowser
- ViewProjectCalendar
- ViewProjectInfo
- ViewProjectManagement
- ViewPropertiesWindow
- ViewRecording
- ViewRelationships
- ViewRelMatrix
- ViewRequirementTypes
- ViewResources
- ViewRules
- ViewScripting
- ViewSearch
- ViewSourceCode
- ViewTaggedValues
- ViewTaskAllocations
- ViewTesting
- ViewTestingDetails
- ViewTestpoints
- ViewTransformationTemplates
- ViewWatches
- ViewWebBrowser
- ViewWorkbench

To run Add-In functions from the Learning Center, you create an attribute in the Learning Center «*stereotype*» Class with the following format:

```
" Assembly : : FunctionName ( ) "
```

where *Assembly* is the name of the Add-In and *FunctionName* is the name of a public function in the Add-In. Give the attribute an initial value of the text that is to appear in the Learning Center. The function receives two parameters and returns a success status, as in the following VB.Net example:

```
Public Function ShowMyDiagram(ByRef Repository As EA.Repository, ByVal
args As Object) As String
    Dim ret As String
    ret = Repository.SQLQuery("select ea_guid from t_diagram where
diagram_type='Custom' and StyleEx like
'*;MDGDgm=MyDiagrams::MyCustomDiagram;*'")
    If ret Is Nothing Then
        ShowMyDiagram = False
        Exit Function
    End If

    Dim oXML As MSXML2.DOMDocument = New MSXML2.DOMDocument
    oXML.LoadXML(ret)
```

```

    Dim NodeList As MSXML2.IXMLDOMNodeList = oXML.selectNodes("//
    ea_guid")
    If NodeList.Length = 0 Then
        ShowMyDiagram = False
        Exit Function
    End If

    Dim Node As MSXML2.IXMLDOMNode
    Dim diag As EA.Diagram
    If NodeList.Length >= 1 Then
        Node = NodeList.item(0)
        diag = Repository.GetDiagramByGuid(Node.text)
        Repository.OpenDiagram(diag.DiagramID)
        Repository.ShownProjectView(diag)
    End If

    ShowMyDiagram = True
End Function

```

#### 6.10.1.2.5.2 Save a Learning Center Profile

The best organization structure for the model in which you are creating your Learning Center Profile is:

- A single «*profile*» package
- Three diagrams within the «*profile*» package named *Toolboxes*, *Contexts* and *Context Allocations*
- Each toolbox page «*stereotype*» element is owned by the «*profile*» package and appears on the *Toolboxes* diagram
- Each «*metaclass*» element is owned by the «*profile*» package and appears on the *Toolboxes* diagram.

From this structure, creating a Learning Center Profile is as simple as right-clicking on the «*profile*» package in the Project Browser and selecting the **Save Package as UML Profile** context menu option.

#### 6.10.1.2.6 Define Validation Configuration

The Model Validation Configuration dialog can be opened using the **Project | Model Validation | Configure...** menu option. Using this dialog, you can choose which sets of validation rules are and are not executed when a user performs a validation. Rather than perform this configuration manually and potentially have to change the settings every time Enterprise Architect is started and a different technology is set active, you can define the configuration settings within the MTS file.

To specify a set of rules as a white-list (that is, anything added to this list is turned ON), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```

<Model Validation>
  <RuleSet name=" BPMNRules" /> <!-- ruleset ID defined in the Project .
  DefineRuleCategory call -->
  <RuleSet name=" MVR7F0001" /> <!-- notice you can turn on/off system
  rules as well! -->
</ Model Validation>

```

Ensure that the ruleset IDs do not contain any spaces.

To specify a set of rules as a black-list (that is, anything added to this list is turned OFF), open your MTS file in a text editor and copy and paste the following `<Model Validation>` block at the top level inside the `<MDG. Selections>` block:

```

<Model Validation isBlackList="true">
  <RuleSet name=" BPMNRules" />
  <RuleSet name=" MVR7F0001" />
</ Model Validation>

```

In the examples above, "BPMNRules" is the rule-set ID defined in the Project . DefineRuleCategory call - see [Project Interface](#)<sup>[1944]</sup> for details. "MVR7F0001" is one of Enterprise Architect's built-in rule-sets. These validation options are applied when you activate the appropriate technology. The global (default) technology has all rules turned on.

### 6.10.1.2.7 Incorporate Model Templates

Model Templates can be added into a model, either on creation of the model, or at any time by right-clicking on a package in the **Project Browser** and selecting the **Add | Add a New Model using Wizard...** context menu option. To include your own model templates in this dialog, add them to your MDG Technology as described in the following table:

Step	Action	See also
1	<p>Create a package that contains all sub-packages, diagrams, elements, notes and information links that you want to provide in the model template</p> <p>See the <i>Model Templates</i> section and the <i>EAExample.eap</i> model for illustrations of what you might include, or create a model from a standard template and see what is generated</p> <p>Your model template package must be self contained and not contain any dependencies or other links to elements outside the package</p>	<p><a href="#">Model Templates</a> <sup>[52]</sup></p> <p><a href="#">Model Wizard</a> <sup>[52]</sup></p>
2	Export your package to XML	<a href="#">Export to XML</a> <sup>[32]</sup>
3	<p>Create a reference to the XML file in the MTS file; open your MTS file in a text editor and copy and paste the following <code>&lt;Model Templates&gt;</code> block at the top level inside the <code>&lt;MDG. Selections&gt;</code> block:</p> <pre>&lt;Model Templates&gt;   &lt;Model name="Template Name"     description="This is the description."     location="MyTemplatePackage.xml"     default="yes"     icon = "34"     filter = "Filter Name" /&gt; &lt;/ Model Templates&gt;</pre>	<p><a href="#">Working with MTS Files</a> <sup>[107]</sup></p>

You can include as many `<Model Templates>` blocks in your MTS file as you have model templates. The attributes have the following meanings:

- **Model name:** The name of the model template to show in the Select model(s) dialog, which displays when you create a new model or when you execute the **Add a New Model using Wizard** menu option
- **description:** The text to display in the Select model(s) dialog when the name is selected
- **location:** The path of the XML file that contains the XML export of the model template package, relative to the location of the MDG Technology file; if the XML file is in the same folder as the technology file then this just contains the file name
- **default:** Contains either **yes** to indicate that the model template is checked by default, or **no** to indicate that the model template is un-checked by default
- **icon:** Contains an index to Enterprise Architect's base icons list; to show the appropriate view icon, use one of the following values: **29** = Use Case, **30** = Dynamic; **31** = Class; **32** = Component; **33** = Deployment; **34** = Simple
- **filter:** If you have a large number of model templates, you can group them on the **Select model(s)** dialog by giving all the model templates in the same group the same filter name; the filter name given appears in the **Select from:** list box in the **Select model(s)** dialog

### 6.10.1.2.8 Set Up Technology Element Images

This topic outlines how to capture images to represent MDG Technology elements, so that the images are displayed on a diagram a user creates through the technology when it is deployed in the user's model. Note that you would probably work backwards and forwards through the steps many times, adding objects as you identify the requirement for them.

To capture images to represent MDG Technology elements, follow the steps below

Step	Action	See also
1	Import suitable images into the MDG Technology development model from various sources, using the <b>Add New</b> button on the Image Manager.	<a href="#">Image Manager</a> <sup>[595]</sup>
2	Design and create a Stereotype (UML) Profile containing (if appropriate) a stereotype definition for each element or connector to be owned by the technology. These stereotype definitions can contain Shape Scripts that in turn incorporate the imported images.	<a href="#">Stereotype (UML) Profile</a> <sup>[1047]</sup> <a href="#">Shape Scripts</a> <sup>[1050]</sup> <a href="#">Drawing Methods</a> <sup>[1095]</sup>
3	Design and create a Toolbox Profile with stereotype elements that contain an attribute for each element or connector that can be dropped onto a diagram from the toolbox. These attributes identify the name of the technology element or connector, any modifying stereotype (which might incorporate the required image) and the UML or Extended element or connector on which the technology object is based. For example: <i>SysML::Block(UML::Class)</i> , where <i>SysML</i> is the Technology Profile, <i>UML::Class</i> is the UML element used as the base, and <i>Block</i> is the stereotype that modifies the Class to turn it into a SysML Block element.	<a href="#">Toolbox Profiles</a> <sup>[1076]</sup>
4	Design and create a Diagram Profile that identifies the Toolbox Profile. When a diagram of the type defined in the Diagram Profile is opened, it in turn opens a set of toolbox pages as defined by the Toolbox Profile.	<a href="#">Diagram Profiles</a> <sup>[1082]</sup>
5	Create or update the technology as required, adding the Stereotype Profile, Diagram Profile, Toolbox Profile and Image files to the technology from the development model.	<a href="#">Creating MDG Technologies</a> <sup>[1066]</sup> <a href="#">Adding Stereotype Profile</a> <sup>[1068]</sup> <a href="#">Adding Diagram Profile</a> <sup>[1070]</sup> <a href="#">Adding Toolbox Profile</a> <sup>[1070]</sup> <a href="#">Adding Image Files</a> <sup>[1073]</sup>
6	Deploy the technology as appropriate. When a user applies the technology to their own model, and creates a diagram under that technology, the elements they create on the diagram should be represented by the images you assigned to those elements when you created the technology.	<a href="#">Deploying MDG Technologies</a> <sup>[1090]</sup>

### 6.10.1.2.9 Deploy An MDG Technology

An MDG Technology can be deployed in one of two ways: as a file or from an Add-In.

#### Deploy From a File

To deploy your technology as a file, you have a number of choices:

- Import it into the %APPDATA% folder. See the [Import MDG Technologies](#) <sup>[1037]</sup> topic.
- Copy it to a folder named MDG Technologies, which you must create under your Enterprise Architect installation directory (by default this is C:\Program Files\Sparx Systems\EA. When you restart Enterprise Architect, your MDG Technology is deployed.
- Copy it to any folder in your file system, including network drives: use the Enterprise Architect **Settings | MDG Technologies...** menu option, press the **Advanced** button and add the folder to the Technologies path. This deployment method enables you to quickly and easily deploy a technology to all Enterprise Architect users on a LAN.
- Upload it to an internet or intranet location: use the Enterprise Architect **Settings | MDG Technologies...**

menu option, press the **Advanced** button and add the URL to the `Technologies` path. This deployment method enables you to quickly and easily deploy a technology to an even wider group of Enterprise Architect users.

### Deploy From an Add-in

To deploy your technology from an Add-In, you must write an [EA\\_OnInitializeTechnologies](#) <sup>[2050]</sup> function. The following example is written in VB.Net:

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
    EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

## 6.10.1.3 Shape Scripts

### Introduction

Enterprise Architect *Shape Scripts* enable you to specify custom shapes via a scripting language. These custom shapes are drawn instead of the standard UML notation. Each script is associated with a particular stereotype, and is drawn for every element of that stereotype. The following topics describe how to create and apply Shape Scripts:

- [Getting Started with Shape Scripts](#) <sup>[1091]</sup>
- [Write Scripts](#) <sup>[1093]</sup>
- [Example Scripts](#) <sup>[1106]</sup>
- [Shape Editor](#) <sup>[1092]</sup>
- [Add Shape Scripts to UML Profiles](#) <sup>[1050]</sup>

### 6.10.1.3.1 Getting Started With Shape Scripts

Shape Scripts are associated with stereotypes and are defined via the Stereotypes tab of the UML Types dialog. Each stereotype defined can have a Shape Script.

**Access:** **Settings | UML Types > Stereotypes: Shape Script**

Step	Action	See also
1	You can create a Shape Script for an existing stereotype by selecting the stereotype from the list  Alternatively, you can create new stereotypes by clicking on the <b>New</b> button and giving the stereotype a name - select a base Class and click on the <b>Save</b> button  Once the stereotype is saved, it displays in the list	
2	To override the appearance, select the <b>Shape Script</b> radio button and then click on the <b>Assign</b> button  The Shape Script Editor displays	<a href="#">Shape Script Editor</a> <sup>[1092]</sup>
3	Type the Shape Scripts in the Edit window  Click on the <b>Refresh</b> button in order to view the shape in the preview window	<a href="#">Writing Scripts</a> <sup>[1093]</sup>
4	If you define a composite Shape Script (such as the connector at the end of the <i>Example Scripts</i> topic), click on the <b>Next Shape</b> button to page through the components of the shape	<a href="#">Example Scripts</a> <sup>[1106]</sup>

Step	Action	See also
5	Once you have finished writing your Shape Script, click on the <b>OK</b> button To save the Shape Script you must click on the <b>Save</b> button on the Stereotypes tab	
6	Once you have created your Shape Script for a particular stereotype, you can assign that stereotype to an element or connector; the appearance reflects the Shape Script you created To do this, drag and drop the appropriate element or connector into your diagram	
7	Right-click on the element or connector and select the <b>Properties</b> context menu option Click on the <b>Stereotype</b> field drop-down arrow, select the stereotype you created and click on the <b>OK</b> button The object's shape now reflects the Shape Script you created	

**Notes:**

- If an element's appearance is modified by a Shape Script, many of the options on the **Advanced** context menu for that element are disabled

**6.10.1.3.2 Shape Editor**

The Shape Editor enables you to create Shape Scripts. It provides the facilities of the *Common Code Editor*, including intellisense for Shape Script attributes and functions.

You create the Shape Script on a stereotype that you type in or select on the **Stereotype** field on the UML Types dialog.

**Access:** **Settings | UML Types > Stereotypes (specify stereotype): Shape Script, Assign**

**Reference:**

Field	Usage	See also
<b>Format</b>	Select the Shape Script version	
<b>Import</b>	Import a Shape Script from a text file	
<b>Export</b>	Export a Shape Script to a text file	
<b>OK</b>	Exit from the Shape Editor, don't forget to save your script on the Stereotypes tab	<a href="#">Getting Started With Shape Scripts</a> <sup>[109]</sup>
<b>Next Shape</b>	Rotate though the multiple shape definitions	
<b>Refresh</b>	Parse your script and display the result in the Preview window	

**Learn More**

- [Code Editors](#) <sup>[1403]</sup>, for more information on intellisense and the Common Code Editor

### 6.10.1.3.3 Write Scripts

This topic is a detailed reference for writing Shape Scripts. For an introduction to writing Shape Scripts, see the *Getting Started With Shape Scripts* and *Example Scripts* topics.

See the following reference topics for more detailed information on shape scripting:

- [Shape Attributes](#) <sup>[1093]</sup>
- [Drawing Methods](#) <sup>[1095]</sup>
- [Color Queries](#) <sup>[1100]</sup>
- [Conditional Branching](#) <sup>[1100]</sup>
- [Query Methods](#) <sup>[1100]</sup>
- [Display Element/Connector Properties](#) <sup>[1100]</sup>
- [Sub-shapes](#) <sup>[1103]</sup>
- [Reserved Names](#) <sup>[1104]</sup>
- [Miscellaneous](#) <sup>[1105]</sup>
- [Syntax Grammar](#) <sup>[1105]</sup>

#### Learn More:

#### 6.10.1.3.3.1 Shape Attributes

*syntax: attribute "=" value ";"*

example:

```
shape main
{
  // Initialisation attributes - must be before drawing commands
  noshadow = "true";
  h_align = "center";

  // drawing commands
  rectangle(0, 0, 100, 100);
  println("foo bar");
}
```

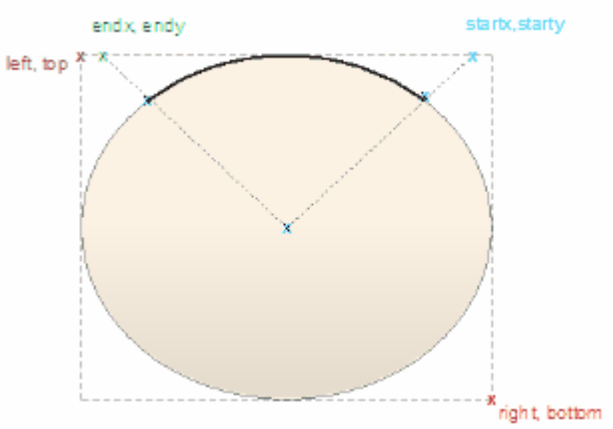

Attribute Name	Type	Description	See also
<b>bottomAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the bottom edge of its parent.  For example: <i>bottomAnchorOffset=(0,-10)</i> ; move embedded element up 10 pixels from the bottom edge	
<b>dockable</b>	<i>string</i>	Makes the shape default to dockable, so that it can be aligned with and joined to other elements (both other Shape Scripts and standard elements) on a diagram. You cannot reverse the dockable status with the <b>Appearance</b> menu option; to change the status, you must edit the Shape Script.  Valid values: <b>standard</b> or <b>off</b>	<a href="#">Appearance Menu Section</a> <sup>[658]</sup>
<b>editableField</b>	<i>string</i>	Defines a shape as an editable region of the element.	

Attribute Name	Type	Description	See also
		This field impacts element shapes only, line glyphs are not supported. Valid Values: <b>alias, name, note, stereotype</b>	
<b>endPointY, endPointX</b>	<i>integer</i>	Only used for the reserved target and source shapes for connectors; this point determines where the main connector line connects to the end shapes. Default: <b>0</b> and <b>0</b>	
<b>fixedAspectRatio</b>	<i>string</i>	Set to <b>true</b> to fix the aspect ratio. Do not use if you do not want to fix the aspect ratio.	
<b>h_Align</b>	<i>string</i>	Affects horizontal placement of printed text and subshapes depending on the <b>layoutType</b> attribute. Valid values: <b>left, center, or right</b>	
<b>layoutType</b>	<i>string</i>	Determines how subshapes are sized and positioned. See Subshape Layout for further details. Valid values: <b>leftright, topdown, border</b>	<a href="#">Subshape Layout</a> [1103]
<b>leftAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the left edge of its parent. For example: <i>leftAnchorOffset=(10,0)</i> ; move embedded element right 10 pixels from the left edge	
<b>noShadow</b>	<i>string</i>	Set to <b>true</b> to suppress the shapes shadow from being rendered. Valid values: <b>true or false</b> (default= <b>false</b> )	
<b>orientation</b>	<i>string</i>	Applies to decoration shapes only. Determines where the decoration is positioned within the containing element glyph. Valid values: <b>NW, N, NE, E, SE, S, SW, W</b>	
<b>preferredHeight</b>		Used by <b>border</b> layoutType - north and south Used in drawing the source and target shapes for connectors to determine how wide the line is.	
<b>preferredWidth</b>		Used by <b>border</b> layoutType - east and west. Used by <b>leftright</b> layoutType, shapes where <i>scalable</i> is <b>false</b> to determine how much space they occupy for layout purposes.	
<b>rightAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the right edge of its parent. For example: <i>rightAnchorOffset=(-10,0)</i> ; move embedded element left 10 pixels from the right edge	

Attribute Name	Type	Description	See also
<b>rotatable</b>	<i>string</i>	Set to <b>false</b> to prevent rotation of the shape. This attribute is only applicable to the source and target shapes for lines glyphs. Valid values: <b>true</b> or <b>false</b> (default = <b>true</b> )	
<b>scalable</b>	<i>string</i>	Set to <b>false</b> to stop the shape from being relatively sized to the associated diagram glyph. Valid values: <b>true</b> or <b>false</b> (default= <b>true</b> )	
<b>topAnchorOffset</b>	<i>(int,int)</i>	When creating a Shape Script for an embedded element (such as a Port), use this attribute to offset the shape from the top edge of its parent.  For example: <i>topAnchorOffset=(0,10)</i> ; move embedded element down 10 pixels from the top edge	
<b>v_Align</b>	<i>string</i>	Affects vertical placement of printed text and subshapes depending on the <b>layoutType</b> attribute. Valid values: <b>top</b> , <b>center</b> , or <b>bottom</b>	

#### 6.10.1.3.3.2 Drawing Methods

Method Name	Description	See also
<b>addsubshape</b> ( <b>string</b> <b>shapename</b> ( , <b>int width</b> , <b>int height</b> ) )	Adds a sub-shape with the name <b>shapename</b> that must be defined within the current shape definition	
<b>arc</b> ( <b>int left</b> , <b>int top</b> , <b>int right</b> , <b>int bottom</b> , <b>int startingpointx</b> , <b>int startingpointy</b> , <b>int endingpointx</b> , <b>int endingpointy</b> )	Draws an elliptical anticlockwise arc with the ellipse having extents at <b>left</b> , <b>top</b> , <b>right</b> and <b>bottom</b>  The start point of the arc is defined by the intersection of the ellipse and the line from the center of the ellipse to the point ( <b>startingpointx</b> , <b>startingpointy</b> )  The end of the arc is similarly defined by the intersection of the ellipse and the line from the center of the ellipse to the point ( <b>endingpointx</b> , <b>endingpointy</b> )  For example: Ar c ( 0, 0, 100, 100, 95, 0, 5, 0 ) ;	

Method Name	Description	See also
	 <p>The diagram shows a light brown circular arc. A dashed black rectangle is drawn around the arc, representing its bounding box. The top-left corner of the rectangle is labeled 'left, top' in red. The top-right corner is labeled 'startx, starty' in blue. The bottom-right corner is labeled 'right, bottom' in red. The bottom-left corner is labeled 'endx, endy' in green. A dashed line connects the top-left and top-right corners, and another dashed line connects the top-right and bottom-right corners. A dashed line also connects the top-left and bottom-right corners, forming a triangle with the arc's center.</p>	
<b>arco</b> ( <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom,</b> <b>int</b> <b>startingpointx,</b> <b>int</b> <b>startingpointy,</b> <b>int</b> <b>endingpointx,</b> <b>int</b> <b>endingpointy)</b>	<p>As for the arc method, except that a line is drawn from the current position to the starting point of the arc, and then the current position is updated to the end point of the arc</p>	
<b>bezierto</b> ( <b>int</b> <b>controlpoint1x,</b> <b>int</b> <b>controlpoint1y,</b> <b>int</b> <b>controlpoint2x,</b> <b>int</b> <b>controlpoint2y,</b> <b>int endpointx,</b> <b>int endpointy)</b>	<p>Draws a bezier curve and updates the pen position</p>	
<b>defSize(int width, int height)</b>	<p>Sets the default size of the element</p> <p>This can appear in IF and ELSE clauses with different values in each, and causes the element to be resized automatically each time the values change; for example:</p> <pre> if ( HasTag( " horizontal ", " true" ) ) {     def Si ze( 100, 20 );     r ect angl e( 0, 0, 100, 100 ); } el se {     def Si ze( 20, 100 );     r ect angl e( 0, 0, 100, 100 ); } </pre> <p>The above example sets the shape to the specified default size each time the Tagged Value <i>horizontal</i> is changed</p>	

Method Name	Description	See also
	When this is set, ( <b>Alt+Z</b> ) also resizes the shape to the defined dimensions  The minimum value for both <b>int width</b> and <b>int height</b> is <b>10</b>	
<b>drawnativeshape()</b>	Causes Enterprise Architect to render the shape using its usual, non-Shapescript notation; subsequent drawing commands are super-imposed over the native notation  This method is only enabled for element Shape Scripts; line Shape Scripts are not supported	
<b>ellipse(</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom)</b>	Draws an ellipse with extents defined by <b>left</b> , <b>top</b> , <b>right</b> and <b>bottom</b>	
<b>endpath()</b>	Ends the sequence of drawing commands that define a path	
<b>fillandstrokepath()</b>	Fills the previously defined path with the current fill color, then draws its outline with the current pen	
<b>fillpath()</b>	Fills the previously defined path with the current fill color	
<b>hidelabel(</b> <b>string</b> <b>labelname)</b>	Hides the label specified by <b>labelname</b> , where <b>labelname</b> is one of the following values: <ul style="list-style-type: none"> <li>• middletoplabel</li> <li>• middlebottomlabel</li> <li>• lefttoplabel</li> <li>• leftbottomlabel</li> <li>• righttoplabel</li> <li>• rightbottomlabel</li> </ul>	
<b>image(</b> <b>string</b> <b>imageld,</b> <b>int left,</b> <b>int top,</b> <b>int right,</b> <b>int bottom)</b>	Draws the image that has the name <b>imageld</b> in the Image Manager  The image must exist within the model in which the stereotype is used; if it does not already exist in the model, you must import it as reference data or select it from within a technology file  If the image is in a technology file, it should have a filename of the format <i>&lt;technology ID&gt;::&lt;imagename&gt;.&lt;extension&gt;</i>	<a href="#">Reference data</a> <sup>[240]</sup> <a href="#">Adding images in MDG technology</a> <sup>[1073]</sup>
<b>lineto(</b> <b>int x,</b> <b>int y)</b>	Draws a line from the current cursor position to a point specified by <b>x</b> and <b>y</b> , and then updates the pen cursor to that position	
<b>moveto(</b> <b>int x,</b> <b>int y)</b>	Moves the pen cursor to the point specified by <b>x</b> and <b>y</b>	
<b>polygon(</b> <b>int centerx,</b> <b>int centery,</b> <b>int</b> <b>numberofsides,</b>	Draws a regular polygon with center at the point ( <b>centerx</b> , <b>centery</b> ), and <b>numberofsides</b> number of sides	

Method Name	Description	See also
<b>int radius, float rotation)</b>		
<b>print( string text)</b>	Prints the specified text string You cannot change the font size, type or color of this text	
<b>printifdefined( string propertyname, string truepart(, string falsepart ) )</b>	Prints the <i>truepart</i> if the given property exists and has a non-empty value, otherwise prints the optional <i>falsepart</i> You cannot change the font size, type or color of this text	
<b>println( string text)</b>	Appends a line of text to the shape and a line break You cannot change the font size, type or color of this text	
<b>printwrapped( string text)</b>	Prints the specified text string, wrapped over multiple lines if the text is wider than its containing shape You cannot change the font size, type or color of this text	
<b>rectangle( int left, int top, int right, int bottom)</b>	Draws a rectangle with extents at <b>left, top, right, bottom</b> . Values are percentages	
<b>roundrect( int left, int top, int right, int bottom, int abs_cornerwidth, int abs_cornerheight)</b>	Draws a rectangle with rounded corners, with extents defined by <b>left, top, right</b> and <b>bottom</b> The size for the corners is defined by <b>abs_cornerwidth</b> and <b>abs_cornerheight</b> ; these values do not scale with the shape	
<b>setdefaultcolors()</b>	Returns the brush and pen color to the default settings, or to the user-defined colors if available	<a href="#">Color Queries</a> <sup>[1100]</sup>
<b>setfillcolor( int red, int green, int blue)</b>  <b>setfillcolor( Color newColor)</b>	Sets the fill color You can specify the required color by defining RGB values or using a color value returned by any of the Color Queries such as:  Get User Fill Color ( )	<a href="#">Color Queries</a> <sup>[1100]</sup>
<b>setfixedregion( int xStart, int yStart, int xEnd, int yEnd)</b>	Fixes a region in a connector into which a subshape can be drawn, so that the subshape is not rescaled with the length or orientation of the connector line  For an example, see the end of the table in the <i>Example Scripts</i> topic	<a href="#">Example Scripts</a> <sup>[1106]</sup>
<b>setlinestyle( string linestyle)</b>	Changes the stroke pattern for commands that use the pen	

Method Name	Description	See also
	<p><b>string linestyle:</b> has the following valid styles:</p> <ul style="list-style-type: none"> <li>• <b>solid</b></li> <li>• <b>dash</b></li> <li>• <b>dot</b></li> <li>• <b>dashdot</b></li> <li>• <b>dashdotdot</b></li> </ul>	
<b>setorigin(</b> <b>string</b> <b>relativeTo,</b> <b>int xOffset,</b> <b>int yOffset)</b>	<p>Positions floating text labels relative to the main shape</p> <p><b>relativeTo</b> is one of <b>N, NE, E, SE, S, SW, W, NW, CENTER</b></p> <p><b>xOffset</b> and <b>yOffset</b> are in pixels, not percentage values, and can be negative</p>	
<b>setpen(</b> <b>int red,</b> <b>int green,</b> <b>int blue( ,</b> <b>int</b> <b>penwidth ) )</b>	<p>Sets the pen to the defined color and optionally sets the pen width</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	
<b>setpencolor(</b> <b>int red,</b> <b>int green,</b> <b>int blue)</b>  <b>setpencolor(</b> <b>Color</b> <b>newColor)</b>	<p>Sets the pen color</p> <p>You can specify the required color by defining RGB values or using a color value returned by any of the Color Queries; for example:</p> <p style="padding-left: 40px;">Get User Fill Color ( )</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	<a href="#">Color Queries</a> <sup>[1100]</sup>
<b>setpenwidth(</b> <b>int penwidth)</b>	<p>Sets the width of the pen. Pen width should be between 1 and 5</p> <p>This method is only for line-drawing commands. It does not affect any text commands</p>	
<b>showlabel(</b> <b>string</b> <b>labelname)</b>	<p>Reveals the hidden label specified by <b>labelname</b>, where <b>labelname</b> is one of the following values:</p> <ul style="list-style-type: none"> <li>• <b>middletoplabel</b></li> <li>• <b>middlebottomlabel</b></li> <li>• <b>lefttoplabel</b></li> <li>• <b>leftbottomlabel</b></li> <li>• <b>righttoplabel</b></li> <li>• <b>rightbottomlabel</b></li> </ul>	
<b>startcloudpath(</b> <b>puffWidth,</b> <b>puffHeight,</b> <b>noise)</b>	<p>Similar to <b>StartPath</b>, except that it draws the path with cloud-like curved segments (<i>puffs</i>)</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <i>float</i> <b>puffWidth</b> (default = <b>30</b>), the horizontal distance between puffs</li> <li>• <i>float</i> <b>puffHeight</b> (default = <b>15</b>), the vertical distance between puffs</li> <li>• <i>float</i> <b>noise</b> (default = <b>1.0</b>), the randomization of the puffs' positions</li> </ul>	
<b>startpath()</b>	<p>Starts the sequence of drawing commands that define a path</p>	

Method Name	Description	See also
<code>strokepath()</code>	Draws the outline of the previously defined path with the current pen	

#### 6.10.1.3.3 Color Queries

Color queries can only be used to retrieve arguments for the *SetPenColor* and *SetFillColor* commands. These queries can be used in place of the arguments.

`getUserFillColor()`

`getUserBorderColor()`

`getUserFontColor()`

`getUserPenSize()`

```

shape main
{
    setfillcolor(getuserbordercolor());
    setpencolor(getuserfillcolor());

    rectangle(0, 0, 100, 100);
}

```

#### 6.10.1.3.3.4 Conditional Branching

Shape Scripts provide condition branching with the *if else* statement, and query methods that evaluate to either *True* or *False*. See:

- [Syntax Grammar](#) <sup>[1105]</sup> for IF statement syntax
- [Query Methods](#) <sup>[1100]</sup> for methods that can be used as the conditional expression for IF statements
- [Example Scripts](#) <sup>[1106]</sup> for an example.

#### 6.10.1.3.3.5 Query Methods

Two query methods are available for seeing if the associated element has certain tags or properties; these methods can be used as the conditional expression for an *if else* statement.

Method	Description	See also
<code>boolean HasTag( string tagname, ( string tagvalue ) )</code>	Returns <b>true</b> if the associated element has a tag value with the name <i>tagname</i>  If the second parameter <i>tagvalue</i> is provided, the tag <i>tagname</i> must be present, and the value of the tag has to be equal to <i>tagvalue</i> for the method to return <b>true</b>	
<code>boolean HasProperty( string propertyname, ( string propertyvalue ) )</code>	Returns <b>true</b> if the associated element has a property with the name <i>propertyname</i>  If the second parameter <i>propertyvalue</i> is provided, the property must be present, and the value of the property has to be equal to <i>propertyvalue</i> for the method to return <b>true</b>	<a href="#">Display Element/Connector Properties</a> <sup>[1100]</sup>

#### 6.10.1.3.3.6 Display Element/Connector Properties

The commands `print`, `println`, and `printwrapped` all take a string parameter representing the text to be printed. Element and connector properties can be added to the text using the substitution macro `#propertyname#`.

For example: `println("name: #NAME#");`

In addition to the properties listed below, Tagged Values can also be displayed by prefixing the Tagged Value name with TAG:.

For example: `print("#TAG:condition#");`

You can also test against and display an element's *custom* properties in the same way as you do the named properties.

For example: `if(hasproperty("Name","Value"))`

...

and: `print("#Name#");`

There are further examples of Shape Scripts and commands in the *Example Scripts* topic.

#### 6.10.1.3.3.7 Sub-Shapes

Shapes can contain - and be composed of - other shapes.

##### Subshape Layout:

To set the layout type, the *layoutType* attribute must be set in the *initialization attributes* section of the script; in other words, before any of the methods are called. Valid values for this attribute are:

- **LeftRight** - Shapes with leftright layout position subshapes side by side, with the first added on the left, and subsequent subshapes to the right
- **TopDown** - TopDown places subshapes in a vertical arrangement, with the first shape added to the top and subsequent shapes added below
- **Border** - Border layout requires an additional argument to the *addsubshape* method to specify which region of the containing shape the subshape is to occupy: N, E, S, W or CENTER; each region can only be occupied by one subshape

A subshape that is assigned to the E or W region must have its *preferredwidth* attribute specified in its declaration and, similarly, subshapes added to N or S must have their *preferredheight* attribute set; in this case, the values for these attributes are treated as static lengths and do not scale glyphs

For example:

```
shape main
{
  layouttype="topdown";
  setfillcolor(0,0,255);
  rectangle(0,0,100,100);
  addsubshape("sub",50,100,20,0);
  addsubshape("sub",50,100,30,-100);
  addsubshape("sub",50,100,40,-200);
  addsubshape("sub",50,100,50,-300);

  shape sub
  {
    setfillcolor(0,255,0);
    ellipse(0,0,100,100);
  }
}
```

The above script provides the following shape:

#### 6.10.1.3.3.8 Reserved Names

##### Elements

Elements (such as Class, State or Event) have the following reserved names for parts of the shape.

Name	Description
<b>shape main</b>	The <b>main</b> shape is the whole shape.
<b>shape label</b>	The shape <b>label</b> gives the shape a detached label.
<b>decoration &lt;identifier&gt;</b>	<b>Decoration</b> gives the shape a decoration as defined by the name in <identifier>.

##### Connectors

Connectors (such as Association, Dependency or Generalization) have the following reserved names for parts of the shape.

Name	Description
<b>shape main</b>	The <b>main</b> shape is the whole shape.
<b>shape source</b>	The <b>source</b> shape is an extra shape at the source end of the connector.
<b>shape target</b>	The <b>target</b> shape is an extra shape at the target end of the connector.
<b>shape &lt;labelID&gt;</b>	The <labelID> gives the connector a detached label, where <labelID> is one of the following: <ul style="list-style-type: none"> <li>• LeftTopLabel</li> <li>• MiddleTopLabel</li> <li>• RightTopLabel</li> <li>• LeftBottomLabel</li> <li>• MiddleBottomLabel</li> <li>• RightBottomLabel</li> </ul>

### 6.10.1.3.3.9 Miscellaneous

#### Return Command

Execution of the script can be terminated by using the return command. Please see [Example Scripts](#) <sup>1106</sup> for an example.

#### Looping

The Shape Script feature does not support looping constructs.

#### Comments

C-style comments are supported. For example:

```
// C Style Single Line comment
/* Multi Line
comment supported */
```

#### String Manipulation

Not Supported.

#### Arithmetical Operations

Not Supported.

#### Variables Declaration

Not Supported.

#### Change ShapeScript Fonts

Not possible.

#### Can I apply a Shapescrpt without using Stereotypes?

No.

### 6.10.1.3.3.10 Syntax Grammar

Grammar symbols:

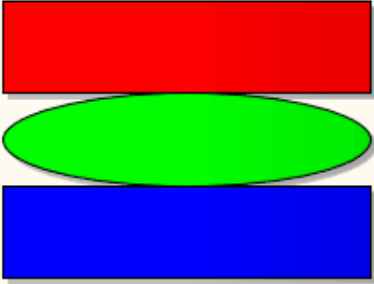

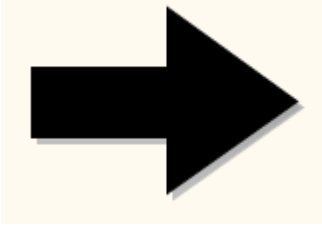

- \* = zero or more
- + = one or more
- | = or
- ; = terminator

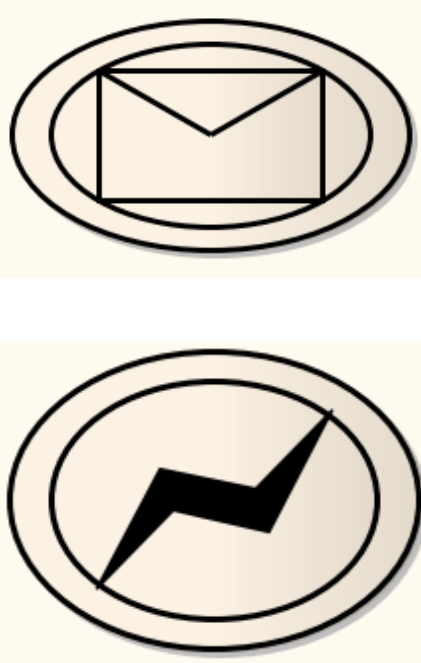

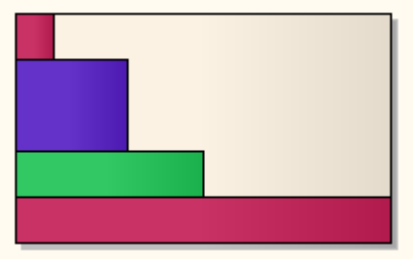

<b>ShapeScript</b>	::=	<Shape>*;

#### 6.10.1.3.4 Example Scripts

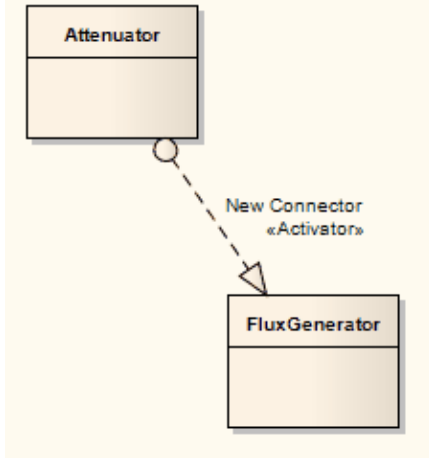

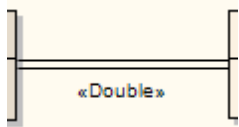

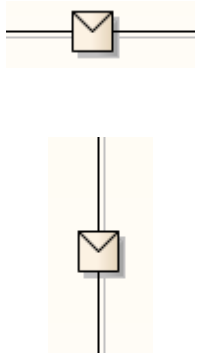

Below is a selection of example Shape Scripts.

Code	Result
<pre>// BASIC SHAPES shape main {   setfillcolor(255,0,0); // (R,G,B)   rectangle(0,0,90,30); // (x1,y1,x2,y2)    setfillcolor(0,255,0); // (R,G,B)   ellipse(0,30,90,60); // (x1,y1,x2,y2)    setfillcolor(0,0,255); // (R,G,B)   rectangle(0,60,90,90); // (x1,y1,x2,y2) }</pre>	
<pre>// SINGLE CONDITIONAL SHAPE shape main {   if (HasTag("Trigger", "Link"))   { // Only draw if the object has a Tagged Value     // Trigger=Link     // Set the fill color for the path     setfillcolor(0,0,0);     startpath(); // Start to trace out a path     moveto(23,40);     lineto(23,60);   } }</pre>	

Code	Result
<pre> lineto(50,60); lineto(50,76); lineto(76,50); lineto(50,23); lineto(50,40); endpath(); // End tracing out a path // Fill the traced path with the fill color fillandstrokepath(); return; } </pre>	
<pre> // MULTI CONDITIONAL SHAPE shape main {   startpath();   ellipse(0,0,100,100);   endpath();   fillandstrokepath();   ellipse(3,3,27,27);    if (HasTag("Trigger", "None"))   {     return;   }    if (HasTag("Trigger", "Error"))   {     setfillcolor(0,0,0);     startpath();     moveto(23,77);     lineto(37,40);     lineto(60,47);     lineto(77,23);     lineto(63,60);     lineto(40,53);     lineto(23,77);     endpath();     fillandstrokepath();     return;   }    if (HasTag("Trigger", "Message"))   {     rectangle(22,22,78,78);     moveto(22,22);     lineto(50,50);     lineto(78,22);     return;   } } </pre>	
<pre> // SUB SHAPES shape main {   rectangle(0,0,100,100);    addsubshape("red", 10, 20);   addsubshape("blue", 30, 40);   addsubshape("green", 50, 20);   addsubshape("red", 100, 20);    shape red   {     setfillcolor(200, 50, 100);   } } </pre>	

Code	Result
<pre> rectangle(0,0,100,100); }  shape blue {   setfillcolor(100, 50, 200);   rectangle(0,0,100,100); }  shape green {   setfillcolor(50, 200, 100);   rectangle(0,0,100,100); } </pre>	
<pre> // EDITABLE FIELD SHAPE shape main {   rectangle(0,0,100,100);    addsubshape("namecompartment", 100, 20);   addsubshape("stereotypercompartment", 100, 40);    shape namecompartment   {     h_align = "center";     editablefield = "name";      rectangle(0,0,100,100);     println("name: #name#");   }    shape stereotypercompartment   {     h_align = "center";     editablefield = "stereotype";      rectangle(0,0,100,100);     println("stereotype: #stereotype#");   } } </pre>	 <p>The diagram shows a class box for <b>Class5</b>. The top compartment contains the name <b>Class5</b>. The middle compartment contains the stereotype <b>Editable</b> and the field <b>Field Shape</b>. The bottom compartment is empty.</p>
<pre> // RETURN STATEMENT SHAPE shape main {   if(hasTag("alternatenotation", "false"))   {     //draw ea's inbuild glyph     drawnativeshape();     //exit script with the return statement     return;   }    //alternate notation commands   //...   rectangle(0,0,100,100); } </pre>	 <p>The diagram shows a class box for <b>Attenuator</b>. The top compartment contains the name <b>Attenuator</b>. The middle compartment contains the stereotype <b>«returnStatement»</b> and the name <b>Attenuator</b>. The bottom compartment contains the tag <b>tags</b> and the value <b>alternatenotation = false</b>.</p>  <p>The diagram shows an empty class box.</p>

Code	Result
<pre> //EMBEDDED ELEMENT SHAPE POSITION ON PARENT EDGE shape main {     defsize(60,60);     startpath();      if(hasproperty("parentedge","top"))     {         moveto(0,100);         lineto(50,0);         lineto(100,100);     }      if(hasproperty("parentedge","bottom"))     {         moveto(0,0);         lineto(50,100);         lineto(100,0);     }      if(hasproperty("parentedge","left"))     {         moveto(100,0);         lineto(0,50);         lineto(100,100);     }      if(hasproperty("parentedge","right"))     {         moveto(0,0);         lineto(100,50);         lineto(0,100);     }     endpath();     setfillcolor(153,204,255);     fillandstrokepath(); } </pre>	 <p>The result shows four instances of a class named 'Class1' (represented as a rectangle with a top section labeled 'Class1'). Each instance has a blue triangular boundary shape attached to a different side of the rectangle. The top instance has the boundary on the top edge, the bottom on the bottom edge, the left on the left edge, and the right on the right edge. Each instance is labeled with '«Boundary» ProvidedInterface1'.</p>
<pre> // CLOUD PATH EXAMPLE SHAPE shape main {     StartCloudPath();     Rectangle(0,0,100,100);     EndPath();     FillAndStrokePath(); } </pre>	 <p>The result shows a cloud shape drawn within a rectangular frame. The frame is labeled 'class Shape Scripts' in the top-left corner. The cloud is filled with a light blue color and has a dark blue outline.</p>
<pre> // CONNECTOR SHAPE shape main {     // draw a dashed line     noshadow=true;     setlinestyle("DASH");     moveto(0,0);     lineto(100,0); } </pre>	

Code	Result
<pre> shape source {     // draw a circle at the source end     rotatable = true;     startpath();     ellipse(0,6,12,-6);     endpath();     fillandstrokepath(); }  shape target {     // draw an arrowhead at the target end     rotatable = true;     startpath();     moveto(0,0);     lineto(16,6);     lineto(16,-6);     endpath();     fillandstrokepath(); } </pre>	
<pre> // DOUBLE LINE shape main {     setlinestyle("DOUBLE");     moveto(0,0);     lineto(100,0); } </pre>	
<pre> // ROTATION DIRECTION shape main {     moveto(0,0);     lineto(100,0);     setfixedregion(40,-10,60,10);     rectangle(40,-10,60,10);     if(hasproperty("rotationdirection","up"))          moveto(60,-10);         lineto(50,0);         lineto(60,10);     }     if(hasproperty("rotationdirection","down"))     {         moveto(40,-10);         lineto(50,0);         lineto(40,10);     }     if(hasproperty("rotationdirection","left"))     {         moveto(40,-10);         lineto(50,0);         lineto(60,-10);     }     if(hasproperty("rotationdirection","right"))     {         moveto(40,10);         lineto(50,0);         lineto(60,10);     } } </pre>	

### 6.10.1.4 Tagged Value Types

Enterprise Architect provides a number of predefined Tagged Value Types that enable you to create your own:

- Tagged Values that are structured with a specific format, with or without tag filters, or
- Tagged Values that return values from the various reference data tables.

You can also use a masking parameter to create your own customized masked Tagged Value Type.

#### Notes:

- You can transport Tagged Value Type definitions between models, using the Export Reference Data and Import Reference Data options; Tagged Value Types are exported as *Property Types*

#### Learn More:

- [Predefined Tagged Value Types](#)<sup>[1111]</sup>

- [Custom Tagged Value Type](#)<sup>[1116]</sup>
- [Reference Data](#)<sup>[1114]</sup>
- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

#### 6.10.1.4.1 Predefined Structured Types

This table details the predefined structured Tagged Value types, along with the syntax used to create the initial values for their use. You use these to create your own structured Tagged Values.

**Tagged Value Type** and **Format** entries are case-sensitive.

Tagged Value Type	Format	Description	See also
AddinBroadcast	<b>Type=AddinBroadcast;</b> <b>Values=YourAddinName;</b>	Allows an AddIn to respond to an attempt to edit this Tagged Value by showing a dialog in which the value and notes can be edited	
Boolean	<b>Type=Boolean;</b> <b>Default=Val;</b>	Enables input of <b>True</b> or <b>False</b> , either of which can be the default value	
Classifier	<b>Type=Classifier;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	<b>Deprecated - use RefGUID and RefGUIDList</b> Returns the <i>name</i> of a user-selected element from the model, where <b>Type1</b> and <b>Type2</b> specify one or more allowed element types and <b>Stereotype1</b> represents an allowed stereotype	
Color	<b>Type=Color;</b> <b>Default=Val;</b>	Enables input of a color value from a color chooser menu, where the value is the decimal integer translation of the color's Hex RGB value  For example, the RGB for Red is <b>FF</b> , and the decimal value is <b>255</b>	
Const	<b>Type=Const;</b> <b>Default=Val;</b>	Enables creation of a read-only constant value	

Tagged Value Type	Format	Description	See also
Custom	<b>Type= Custom;</b>	Enables you to create your own template for predefined types; more information is provided in the Create Custom Tagged Value Type topic.	<a href="#">Create Custom Tagged Value Type</a> [1116]
DateTime	<b>Type=DateTime;</b>	Enables input of the date and time for the Tagged Value from a calendar menu.	
Directory	<b>Type=Directory;</b> <b>Default=Val;</b>	Enables entry of a directory path from a browser.  You can set a default directory path as a string value.	
Enum	<b>Type=Enum;</b> <b>Values=Val1,Val2,Val3;</b> <b>Default=Val2;</b>	Enables definition of a comma-separated list, where <b>Val1</b> , <b>Val2</b> and <b>Val3</b> represent values in the list and <b>Default</b> represents the default value of the list.	
File	<b>Type=File;</b> <b>Default=Val;</b>	Enables input of a filename from a file browser dialog. The named file can be launched in its default application  You can set a default file as a string containing the file path and file name	
Float, Decimal, Double	<b>Type=Float;</b> <b>Type=Decimal;</b> <b>Type=Double;</b> <b>Default=Val;</b>	Enable entry of a Float, Decimal or Double value. These types all map to the same type of data.  You can set a default for any or all of these.	
Integer	<b>Type=Integer;</b> <b>Default=Val;</b>	Enables entry of an Integer value, and a default.	
Memo	<b>Type=Memo;</b>	Enables input of large and complex Tagged Values.	
RefGUID	<b>Type=RefGUID;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	Enables the Tagged Value to reference an element from the model by specifying the element's <i>GUID</i> , where <b>Type1</b> and <b>Type2</b> specify one or more allowed diagram objects (such as <b>Class</b> , <b>Component</b> , <b>Attribute</b> or <b>Operation</b> ) and <b>Stereotype1</b> represents an allowed stereotype.  Set the classifier, attribute or operation for a Tagged Value of this type by clicking on the ( ... ) button against the Tagged Value in the <b>Tagged Value</b> window.	<a href="#">Classifier</a> [692], <a href="#">Attribute or Operation</a> [696]
RefGUIDList	<b>Type=RefGUIDList;</b> <b>Values=Type1,Type2;</b> <b>Stereotypes=Stereotype1;</b>	Enables the Tagged Value to reference a list of elements from the model by specifying each element's <i>GUID</i> , where <b>Type1</b> and <b>Type2</b> specify one or more allowed diagram objects (such as <b>Class</b> or <b>Component</b> ) and <b>Stereotype1</b> represents an allowed stereotype.  Set the classifier, attribute or operation for a	<a href="#">Classifier</a> [692], <a href="#">Attribute or Operation</a> [696]

Tagged Value Type	Format	Description	See also
		Tagged Value of this type by clicking on the ( ... ) button against the Tagged Value in the <b>Tagged Value</b> window.	
Spin	<b>Type=Spin;</b> <b>LowerBound=x;</b> <b>UpperBound=x;</b> <b>Default=Val;</b>	Enables creation of a spin control with the value of <b>LowerBound</b> being the lowest value and <b>UpperBound</b> being the highest value. You can also set a default within that range.	
String	<b>Type=String;</b> <b>Default=Val;</b>	Enables entry of a string value, up to 255 characters in length, and a default text string. For longer texts, use Type=Memo.	Type= <a href="#">Memo</a> <sup>[1112]</sup>
URL	<b>Type=URL;</b> <b>Default=Val;</b>	Enables entry of a web URL. The URL should start with: <ul style="list-style-type: none"> <li>• 'http://'</li> <li>• 'https://'</li> <li>• 'www.'</li> </ul> You can set a default URL as a string value.	

#### Tag Filters:

The following table details filters that can be used to restrict where a Tagged Value can be applied.

Filter	Format	Description	See also
Applies To	<b>AppliesTo=Type1,Type2;</b>	Restricts the element types this filter can be applied to, where <b>Type1</b> and <b>Type2</b> are the valid types.  Possible values are: <ul style="list-style-type: none"> <li>• all element types</li> <li>• all connector types</li> <li>• Attribute</li> <li>• Operation and</li> <li>• OperationParameter.</li> </ul>	
BaseStereotype	<b>BaseStereotype=S1,S2;</b>	Restricts the stereotypes that this tag belongs to, where <b>S1</b> and <b>S2</b> are the allowed stereotypes.

#### 6.10.1.4.4 Create Reference Data Tagged Values

To create your own Tagged Value based on a predefined Reference Data Tagged Value Type, follow the steps below:

Step	Description	See Also
1	Select the <b>Settings   UML Types</b> menu option The UML Types dialog displays; select the Tagged Value Types tab	
2	In the <b>Tag</b> field type an appropriate Tagged Value name	
3	In the <b>Description</b> field type a description of the purpose of the Tagged Value, if required	
4	In the <b>Detail</b> field copy-and-paste or type the syntax of the predefined Reference Data Tagged Value Type This enables you to assign any of the previously defined Authors to a model feature	<a href="#">Model Elements and Features with Tagged Values</a> <sup>[764]</sup>

**Notes:**

- If the values in the reference data are changed after the Tagged Value Type is created, Enterprise Architect must be reloaded in order to reflect the changes in the Tagged Value Type

**Learn More:**

- [Predefined Reference Data](#)<sup>[1114]</sup>

**6.10.1.4.5 Create Custom Tagged Value Type**

Custom masked Tagged Values give you great flexibility in designing model components that accept data entries.

**How to:**

To create a masked Tagged Value follow the steps below:

Step	Action	See Also
1	Select the <b>Settings   UML Types</b> menu option The UML Types dialog displays; select the Tagged Value Types tab	
2	In the <b>Tag</b> field type an appropriate name for the Tagged Value	
3	In the <b>Description</b> field type the purpose of the Tagged Value, if required	
4	In the <b>Detail</b> field type <b>Type=Custom;</b>	

The type **Custom** enables you to set up the appropriate mask, using the following characters to define the format of the mask:

Mask	Description
<b>D</b>	Enables the Tagged Value to display digits only.
<b>d</b>	Enables the Tagged Value to display digits or spaces.
<b>+</b>	Enables the use of <b>+</b> , <b>-</b> or <i>spaces</i> .
<b>C</b>	Enables the use of alpha characters only.
<b>c</b>	Enables the Tagged Value to be an alpha character or a space.
<b>A</b>	Enables the use of alphanumeric characters.
<b>a</b>	Enables the Tagged Value to use alphanumeric values or a space.

In the diagram below the **Mask** configuration option shows syntax that first defines seven blank spaces, which are occupied by characters determined by the template option. The first two visible characters in the **Mask** option are represented by a lower case **c** indicating that the enableable information can entered as either an alpha character or as a space. The following blank spaces again indicate space defined by the template option and the remaining characters are defined by the **d** character, which represents the enableable characters as digits or spaces. The hyphen is present in the final output, splitting up the digits.

With the **Template** configuration option, the syntax defines the template of the masked option by occupying the blank spaces that are present in the **Mask** option. The template is used to ensure that this information is

present with every use of this custom Tagged Value. The underscored values indicate the area that is to be occupied by data input by the user as defined in the **Mask** option.

The screenshot shows the 'Tagged Value Types' dialog box. At the top, there are three tabs: 'Stereotypes', 'Tagged Value Types', and 'Cardinality Values'. The 'Tagged Value Types' tab is active. Below the tabs, there are two input fields: 'Tag Name:' with the value 'MemberZip' and 'Description:' with the value 'Zip Code'. Below these is a 'Detail:' section with a text area containing the following text: 'Type=Custom:', 'Mask= cc dddd.dddd;', and 'Template=State: \_\_Zip: \_\_\_\_; \_\_\_\_;'. To the right of the text area is a vertical scrollbar. Below the 'Detail' section are three buttons: 'New', 'Save', and 'Delete'. At the bottom of the dialog is a 'Defined Tag Types:' section with a table. The table has two columns: 'Type' and 'Description'. The table contains the following rows: 'IORules' with description 'IORules', 'MemberZip' with description 'Zip Code' (highlighted in blue), 'Message', and 'OutMessage'.

### 6.10.1.5 Code Template Framework

The Code Template Framework (CTF) is used during forward engineering of UML models. This section discusses how you customize the way in which Enterprise Architect generates source code, using the [Code Template Editor](#).<sup>[1150]</sup>

Enterprise Architect's code templates specify the transformation from UML elements to the various parts of a given programming language. The templates are written as plain text with a [syntax](#)<sup>[1117]</sup> that shares some aspects of both mark-up languages and scripting languages. The Base Templates provided in Enterprise Architect are described in the [Base Templates](#)<sup>[1492]</sup> topic.

#### 6.10.1.5.1 Code Template Syntax

Code Templates are written as plain text, using Enterprise Architect's code template editor (see [The Code Template Editor](#)<sup>[1150]</sup>). The template syntax centers on three basic constructs:

- [Literal Text](#)<sup>[1117]</sup>
- [Macros](#)<sup>[1118]</sup>
- [Variables](#)<sup>[1148]</sup>

Templates can contain any or all of these constructs.

##### 6.10.1.5.1.1 Literal Text

All text within a given template that is not part of a macro or a variable definition/reference, is considered literal text. With the exception of blank lines, which are ignored, literal text is directly substituted from the template into the generated code.

Consider the following excerpt from the java Class Declaration template:

```
%PI = " " %
%CONVERT_SCOPE( classScope ) %

%classStereotype=="static" ? "static": " " %
```

```

%classStereotype=="final" ? "final": "" %
%classStereotype=="static final" ? "static final": "" %
%classAbstract=="T" ? "abstract": "" %
%PI="" %
class %className%$bases

```

On the final line, the word *class*, including the subsequent space, would be treated as literal text and thus reproduced in the output. The blank line following the *CONVERT\_SCOPE* macro, however, would have no effect on the output.

The %, \$ and " characters have special meaning in the template syntax and cannot always be used as literal text. If these characters must be generated from within the templates, they can be safely reproduced using the following direct substitution macros:

Macro	Action
%dl%	Produce a literal \$ character.
%pc%	Produce a literal % character.
%qt%	Produce a literal " character.

#### 6.10.1.5.1.2 Macros

Macros provide access to element fields within the UML model and are also used to structure the generated output. All macros are enclosed within percent (%) signs. The CTF contains six basic types of macros:

- [Template substitution macros](#) <sup>[1118]</sup>
- [Field substitution macros](#) <sup>[1119]</sup>
- [Tagged Value substitution macros](#) <sup>[1132]</sup>
- [Control macros](#) <sup>[1136]</sup>
- [Function macros](#) <sup>[1133]</sup>
- [EASL code generation macros](#) <sup>[1139]</sup>

In general, macros (including the % delimiters) are substituted with literal text in the output. For example consider the following item from the *Class Declaration* template:

```
... class %className% ...
```

The field substitution macro, *%className%*, would result in the current Class name being substituted in the output. So if the Class being generated was named *Foo*, the output would be:

```
... class Foo ...
```

*Template substitution* macros correspond to [Base templates](#) <sup>[1492]</sup>. These macros result in the execution of the named template. By convention, template macros are named according to Pascal casing.

Structure: %<TemplateName>%

where <TemplateName> can be one of the templates listed below.

When a template is referenced from within another template, it is generated with respect to the elements currently in scope. The specific template is selected based on the stereotypes of the elements in scope.

As noted previously, there is an implicit hierarchy among the various templates. Some care should be taken in order to preserve a sensible hierarchy of template references. For example, it does not make sense to use the *%ClassInherits%* macro within any of the attribute or operation templates. Conversely, the *Operation* and *Attribute* templates are designed for use within the *ClassBody* template.

The CTF contains the following template substitution macros:

- AttributeDeclaration
- ClassParameter
- NamespaceBody

- AttributeNotes
- Attribute
- Class
- ClassImpl
- ClassBase
- ClassBody
- ClassBodyImpl
- ClassDeclaration
- ClassDeclarationImpl
- ClassInherits
- ClassInterface
- ClassNotes
- File
- FileImpl
- ImportSection
- ImportSectionImpl
- InnerClass
- InnerClassImpl
- LinkedAttribute
- LinkedAttributeNotes
- LinkedAttributeDeclaration
- LinkedClassBase
- LinkedClassInterface
- Namespace
- NamespaceDeclaration
- NamespaceImpl
- Operation
- OperationBody
- OperationBodyImpl
- OperationDeclaration
- OperationDeclarationImpl
- OperationImpl
- OperationNotes
- Parameter

The *field substitution* macros provide access to data in the model. In particular, they are used to access data fields from:

- Packages
- Classes
- Attributes
- Operations
- Parameters.

Field substitution macros are named according to Camel casing. By convention, the macro is prefixed with an abbreviated form of the corresponding model element. For example, attribute-related macros begin with **att**, as in the `%attName%` macro, to access the name of the attribute in scope.

Macros that represent checkboxes return a value of T if the box is selected. Otherwise the value is empty.

The following table lists each of the field substitution macros with a description of the result.

Macro Name	Description
attAlias	<b>Attributes</b> dialog: <b>Alias</b> .
attAllowDuplicates	<b>Attributes Detail</b> dialog: <b>Allow Duplicates</b> checkbox.
attClassifierGUID	The unique GUID for the classifier of the current attribute.
attCollection	<b>Attributes Detail</b> dialog: <b>Attribute is a Collection</b> checkbox.
attConst	<b>Attributes</b> dialog: <b>Const</b> checkbox.
attContainerType	<b>Attributes Detail</b> dialog: <b>Container Type</b> .
attContainment	<b>Attributes</b> dialog: <b>Containment</b> .
attDerived	<b>Attributes</b> dialog: <b>Derived</b> checkbox.
attGUID	The unique GUID for the current attribute.
attInitial	<b>Attributes</b> dialog: <b>Initial</b> .
attIsEnumLiteral	<b>Attributes</b> dialog: <b>Is Literal</b> checkbox.
attLength	<b>Column</b> dialog: <b>Length</b> .

Macro Name	Description
attLowerBound	<b>Attributes Detail</b> dialog: <b>Lower Bound</b> .
attName	<b>Attributes</b> dialog: <b>Name</b> .
attNotes	<b>Attributes</b> dialog: <b>Notes</b> .
attOrderedMultiplicity	<b>Attributes Detail</b> dialog: <b>Ordered Multiplicity</b> checkbox.
attProperty	<b>Attributes</b> dialog: <b>Property</b> checkbox.
attQualType	The attribute type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the attribute classifier has not been set, is equivalent to the <i>attType</i> macro.
attScope	<b>Attributes</b> dialog: <b>Scope</b> .
attStatic	<b>Attributes</b> dialog: <b>Static</b> checkbox.
attStereotype	<b>Attributes</b> dialog: <b>Stereotype</b> .
attType	<b>Attributes</b> dialog: <b>Type</b> .
attUpperBound	<b>Attributes Detail</b> dialog: <b>Upper Bound</b> .
attVolatile	<b>Attributes Detail</b> dialog: <b>Transient</b> checkbox.
classAbstract	<b>Class</b> dialog: <b>Abstract</b> checkbox.
classAlias	<b>Class</b> dialog: <b>Alias</b> .
classArguments	<b>Class Detail</b> dialog: <b>C++ Templates: Arguments</b> .
classAuthor	<b>Class</b> dialog: <b>Author</b> .
classBaseName	<b>Type Hierarchy</b> dialog: <b>Class Name</b> (for use where no connector exists between child and base Classes).
classBaseScope	The scope of the inheritance as reverse engineered. (For use where no connector exists between child and base Classes.)
classBaseVirtual	The virtual property of the inheritance as reverse engineered. (For use where no connector exists between child and base Classes.)
classComplexity	<b>Class</b> dialog: <b>Complexity</b> .
classCreated	The date and time the Class was created.
classGUID	The unique GUID for the current Class.
classHasConstructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns <b>T</b> if one is a default constructor. Typically used with the <a href="#">genOptGenConstructor</a> <sup>[1125]</sup> macro.
classHasCopyConstructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns <b>T</b> if one is a copy constructor. Typically used with the <a href="#">genOptGenCopyConstructor</a> <sup>[1125]</sup> macro.
classHasDestructor	Looks at the list of methods in the current object and, depending on the conventions of the current language, returns <b>T</b> if one is a destructor. Typically used with the <a href="#">genOptGenDestructor</a> <sup>[1125]</sup> macro.

Macro Name	Description
classHasParent	<b>True</b> , if the Class in scope has one or more base Classes.
classImports	<b>Code Gen</b> dialog: <b>Imports</b> .
classIsActive	<b>Class Advanced</b> dialog: <b>Is Active</b> checkbox.
classIsInstantiated	<b>True</b> , if the Class is an instantiated template Class.
classIsLeaf	<b>Class Advanced</b> dialog: <b>Is Leaf</b> checkbox.
classIsRoot	<b>Class Advanced</b> dialog: <b>Is Root</b> checkbox.
classIsSpecification	<b>Class Advanced</b> dialog: <b>Is Specification</b> checkbox.
classKeywords	<b>Class</b> dialog: <b>Keywords</b> .
classLanguage	<b>Class</b> dialog: <b>Language</b> .
classMacros	A space separated list of macros defined for the Class.
classModified	The date and time the Class was last modified.
classMultiplicity	<b>Class Advanced</b> dialog: <b>Multiplicity</b> .
className	<b>Class</b> dialog: <b>Name</b> .
classNotes	<b>Class</b> dialog: <b>Note</b> .
classParamDefault	<b>Class Detail</b> dialog.
classParamName	<b>Class Detail</b> dialog.
classParamType	<b>Class Detail</b> dialog.
classPersistence	<b>Class</b> dialog: <b>Persistence</b> .
classPhase	<b>Class</b> dialog: <b>Phase</b> .
classQualName	The Class name prefixed by its outer Classes. Class names are separated by double colons (::).
classScope	<b>Class</b> dialog: <b>Scope</b> .
classStereotype	<b>Class</b> dialog: <b>Stereotype</b> .
classStatus	<b>Class</b> dialog: <b>Status</b> .
classVersion	<b>Class</b> dialog: <b>Version</b> .
connectorAlias	Connector <b>Properties</b> dialog: <b>Alias</b> .
connectorDestAccess	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Access</b> .
connectorDestAggregation	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Aggregation</b> .
connectorDestAlias	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Alias</b> .
connectorDestAllowDuplicates	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Allow Duplicates</b> checkbox.
connectorDestChangeable	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Changeable</b> .
connectorDestConstraint	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Constraint(s)</b> .

Macro Name	Description
connectorDestContainment	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Containment</b> .
connectorDestDerived	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Derived</b> checkbox.
connectorDestDerivedUnion	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>DerivedUnion</b> checkbox.
connectorDestElem*	A set of macros that access a property of the element at the target end of a connector. The * (asterisk) is a wildcard that corresponds to any class substitution macro in this list; for example: <i>connectorDestElemAlias (classAlias)</i> , <i>connectorDestElemAuthor (classAuthor)</i> .
connectorDestElemType	The element type of the connector destination element. (Separate from the <i>connectorDestElem*</i> macros because there is no <i>classType</i> substitution macro.)
connectorDestMemberType	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Member Type</b> .
connectorDestMultiplicity	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Multiplicity</b> .
connectorDestNavigability	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Navigability</b> .
connectorDestNotes	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Role Notes</b> .
connectorDestOrdered	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Ordered</b> checkbox.
connectorDestOwned	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Owned</b> checkbox.
connectorDestQualifier	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Qualifier(s)</b> .
connectorDestRole	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Role</b> .
connectorDestScope	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Target Scope</b> .
connectorDestStereotype	Connector <b>Properties</b> dialog, <b>Target Role</b> tab: <b>Stereotype</b> .
connectorDirection	Connector <b>Properties</b> : <b>Direction</b> .
connectorEffect	<b>Transition Constraints</b> dialog: <b>Effect</b> .
connectorGuard	<b>Object Flow</b> and <b>Transition Constraints</b> dialog: <b>Guard</b> .
connectorGUID	The unique GUID for the current connector.
connectorName	Connector <b>Properties</b> : <b>Name</b> .
connectorNotes	Connector <b>Properties</b> : <b>Notes</b> .
connectorSourceAccess	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Access</b> .
connectorSourceAggregation	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Aggregation</b> .
connectorSourceAlias	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Alias</b> .
connectorSourceAllowDuplicates	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Allow Duplicates</b> checkbox.
connectorSourceChangeable	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Changeable</b> .
connectorSourceConstraint	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Constraint(s)</b> .
connectorSourceContainment	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Containment</b> .

Macro Name	Description
connectorSourceDerived	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Derived</b> checkbox.
connectorSourceDerivedUnion	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>DerivedUnion</b> checkbox.
connectorSourceElem*	A set of macros that access a property of the element at the source end of a connector. The * (asterisk) is a wildcard that corresponds to any class substitution macro in this list; for example: <i>connectorSourceElemAlias (classAlias)</i> , <i>connectorSourceElemAuthor (classAuthor)</i> .
connectorSourceElemType	The element type of the connector source element. (Separate from the <i>connectorSourceElem*</i> macros because there is no <i>classType</i> substitution macro.)
connectorSourceMemberType	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Member Type</b> .
connectorSourceMultiplicity	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Multiplicity</b> .
connectorSourceNavigability	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Navigability</b> .
connectorSourceNotes	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Role Notes</b> .
connectorSourceOrdered	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Ordered</b> checkbox.
connectorSourceOwned	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Owned</b> checkbox.
connectorSourceQualifier	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Qualifier(s)</b> .
connectorSourceRole	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Role</b> .
connectorSourceScope	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Target Scope</b> .
connectorSourceStereotype	Connector <b>Properties</b> dialog, <b>Source Role</b> tab: <b>Stereotype</b> .
connectorStereotype	Connector <b>Properties</b> dialog: <b>Stereotype</b> .
connectorTrigger	<b>Transition Constraints</b> dialog: <b>Trigger</b> .
connectorType	The connector type; for example, Association or Generalization.
connectorWeight	<b>Object Flow Constraints</b> dialog: <b>Weight</b> .
constraintName	<b>Class</b> dialog, <b>Constraints</b> tab: <b>Name</b> .
constraintNotes	<b>Class</b> dialog, <b>Constraints</b> tab: <b>Notes</b> .
constraintStatus	<b>Class</b> dialog, <b>Constraints</b> tab: <b>Status</b> .
constraintType	<b>Class</b> dialog, <b>Constraints</b> tab: <b>Type</b> .
constraintWeight	<b>Class</b> dialog, <b>Constraints</b> tab: ordering (hand up/down) keys.
eaDateTime	The current time with format: <i>DD-MMM-YYYY HH:MM:SS AM/PM</i> .
eaGUID	A unique GUID for this generation.
eaVersion	Program Version (Located in an Enterprise Architect dialog by selecting <b>Help   About EA</b> ).
effortName	<b>Project Management</b> window: <b>Effort</b> .
effortNotes	<b>Project Management</b> window: <b>Notes</b> (unlabelled).

Macro Name	Description
effortTime	<b>Project Management</b> window: <b>Time</b> .
effortType	<b>Project Management</b> window: <b>Type</b> .
elemType	The element type: Interface or Class.
fileExtension	The file type extension of the file being generated.
fileName	The name of the file being generated.
fileNameImpl	The filename of the implementation file for this generation, if applicable.
fileHeaders	<b>Code Gen</b> dialog: <b>Headers</b> .
fileImports	<b>Code Gen</b> dialog: <b>Imports</b> . For supported languages this also includes dependencies derived from associations.
filePath	The full path of the file being generated.
filePathImpl	The full path of the implementation file for this generation, if applicable.
genOptActionScriptVersion	<b>ActionScript Specifications</b> dialog: <b>Default Version</b> .
genOptCDefaultAttributeType	<b>C Specifications</b> dialog: <b>Default Attribute Type</b> .
genOptCGenMethodNotesInBody	<b>C Specifications</b> dialog: <b>Method Notes In Implementation</b> .
genOptCGenMethodNotesInHeader	<b>C Specifications</b> dialog: <b>Method Notes In Header</b> .
genOptCSynchNotes	<b>C Specifications</b> dialog: <b>Synchronize Notes in Generation</b> .
genOptCSynchCFile	<b>C Specifications</b> dialog: <b>Synchronise Implementation file in Generation</b> .
genOptCDefaultSourceDirectory	<b>C Specifications</b> dialog: <b>Default Source Directory</b> .
genOptCNamespaceDelimiter	<b>C Specifications</b> dialog: <b>Namespace Delimiter</b> .
genOptCOperationRefParam	<b>C Specifications</b> dialog: <b>Reference as Operation Parameter</b> .
genOptCOperationRefParamStyle	<b>C Specifications</b> dialog: <b>Reference Parameter Style</b> .
genOptCOperationRefParamName	<b>C Specifications</b> dialog: <b>Reference Parameter Name</b> .
genOptCConstructorName	<b>C Specifications</b> dialog: <b>Default Constructor Name</b> .
genOptCDestructorName	<b>C Specifications</b> dialog: <b>Default Destructor Name</b> .
genOptCPPCommentStyle	<b>C++ Specifications</b> dialog: <b>Comment Style</b> .
genOptCPPDefaultAttributeType	<b>C++ Specifications</b> dialog: <b>Default Attribute Type</b> .
genOptCPPDefaultReferenceType	<b>C++ Specifications</b> dialog: <b>Default Reference Type</b> .
genOptCPPDefaultSourceDirectory	<b>C++ Specifications</b> dialog: <b>Default Source Directory</b> .
genOptCPPGenMethodNotesInHeader	<b>C++ Specifications</b> dialog: <b>Method Notes In Header</b> checkbox.

Macro Name	Description
genOptCPPGenMethodNotesInBody	<b>C++ Specifications</b> dialog: <b>Method Notes In Body</b> checkbox.
genOptCPPGetPrefix	<b>C++ Specifications</b> dialog: <b>Get Prefix</b> .
genOptCPPHeaderExtension	<b>C++ Specifications</b> dialog: <b>Header Extension</b> .
genOptCPPSetPrefix	<b>C++ Specifications</b> dialog: <b>Set Prefix</b> .
genOptCPPSourceExtension	<b>C++ Specifications</b> dialog: <b>Source Extension</b> .
genOptCPPSynchCPPFile	<b>C++ Specifications</b> dialog: <b>Synchronize Notes</b> .
genOptCPPSynchNotes	<b>C++ Specifications</b> dialog: <b>Synchronize CPP File</b> .
genOptCSDefaultAttributeType	<b>C# Specifications</b> dialog: <b>Default Attribute Type</b> .
genOptCSSourceExtension	<b>C# Specifications</b> dialog: <b>Default file extension</b> .
genOptCSGenDispose	<b>C# Specifications</b> dialog: <b>Generate Dispose</b> .
genOptCSGenFinalizer	<b>C# Specifications</b> dialog: <b>Generate Finalizer</b> .
genOptCSGenNamespace	<b>C# Specifications</b> dialog: <b>Generate Namespace</b> .
genOptCSDefaultSourceDirectory	<b>C# Specifications</b> dialog: <b>Default Source Directory</b> .
genOptDefaultAssocAttName	<b>Attribute Specifications</b> dialog: <b>Default name for associated attrib.</b>
genOptDefaultConstructorScope	<b>Object Lifetimes</b> dialog: <b>Default Constructor Visibility</b> .
genOptDefaultCopyConstructorScope	<b>Object Lifetimes</b> dialog: <b>Default Copy Constructor Visibility</b> .
genOptDefaultDatabase	<b>Code Editors</b> dialog: <b>Default Database</b> .
genOptDefaultDestructorScope	<b>Object Lifetimes</b> dialog: <b>Default Destructor Constructor Visibility</b> .
genOptGenCapitalisedProperties	<b>Source Code Engineering</b> dialog: <b>Capitalize Attribute Names for Properties</b> checkbox.
genOptGenComments	<b>Source Code Engineering</b> dialog: <b>Generate Comments</b> checkbox.
genOptGenConstructor	<b>Object Lifetimes</b> dialog: <b>Generate Constructor</b> checkbox.
genOptGenConstructorInline	<b>Object Lifetimes</b> dialog: <b>Constructor Inline</b> checkbox.
genOptGenCopyConstructor	<b>Object Lifetimes</b> dialog: <b>Generate Copy Constructor</b> checkbox.
genOptGenCopyConstructorInline	<b>Object Lifetimes</b> dialog: <b>Copy Constructor Inline</b> checkbox.
genOptGenDestructor	<b>Object Lifetimes</b> dialog: <b>Generate Destructor</b> checkbox.
genOptGenDestructorInline	<b>Object Lifetimes</b> dialog: <b>Destructor Inline</b> checkbox.
genOptGenDestructorVirtual	<b>Object Lifetimes</b> dialog: <b>Virtual Destructor</b> checkbox.
genOptGenImplementedInterfaceOps	<b>Attribute/Operations Specifications</b> dialog: <b>Generate methods for implemented interfaces</b> checkbox.
genOptGenPrefixBoolProperties	<b>Source Code Engineering</b> dialog: <b>Use is prefix for boolean property Get()</b> .

Macro Name	Description
genOptGenRoleNames	<b>Source Code Engineering</b> dialog: <b>Autogenerate role names when creating code.</b>
genOptGenUnspecAssocDir	<b>Source Code Engineering</b> dialog: <b>Do not generate members where Association direction is unspecified</b> checkbox.
genOptJavaDefaultAttributeType	<b>Java Specifications</b> dialog: <b>Default attribute type.</b>
genOptJavaGetPrefix	<b>Java Specifications</b> dialog: <b>Get Prefix.</b>
genOptJavaDefaultSourceDirectory	<b>Java Specifications</b> dialog: <b>Default Source Directory.</b>
genOptJavaSetPrefix	<b>Java Specifications</b> dialog: <b>Set Prefix.</b>
genOptJavaSourceExtension	<b>Java Specifications</b> dialog: <b>Source code extension.</b>
genOptPHPDefaultSourceDirectory	<b>PHP Specifications</b> dialog: <b>Default Source Directory.</b>
genOptPHPGetPrefix	<b>PHP Specifications</b> dialog: <b>Get Prefix.</b>
genOptPHPSetPrefix	<b>PHP Specifications</b> dialog: <b>Set Prefix.</b>
genOptPHPSourceExtension	<b>PHP Specifications</b> dialog: <b>Default file extension.</b>
genOptPHPVersion	<b>PHP Specifications</b> dialog: <b>PHP Version.</b>
genOptPropertyPrefix	<b>Source Code Engineering</b> dialog: <b>Remove prefixes when generating Get/Set properties.</b>
genOptVBMultiUse	<b>VB Specifications</b> dialog: <b>Multiuse</b> checkbox.
genOptVBPersistable	<b>VB Specifications</b> dialog: <b>Persistable</b> checkbox.
genOptVBDataBindingBehavior	<b>VB Specifications</b> dialog: <b>Data binding behavior</b> checkbox.
genOptVBDataSourceBehavior	<b>VB Specifications</b> dialog: <b>Data source behavior</b> checkbox.
genOptVBGlobal	<b>VB Specifications</b> dialog: <b>Global namespace</b> checkbox.
genOptVBCreatable	<b>VB Specifications</b> dialog: <b>Creatable</b> checkbox.
genOptVBExposed	<b>VB Specifications</b> dialog: <b>Exposed</b> checkbox.
genOptVBMTS	<b>VB Specifications</b> dialog: <b>MTS Transaction Mode.</b>
genOptVBNetGenNamespace	<b>VB.Net Specifications</b> dialog: <b>Generate Namespace.</b>
genOptVBVersion	<b>VB Specifications</b> dialog: <b>Default Version.</b>
genOptWrapComment	<b>Source Code Engineering</b> dialog: <b>Wrap length for comment lines.</b>
importClassName	The name of the Class being imported.
importFileName	The filename of the Class being imported.
importFilePath	The full path of the Class being imported.
importFromAggregation	<b>T</b> if the Class has an Aggregation connector to a Class in this file, <b>F</b> otherwise.
importFromAssociation	<b>T</b> if the Class has an Association connector to a Class in this file, <b>F</b>

Macro Name	Description
	otherwise.
importFromAtt	<b>T</b> if an attribute of a Class in the current file is of the type of this Class, <b>F</b> otherwise.
importFromDependency	<b>T</b> if the Class has a Dependency connector to a Class in this file, <b>F</b> otherwise.
importFromGeneralization	<b>T</b> if the Class has a Generalization connector to a Class in this file, <b>F</b> otherwise.
importFromMeth	<b>T</b> if a method return type of a Class in the current file is the type of this Class, <b>F</b> otherwise.
importFromParam	<b>T</b> if a method parameter of a Class in the current file is of the type of this Class, <b>F</b> otherwise.
importFromRealization	<b>T</b> if the Class has a Realization connector to a Class in this file, <b>F</b> otherwise.
importInFile	<b>T</b> if the Class is in the current file, <b>F</b> otherwise.
importPackagePath	The package path with a '.' separator of the Class being imported.
importRelativeFilePath	The relative file path of the Class being imported from the file path of the file being generated.
linkAttAccess	<b>Association Properties Target Role</b> dialog: <b>Access</b> .
linkAttCollectionClass	The collection appropriate for the linked attribute in scope.
linkAttContainment	<b>Association Properties Target Role</b> dialog: <b>Containment</b> .
linkAttName	<b>Association Properties</b> dialog: <b>Target</b> .
linkAttNotes	<b>Association Properties Target Role</b> dialog: <b>Role Notes</b> .
linkAttQualName	The Association target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).
linkAttRole	<b>Association Properties Target Role</b> dialog: <b>Role</b> .
linkAttStereotype	<b>Association Properties Target Role</b> dialog: <b>Stereotype</b> .
linkAttTargetScope	<b>Association Properties Target Role</b> dialog: <b>Target Scope</b> .
linkCard	<b>Link Properties Target Role</b> dialog: <b>Multiplicity</b> .
linkedFileLastWrite	Class <b>Properties</b> dialog: <b>Last Write</b> .
linkedFileNotes	Class <b>Properties</b> dialog: <b>Notes</b> .
linkedFilePath	Class <b>Properties</b> dialog: <b>File Path</b> .
linkedFileSize	Class <b>Properties</b> dialog: <b>Size</b> .
linkedFileType	Class <b>Properties</b> dialog: <b>Type</b> .
linkGUID	The unique GUID for the current connector.
linkParentName	<b>Generalization Properties</b> dialog: <b>Target</b> .

Macro Name	Description
linkParentQualName	The Generalization target qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited).
linkStereotype	The stereotype of the current connector.
linkVirtualInheritance	<b>Generalization Properties</b> dialog: <b>Virtual Inheritance</b> .
metricName	<b>Project Management</b> dialog, <b>Metrics</b> tab: <b>Metric</b> field.
metricNotes	<b>Project Management</b> dialog, <b>Metrics</b> tab: (Notes) field.
metricType	<b>Project Management</b> dialog, <b>Metrics</b> tab: <b>Type</b> field.
metricWeight	<b>Project Management</b> dialog, <b>Metrics</b> tab: <b>Weight</b> field.
opAbstract	<b>Operation</b> dialog: <b>Virtual</b> checkbox.
opAlias	<b>Operation</b> dialog: <b>Alias</b> .
opBehavior	<b>Operation Behavior</b> dialog: <b>Behavior</b> .
opCode	<b>Operation Behavior</b> dialog: <b>Initial Code</b> .
opConcurrency	<b>Operation</b> dialog: <b>Concurrency</b> .
opConst	<b>Operation</b> dialog: <b>Const</b> checkbox.
opGUID	The unique GUID for the current operation.
opImplMacros	A space-separated list of macros defined in the implementation of this operation.
opIsQuery	<b>Operation</b> dialog: <b>IsQuery</b> checkbox.
opMacros	A space-separated list of macros defined in the declaration for this operation.
opName	<b>Operation</b> dialog: <b>Name</b> .
opNotes	<b>Operation</b> dialog: <b>Notes</b> .
opPure	<b>Operation</b> dialog: <b>Pure</b> checkbox.
opReturnArray	<b>Operation</b> dialog: <b>Return Array</b> checkbox.
opReturnClassifierGUID	The unique GUID for the classifier of the current operation.
opReturnQualType	The operation return type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the return type classifier has not been set, is equivalent to the <i>opReturnType</i> macro.
opReturnType	<b>Operation</b> dialog: <b>Return Type</b> .
opScope	<b>Operation</b> dialog: <b>Scope</b> .
opStatic	<b>Operation</b> dialog: <b>Static</b> checkbox.
opStereotype	<b>Operation</b> dialog: <b>Stereotype</b> .
opSynchronized	<b>Operation</b> dialog: <b>Synchronized</b> checkbox.
packageAbstract	<b>Package</b> dialog: <b>Abstract</b> .

Macro Name	Description
packageAlias	<b>Package</b> dialog: <b>Alias</b> .
packageAuthor	<b>Package</b> dialog: <b>Author</b> .
packageComplexity	<b>Package</b> dialog: <b>Complexity</b> .
packageGUID	The unique GUID for the current package.
packageKeywords	<b>Package</b> dialog: <b>Keywords</b> .
packageLanguage	<b>Package</b> dialog: <b>Language</b> .
packageName	<b>Package</b> dialog: <b>Name</b> .
packagePath	The string representing the hierarchy of packages, for the Class in scope. Each package name is separated by a dot (.).
packagePhase	<b>Package</b> dialog: <b>Phase</b> .
packageScope	<b>Package</b> dialog: <b>Scope</b> .
packageStatus	<b>Package</b> dialog: <b>Status</b> .
packageStereotype	<b>Package</b> dialog: <b>Stereotype</b> .
packageVersion	<b>Package</b> dialog: <b>Version</b> .
paramClassifierGUID	The unique GUID for the classifier of the current parameter.
paramDefault	<b>Operation Parameters</b> dialog: <b>Default</b> .
paramFixed	<b>Operation Parameters</b> dialog: <b>Fixed</b> checkbox.
paramGUID	The unique GUID for the current parameter.
paramIsEnum	<b>True</b> , if the parameter uses the <i>enum</i> keyword (C++).
paramKind	<b>Operation Parameters</b> dialog: <b>Kind</b> .
paramName	<b>Operation Parameters</b> dialog: <b>Name</b> .
paramNotes	<b>Operation Parameters</b> dialog: <b>Notes</b> .
paramQualType	The parameter type qualified by the namespace path (if generating namespaces) and the classifier path (dot delimited). If the parameter classifier has not been set, is equivalent to the <i>param Type</i> macro.
paramType	<b>Operation Parameters</b> dialog: <b>Type</b> .
problemCompletedBy	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Completed by</b> .
problemCompletedDate	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Completed</b> .
problemHistory	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>History</b> .
problemName	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Name</b> .
problemNotes	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Description</b> .
problemPriority	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Priority</b> .
problemRaisedBy	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Raised by</b> .

Macro Name	Description
problemRaisedDate	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Raised</b> .
problemStatus	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Status</b> .
problemVersion	<b>Maintenance</b> dialog, <b>Element Issues</b> tab: <b>Version</b> .
requirementDifficulty	<b>Properties</b> dialog: <b>Require</b> tab: <b>Difficulty</b> .
requirementLastUpdated	<b>Properties</b> dialog: <b>Require</b> tab: <b>Last Update</b> .
requirementName	<b>Properties</b> dialog: <b>Require</b> tab: <b>Short Description</b> .
requirementNotes	<b>Properties</b> dialog: <b>Require</b> tab: <b>Notes</b> .
requirementPriority	<b>Properties</b> dialog: <b>Require</b> tab: <b>Priority</b> .
requirementStatus	<b>Properties</b> dialog: <b>Require</b> tab: <b>Status</b> .
requirementType	<b>Properties</b> dialog: <b>Require</b> tab: <b>Type</b> .
resourceAllocatedTime	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Allocated Time</b> .
resourceEndDate	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>End Date</b> .
resourceExpectedTime	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Expected Time</b> .
resourceExpendedTime	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Time Expended</b> .
resourceHistory	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>History</b> .
resourceName	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Resource</b> .
resourceNotes	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Description</b> .
resourcePercentCompleted	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Completed (%)</b> .
resourceRole	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Role</b> .
resourceStartDate	<b>Project Management</b> window, <b>Resource Allocation</b> tab: <b>Start Date</b> .
riskName	<b>Project Management</b> window, <b>Risks</b> tab: <b>Risk</b> .
riskNotes	<b>Project Management</b> window, <b>Risks</b> tab: (Notes).
riskType	<b>Project Management</b> window, <b>Risks</b> tab: <b>Type</b> .
riskWeight	<b>Project Management</b> window, <b>Risks</b> tab: <b>Weight</b> .
scenarioGUID	The unique ID for a scenario. Identifies the scenario unambiguously within a model.
scenarioName	<b>Properties</b> dialog, <b>Scenario</b> tab: <b>Scenario</b> .
scenarioNotes	<b>Properties</b> dialog, <b>Scenario</b> tab: (Notes).
scenarioType	<b>Properties</b> dialog, <b>Scenario</b> tab: <b>Type</b> .
testAcceptanceCriteria	<b>Testing</b> window: <b>Acceptance Criteria</b> .

Macro Name	Description
testCheckedBy	<b>Testing</b> window: <b>Checked By</b> .
testDateRun	<b>Testing</b> window: <b>Last Run</b> .
testClass	The <b>Testing</b> window tab (the type of test defined): <b>Unit, Integration, System, Acceptance, Scenario</b> .
testInput	<b>Testing</b> window: <b>Input</b> .
testName	<b>Testing</b> window: <b>Test</b> .
testNotes	<b>Testing</b> window: <b>Description</b> .
testResults	<b>Testing</b> window: <b>Results</b> .
testRunBy	<b>Testing</b> window: <b>Run By</b> .
testStatus	<b>Testing</b> window: <b>Status</b> .
testType	<b>Testing</b> window: <b>Type</b> .

Field substitution macros can be used in one of two ways:

#### Use 1: Direct Substitution

This form directly substitutes the corresponding value of the element in scope into the output.

Structure: %<macroName>%

Where <macroName> can be any of the macros listed above.

#### **Examples:**

- %className%
- %opName%
- %attName%

#### Use 2: Conditional Substitution

This form of the macro enables alternative substitutions to be made depending on the macro's value.

Structure: %<macroName> ( == "<text>" ) ? <subTrue> ( : <subFalse> ) %

Where:

- ( <text> ) denotes that <text> is optional
- <text> is a string representing a possible value for the macro
- <subTrue> and <subFalse> can be a combination of quoted strings and the keyword value; where the value is used, it is replaced with the macro's value in the output.

#### **Examples:**

- %classAbstract=="T" ? "pure" : ""%
- %opStereoType=="operator" ? "operator" : ""%
- %paramDefault!="" ? "=" value : ""%

The above three examples output nothing if the condition fails. In this case the false condition can be omitted, resulting in the following usage:

### Examples:

- `%classAbstract=="T" ? "pure" %`
- `%opStereotype=="operator" ? "operator" %`
- `%paramDefault != "" ? " = " value%`

The third example of both blocks shows a comparison checking for a non-empty value or existence. This test can also be omitted.

- `%paramDefault ? " = " value : "" %`
- `%paramDefault ? " = " value%`

All of the above examples containing `paramDefault` are equivalent. If the parameter in scope had a default value of **10**, the output from each of them would normally be:

`= 10`

### Notes:

- In a conditional substitution macro, any white space following `<macroName>` is ignored; if white space is required in the output, it should be included within the quoted substitution strings

*Tagged Value* macros are a special form of field substitution macros, which provide access to element tags and the corresponding Tagged Values.

### Use 1: Direct Substitution

This form of the macro directly substitutes the value of the named tag into the output.

Structure: `%<macroName>: " <tagName> " %`

`<macroName>` can be one of:

- `attTag`
- `classTag`
- `connectorDestElemTag`
- `connectorDestTag`
- `connectorSourceElemTag`
- `connectorSourceTag`
- `connectorTag`
- `linkAttTag`
- `linkTag`
- `opTag`
- `packageTag`
- `paramTag`

This corresponds to the tags for attributes, Classes, operations, packages, parameters, connectors with both ends, elements at both ends of connectors and connectors including the attribute end.

`<tagName>` is a string representing the specific tag name.

### Examples:

`%opTag: " attribute " %`

### Use 2: Conditional Substitution

This form of the macro mimics the conditional substitution defined for field substitution macros.

Structure: `%<macroName>: "<tagName>" ( == "<test>" ) ? <subTrue> ( : <subFalse> ) %`

Where:

- `<macroName>` and `<tagName>` are as defined above
- `( <text> )` denotes that `<text>` is optional
- `<test>` is a string representing a possible value for the macro
- `<sub True>` and `<sub False>` can be a combination of quoted strings and the keyword value. Where the value is used, it gets replaced with the macro's value in the output.

### Examples:

```
%opTag: "oplnline" ? "inline" : "" %
%opTag: "oplnline" ? "inline" %
%classTag: "unsafe" == "true" ? "unsafe" : "" %
%classTag: "unsafe" == "true" ? "unsafe" %
```

Tagged Value macros use the same naming convention as field substitution macros.

*Function macros* are a convenient way of manipulating and formatting various element data. Each function macro returns a result string. There are two primary ways to use the results of function macros:

- Direct substitution of the returned string into the output, such as: `%TO_LOWER(attName)%`
- Storing the returned string as part of a variable definition such as: `$name = %TO_LOWER(attName)%`

Function macros can take parameters, which can be passed to the macros as:

- String literals, enclosed within double quotation marks
- Direct substitution macros without the enclosing percent signs
- Variable references
- Numeric literals.

Multiple parameters are passed using a comma-separated list.

Function macros are named according to the All-Caps style, as in: `%CONVERT_SCOPE(opScope)%`

The available function macros are described below. Parameters are denoted by angle brackets, as in: `FUNCTION_NAME(<param>)`.

### **CONVERT\_SCOPE(<umlScope>)**

For use with supported languages. Converts `<umlScope>` to the appropriate scope keyword for the language being generated. The following table shows the conversion of `<umlScope>` with respect to the given language.

Language	Package	Public	Private	Protected
C++	public	public	private	protected
C#	internal	public	private	protected
Delphi	protected	public	private	protected
Java		public	private	protected
PHP	public	public	private	protected
VB	Protected	Public	Private	Protected
VB .Net	Friend	Public	Private	Protected

**COLLECTION\_CLASS(<language>)**

Gives the appropriate collection Class for the language specified for the current linked attribute.

**CSTYLE\_COMMENT(<wrap\_length>)**

Converts the notes for the element currently in scope to plain C-style comments, using `/*` and `*/`.

**DELPHI\_PROPERTIES(<scope>, <separator>, <indent>)**

Generates a Delphi property.

**DELPHI\_COMMENT(<wrap\_length>)**

Converts the notes for the element currently in scope to Delphi comments.

**EXEC\_ADD\_IN(<addin\_name>, <function\_name>, <prm\_1>, ..., <prm\_n>)**

Invokes an Enterprise Architect Add-In function, which can return a result string. `<addin_name>` and `<function_name>` specify the names of the Add-In and function to be invoked. Parameters to the Add-In function can be specified via parameters `<prm_1>` to `<prm_n>`. For example:

```
$result = %EXEC_ADD_IN( " MyAddin" , " ProcessOperation" , classGUID , opGUID ) %
```

Any function that is to be called by the `EXEC_ADD_IN` macro must have two parameters: an `EA.Repository` object, and a `Variant` array that contains any additional parameters from the `EXEC_ADD_IN` call. Return type should be `Variant`. For example:

```
Public Function ProcessOperation( Repository As EA.Repository , args As Variant ) As Variant
```

**FIND(<src>, <subString>)**

Position of the first instance of `<subString>` in `<src>`; -1 if none.

**GET\_ALIGNMENT()**

Returns a string where all of the text on the current line of output is converted into spaces and tabs.

**JAVADOC\_COMMENT(<wrap\_length>)**

Converts the notes for the element currently in scope to `javadoc`-style comments.

**LEFT(<src>, <count>)**

The first `<count>` characters of `<src>`.

**LENGTH(<src>)**

Length of `<src>`.

**MID(<src>, <count>)****MID(<src>, <start>, <count>)**

Substring of `<src>` starting at `<start>` and including `<count>` characters. Where `<count>` is omitted the rest of the string is included.

**PI(<option>, <value>, ...)**

Sets the PI for the current template to `<value>`. `<option>` controls when the new PI takes effect. Valid values are:

- *I, Immediate*: the new PI is generated before the next non-empty template line

- *N*, Next: the new PI is generated after the next non-empty template line.

Multiple pairs of options are allowed in one call. For more details, see the [description of PI](#).<sup>[1138]</sup>

**PROCESS\_END\_OBJECT(<template\_name>)**

Enables the Classes that are one Class further away from the base Class, to be transformed into objects (such as attributes, operations, packages, parameters and columns) of the base Class. <template\_name> refers to the working template that temporarily stores the data.

**REMOVE\_DUPLICATES(<source>, <separator>)**

Where <source> is a <separator> separated list; this removes any duplicate or empty strings.

**REPLACE(<string>, <old>, <new>)**

Replaces all occurrences of <old> with <new> in the given string <string>.

**RESOLVE\_OP\_NAME()**

Resolves clashes in interface names where two method-from interfaces have the same name.

**RESOLVE\_QUALIFIED\_TYPE()****RESOLVE\_QUALIFIED\_TYPE(<separator>)****RESOLVE\_QUALIFIED\_TYPE(<separator>, <default>)**

Generates a qualified type for the current attribute, linked attribute, linked parent, operation, or parameter. Enables the specification of a separator other than . and a default value for when some value is required.

**RIGHT(<src>, <count>)**

The last <count> characters of <src>.

**TO\_LOWER(<string>)**

Converts <string> to lower case.

**TO\_UPPER(<string>)**

Converts <string> to upper case.

**TRIM(<string>)****TRIM(<string>, <trimChars>)**

Removes trailing and leading white spaces from <string>. If <trimChars> is specified, all leading and trailing characters in the set of <trimChars> are removed.

**TRIM\_LEFT(<string>)****TRIM\_LEFT(<string>, <trimChars>)**

Removes the specified leading characters from <string>.

**TRIM\_RIGHT(<string>)****TRIM\_RIGHT(<string>, <trimChars>)**

Removes the specified trailing characters from <string>.

**VB\_COMMENT(<wrap\_length>)**

Converts the notes for the element currently in scope to Visual Basic style comments.

**WRAP\_COMMENT(<comment>, <wrap\_length>, <indent>, <start\_string>)**

Wraps the text <comment> at width <wrap\_length> putting <indent> and <start\_string> at the beginning of each line. For example:

```
$behavior = %WRAP_COMMENT( opBehavior, "40", " ", "//" ) %
```

<wrap\_length> must still be passed as a string, even though WRAP\_COMMENT treats this parameter as an integer.

**WRAP\_LINES(<text>, <wrap\_length>, <start\_string>(, <end\_string> ) )**

Wraps <text> as designated to be <wrap\_length>, adding <start\_string> to the beginning of every line and <end\_string> to the end of the line if it is specified.

**XML\_COMMENT(<wrap\_length>)**

Converts the notes for the element currently in scope to XML-style comments.

*Control macros* are used to control the processing and formatting of the templates. The basic types of control macro include:

- The *list* macro, for generating multiple element features, such as attributes and operations
- The branching macros, which form *if-then-else* constructs to conditionally execute parts of a template
- The PI macro, which takes effect from the next non-empty line
- A PI [function macro](#)<sup>[1133]</sup> that enables setting PI to a variable and adds the ability to set the PI that is generated before the next line
- The PI macro for formatting new lines in the output
- The synchronization macros.

In general, control macros are named according to Camel casing.

**List**

The *list* macro is used to generate multiple elements. The basic structure is:

```
%list=<Template Name> @separator=<string> @indent=<string> ( <conditions> ) %
```

where <string> is a double-quoted literal string and <TemplateName> can be one of the following template names:

- Attribute
- Class
- ClassBase
- ClassImpl
- ClassInterface
- Constraint
- Custom Template (custom templates enable you to define your own templates; for more information see [Custom Templates](#))<sup>[1150]</sup>.
- Effort
- InnerClass
- InnerClassImpl
- LinkedFile
- Metric
- Namespace
- Operation
- OperationImpl
- Parameter
- Problem

- Requirement
- Resource
- Risk
- Scenario
- Test

`<conditions>` is optional and appears the same as the conditions for *if* and *elseif* statements.

### Example:

```
%list="Attribute" @separator="\n" @indent="  "%
```

The *separator* attribute, denoted above by `@separator`, specifies the space that should be used between the list items. This excludes the last item in the list.

The *indent* attribute, denoted by `@indent`, specifies the space by which each line in the generated output should be indented.

The above example would output the result of processing the *Attribute* template, for each attribute element of the Class in scope. The resultant list would separate its items with a single new line and indent them two spaces respectively. If the Class in scope had any stereotyped attributes, they would be generated using the appropriately specialized template.

There are some special cases to consider when using the *list* macro:

- If the *Attribute* template is used as an argument to the list macro, this also generates attributes derived from associations by executing the appropriate *LinkedAttribute* template
- If the *ClassBase* template is used as an argument to the list macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassBase* template
- If the *ClassInterface* template is used as an argument to the list macro, this also generates Class bases derived from links in the model by executing the appropriate *LinkedClassInterface* template
- If *InnerClass* or *InnerClassImpl* is used as an argument to the list macro, these Classes are generated using the *Class* and *ClassImpl* templates respectively. These arguments tell Enterprise Architect that it should process the templates based on the inner Classes of the Class in scope.

### Branching (if-then-else Constructs)

The CTF supports a limited form of branching through the following macros:

- *if*
- *elseif*
- *endif*
- *endTemplate*

The basic structure of the *if* and *elseif* macros is:

```
%if <test> <operator> <test>%
```

where `<operator>` can be one of:

- `==`
- `!=`

and `<test>` can be one of:

- a string literal, enclosed within double quotation marks
- a direct substitution macro, without the enclosing percent signs
- a variable reference.

Branches can be nested, and multiple conditions can be specified using one of:

- *and*
- *or*.

When specifying multiple conditions, *and* and *or* have the same order of precedence, and conditions are processed left to right.

The *endif* or *endTemplate* macros must be used to signify the end of a branch. In addition, the *endTemplate* macro causes the template to return immediately, if the corresponding branch is being executed.

#### Example:

```
%if elementType == "Interface" %
;
%else%
%OperationBody%
%endif%
```

#### Example:

```
$bases=%d ist="ClassBase" @separator=", "%
$interfaces=%d ist="ClassInterface" @separator=", "%
%if $bases != "" and $interfaces != ""%
: $bases, $interfaces
%else self $bases != ""%
: $bases
%else self $interfaces != ""%
: $interfaces
%endif%
```

#### The PI Macro

There are two primary means of generating whitespace from the templates:

- Explicitly using the *newline*, *space* and *tab* characters (**\n**, **\t**) as part of Literal Text
- Using the *PI* macro to format lines in the template that result in non-empty substitutions in the output.

By default, each template line that generates a non-empty substitution also results in a newline being produced in the output. This behavior can be changed through the *PI* macro.

To demonstrate the use of the *PI* macro, consider the default *C# Operation* template:

```
%opTag: "Attribute" %
```

Default PI is \n, so any attributes would be on their own line

```
%PI = " "%
```

Blank lines have no effect on the output

```
%opTag: "unsafe" == "true" ?
```

Set the PI, so keywords are separated by a space

```
"unsafe" : "" %
```

```
%CONVERT_SCOPE(opScope) %
```

Any keyword that does not apply - that is, the macro produces an empty result - does not result in a space

```
%opTag: "new" == "true" ? "new" :
```

```
" " %
```

```
%opAbstract == "T" ? "abstract" :
```

```
" " %
```

```
%opConst == "T" ? "sealed" : "" %
```

```
%opStatic == "T" ? "static" : "" %
```

```
%opTag: "extern" == "true" ?
```

```
"extern" : "" %
```

Only one space is generated for this line

```
%opTag: "delegate" == "true" ?
```

```
"delegate" : "" %
```

```
%opTag: "override" == "true" ?
```

```
"override" : "" %
```

The final line in the template does not generate a space

```
%opTag: "virtual" == "true" ?
```

```
"virtual" : "" %
```

```
%opReturnType%%opReturnArray == "T"
```

```
? "( ) " : "" %
```

```
%opStereotype == "operator" ?
```

```
"operator" : "" %
```

```
%opName%( %d ist="Parameter"
```

```
@separator=", "%)
```

In the above example macros for the various keywords are to be arranged vertically for readability. In the output, however, each relevant keyword is to be separated by a single space. This is achieved by the line:

```
%PI =" " %
```

Notice how you do not specify the space between each of the possible keywords. This space is already implied by setting the PI to a single space. Essentially the PI acts as a convenience mechanism for formatting the output from within the templates.

The structure for setting the processing instruction is:

```
%PI =<value>%
```

where *<value>* can be a literal string enclosed by double quotes.

The following points apply to the *PI* macro:

- The value of the PI is not accessed explicitly
- Only template lines that result in a non-empty substitution cause the PI to be generated
- The last non-empty template line does not cause the PI to be generated
- The PI is not appended to the last substitution, regardless of which template line caused that substitution.

### **Synchronization Macros**

The *synchronization macros* are used to provide formatting hints to Enterprise Architect when inserting new sections into the source code, during forward synchronization. The values for synchronization macros must be set in the **File** templates.

The structure for setting synchronization macros is:

```
%<name>=<value>%
```

where *<name>* can be one of the macros listed below and *<value>* is a literal string enclosed by double quotes.

Macro Name	Description
<b>synchNewClassNotesSpace</b>	Space to append to a new Class note. Default value: \ n .
<b>synchNewAttributeNotesSpace</b>	Space to append to a new attribute note. Default value: \ n .
<b>synchNewOperationNotesSpace</b>	Space to append to a new operation note. Default value: \ n .
<b>synchNewOperationBodySpace</b>	Space to append to a new operation body. Default value: \ n .
<b>synchNamespaceBodyIndent</b>	Indent applied to Classes within non-global namespaces. Default value: \ t .

Enterprise Architect provides two Enterprise Architect Simulation Library (EASL) code generation macros to generate code from behavioral models. These are:

- EASL\_GET and
- EASLList.

### **EASL\_GET**

The *EASL\_GET* macro is used to retrieve a property or a collection of an EASL object. The EASL objects and the properties and collections for each object are identified in the [EASL Collections](#)<sup>[114]</sup> and [EASL Properties](#)<sup>[114]</sup> topics.

## Syntax

```
$result = %EASL_GET( <<Property>>, <<Owner ID>>, <<Name>>)
```

where:

- <<Property>> is either "Property" or "Collection"
- <<OwnerID>> is the ID of the owner object for which the property/collection is to be retrieved
- <<Name>> is the name of the property or Collection being accessed
- \$result is the returned value; this is "" if not a valid property.

## Example

```
$sPropName = %EASL_GET( " Property", $context, " Name" ) %
```

## EASLList

The *EASLList* macro is used to render each object in an EASL collection using the appropriate template.

## Syntax

```
$result = %EASLList = <<TemplateName>> @separator = <<Separator>>
@indent = <<indent>> @owner = <<OwnedID>>
@collection = <<CollectionName>> @option1 = <<OPTION1>>
@option2 = <<OPTION2>> . . . . . @optionN = <<OPTIONN>> %
```

where:

- <<TemplateName>> is the name of any [behavioral model template](#)<sup>[1140]</sup> or [custom template](#)<sup>[1150]</sup>
- <<Separator>> is a list separator (such as "\n")
- <<indent>> is any indentation to be applied to the result
- <<owner>> is the ID of the object that contains the required collection
- <<CollectionName>> is the name of the required collection
- <<OPTION1>>...<<OPTION99>> are miscellaneous options that might be passed on the template; each option is given as an additional input parameter to the template
- \$result is the resultant value; this is "" if not a valid collection.

## Example

```
$sStates = %EASLList = " State" @separator = "\n" @indent = "\t"
@owner = $StateMachineGUID @collection = " States"
@option = $sOption%
```

## Behavioral Model Templates

- Action
- Action Assignment
- Action Break
- Action Call
- Action Create
- Action Destroy
- Action If
- Action Loop
- Action Opaque
- Action Parallel
- Action RaiseEvent
- Action RaiseException

- Action Switch
- Behavior
- Behavior Body
- Behavior Declaration
- Behavior Parameter
- Call Argument
- Guard
- Property Object
- Property Declaration
- Property Notes
- State
- State CallBack
- State Enumerate
- State EnumeratedName
- StateMachine
- StateMachine HistoryVar
- Transition
- Transition Effect
- Trigger.

This topic lists the EASL collections for each of the EASL objects, as retrieved by the [EASL\\_GET](#)<sup>[1139]</sup> code generation macro.

### Action

Collection Name	Description
Arguments	The Action's arguments.
SubActions	The sub-actions of the Action.

### Behavior

Collection Name	Description
Actions	The Behavior's Actions.
Nodes	The Behavior's nodes.
Parameters	The Behavior's parameters.
Variables	The Behavior's variables.

### Classifier

Collection Name	Description
AllStateMachines	All State Machines for the Classifier.
AsynchProperties	The asynchronous properties of the Classifier.
AsynchTriggers	The asynchronous triggers of the Classifier.

Collection Name	Description
Behaviors	The behaviors of the Classifier.
Properties	The properties of the Classifier.
TimedProperties	The timed properties of the Classifier.
TimedTriggers	The timed triggers of the Classifier.
Triggers	All triggers of the Classifier.

**Construct**

Collection Name	Description
AllChildren	The Construct's children.
ClientDependencies	The client dependencies on the Construct.
StereoTypes	The stereotypes of the Construct.
SupplierDependencies	The supplier dependencies on the Construct.

**Node**

Collection Name	Description
IncomingEdges	The Node's incoming edges.
OutgoingEdges	The Node's outgoing edges.
SubNodes	The sub-nodes of the Node.

**State**

Collection Name	Description
DoBehaviors	The State's Do behaviors.
EntryBehaviors	The State's Entry behaviors.
ExitBehaviors	The State's Exit behaviors.

**StateMachine**

Collection Name	Description
AllFinalStates	The State Machine's final States.
AllStates	All States within the State Machine, including those within Submachine States.

Collection Name	Description
DerivedTransitions	The State Machine's derived transitions with the associated valid effect.
States	The States within the State Machine.
Transitions	The transitions within the State Machine.
Vertices	The State Machine's vertices.

### Transition

Collection Name	Description
Effects	The Transition's effects.
Guards	The Transition's guards.
Triggers	The Transition's triggers.

### Trigger

Collection Name	Description
TriggeredTransitions	The triggered transitions associated with the Trigger.

### Vertex

Collection Name	Description
DerivedOutgoingTransitions	The Vertex's derived outgoing transitions after traversing the pseudo-nodes.
IncomingTransitions	The Vertex's incoming transitions.
OutgoingTransitions	The Vertex's outgoing transitions.

This topic lists the EASL properties for each of the EASL objects, as retrieved by the [EASL GET](#)<sup>[1139]</sup> code generation macro.

### Action

Property Name	Description
Behavior	The Action's associated behavior ( <i>Call Behavior Action</i> or <i>Call Operation Action</i> ).
Body	The Action's body.
Context	The Action's context.
Guard	The Action's guard.
IsFinal	A check on whether the action is a final Action.

Property Name	Description
IsGuarded	A check on whether the action is a guarded Action.
IsInitial	A check on whether the action is an initial Action.
Kind	The Action's kind.
Next	The Action's next action.
Node	The Action's associated node in the graph.

#### Argument

Property Name	Description
Parameter	The ID of the Argument's associated parameter.
Value	The default value of the argument.

#### Behavior

Property Name	Description
InitialAction	The Behavior's initial action.
isReadOnly	The isReadOnly of the Behavior.
isSingleExecution	The isSingleExecution of the Behavior.
Kind	The kind of Behavior.
ReturnType	The return type of the Behavior.
Specification	The specification of the Behavior.

#### CallEvent

Property Name	Description
Operation	The operation of the CallEvent.

#### ChangeEvent

Property Name	Description
ChangeExpression	The change expression of the ChangeEvent.

#### Classifier

Property Name	Description
HasBehaviors	A check on whether the Classifier has behavioral models (Activity and Interaction).
Language	The Classifier's language.
StateMachine	The State Machine of the Classifier.

**Condition**

Property Name	Description
Expression	The Condition's expression.
Lower	The Condition's lower value.
Upper	The Condition's upper value.

**Construct**

Property Name	Description
GetTaggedValue	The Property's Tagged Value.
IsStereotypeApplied	A check on whether a particular stereotype is applied to the Property.
Notes	Notes on the Property.
UMLType	The UML type of the Property.
Visibility	The visibility of the Property.

**Edge**

Property Name	Description
From	The ID of the node from which the Edge arises.
To	The ID of the node at which the Edge is targeted.

**EventObject**

Property Name	Description
EventKind	The event kind of the Event Object.

**Instance**

Property Name	Description
Classifier	The classifier of the Instance.
Value	The value of the Instance.

#### Parameter

Property Name	Description
Direction	The direction of the Parameter.
Type	The type of the Parameter.
Value	The value of the parameter.

#### Primitive

Property Name	Description
FQName	The FQ name of the Primitive.
ID	The ID of the Primitive.
Name	The name of the Primitive.
ObjectType	The object type of the Primitive.
Parent	The IDParent of the Primitive.

#### PropertyObject

Property Name	Description
BoundSize	The bound size of the PropertyObject (if it is a collection).
ClassifierStereoType	The stereotype of the PropertyObject's classifier.
IsAsynchProp	A check on whether the PropertyObject is an asynchronous property.
IsCollection	A check on whether the PropertyObject is a collection.
IsOrdered	A check on whether the PropertyObject is ordered (if it is a collection).
IsTimedProp	A check on whether the PropertyObject is a timed property.
Kind	The PropertyObject's kind.
LowerValue	The PropertyObject's lower value (if it is a collection).
Type	The PropertyObject's type.
UpperValue	The PropertyObject's upper value (if it is a collection).
Value	The PropertyObject's value.

**SignalEvent**

Property Name	Description
Signal	The signal of the SignalEvent.

**State**

Property Name	Description
HasSubMachine	A check on whether the State is a Submachine state.
IsFinalState	A check on whether the State is a final state.
SubMachine	Get the ID of the Submachine contained by the State (if applicable).

**StateMachine**

Property Name	Description
HasSubMachineState	A check on whether the State Machine has a Submachine state.
InitialState	The State Machine's initial state.
SubMachineState	The State Machine's Submachine state.

**TimeEvent**

Property Name	Description
When	The 'when' property of the TimeEvent.

**Transition**

Property Name	Description
HasEffect	A check on whether the transition has a valid effect.
IsDerived	A check on whether the transition is a derived transition.
IsTranscend	A check on whether the transition transcends from one State Machine (Submachine state) to another.
IsTriggered	A check on whether the transition is triggered.
Source	The Transition's source.
Target	The Transition's target.

**Trigger**

Property Name	Description
AsynchDestinationState	The asynchronous destination state of the Trigger (if it is an asynchronous trigger).
DependentProperty	The ID of the property associated with the Trigger.
Event	The Trigger's event.
Name	The Trigger's name.
Type	The Trigger's type.

### Vertex

Property Name	Description
IsHistory	A check on whether the vertex is a history state.
IsPseudoState	A check on whether the vertex is a pseudo state.
PseudoStateKind	The Vertex's pseudo-state kind.

#### 6.10.1.5.1.3 Variables

Template variables provide a convenient way of storing and retrieving data within a template. This section explains how variables are defined and referenced.

#### Variable Definitions

Variable definitions take the basic form:

```
$<name> = <value>
```

where *<name>* can be any alpha-numeric sequence and *<value>* is derived from a macro or another variable.

A simple example definition would be:

```
$foo = %ClassName%
```

Variables can be defined, using values from:

- Substitution, function or list macros
- String literals, enclosed within double quotation marks
- Variable references.

#### **Definition Rules**

The following rules apply to variable definitions:

- Variables have global scope within the template in which they are defined and are not accessible to other templates
- Each variable must be defined at the start of a line, without any intervening whitespace
- Variables are denoted by prefixing the name with \$, as in \$foo
- Variables do not have to be declared, prior to being defined
- Variables must be defined using either the assignment operator (=), or the addition-assignment operator (+=)
- Multiple terms can be combined in a single definition using the addition operator (+).

## Examples

Using a substitution macro:

```
$foo = %opTag: " bar " %
```

Using a literal string:

```
$foo = " bar "
```

Using another variable:

```
$foo = $bar
```

Using a list macro:

```
$ops = %dlist=" Operation" @separator="\n\n" @ndent="\t" %
```

Using the addition-assignment operator (+=):

```
$body += %dlist=" Operation" @separator="\n\n" @ndent="\t" %
```

The above definition is equivalent to the following:

```
$body = $body + %dlist=" Operation" @separator="\n\n" @ndent="\t" %
```

Using multiple terms:

```
$templateArgs = %dlist=" ClassParameter" @separator=", " %
$template = "template<" + $templateArgs + ">"
```

## Variable References

Variable values can be retrieved by using a reference of the form:

```
$<name>
```

where <name> can be a previously defined variable.

Variable references can be used in one of the following ways:

- As part of a macro, such as the argument to a function macro
- As a term in a variable definition
- As a direct substitution of the variable value into the output.

It is legal to reference a variable before it is defined. In this case, the variable is assumed to contain an empty string value: ""

## Example 1

Using variables as part of a macro. The following is an excerpt from the default C++ ClassNotes template.

```
$wrapLen = %genOpt WrapComment % Define variables to store the style and wrap length
$style = % options.
genOpt CPPComment Style%

%if $style == "XML.NET" % Reference to $style as part of a condition.
%XML_COMMENT($wrapLen) %
%else%
%CSTYLE_COMMENT($wrapLen) % Reference to $wrapLen as an argument to function
%endif % macro.
```

## Example 2

Using variable references as part of a variable definitions:

```
$foo = "foo" Define our variables.
$bar = "bar"
```

```
$foobar = $foo + $bar
```

*\$foobar* now contains the value *foobar*.

### Example 3

Substituting variable values into the output

```
$bases=%classInherits%
```

Store the result of the *ClassInherits* template in *\$bases*.

```
Class %className%$bases
```

Now output the value of *\$bases* after the Class name.

#### 6.10.1.5.2 The Code Template Editor in MDG Development

The following topics describe how you use the Code Template Editor window to create custom templates:

- [Custom Templates](#) <sup>[1150]</sup>
- [Override Default Templates](#) <sup>[1151]</sup>
- [Add New Stereotyped Templates](#) <sup>[1152]</sup>
- [Create Templates For Custom Languages](#) <sup>[1152]</sup>

The Code Template Editor provides the facilities of the **Common Code Editor**, including intellisense for the code generation template macros. For more information on intellisense and the Common Code Editor, see the Code Editors topic.

#### Learn More:

- [Code Generation Template Macros](#) <sup>[1118]</sup>
- [Code Editors](#) <sup>[1403]</sup>

#### 6.10.1.5.2.1 Custom Templates

Custom templates enable you to generate an element in many different ways. Enterprise Architect enables you to define custom templates that are associated with given elements and call these templates from existing templates. You can even add stereotype overrides to your custom templates. For example, you might list all of your parameters and their notes in your method notes.

To create a new custom template, follow the steps below:

Step	Description	See Also
1	Select the <b>Settings   Code Generation Templates</b> menu option, or press ( <b>Ctrl+Shift+P</b> ). The <b>Code Templates Editor</b> tab opens.	
2	In the <b>Language</b> field, click on the drop-down arrow and select the appropriate language.	
3	Click on the <b>Add New Custom Template</b> button. The <b>Create New Custom Template</b> dialog displays.	
4	In the <b>Template Type</b> field, click on the drop-down arrow and select the appropriate element. The elements currently supported are: <ul style="list-style-type: none"> <li>• Attribute</li> <li>• Class</li> <li>• Class Base</li> <li>• Class Interface</li> <li>• Class Parameter</li> <li>• Connector</li> <li>• Import</li> </ul>	

Step	Description	See Also
	<ul style="list-style-type: none"> <li>• Linked Attribute</li> <li>• Linked Class Base</li> <li>• Linked Class Interface</li> <li>• Namespace</li> <li>• Operation</li> <li>• Parameter</li> </ul> <p><b>&lt;None&gt;</b> requires special treatment. It enables the definition of a function macro that doesn't actually apply to any of the types, but must be called as a function to define variables \$parameter1, \$parameter2 and so on for each value passed in.</p>	
5	In the <b>Template Name</b> field, type an appropriate name, then click on the <b>OK</b> button.	
6	On the <b>Code Templates Editor</b> tab, the new template displays in the <b>Templates</b> list with the value <b>Yes</b> in the <b>Modified</b> field. The template is called <Template Type>_<Template Name>.	
7	Select the appropriate template from the <b>Templates</b> list and edit the contents in the <b>Template</b> field to meet your requirements.	
8	Click on the <b>Save</b> button. This stores the new stereotyped template in the .EAP file. The template is now available from the list of templates and via direct substitution for use.	

#### 6.10.1.5.2.2 Override Default Templates

Enterprise Architect has a set of built-in or default code generation templates. The **Code Templates Editor** enables you to modify these default templates, hence customizing the way in which Enterprise Architect generates code. You can choose to modify any or all of the base templates to achieve your required coding style.

Any templates that you have overridden are stored in the .EAP file. When generating code, Enterprise Architect first checks whether a template has been modified and if so, uses that template. Otherwise the appropriate default template is used.

To override a default code generation template, follow the steps below

Step	Description	See Also
1	Select the <b>Configuration   Code Generation Templates</b> menu option. The <b>Code Templates Editor</b> displays.	
2	Select the appropriate language from the <b>Language</b> list.	
3	Select one of the base templates from the <b>Templates</b> list.	
4	If the base template has stereotyped overrides, you can select one of these from the <b>Stereotype Overrides</b> list.	
5	In the <b>Code Templates Editor</b> , make the required modifications.	
6	Click on the <b>Save</b> button. This stores the modified version of the template to the .EAP file. The template is marked as modified.	

When generating code, Enterprise Architect now uses the overridden template, instead of the default template.

### 6.10.1.5.2.3 Add New Stereotyped Templates

Sometimes it is useful to define a specific code generation template for use with elements of a given stereotype. This enables different code to be generated for elements, depending on their stereotype. Enterprise Architect provides some default templates, which have been specialized for commonly used stereotypes in supported languages. For example the Operation Body template for C# has been specialized for the *property* stereotype, so that it automatically generates its constituent *get* and *set* methods. Users can override the default stereotyped templates as described in the previous topic. Additionally users can define templates for their own stereotypes, as described below.

To add a new stereotyped template, follow the steps below:

Step	Description	See Also
1	Select the <b>Configuration   Code Generation Templates</b> menu option to open the <b>Code Templates Editor</b> .	
2	Select the appropriate language, from the <b>Language</b> list.	
3	Select one of the base templates, from the <b>Templates</b> list.	
4	Click on the <b>Add New Stereotyped Override</b> button. The <b>New Template Override</b> dialog displays.	
5	Select the required <b>Feature</b> and/or <b>Class</b> stereotype and click on the <b>OK</b> button.	
6	The new stereotyped template override displays in <b>Stereotype Overrides</b> list, marked as modified.	
7	Make the required modifications in the <b>Code Templates Editor</b> .	
8	Click on the <b>Save</b> button. This stores the new stereotyped template in the .EAP file.	

Enterprise Architect can now use the stereotyped template, when generating code for elements of that stereotype.

Note that Class and feature stereotypes can be combined to provide a further level of specialization for features. For example, if properties should be generated differently when the Class has a stereotype *MyStereotype*, then both *property* and *MyStereotype* should be specified in the **New Template Override** dialog.

### 6.10.1.5.2.4 Create Custom Language Template

Enterprise Architect can forward generate code for languages that it does not specifically support, if the appropriate code generation templates are defined for that language. This topic outlines the steps required to define templates for custom languages.

To define a template for a custom language, follow the steps below

Step	Description	See Also
1	Create the custom language as a new product. To do this: <ul style="list-style-type: none"> <li>Select the <b>Settings   Code Datatypes</b> menu option. The <b>Programming Languages Datatypes</b> dialog displays.</li> <li>In the <b>Product Name</b> field type the name of the new language, and in the <b>Datatype</b> field type a datatype (one is enough to declare that the new language</li> </ul>	<a href="#">Data Types</a> [779]

Step	Description	See Also
	exists).	
2	Select the <b>Settings   Code Generation Templates</b> menu option. The <b>Code Templates Editor</b> view displays.	
3	In the <b>Language</b> field, click on the drop-down arrow and select the custom language.	
4	From the <b>Templates</b> list, select one of the base templates.	
5	Define the template using the <b>Code Templates Editor</b> .	
6	Click on the <b>Save</b> button. This stores the template in the .EAP file.	
7	Repeat steps 1 to 6 for each of the relevant base templates for the custom language.	

**Notes:**

- The File template must be defined for the custom language. The File template can then see the Import Section, Namespace and Class templates

**Part**

## 7 Requirement Models

### Topics:

Topic	Detail	See also
<b>Introduction</b>	<p>This section describes the Enterprise Architect Requirements Management facilities, and discusses:</p> <ul style="list-style-type: none"> <li>• What requirements are</li> <li>• How requirements are generated and organized</li> <li>• How Enterprise Architect supports and simplifies Requirements Management</li> </ul>	<a href="#">White Paper</a> (Requirements Management with Enterprise Architect)
<b>What is a Requirement?</b>	<p>Requirements are essentially what the system, application or business process <i>is required</i> to do</p> <p>A requirement can be:</p> <ul style="list-style-type: none"> <li>• Broad and high level, defining - for example - that a process is necessary to update a particular database</li> <li>• More specialized and detailed, recording the expectation that - for example - a system call must always be acknowledged by return</li> </ul> <p>Detailed requirements can be organized into a hierarchy culminating in a high-level requirement, so that satisfying each of the detailed requirements results in meeting the higher-level requirements and ultimately the top-level requirement</p> <p>This hierarchical structure helps manage the complexity of large systems with thousands of requirements and many processes being developed to implement the requirements</p>	
<b>Gathering Requirements</b>	<p>Gathering requirements is typically the first step in developing a solution, be it for developing a system or a process. Requirements are gathered from all parties expected to use, maintain or benefit from the solution, and are organized into groups, functional areas and hierarchies as necessary. They can be transcribed into a spreadsheet or a requirements gathering or management tool, or they can be created in an integrated modeling tool such as Enterprise Architect.</p>	
<b>Requirements Management and Enterprise Architect</b>	<p>The management of requirements is one of the more problematic disciplines in software development, for reasons such as:</p> <ul style="list-style-type: none"> <li>• Diverse group input into the requirements</li> <li>• Organizational boundary divisions</li> <li>• Tool boundary divisions</li> <li>• Volatility of requirements</li> <li>• Imprecision and ambiguity in natural languages</li> </ul> <p>These can cause issues with:</p> <ul style="list-style-type: none"> <li>• Traceability and</li> <li>• Integration with change and configuration management systems</li> </ul> <p>Enterprise Architect can reduce or eliminate these</p>	<a href="#">Create Requirements</a> <sup>[1159]</sup> <a href="#">View Requirements</a> <sup>[1173]</sup> <a href="#">Import Requirements Using CSV</a> <sup>[1165]</sup> <a href="#">Model Requirements</a> <sup>[1168]</sup> <a href="#">Requirement Properties</a> <sup>[1160]</sup> <a href="#">Extend Requirement Properties</a> <sup>[1163]</sup> <a href="#">Trace Use Of Requirements</a> <sup>[1173]</sup> <a href="#">Relationship Matrix</a> <sup>[498]</sup>

Topic	Detail	See also
	<p>problems in Requirements Management; it is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model. Within Enterprise Architect, you can:</p> <ul style="list-style-type: none"> <li>• <b>Create</b> and <b>view</b> requirements as entities and properties directly in the model</li> <li>• Collate the requirements in an external CSV file and then <b>import</b> them into your model</li> <li>• Detail <b>use cases</b> and scenarios directly in the model</li> <li>• Enter <b>standard attributes</b> (properties) for each requirement, such as difficulty, status and type, and <b>define your own attributes</b> (properties)</li> <li>• <b>Trace</b> requirements to Use Cases, business rules, test cases and analysis artifacts (using, for example, the Relationship Matrix)</li> <li>• Trace and view the impact of <b>changes</b> on requirements (through, for example, the <b>Traceability</b> window) and <b>review the changes</b> themselves</li> <li>• Create customer-quality MS Word and HTML <b>reports</b> on requirements</li> </ul>	<p><a href="#">Traceability Window</a><sup>[497]</sup></p> <p><a href="#">Manage Requirement Changes</a><sup>[1174]</sup></p> <p><a href="#">Report on Requirements</a><sup>[1176]</sup></p>

**Notes:**

- All of these features are illustrated by examples in the EAExample.eap model, provided as part of your Enterprise Architect installation in the Enterprise Architect Program Files directory:

..\Program Files\Sparx Systems\EA

## 7.1 Requirements

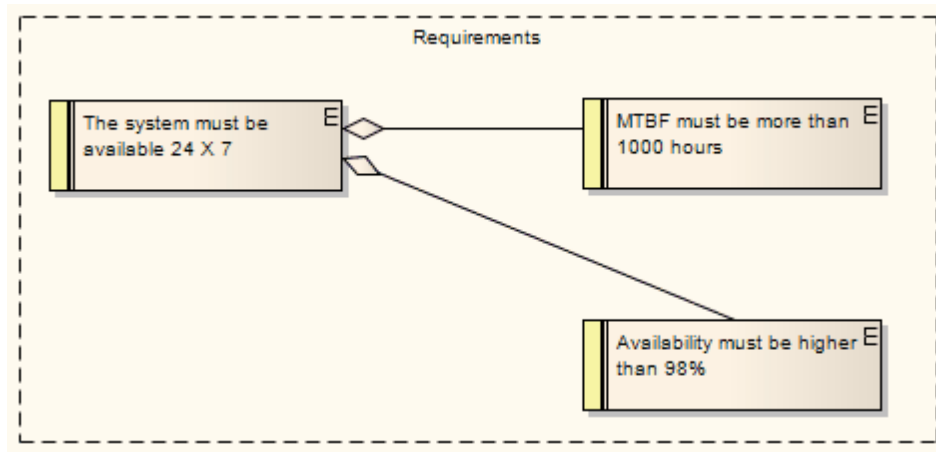

### Description

As an analysis step, often it is desirable to capture simple system requirements. These are eventually realized by Use Cases.

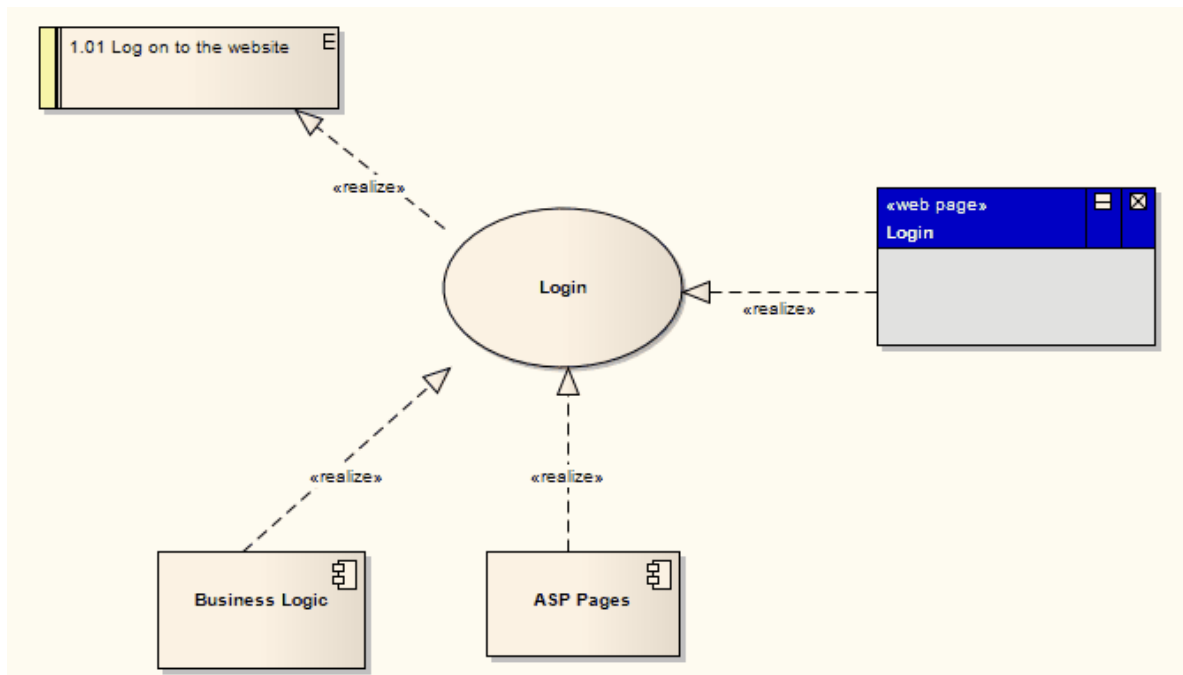

In the initial requirement gathering phase, cataloging requirements can be achieved using the Requirement extension on a Custom diagram.

### Examples

Requirements can be aggregated to create a hierarchy. The diagram below illustrates how this might be done.

In the following diagram, a requirement that a user can log into a website is implemented by the *Login* Use Case, which in turn is implemented by the *Business Logic*, *ASP Pages* and *Login Web Page*. Using this approach, you can easily model quite detailed and complex dependencies and implementation relationships.

#### Notes:

- External requirements can be displayed with or without an identifying **E** (for External) in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page.
- The colors on Requirement elements identify the status of the requirement. You change the status - and hence color - on the element **Properties** dialog. You set the color for each status on the **Status Types** dialog.

#### Toolbox Icon

## 7.2 Create Requirements

**Topics:**

Topic	Detail	See also
Usage	<p>Within Enterprise Architect you can create external Requirement elements in a number of ways, such as:</p> <ul style="list-style-type: none"> <li>• Dragging a <i>Requirement</i> icon from the Toolbox into a specific diagram (which also adds the Requirement to the diagram's parent package - see below)</li> <li>• Dragging text from a text file onto a diagram, to generate a requirement based on that text - see below</li> <li>• Generating an element within a specific package in the Project Browser - see below</li> <li>• Importing requirements from a spreadsheet application such as Excel, via CSV</li> <li>• Creating Requirement elements on the Package Browser or Diagram List for the selected package or diagram</li> <li>• Converting an internal responsibility into an external element, in a selected target package</li> <li>• Importing requirements from another requirements management tool, such as Telelogic DOORS (in this case via the Sparx Systems MDG Link For DOORS integration tool)</li> </ul>	<p><a href="#">Import Requirements using CSV</a><sup>[1165]</sup></p> <p><a href="#">Package Browser</a><sup>[458]</sup></p> <p><a href="#">Diagram List</a><sup>[464]</sup></p> <p><a href="#">Converting an Internal Responsibility</a><sup>[1170]</sup></p> <p><a href="#">Sparx Systems MDG Link For DOORS</a></p>

**How To:**

To create Requirement elements in a diagram, follow the steps below:

Step	Action	See Also
1	Open the Custom pages on the Toolbox	<a href="#">Custom Group</a> <sup>[564]</sup>
2	Drag the <i>Requirement</i> element onto the current diagram	
3	Enter the <b>Name</b> and other details for the requirement Enterprise Architect creates a Requirement element in the current diagram and in the diagram's parent package	<a href="#">Requirement Properties</a> <sup>[1160]</sup>

*Alternatively:*

(The following procedure converts a text section heading into an element name and the section text into the element's Notes text. You can use this procedure to generate elements of a *range* of types; however, it is particularly useful for generating Requirements from a requirements specification document.)

Step	Action	See Also
1	Open an Enterprise Architect diagram in the Diagram View	
2	Open the required document file containing the text you want to generate Requirement elements from (this can be opened in any common text editing	

Step	Action	See Also
	tool)	
3	Highlight the required heading and associated text and drag them from the text file into the diagram The <b>Toolbox Shortcut</b> menu displays	<a href="#">Toolbox Shortcut Menu</a> <sup>[553]</sup>
4	Navigate through the menus and select the required element type (in this case, click on <b>Common</b> and <b>Requirement</b> )	
5	Enterprise Architect creates a (Requirement) element in the diagram, and displays the Properties dialog with the section heading in the <b>Name</b> (or equivalent) field and the text in the <b>Notes</b> field; the element is also added to the diagram's parent package	

To create a requirement directly in the Project Browser, follow the steps below

Step	Action	See Also
1	Right-click on the required parent package to open the context menu	
2	Select the <b>Insert   New Element</b> menu option; alternatively, press ( <b>Ctrl+M</b> )	
3	In the New Element dialog select the Requirement type	
4	Enter the <b>Name</b> (or select <b>Auto</b> ) and click on the <b>OK</b> button Enterprise Architect creates a requirement in the current package	

#### Notes:

- The Requirement element name can be simply descriptive text, with or without a manually-typed reference number; however, as requirements often have to have a unique reference for external checking, you can use the Enterprise Architect auto-numbering facility to automatically apply a numbering system with or without prefixes and suffixes - set the element type to **Requirement**
- External Requirement elements can be displayed with or without an identifying **E** in the top right corner; to toggle display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page
- Requirement elements can be color coded to indicate their status

#### Learn More:

- [Auto Naming and Auto Counters](#) <sup>[630]</sup>
- [Objects](#) <sup>[434]</sup>
- [Color Code External Requirements](#) <sup>[1162]</sup>

### 7.2.1 Requirement Properties

Requirement properties differ slightly from the properties of other elements; they include information related to the Type, Status, Difficulty and Priority of the Requirement. The **Notes** field is also important, as it describes precisely what requirement the element represents. Requirement naming can also require careful consideration and could reflect either a categorical naming convention, or simply a loose English description of the Requirement.

**Access:** [Requirement Element Context Menu | Properties](#)

**Use to:**

- Document requirements
- Set Requirement features such as Type, Status and Priority
- Set other element properties common to both Requirements and other model Elements

**Reference:**

Field	Usage	See Also
<b>Short Description</b>	The name of this requirement, which could include numbering, plain English description or some other formal specification	
<b>Alias</b>	An alias to be used for this requirement	<a href="#">Auto Counters</a> <sup>[630]</sup>
<b>Status</b>	The current status of this requirement	<a href="#">Color Code Requirements</a> <sup>[1162]</sup>
<b>Difficulty</b>	An estimate of the difficulty in meeting this requirement. Enterprise Architect supports the values 'Low', 'Medium', 'High'	
<b>Priority</b>	The relative importance of meeting this requirement compared to other requirements; select from: <ul style="list-style-type: none"> <li>• <b>Low</b></li> <li>• <b>Medium</b></li> <li>• <b>High'</b></li> </ul>	
<b>Author</b>	The author of this requirement	<a href="#">Authors</a> <sup>[780]</sup>
<b>Key Words</b>	A set of words that could be used to index or define the subject of this requirement	
<b>Type</b>	The type of this requirement. This is typically used as a category for the requirement.	<a href="#">Requirement Types</a> <sup>[787]</sup>
<b>Phase</b>	The phase of this requirement.	
<b>Version</b>	The version of this requirement.	
<b>Last Update</b>	Read-only field specifying when this requirement was last changed.	
<b>Created</b>	Read-only field specifying when this requirement was first created.	
<b>Notes</b>	The description of this requirement.	<a href="#">Note Editors</a> <sup>[771]</sup> , <a href="#">Linked Documents</a> <sup>[731]</sup>

**Notes:**

- In Requirement Management tools and texts, the characteristics of a requirement are commonly called attributes. However, in UML the term attribute refers to a different type of feature, and the requirement characteristics are defined as properties. In this Enterprise Architect documentation, the term

properties is used

- In a project, it might be necessary to define more information in a requirement than is provided by the standard properties. For more information on extending the requirement properties, see the Extend Requirement Properties topic

#### Learn More

- [Extend Requirement Properties](#) <sup>[1163]</sup>

## 7.2.2 Color Code External Requirements

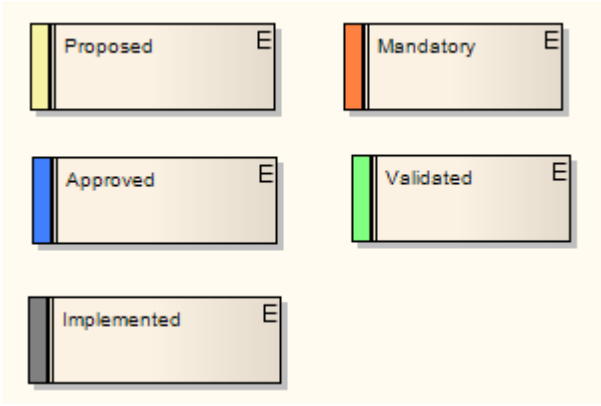

External requirements can be color coded to provide quick visual cues indicating the status of a requirement.

#### How to:

To enable color coded external requirements follow the steps below

Step	Action
1	Select the <b>Tools   Options</b> menu option The Options dialog displays
2	From the hierarchical tree select Objects, and select the <b>Show status colors on diagrams</b> checkbox to enable the status of external requirements to be represented by color coding

#### Topics:

Topic	Detail	See also
Usage	<p>The color code requirements use the following default conventions:</p> <ul style="list-style-type: none"> <li>• Yellow for Proposed</li> <li>• Blue for Approved</li> <li>• Green for Validated</li> <li>• Orange for Mandatory</li> <li>• Black for Implemented</li> </ul>  <p>The diagram shows five external requirement boxes, each with a colored vertical bar on the left side indicating its status. The boxes are labeled: Proposed (yellow bar), Mandatory (orange bar), Approved (blue bar), Validated (green bar), and Implemented (black bar). Each box also has a small 'E' in the top right corner.</p>	<a href="#">Status Types Dialog</a> <sup>[785]</sup>
	You can change these colors, and add or remove status types, using the Status Types dialog	

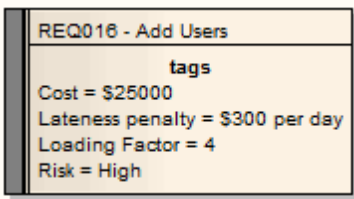

## 7.2.3 Extend Requirement Properties

### Topics:

Topic	Detail	See also
<b>Introduction</b>	<p>A project might apply further properties to a requirement, such as cost, lateness penalty or risk to the business if not met. You can add these properties to specific Requirement elements, or configure them to be automatically available in all Requirement elements on creation, using <b>Tagged Values</b>. (These are sometimes referred to as User-defined attributes.)</p> <p>Extended element properties are not visible unless you open the <b>Tagged Values</b> window for the element. Alternatively, you can display the additional properties on the element image on its diagrams.</p>	<p><a href="#">Tagged Values</a> <sup>[764]</sup></p> <p><a href="#">Display Tagged Values on Diagrams</a> <sup>[1164]</sup></p>
<b>Add Tagged Values to Existing Requirements</b>	<p>To add a property to a single Requirement as a <b>Tagged Value</b>, simply click on the Requirement, display the <b>Tagged Values</b> window ( <b>Ctrl+Shift+6</b> ), and <b>enter</b> the name of the property as the tag name and the value of the property as the tag value.</p> <p>It is likely that any property you add to one Requirement would also apply to others. You might therefore use a predefined Tagged Value Type to identify your Requirement property, so that you can select it whenever required. The predefined Tagged Value Type also enables you to define specific values for the Tagged Value. If the appropriate predefined Tagged Value Type does not exist, a Technology Developer can create it to add to the <b>structured tags</b>, <b>reference tags</b>, or <b>customized tags</b> collections.</p>	<p><a href="#">Assign a Tagged Value to an Item</a> <sup>[766]</sup></p> <p><a href="#">Create Structured Tagged Values</a> <sup>[1114]</sup></p> <p><a href="#">Create Reference Date Tagged Values</a> <sup>[1115]</sup></p> <p><a href="#">Create a Custom Tagged Value Type</a> <sup>[1116]</sup></p>
<b>Configure Requirements to be Created With Extended Properties</b>	<p>If it is necessary to create all Requirements with the same extended set of properties, you can create a Requirement Template diagram and either create a special Requirement that defines those properties (as Tagged Values), or drag an existing Requirement with those properties onto the diagram. You then set the Requirement Template diagram as the template for all new Requirement elements, so that those new Requirements automatically have all of the properties you want.</p> <p>However, this then excludes other Requirement element formats, including the standard Requirement format. If you want to use another Requirement format, you have to replace or cancel the current Template. Alternatively, you can create a Profile.</p> <p>A Profile also defines exactly what a new Requirement element should contain, and how it should display in diagrams. However, a Profile is a collection of alternative element definitions, so it does not override the default Requirement format, nor does it prevent you from defining several different types of Requirement element. You can therefore have separate and parallel definitions of elements for business requirements, system requirements, project requirements, or any other category of requirement you decide to work with.</p> <p>For information on importing and using existing Profile files, see the <b>UML Profiles</b> topic. For information on creating new Profiles, see the <b>Developing Profiles</b> topic.</p>	<p><a href="#">Set Element Template Package</a> <sup>[645]</sup></p> <p><a href="#">UML Profiles</a> <sup>[1028]</sup></p> <p><a href="#">Developing Profiles</a> <sup>[1041]</sup></p>

## 7.2.4 Display Tagged Values On Diagrams

### Topics:

Topic	Detail	See also
Usage	<p>If you have extended the properties of a Requirement, you might want to make those properties visible in the Requirement elements in your diagrams, by switching on display of the element tags compartment. You can do this in one of two ways:</p> <ul style="list-style-type: none"> <li>To display the <i>tags</i> compartment on all elements on a diagram, double-click on the diagram background and select the <b>Elements</b> tab of the <b>Diagram Properties</b> dialog; select the <b>Tags</b> checkbox and click on the <b>OK</b> button</li> <li>To display the <i>tags</i> compartment on a specific element on a diagram, right-click on the element and select the <b>Feature Visibility</b> context menu option; select the <b>Tags</b> checkbox in the <b>Show Element Compartments</b> panel of the <b>Feature Visibility</b> dialog, and click on the <b>OK</b> button</li> </ul> <p>The Tagged Values are then displayed in the Requirement element on the diagram.</p> 	

### Learn More:

- [Elements](#)<sup>[575]</sup>
- [Feature Visibility](#)<sup>[587]</sup>

## 7.2.5 Connect Requirements

### Topics:

Topic	Detail	See also
Abstract	<p>A Requirement element can be connected to other Requirements, most commonly using <b>Aggregate relationships</b> to form a hierarchy of requirements.</p> <p>Requirements are also connected to other types of element, most commonly Use Cases, by <b>Realize or Implements</b> relationships.</p> <p>These relationships are very important, both in identifying how the Requirements are organized and used in the model, and in <b>tracing</b> the development from the Requirements throughout the model. Both of these tasks are very simple in Enterprise Architect, because once a connector on a Requirement exists, Enterprise Architect automatically lists the Requirement in the:</p>	<p><a href="#">Aggregate relationships</a><sup>[970]</sup></p> <p><a href="#">Realization</a><sup>[1009]</sup></p> <p><a href="#">Trace Requirements</a><sup>[1173]</sup></p> <p><a href="#">Traceability</a><sup>[497]</sup></p> <p><a href="#">Requirements</a><sup>[666]</sup></p> <p><a href="#">Requirement</a></p>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>Requirements Traceability window (an important tool in examining the role of Requirements in the model)</li> <li>Requirements tab of the target element Properties dialog</li> <li>Links tab of the Requirement element Properties dialog</li> <li>Scenarios &amp; Requirements window</li> <li>Relationships Window</li> <li>Dependency and Implementation reports</li> <li>Standard RTF output</li> </ul> <p>The connector itself is also listed in the Links tab of the target element Properties dialog, and in the Relationship Matrix. There are, therefore, many ways to locate, view and track Requirement relationships.</p>	<a href="#">Properties</a> <sup>[1160]</sup> <a href="#">Scenarios &amp; Requirements</a> <sup>[69]</sup> <a href="#">Relationships Window</a> <sup>[506]</sup> <a href="#">Dependency</a> <sup>[1797]</sup> <a href="#">Implementation reports</a> <sup>[1799]</sup> <a href="#">Standard RTF output</a> <sup>[1738]</sup> <a href="#">Links</a> <sup>[668]</sup> <a href="#">Relationship Matrix</a> <sup>[498]</sup>
<b>Connect On Diagram</b>	<p>Relationships can be created on a diagram by clicking on the appropriate connector icon from the <b>Requirement</b> and <b>Common</b> pages of the Toolbox, clicking on the source (originating) element, and dragging to the target element.</p> <p>If you are connecting elements in different packages, you can drag elements from the Project Browser onto a common diagram and set up the relationships there. Alternatively, you can quickly generate a Realize connector by dragging an existing Requirement element from the Project Browser over the element that implements the Requirement. Enterprise Architect interprets this as a request to create the Realize connector and does so automatically. The Requirement element is not added to the diagram. However, if you subsequently drag the Requirement onto the diagram the connector is already in place.</p>	<a href="#">Requirement Group</a> <sup>[565]</sup> <a href="#">Common Group</a> <sup>[554]</sup>
<b>Connect Off Diagram</b>	<p>You can also connect a Requirement element to other elements without necessarily having the elements on the same diagram, or having a diagram open.</p> <p>Use the Relationship Matrix to <b>create relationships</b> for requirements; this is a convenient way of quickly building up complex relationships and hierarchies.</p>	<a href="#">Creating Relationships</a> <sup>[502]</sup>

### 7.2.6 Import Requirements and Hierarchies in CSV

Topics:

Topic	Detail	See also
<b>Usage</b>	<p>You can import Requirements from a spreadsheet application in CSV format. Before doing this you must create a CSV import file specification that:</p> <ul style="list-style-type: none"> <li>In the <b>Default Types</b> field has the value <b>requirement,package</b> to import requirements and a package structure to contain them</li> <li>Has the <b>Preserve Hierarchy</b> checkbox selected</li> <li>Identifies the data fields on the spreadsheet that are to be</li> </ul>	

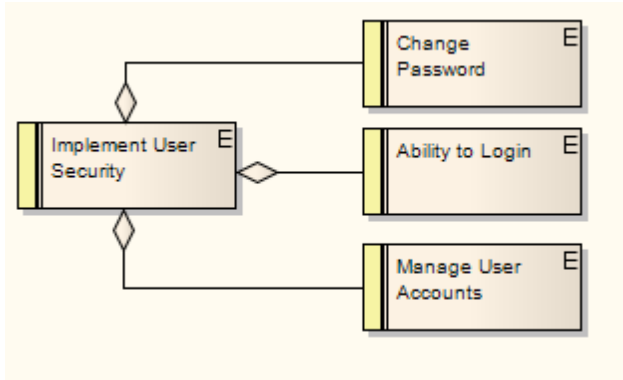

Topic	Detail	See also
	<p>translated into Enterprise Architect, in the order in which they are plotted across the spreadsheet</p> <ul style="list-style-type: none"><li>• Is to operate on a spreadsheet containing the <b>CSV_KEY</b> and <b>CSV_PARENT_KEY</b> fields (which, if not generated by a CSV export from Enterprise Architect, you have added and populated yourself)</li></ul> <p>This enables you to import the individual and grouped requirements from the spreadsheet into Enterprise Architect, and to reconstruct the hierarchies of Requirements in the target package in the Project Browser.</p>	

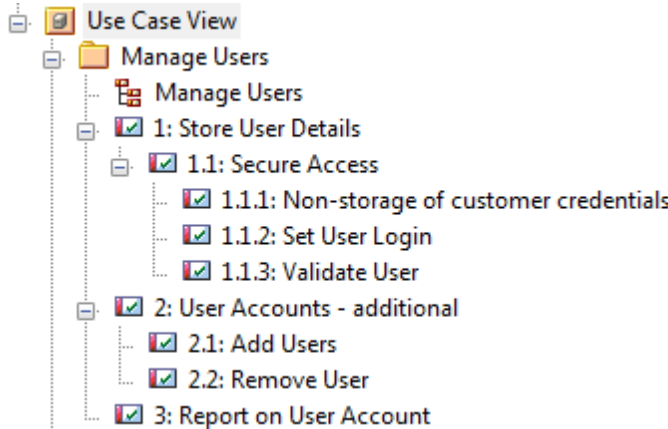

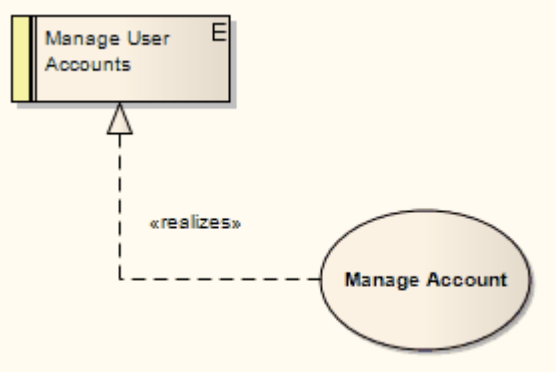

**Learn More:**

- [CSV Import](#) <sup>[344]</sup>
- [CSV Specifications](#) <sup>[340]</sup>
- [Using Preserve Hierarchy](#) <sup>[342]</sup>

### 7.3 Model Requirements

Topics:

Topic	Detail	See also
<p><b>Represent Requirements</b></p>	<p>In Enterprise Architect, a requirement can be modeled as an:</p> <ul style="list-style-type: none"> <li>• <b>External Requirement</b> - an expectation of the system or process, what the system or process must provide, modeled as an element; for example, a business requirement or a stakeholder request - Requirements at this level have their own properties and are reported on separately in RTF reports</li> <li>• <b>Internal requirement</b> – a responsibility of an existing element, what the element must do or accomplish, defined as a property of the element</li> </ul> <p>Requirements Management in Enterprise Architect is primarily concerned with external Requirement elements and the elements that implement or realize them.</p>	<p><a href="#">Requirements</a> [1157]</p> <p><a href="#">Internal requirements</a> [1170]</p>
<p><b>Requirements in the Model</b></p>	<p>Requirement elements can be grouped and organized within <b>Requirements diagrams</b>. The Requirement elements are connected to each other by <i>Aggregate</i> relationships to form a hierarchy:</p>  <p>It is quite usual to develop a package of many hundreds of Requirement elements, arranged individually and in hierarchies of varying complexity. In the Project Browser you can use the <b>Turn On Level Numbering</b> facility to highlight the order and arrangement of the Requirements quickly and easily. The following illustration shows a number of Requirements in a package, where Level Numbering makes the order and arrangement clear:</p>	<p><a href="#">Requirements Diagram</a> [1177]</p> <p><a href="#">Turn On Level Numbering</a> [446]</p> <p><a href="#">RTF Style Template Editor</a> [1755]</p>

Topic	Detail	See also
	 <p>If elements are added, moved or deleted from the package, the numbering automatically adjusts.</p> <p>This numbering can also be applied in the <b>RTF report generator</b> using the LevelNumber field in the Element section – {Element.LevelNumber}.</p>	
Use Cases	<p>Requirements are implemented (realized) by model elements such as Use Cases, Classes, Interfaces and Components. There are many ways to <b>trace</b> either the Requirement for the feature or service modeled by the elements, or the elements that develop the requirement, most visibly in <b>Traceability</b> diagrams that depict the Requirements and the model elements <b>connected</b> by Realize relationships. The Realize connector enables members of the project team to keep design objectives and development in tandem, and the development path and purpose clear.</p>  <p>The more usual realization relationship is between a Requirement and a Use Case. A Requirement can be realized by one or more Use Cases, and a Use Case can realize one or more Requirements.</p> <p>Whilst a Requirement defines a condition that must be met, the <b>Use Case</b> is the key to defining and visualizing how that condition is met. A <b>Use Case diagram</b> depicts the logical grouping of actions, processes and components to achieve a required result, and through the use of <b>Actor</b> elements also defines the user and/or system roles participating in the process.</p> <p>Each Use Case (as a <b>composite element</b>) can contain a combination of child diagrams that define in greater detail how a particular activity or facility might be implemented - such diagrams include <b>Sequence</b>,</p>	<a href="#">Trace</a> <sup>[495]</sup> <a href="#">Traceability</a> <sup>[507]</sup> <a href="#">Connector Requirement</a> <sup>[1164]</sup> <a href="#">Use Case</a> <sup>[937]</sup> <a href="#">Use Case Diagram</a> <sup>[815]</sup> <a href="#">Actor</a> <sup>[879]</sup> <a href="#">Composite Element</a> <sup>[649]</sup> <a href="#">Sequence Diagram</a> <sup>[851]</sup> <a href="#">Communication Diagram</a> <sup>[861]</sup> <a href="#">Activity Diagram</a> <sup>[813]</sup> <a href="#">State Machine Diagram</a> <sup>[817]</sup> <a href="#">Business Rule Flow</a> <sup>[1205]</sup>

Topic	Detail	See also
	<p><b>Communication, Activity, State Machine and Business Rule Flow</b> diagrams. The actual implementation of each Use Case is realized by Class, Component and Interface elements organized in their own diagrams. These realizations can also be captured and viewed in Traceability diagrams, depicting the full development pathway from initial requirement through to testing and production.</p>	

### 7.3.1 Feature

#### Description

A *Feature* is a small, granular function or characteristic expressed in client-valued terms as a satisfaction of a requirement; for example: 'context-sensitive Help', or 'ability to reverse-engineer VB.Net'.

Features are the primary requirements-gathering artifact of the Feature-Driven Design (FDD) methodology. They define the product feature that satisfies what a Requirement element has formalized as a contractual, testable, expected deliverable (for example: requirement - 'every element must provide context-sensitive Help'; feature - 'every element provides context-sensitive Help'). One Feature might realize one or more Requirements, and one Requirement might be realized by more than one Feature.

Features also have relationships with Use Cases. A Use Case defines the interaction a user has with the system in order to satisfy one or more Requirements. The Feature identifies the facility that provides the means for that interaction.

Feature elements are non-UML and are not related to the UML elements of the same name which are either BehavioralFeatures (operations, or methods) or StructuralFeatures (Ports, Parts and attributes).

Feature elements are available from the **Requirements** page of the **Toolbox**.

Feature elements can be displayed with or without an identifying **F** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page.

- [Use Case Element<sup>\[937\]</sup>](#)

### 7.3.2 Internal Requirements

Topic	Detail	See also
<b>Usage</b>	<p>Internal requirements in Enterprise Architect are element responsibilities. They are defined on the <b>Requirements</b> page of the element <b>Properties</b> dialog.</p> <p>Internal requirements form the functional requirements of the system to be built. The meaning of the requirement can vary depending on which element is the host; for example, a business process requirement might mean something different to a Use Case requirement, which again might mean something different to a Class requirement. In the example above, an internal responsibility to enable the user to login to the system has been defined for the Login Use Case. This is a responsibility of the Use Case - an action it is responsible for carrying out - and it applies only to this Use Case.</p> <p>The significant parameters (or, in Requirement Management terms, <i>attributes</i>) are the Type, Status, Difficulty and Priority. Whilst you can provide a detailed description of the responsibility in the <b>Notes</b> field, there is more scope in the name (<b>Requirement</b> field) to define the nature of the responsibility. An additional field, <b>Stability</b>, indicates the probability of the requirement changing; high stability means a low probability of change.</p> <p>The example Use Case above also has connections to two external requirements, which are system functions that the Use Case implements either in full or in part. You can <b>convert</b> an internal responsibility into an external requirement.</p> <p>You can also create internal responsibilities for an element using the <b>Scenarios &amp; Requirements</b> window. A responsibility created in the window displays in the element <b>Properties</b> dialog, and vice versa.</p>	<p><a href="#">Requirements</a> [666]</p> <p><a href="#">Make Internal Requirements External</a> [1170]</p> <p><a href="#">Scenarios &amp; Requirements</a> [697]</p>

#### 7.3.2.1 Make Internal Requirement External

Elements in Enterprise Architect have internal requirements, or responsibilities (what they must do or accomplish). These often overlap or duplicate more formal requirements that the system in general must meet. You can move internal requirements to external requirements (where the requirement can perhaps be implemented by multiple elements) in one go, using the **Move External** function.

##### How To:

To change an internal requirement for an element into an external element, follow the steps below

Step	Action	See Also
1	Double-click on the element in a diagram or in the Project Browser The element Properties dialog displays	
2	Click on the Requirements tab	
3	Locate and highlight the requirement	
4	Click on the <b>Move External</b> button The Browse Project dialog displays	
5	Select the package to place the new requirement in	

Step	Action	See Also
6	Click on the <b>OK</b> button	

Enterprise Architect creates a new Requirement element in the target package and automatically generates a Realization connector from the element to the Requirement.

The requirement is now marked external and the dialog fields grayed out. To edit its details, double-click on the requirement.

The requirement element is now located in the target package.

**Learn More:**

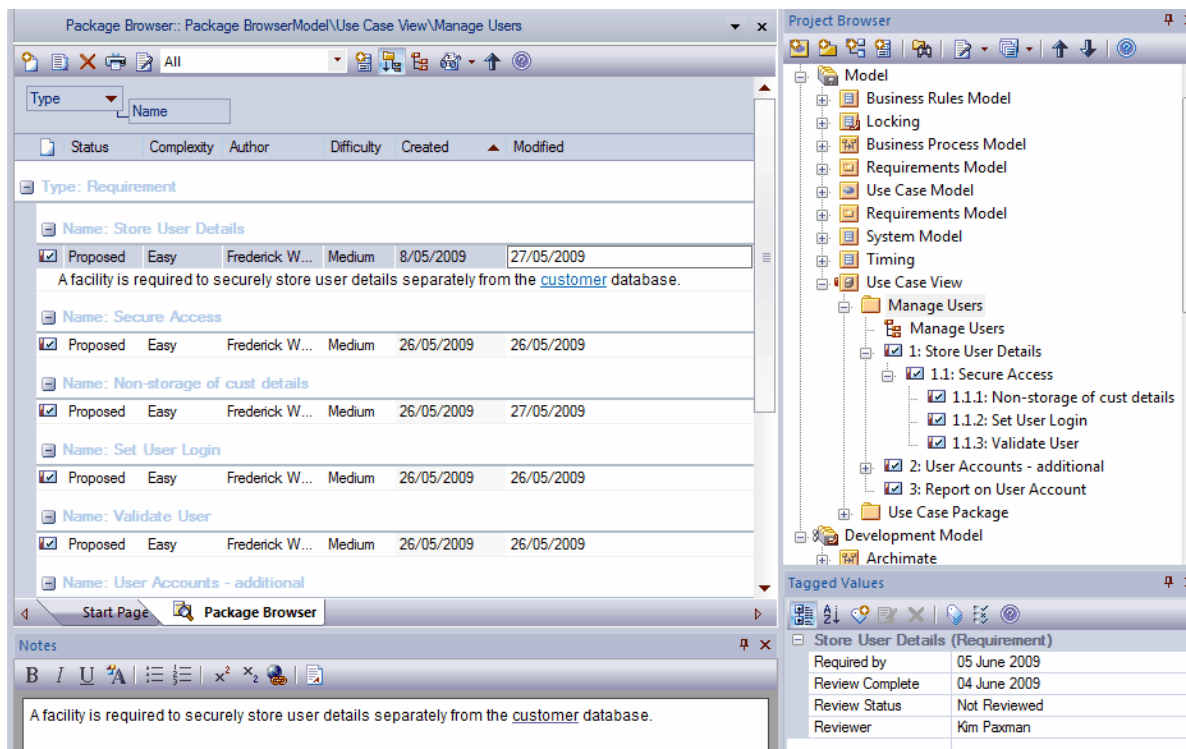

- [Requirement Properties](#)  1160

## 7.4 Manage Requirements

One of the main advantages of managing Requirements in Enterprise Architect is that you can display many different aspects of information on the Requirements, from overall organization and location through lists, current status, general properties, detailed individual notes and specific properties, to relationships and dependencies with other elements in the model.

As most of these aspects are displayed in dockable windows, you can review the Requirements from several different perspectives simultaneously in the Enterprise Architect work area, as shown below:

### Example:

This display shows the position of the *Store User Details* Requirement element in the model, and how it relates to other Requirements (**Project Browser**); the default characteristics of the Requirement (**Package Browser**) and the extended characteristics (**Tagged Values** window), and a detailed description of the Requirement (**Notes** window). You can configure some of these windows to display more information, and/or use other windows and facilities.

### Learn More:

- [View Requirements](#) <sup>[1173]</sup>
- [Trace Use of Requirements](#) <sup>[1173]</sup>
- [Manage Requirement Changes](#) <sup>[1174]</sup>
- [Report on Requirements](#) <sup>[1176]</sup>

## 7.4.1 View Requirements

Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.

### Topics:

Topic	Detail	See also
Usage	<p>Use the following windows and facilities to: locate and list Requirement elements in the model; add, move and delete the elements; display and edit the properties and characteristics of individual elements; and generate reports on packages or specific elements.</p> <ul style="list-style-type: none"> <li>• <b>Project Browser</b> - shows the content and structure of your model</li> <li>• <b>Diagram List</b> - lists the elements in a diagram, filtered and sorted according to the settings you define; shows all or selected default properties of each element</li> <li>• <b>Package Browser</b> - lists the elements in a package, filtered and sorted according to the settings you define; shows all or selected default properties of each element</li> <li>• <b>(Requirements) Diagram</b> - shows the arrangement of a group of Requirements, and can show whether the elements are in the same package or different packages</li> <li>• <b>Model Search</b> - enables you to locate Requirements in general in the model, or specific Requirement elements, according to the search criteria you use</li> <li>• <b>Model Views</b> - enables you to maintain links to commonly-used elements, and to rapidly show developments and changes in (Requirement) package contents through either reports or slide shows of selected diagrams</li> <li>• <b>Properties</b> - shows every standard property of a selected element, whether updated by the user or maintained automatically by the system</li> <li>• <b>Tagged Values</b> - shows extended properties of a selected Requirement element</li> <li>• <b>Element Browser</b> - shows every added-on property, such as attributes, operations, Tagged Values and constraints</li> <li>• <b>Notes</b> - displays the detailed description of a requirement, and any other additional information recorded on the requirement</li> </ul>	<p><a href="#">Project Browser</a><sup>[443]</sup></p> <p><a href="#">Diagram List</a><sup>[464]</sup></p> <p><a href="#">Package Browser</a><sup>[458]</sup></p> <p><a href="#">Requirements Diagram</a><sup>[1177][542]</sup></p> <p><a href="#">Model Search</a><sup>[477]</sup></p> <p><a href="#">Model Views</a><sup>[466]</sup></p> <p><a href="#">Properties</a><sup>[69]</sup></p> <p><a href="#">Tagged Values</a><sup>[764]</sup></p> <p><a href="#">Element Browser</a><sup>[689]</sup></p> <p><a href="#">Notes</a><sup>[77]</sup></p>

## 7.4.2 Trace Use of Requirements

### Topics:

Topic	Detail	See also
Usage	<p>Having investigated the representation of requirements in your model, you might review either how they have been used to direct development through the model, or how a particular development was initiated. This is discussed in greater detail in the <b>Traceability</b> topics, but the windows and facilities you might use to follow development</p>	<p><a href="#">Traceability</a><sup>[495]</sup></p> <p><a href="#">Connect Requirements</a><sup>[1164]</sup></p> <p><a href="#">Relationship</a></p>

Topic	Detail	See also
	<p>from Requirements are briefly described below. The significant feature in tracing Requirements and development is the <b>connectors</b> between the elements.</p> <ul style="list-style-type: none"> <li>• <b>Relationships window</b> - quickly identifies every relationship of which a selected Requirement element is a member, and the partner element in that relationship, whether or not the relationship is visible in the current diagram. If the partner element is not in the diagram, you have the option of adding it</li> <li>• <b>Traceability window</b> - a very useful tool in showing chains of relationships that include the selected element. The window can show, for example, that a Requirement A is realized by a Use Case X, but Use Case X also realizes Requirement B, which in turn is also realized by Use Case Y. You can control the type and extent of these relationship chains, but as the system checks the connectors and partner elements of every relationship within the limits you impose, the system can take some time to produce the final results</li> <li>• <b>Relationship Matrix</b> - a significant tool in mapping the relationships between the Requirements elements in a package and other elements in either that package or a different package. Where a relationship is missing, you can add it; if an existing relationship is misplaced, you can delete it</li> <li>• <b>Properties dialog, Requirements tab</b> - for elements other than Requirements (particularly Use Cases), shows all internal responsibilities and external requirement elements attached to the element</li> <li>• <b>Scenarios &amp; Requirements</b> window - as for the Properties dialog, shows the Requirements and responsibilities of the selected element, and the scenarios and constraints under which the Requirements are being realized</li> </ul>	<p><a href="#">Window</a><sup>[506]</sup></p> <p><a href="#">Traceability window</a><sup>[497]</sup></p> <p><a href="#">Relationship Matrix</a><sup>[498]</sup></p> <p><a href="#">Properties Dialog</a><sup>[662]</sup></p> <p><a href="#">Requirements</a><sup>[666]</sup></p> <p><a href="#">Scenarios &amp; Requirements</a><sup>[697]</sup></p>

### 7.4.3 Manage Requirement Changes

Because requirements are statements of what a system or process must do or provide, they have a great impact on the modeling and development of the system. A new requirement might initiate an extensive program of work, and changes to or removal of that requirement can therefore have a major effect on the model. Issues concerning requirements, and changes to Requirements, must both be carefully managed.

The first steps in managing changes to requirements would be to raise *specific Issue and Change* request items against the Requirement element. You could monitor the appearance of these items using the filtered searches of the *Model Views*. You might then **review** the Requirement properties and/or its relationship hierarchies. During model development, you might capture periodic *Baselines* and use these to review the changes and, if necessary, roll them back to a previous point. You might also use the *Auditing* facility to monitor changes as they are made, and to ensure that no unauthorized or potentially risky changes are being made in the model.

These facilities are briefly discussed below.

#### Topics:

Topic	Detail	See also
<b>Changes and Issues</b>	A change is, very broadly, an item defining an addition or alteration to a requirement. An issue identifies either a failure to meet a requirement,	<p><a href="#">Changes</a><sup>[1733]</sup></p> <p><a href="#">Issues</a><sup>[1731]</sup></p>

Topic	Detail	See also
	<p>or a risk in meeting the requirement.</p> <p>Changes and issues can arise in development at a number of levels, being raised for problems that apply system-wide down to within a specific element. There are two mechanisms that can be used to identify a change or issue, and the work required to resolve it:</p> <ul style="list-style-type: none"> <li>• <b>Change and Issue</b> (or Defect) elements - structured comments that identify a problem at system-level, although they can also be attached to a specific element from which a problem arises. Both types of element resemble the Requirement element, and can be linked to one or more other elements that have to be reviewed, with relationships such as Association, Dependency and Realize. The two types of element can also form hierarchies or groups, where complex problems arise</li> <li>• <b>Maintenance items</b> raised against a specific element, and recorded for that element in the <b>Maintenance</b> window. Maintenance items enable the distinction between Defects (a failure to meet a requirement) and Issues (a risk factor that might affect satisfying the requirement). They also include Tasks, which record work items associated with the element</li> </ul> <p>Maintenance items are very specific, but if there is a possibility of an item having a wider impact on other elements or the system in general, you can <b>translate the item</b> into a Change or Issue element, or any other type of element that best identifies the problem and its solution.</p>	<p><a href="#">Maintenance items</a> <sup>[1725]</sup></p> <p><a href="#">Maintenance Workspace</a> <sup>[1725]</sup></p> <p><a href="#">Create an Element From a Maintenance Item</a> <sup>[1729]</sup></p>
<b>Model Views</b>	<p><b>Model Views</b> are very useful for trapping changes and issues in the model, especially on Requirements. You can set up searches to identify the appearance of new Change or Issue elements, or to detect changes in the properties of the Requirement elements themselves.</p>	<p><a href="#">Model Views</a> <sup>[466]</sup></p>
<b>Baselines</b>	<p>A <b>Baseline</b> is a snapshot of a package or a model branch at a particular point in time, which you determine. You can use the Baseline as a distribution mechanism for changes to the model, but the main use is to enable you to compare the current model with a previous stage, and detect what changes have been made since the Baseline was captured. If you do not want a change to remain in the model, you can roll the affected elements back to the state they had in the Baseline. Therefore, if you maintain your requirements in a specific package or branch, you can capture Baselines of the package and ensure that changes conform to your change management process or, if not, can be reversed.</p>	<p><a href="#">Baselines</a> <sup>[31]</sup></p>
<b>Auditing</b>	<p>The <b>Auditing</b> facility enables you to capture any changes made to your model within the selection criteria that you define. You can, for example, configure the Auditing facility to specifically record <b>changes to Requirement</b> elements. As auditing is continuously monitoring, you can detect changes as they are made, and verify that they are acceptable. You can also store the log of changes, and review it later on. Note that you cannot reverse the changes automatically, as you can with Baselines. You might therefore use Auditing to identify changes to investigate more fully and - if necessary - reverse in a Baseline comparison.</p>	<p><a href="#">Auditing</a> <sup>[300]</sup></p> <p><a href="#">Auditing Settings</a> <sup>[302]</sup></p>

## 7.4.4 Report on Requirements

### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Enterprise Architect provides two report generation facilities that enable you to output RTF reports and HTML reports on your model structure and components. The <b>RTF reporting facility</b> is especially comprehensive, and contains a number of features that provide particular support to Requirements Management:</p> <ul style="list-style-type: none"> <li>• A <b>requirements report template</b> that extracts details of external requirements in the model; you can copy and tailor this template for your particular requirements</li> <li>• Options in the Diagram List, Package Browser and Model Search to generate RTF reports on selected (Requirement) items from the collected information</li> <li>• The <b>Implementation Report</b>, which lists for a selected package the elements that require implementers, together with any source elements in Realize (Implements) relationships with those elements</li> <li>• The <b>Dependency Report</b>, which lists for a selected package any elements that are dependent on another element for their specification; for example, a Use Case derives its specification from the Requirement that it realizes</li> </ul>	<a href="#">RTF Document</a> <small>[1738]</small> <a href="#">RTF Dialog Options</a> <small>[1743]</small> <a href="#">Diagram List</a> <small>[464]</small> <a href="#">Package Browser</a> <small>[458]</small> <a href="#">Model Search</a> <small>[477]</small> <a href="#">Implementation Report</a> <small>[1799]</small> <a href="#">Realization</a> <small>[1009]</small> <a href="#">Dependency Report</a> <small>[1797]</small>

## 7.5 Requirements Diagram

A Requirements diagram is a custom diagram used to describe a system's requirements or features as a visual model.

Requirements are defined using Requirement elements (Custom elements of type Requirement). To view the detailed description of a Requirement, double-click on the element to display its properties.

Requirements can have relationships with other elements such as other Requirements and Use Cases. To view the traceability of a requirement, use the Traceability window.

### Use To:

- Describe a system's requirements or features as a visual model
- Link Requirement elements to Use Cases and Components in the system to illustrate how a particular system requirement is met
- Enable traceability between specifications and design requirements, and the model elements that realize them

**Example Diagram:** [Example Requirements Diagram](#)<sup>[1177]</sup>

### Tools:

Select Requirements diagram elements and connectors from the Requirements pages of the Toolbox.

Requirements Diagram Elements	Requirements Diagram Connectors
 Package	 Aggregate
 Requirement	 Inheritance
 Feature	 Associate
 Object	 Implements

### Learn More:

## 8 Domain Based Models

Enterprise Architect provides specific modeling tools for a range of specialized model types, as outlined below.

Enterprise Architect also provides an additional set of extended diagrams and a set of inbuilt and extension stereotype elements for more general use, and supports you in developing your own modeling languages.

Topic	Detail	See also
<b>Requirements</b>	Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model	<a href="#">Requirements modeling</a> <sup>[1155]</sup>
<b>Business Modeling</b>	Modeling the business process is an essential part of any software development process, enabling the analyst to capture the broad outline and procedures that govern what it is a business does	<a href="#">Business modeling</a> <sup>[1196]</sup>
<b>Business Rules</b>	Business Rule modeling captures the rules that govern a business, and their relationships with the entities and specific tasks within the organization or system	<a href="#">Business Rule modeling</a> <sup>[1202]</sup>
<b>BPMN</b>	The Business Process Modeling Notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles; these profiles enable you to develop BPMN diagrams quickly and simply	<a href="#">BPMN modeling</a> <sup>[1222]</sup>
<b>BPEL</b>	Business Process Execution Language is an executable language for specifying interactions with Web Services  Enterprise Architect uses the BPMN profile as a graphical front-end to capture BPEL Process descriptions	<a href="#">BPEL modeling</a> <sup>[1238]</sup>
<b>SysML</b>	SysML is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that might include hardware, software, information, personnel, procedures and facilities	<a href="#">Systems engineering (SysML)</a> <sup>[1557]</sup>
<b>Data Modeling</b>	Enterprise Architect provides easy-to-use tools for building and maintaining all of the fundamental data models - Conceptual, Logical and Physical; because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction	<a href="#">Data modeling</a> <sup>[1279]</sup>
<b>XSD</b>	Enterprise Architect supports rapid modeling, forward	<a href="#">XML Schema modeling</a>

Topic	Detail	See also
	engineering and reverse engineering of W3C XML schemas (XSD), critical for the development of a complete Service Oriented Architecture (SOA)	<a href="#">(XSD)</a> <sup>[1590]</sup>
<b>WSDL</b>	Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of W3C XML Web Service Definition Language (WSDL), critical for the development of a complete Service Oriented Architecture (SOA)	<a href="#">Web Service modeling (WSDL)</a> <sup>[1620]</sup>
<b>SPEM</b>	The Software and Systems Process Engineering Meta-model (SPEM) is a conceptual framework for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes  SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM	<a href="#">Software Process modeling (SPEM)</a> <sup>[408]</sup>
<b>ArchiMate</b>	ArchiMate is an open-standard enterprise architecture language based on the IEEE 1471 standard, providing a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure  It enables Enterprise Architects to clearly describe, analyse and visualize the relationships among business domains	<a href="#">ArchiMate</a> <sup>[1275]</sup>
<b>Data Flow Diagrams</b>	A data flow diagram (DFD) is a graphical representation of the flow of data through an information system, and can also be used to visualize data processing (structured design)  Developing a DFD helps in identifying the transaction data in the data model	<a href="#">Data Flow Diagrams</a> <sup>[1187]</sup>
<b>Entity Relationship Diagrams</b>	Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs)  ERDs in Enterprise Architect assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS	<a href="#">Entity Relationship Diagrams</a> <sup>[1388]</sup>
<b>Eriksson-Penker Extensions</b>	Eriksson-Penker extensions provide a framework for UML business processing model extensions, to which an Enterprise Architect can add stereotypes and properties appropriate to their business  In Enterprise Architect, the Eriksson-Penker profile provides, through a set of stereotypes, a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization	<a href="#">Eriksson-Penker Extensions</a> <sup>[1276]</sup>
<b>Group of Four Patterns</b>	Gang of Four (GoF) Patterns are 23 classic software design patterns providing recurring solutions to	<a href="#">GoF Patterns</a> <sup>[1554]</sup>

Topic	Detail	See also
	<p>common problems in software design</p> <p>Enterprise Architect provides each pattern through an icon in the Diagram Toolbox</p>	
<b>ICONIX</b>	<p>The ICONIX Process is a streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design</p> <p>Its main activity is robustness analysis, a method for bridging the gap between analysis and design</p>	<a href="#">ICONIX</a> <sup>[155]</sup>
<b>Mind Mapping</b>	<p>A Mind Map is an image-centered diagram used to represent semantic or other connections between words, ideas, tasks or other items arranged radially around a central key word or idea</p> <p>A Mind Map is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing</p>	<a href="#">Mind Mapping</a> <sup>[1185]</sup>
<b>SoaML</b>	<p>Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results</p>	<a href="#">SoaML</a> <sup>[1633]</sup>
<b>SOMF</b>	<p>The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling</p>	<a href="#">SOMF</a> <sup>[1637]</sup>
<b>Extended Diagrams</b>	<p>Enterprise Architect provides an additional set of diagram types that extend the core UML diagrams for domain-specific models</p> <p>Also, the specialized modeling tools listed in the first part of this table each have their own specialized diagrams</p>	<p><a href="#">Analysis Diagram</a><sup>[1190]</sup></p> <p><a href="#">Custom Diagram</a><sup>[1186]</sup></p> <p><a href="#">Requirements Diagram</a><sup>[1177]</sup></p> <p><a href="#">Maintenance Diagram</a><sup>[1723]</sup></p> <p><a href="#">User Interface Diagram</a><sup>[1284]</sup></p> <p><a href="#">Database Diagram</a><sup>[1281]</sup></p> <p><a href="#">Business Modeling and Business Interaction Diagrams</a><sup>[1194]</sup></p>
<b>Inbuilt and Extension Stereotypes</b>	<p>Behavioral and Structural elements can be extended through the use of stereotypes; Enterprise Architect provides a number of inbuilt extensions</p>	<a href="#">Inbuilt and Extension Stereotypes</a> <sup>[1291]</sup>
<b>Build Your Own Modeling Language</b>	<p>Enterprise Architect enables you to extend the scope both of your modeling and of the UML components you use, through the use of stereotypes, profiles and patterns to develop your own modeling applications</p>	<a href="#">Build Your Own Modeling Language</a> <sup>[1040]</sup>

## 8.1 Domain Based Diagrams

In addition to diagrams defined by the UML, Enterprise Architect provides some extended diagram platforms to model business processes or develop custom diagrams.

Diagram Type	Detail	See also
<b>Analysis Diagram</b>	An Analysis diagram is a simplified Activity diagram, which is used to capture high level business processes and early models of system behavior and elements	<a href="#">Analysis Diagram</a> <sup>[1190]</sup>
<b>Custom Diagram</b>	A Custom diagram is an extended Class diagram that is used to capture requirements, user interfaces or custom-design models	<a href="#">Custom Diagram</a> <sup>[1186]</sup>
<b>Requirements Diagram</b>	A Requirements diagram is a custom diagram used to describe a system's requirements or features as a visual model	<a href="#">Requirements Diagram</a> <sup>[1177]</sup>
<b>Maintenance Diagram</b>	A Maintenance diagram is a custom diagram used to describe change requests and issue items within a system model	<a href="#">Maintenance Diagram</a> <sup>[1725]</sup>
<b>User Interface Diagram</b>	User Interface diagrams are custom diagrams used to visually mock-up a system's user interface using forms, controls and labels	<a href="#">User Interface Diagram</a> <sup>[1284]</sup>
<b>Data Modeling Diagram</b>	A Data Modeling diagram is a Class diagram used for representing database schemas	<a href="#">Data Modeling Diagram</a> <sup>[1281]</sup>
<b>Documentation</b>	Virtual documents enable you to structure and filter your RTF and HTML reports by selecting, grouping and ordering individual packages independent of the organization of the Project Browser	<a href="#">Documentation</a> <sup>[1788]</sup>
<b>Business Modeling and Business Interaction</b>	Business Modeling diagrams and Business Interaction diagrams enable you to model both the structure and behavior of a business system  Business Modeling diagrams are based on a Class (UML Structural) diagram, whilst Business Interaction diagrams are based on a Sequence (UML Behavioral) diagram	<a href="#">Business Modeling and Business Interaction</a> <sup>[1194]</sup>

**Access:** From the Toolbox select: **More Tools | Mind Mapping**

**Topics:**

Topic	Detail	See also
<b>Introduction</b>	<p>The following text is derived from the <b>Mind Map</b> entry in the online Wikipedia.</p> <p><i>A Mind Map is a diagram used to represent words, ideas, tasks or other items linked to and arranged radially around a central key word or idea. It is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing.</i></p> <p><i>A Mind Map is an image-centered diagram that represents semantic or other connections between portions of information. By presenting these connections in a radial, non-linear graphical manner, it encourages a brainstorming approach to any given organizational task, eliminating the hurdle of initially establishing an intrinsically appropriate or relevant conceptual framework to work within.</i></p> <p><i>The elements are arranged intuitively according to the importance of the concepts and are organized into groupings, branches, or areas. The uniform graphic formulation of the semantic structure of information on the method of gathering knowledge, may aid recall of existing memories.</i></p> <p>The use of the term Mind Maps is trademarked in the UK and the USA by The Buzan Organization, Ltd.</p>	<p><a href="#">Mind Map</a> (Online Resource)</p>
<b>Mind Mapping in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop Mind Maps quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Mind Mapping facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• A Mind Mapping diagram type, accessed through the New Diagram dialog</li> <li>• A Mind Mapping page in the Toolbox</li> <li>• Mind Mapping element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul>	<p><a href="#">New Diagram</a><sup>[570]</sup></p> <p><a href="#">Toolbox Shortcut</a><sup>[553]</sup></p> <p><a href="#">Quick Linker</a><sup>[624]</sup></p>

Topic	Detail	See also
<p><b>Mind Mapping Toolbox Page</b></p>	<p>The following icons are available:</p>  <ul style="list-style-type: none"> <li>• <i>Central Topic</i> is the main theme of the Mind Map; you would normally have one or two of these on the diagram, but can add as many as are necessary</li> <li>• <i>Main Topic</i> represents the immediate concepts generated by the Central Topic</li> <li>• <i>Topic</i> represents the larger divisions of a Main Topic</li> <li>• <i>Sub Topic</i> represents the finer divisions of a Topic or Main Topic; you could also have Subtopics of Subtopics to represent increasingly finer distinctions</li> <li>• <i>Relationship</i> represents the connection between any two elements; you can have several Relationships per element. Each relationship has three anchor points, so you can curve the lines to develop the flow of concepts more easily</li> </ul> <p>When dragged onto a Mind Mapping diagram, the elements and relationship have the following appearances:</p>  <p>As the elements can represent any concept, object or relationship, you can use the full range of element properties and features to expand on what the element represents, including adding Note elements. However, to preserve the simplicity and readability of the diagram itself, you cannot display the element compartments on the diagram.</p>	
<p><b>Disable Mind Mapping</b></p>	<p>If you prefer not to use Mind Mapping in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>).</p>	<p><a href="#">MDG Technologies</a> 1035</p>

## 8.2.2 Custom Diagram

A Custom diagram is an extended Class diagram that is used to capture requirements, user interfaces or custom-design models.

Custom models provide a few extensions to the UML model and enable some exploratory and non-rigorous

experimentation with model elements and diagrams.

**Tools:**

Select Custom diagram elements and connectors from the Custom pages of the Toolbox.

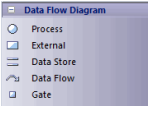

Custom Diagram Elements	Custom Diagram Connectors
 Package	 Associate
 Requirement	 Aggregate
 Issue	 Generalize
 Change	 Realize
 Screen	 Nesting
 UI Control	
 Test Case	
 Entity	

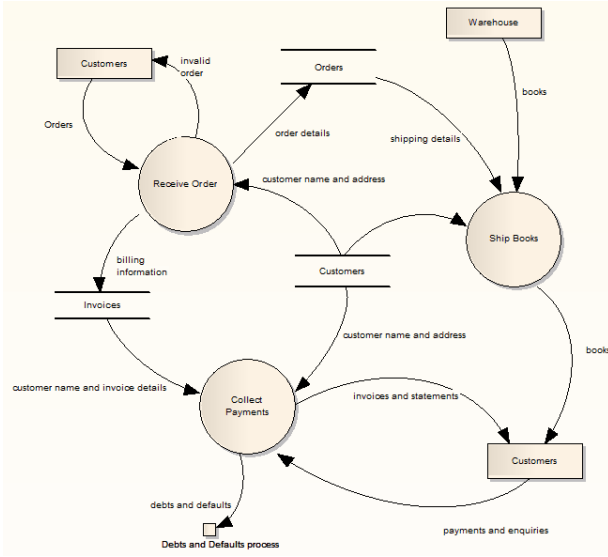

### 8.2.3 Data Flow Diagrams

**Access:** From the Toolbox select: **More Tools | Data Flow Diagrams**

**Topics:**

Images	Topic	Detail	See also
	<b>Introduction</b>	<p>The following text is derived from the <b>Data Flow Diagram</b> entry in the online Wikipedia.</p> <p><i>A data flow diagram (DFD) is a graphical representation of the "flow" of data through an information system. A data flow diagram can also be used for the visualization of data processing (structured design). It is common practice for a designer to draw a context-level DFD first which shows the interaction between the system and outside entities. This context-level DFD is then "exploded" to show more detail of the system being modeled.</i></p> <p><i>Data flow diagrams were invented by Larry Constantine ... based on Martin and Estrin's "data flow graph" model of computation. ( They ) are one of the three essential perspectives of Structured Systems Analysis and Design Method SSADM. The sponsor of a project and the end users will need to be briefed and consulted throughout all stages of a system's evolution. With a dataflow diagram, users are able to visualize how</i></p>	<p><a href="#">Data Flow Diagram</a> (Online Resource)</p>

Images	Topic	Detail	See also
		<p><i>the system will operate, what the system will accomplish, and how the system will be implemented. The old system's dataflow diagrams can be drawn up and compared with the new system's dataflow diagrams to draw comparisons to implement a more efficient system.</i></p> <p><i>Developing a DFD helps in identifying the transaction data in the data model.</i></p>	
	<b>Data Flow Diagrams in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop Data Flow diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Data Flow diagram facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• A Data Flow diagram type, accessed through the New Diagram dialog</li> <li>• A Data Flow Diagram page in the Toolbox</li> <li>• Data Flow element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul>	<a href="#">New Diagram</a> <a href="#">Toolbox Shortcut</a> <a href="#">Quick Linker</a>
	<b>Data Flow Diagram Toolbox Page</b>	<p>The following icons are available:</p> <ul style="list-style-type: none"> <li>• <i>Process</i> is a process or activity in which data is used or generated</li> <li>• <i>External</i> represents an external source, user or depository of the data</li> <li>• <i>Data Store</i> represents an internal physical or electronic repository of data, into and out of which data is stored and retrieved</li> <li>• <i>Data Flow</i> (connector) represents how data flows through the system, in physical or electronic form</li> <li>• <i>Gate</i> represents the termination point of incoming and outgoing messages on a lower level diagram (that is, messages to and from processes depicted elsewhere)</li> </ul> <p>When dragged onto a Data Flow diagram, the elements and relationship have the following appearances:</p>

		 <p>To preserve the simplicity and readability of the diagram, you cannot display the element compartments on the diagram.</p>	
	<b>Context Diagram</b>	A <i>Context</i> diagram is a top-level Data Flow diagram that has just one Process element representing the system being modeled, showing its relationship to external systems.	
	<b>Disable Data Flow Diagrams</b>	If you prefer not to use Data Flow Diagramming in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog ( <b>Settings   MDG Technologies</b> ).	<a href="#">MDG Technologies</a> <small>1035</small>

## 8.2.4 Analysis Stereotypes

### Description

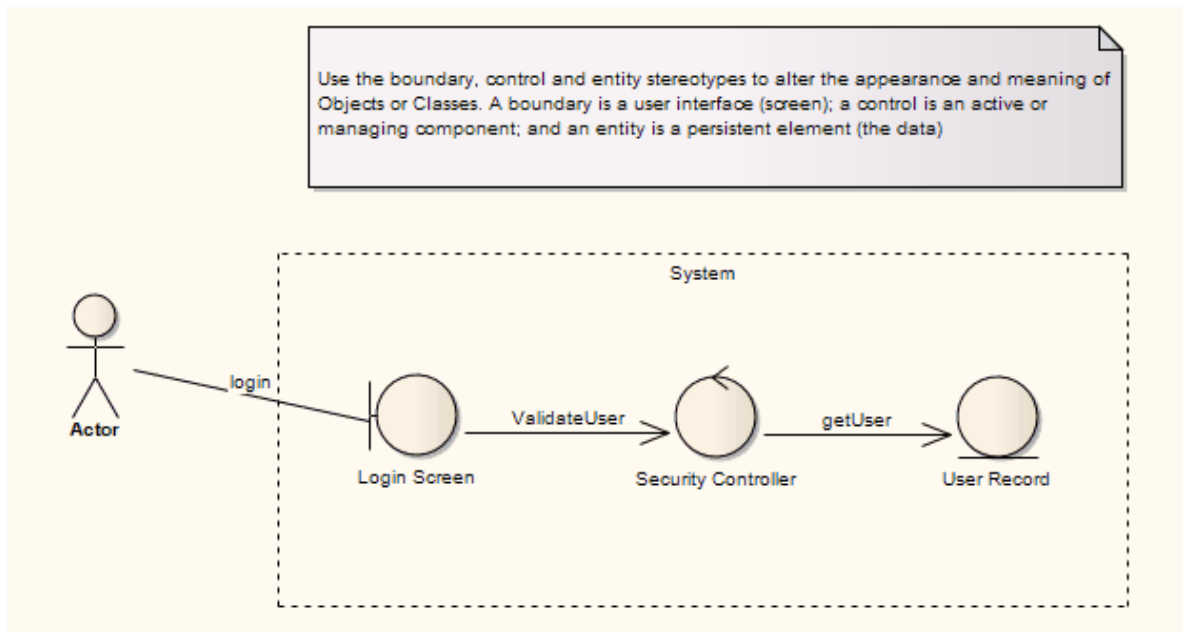

Enterprise Architect has some built in stereotypes that you can assign to an element during analysis. The effect of these stereotypes is to display a different icon from the normal element icon, providing a visual key to the element purpose. The *Robustness* diagram below illustrates the main types of inbuilt icons for elements.

The stereotypes used are:

- Boundary - for a system boundary (for example, a Login screen)
- Control - to specify an element is a controller of some process (as in the Model-View-Controller pattern)
- Entity - the element is a persistent or data element

Also see the Business Modeling elements, used in Business Modeling and Business Interaction diagrams.

### Example

- [Business Modeling](#)<sup>[1194]</sup>

**8.2.5 Analysis Diagram**

An Analysis diagram is a simplified Activity diagram, which is used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a good means of capturing the essential business characteristics and requirements.

Robustness diagrams, used extensively in ICONIX, can be created as Analysis diagrams.

**Example Diagram:** [Example Analysis Diagram](#)<sup>[1192]</sup>

**Tools:**

Select Analysis diagram elements and connectors from the Analysis pages of the Toolbox.

Analysis Diagram Elements	Analysis Diagram Connectors
 Actor	 Information Flow
 Object	 Object Flow
 Process	 Associate
 Collaboration	 Realize

Analysis Diagram Elements	Analysis Diagram Connectors
 Collaboration Use	 Representation

### 8.3 Business Models

Enterprise Architect provides specific modeling tools for a range of analysis and Business Modeling types.

Topic	Detail	See also
<b>Requirements</b>	Enterprise Architect is one of the few UML tools that integrate Requirements Management with other software development disciplines in the core product, by defining requirements within the model	<a href="#">Requirements modeling</a> <sup>[1155]</sup>
<b>Business Modeling</b>	Modeling the business process is an essential part of any software development process, enabling the analyst to capture the broad outline and procedures that govern what it is a business does	<a href="#">Business modeling</a> <sup>[1196]</sup>
<b>Business Rules</b>	Business Rule modeling captures the rules that govern a business, and their relationships with the entities and specific tasks within the organization or system	<a href="#">Business Rule modeling</a> <sup>[1202]</sup>
<b>BPMN</b>	The Business Process Modeling Notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles; these profiles enable you to develop BPMN diagrams quickly and simply	<a href="#">BPMN modeling</a> <sup>[1222]</sup>
<b>BPEL</b>	Business Process Execution Language is an executable language for specifying interactions with Web Services  Enterprise Architect uses the BPMN profile as a graphical front-end to capture BPEL Process descriptions	<a href="#">BPEL modeling</a> <sup>[1238]</sup>
<b>SPEM</b>	The Software and Systems Process Engineering Meta-model (SPEM) is a conceptual framework for modeling, documenting, presenting, managing, interchanging, and enacting development methods and processes  SPEM 2.0 focuses on providing the additional information structures that you require for processes modeled with UML 2 Activities or BPMN/BPDM	<a href="#">Software Process modeling (SPEM)</a> <sup>[408]</sup>
<b>ArchiMate</b>	ArchiMate is an open-standard enterprise architecture language based on the IEEE 1471 standard, providing a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure  It enables Enterprise Architects to clearly describe, analyse and visualize the relationships among business domains	<a href="#">ArchiMate</a> <sup>[1275]</sup>
<b>Data Flow Diagrams</b>	A data flow diagram (DFD) is a graphical representation of the flow of data through an information system, and can also be used to visualize data processing (structured design)  Developing a DFD helps in identifying the transaction data in the data model	<a href="#">Data Flow Diagrams</a> <sup>[1187]</sup>

Topic	Detail	See also
<b>Entity Relationship Diagrams</b>	<p>Entity-relationship modeling is an abstract and conceptual database modeling method, used to produce a schema or semantic data model of, for example, a relational database and its requirements, visualized in Entity-Relationship Diagrams (ERDs)</p> <p>ERDs in Enterprise Architect assist you in building conceptual data models through to generating Data Definition Language (DDL) for the target DBMS</p>	<a href="#">Entity Relationship Diagrams</a> <sup>[1388]</sup>
<b>Eriksson-Penker Extensions</b>	<p>Eriksson-Penker extensions provide a framework for UML business processing model extensions, to which an Enterprise Architect can add stereotypes and properties appropriate to their business</p> <p>In Enterprise Architect, the Eriksson-Penker profile provides, through a set of stereotypes, a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization</p>	<a href="#">Eriksson-Penker Extensions</a> <sup>[1276]</sup>
<b>Mind Mapping</b>	<p>A Mind Map is an image-centered diagram used to represent semantic or other connections between words, ideas, tasks or other items arranged radially around a central key word or idea</p> <p>A Mind Map is used to generate, visualize, structure and classify ideas, and as an aid in study, organization, problem solving, decision making, and writing</p>	<a href="#">Mind Mapping</a> <sup>[1185]</sup>
<b>SoaML</b>	Service Oriented Architecture (SOA) is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results	<a href="#">SoaML</a> <sup>[1633]</sup>
<b>SOMF</b>	The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology, offering a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling	<a href="#">SOMF</a> <sup>[1637]</sup>

### 8.3.1 Business Modeling/Interaction

Business Modeling diagrams and Business Interaction diagrams enable you to model both the structure and behavior of a business system. Business Modeling diagrams are based on a Class (UML Structural) diagram, whilst Business Interaction diagrams are based on a Sequence (UML Behavioral) diagram. Both diagram types have the same default Toolbox, which consists of a Business Modeling element page. The available elements include stereotyped Objects, and a stereotyped Actor (Business Actor), Use Case (Business Use Case) and Collaboration (Business Use Case Realization).

**Example Diagram:** [Example Business Modeling Diagram](#) <sup>[1195]</sup>

### 8.3.1.1 Example Business Modeling Diagram

The following diagram shows the appearance of the elements when dragged and dropped onto a Business Modeling diagram:

The following diagram shows the appearance of the elements when dragged and dropped onto a Business Interaction diagram:

### 8.3.2 Business Models

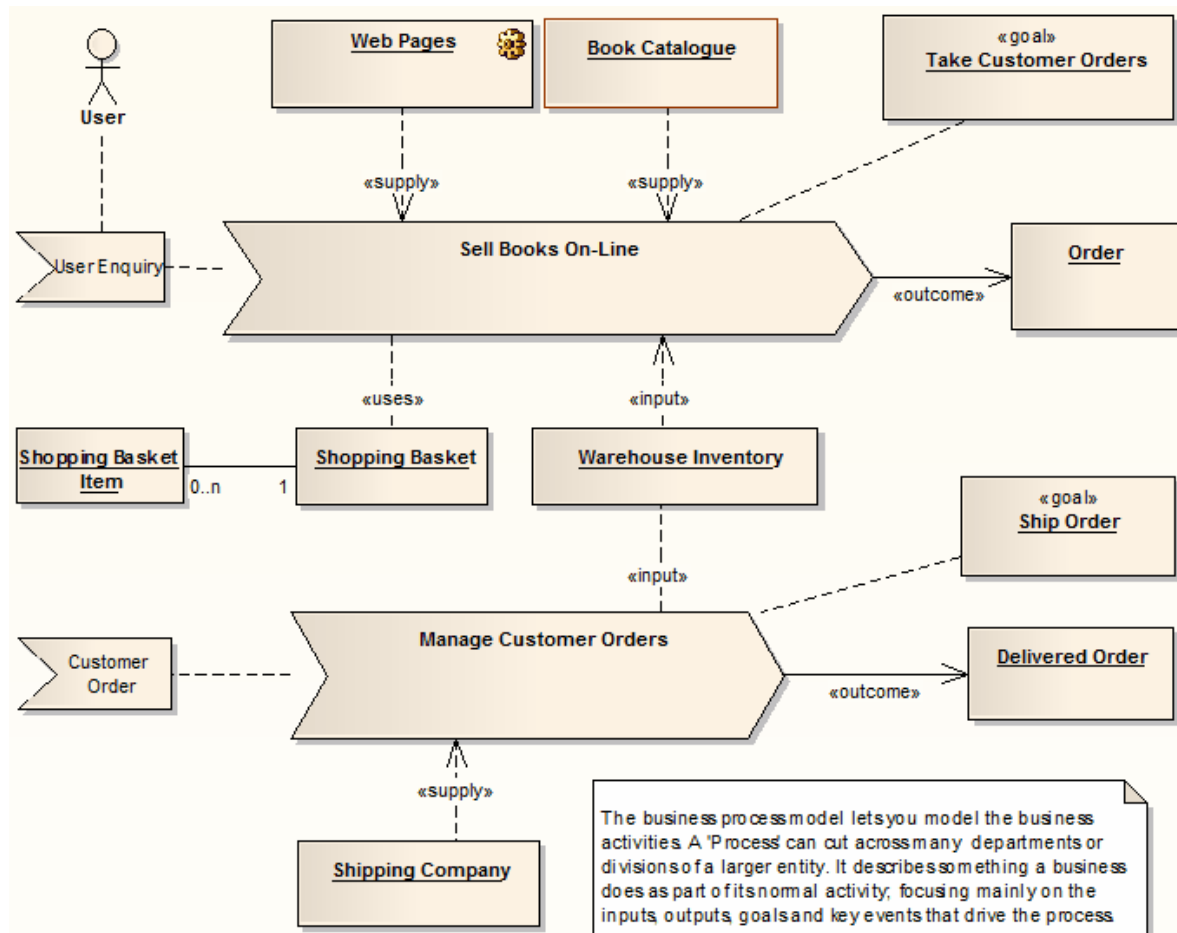

**Topics:**

Topic	Detail	See also
<b>Modeling the Business Process</b>	Modeling the business process is an essential part of any software development process. It enables the analyst to capture the broad outline and procedures that govern what it is a business does. This <b>analysis model</b> provides an overview of where the proposed software system being considered fits into the organizational structure and daily activities. It can also provide the justification for building the system by capturing the current manual and automated procedures	<a href="#">Analysis Model</a> [1196]

Topic	Detail	See also
	<p>that are to be rolled up into a new system, and the associated cost benefit.</p> <p>As an early model of business activity, it enables the analyst to capture the significant events, inputs, resources and outputs associated with business process. By connecting later design elements (such as Use Cases) back to the business process model through Implementation connectors, it is possible to build up a fully traceable model from the broad process outlines to the functional requirements and eventually to the software artefacts actually being constructed.</p> <p>As the Business Process Model typically has a broader and more inclusive range than just the software system being considered, it also enables the analyst to clearly map what is in the scope of the proposed system and what is to be implemented in other ways (such as a manual process).</p>	

**Example:**

The example below demonstrates the kind of model that can be built up to represent a business process. In this model, the goal of the business process is to take customer orders and to ship those orders out. A user starts the process with an inquiry, which leads to the involvement of the Book Catalogue, Shopping Cart, on-line pages and warehouse inventory. The output of significance to the business is a customer order.

The second half of the process model is to respond to a customer order and ship the required items. The second process involves the warehouse inventory and shipping company, and completes when an order is delivered to the customer.

### 8.3.2.1 Analysis Models

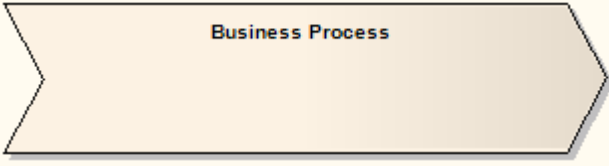

This section discusses the development of analysis models to construct business processes. It describes:

Topic	Link
Process Modeling Notation	<a href="#">Process Modeling Notation</a> <sup>[1198]</sup>
Inputs, Resources and Information	<a href="#">Inputs, Resources and Information</a> <sup>[1199]</sup>
Events	<a href="#">Events</a> <sup>[1200]</sup>
Outputs	<a href="#">Outputs</a> <sup>[1200]</sup>
Goals	<a href="#">Goals</a> <sup>[1201]</sup>
A Complete Business Process	<a href="#">A Complete Business Process</a> <sup>[1201]</sup>

#### 8.3.2.1.1 Process Modeling Notation

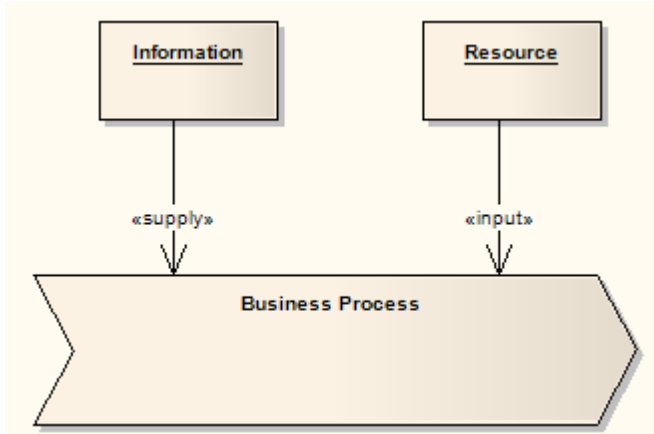

##### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>A business process model typically defines the following elements:</p> <ul style="list-style-type: none"> <li>• The goal or reason for the process</li> <li>• Specific inputs</li> <li>• Specific outputs</li> <li>• Resources consumed</li> <li>• Activities that are performed in some order, and</li> <li>• Events that drive the process</li> </ul> <p>The business process:</p> <ul style="list-style-type: none"> <li>• Can affect more than one organizational unit</li> <li>• Can have a horizontal organizational impact</li> <li>• Creates value of some kind for the customer; customers can be internal or external</li> </ul> <p>A business process is a collection of activities designed to produce a specific output for a particular customer or market. It implies a strong emphasis on how the work is done within an organization, in contrast to a product's focus on what. A process is thus a specific ordering of work activities across time and place, with a beginning, an end, and clearly defined inputs and outputs: a structure for action. The notation used to depict a business process is illustrated below.</p>	<p><a href="#">Process</a> <sup>[1300]</sup></p> <p><a href="#">Events</a> <sup>[1200]</sup></p> <p><a href="#">Activity</a> <sup>[875]</sup></p>

Topic	Detail	See also
	 <p>The <b>process notation</b> implies a flow of activities from left to right. Typically an <b>Event</b> element is placed to the left of the process and the output to the right. To specifically notate the internal activities, <b>Activity</b> elements can be placed inside the process element.</p>	
<p><b>The BPMN File</b></p>	<p>One popular notation and approach to business modeling is the Business Process Modeling Notation (BPMN). This notation is specifically targeted at the business modeling community and has a relatively direct mapping to UML through a BPMN Profile. Sparx Systems provides a built-in <b>profile for BPMN</b> modeling in Enterprise Architect.</p>	<p><a href="#">BPMN Models</a> <small>[1222]</small></p>

**8.3.2.1.2 Inputs, Resources and Information**

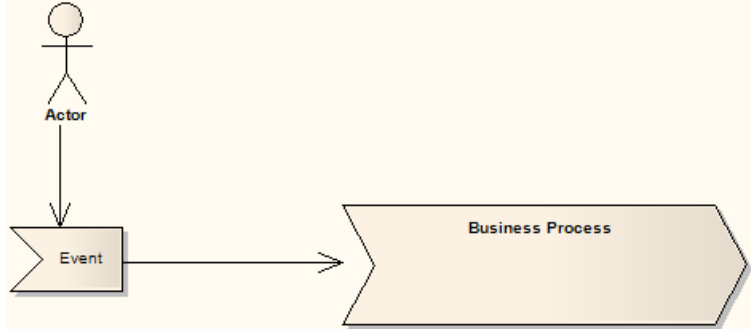

Topics:

Topic	Detail	See also
<p><b>Abstract</b></p>	<p>Business processes use information to tailor or complete their activities. Information, unlike resources, is not consumed in the process; rather it is used as part of the transformation process. Information can come from external sources, from customers, from internal organizational units and could even be the product of other processes. A resource is an input to a business process and, unlike information, is typically consumed during the processing. For example, as each daily train service is run and actuals recorded, the service resource is 'used up' as far as the process of recording actual train times is concerned.</p> <p>The notation to illustrate information and resources is shown below.</p>  <p>A <i>Supply</i> connector indicates that the information or object linked to the process is not used up in the processing phase. For example, order templates can be used over and over to provide new orders of a</p>	

Topic	Detail	See also
	<p>certain style; the templates are not altered or exhausted as part of this activity.</p> <p>An <i>Input</i> connector indicates that the attached object or resource is consumed in the processing procedure. As an example, as customer orders are processed they are completed and signed off, and typically are used only once per unique resource (order).</p>	

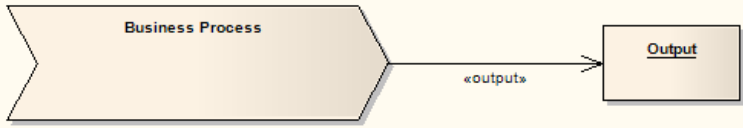

### 8.3.2.1.3 Events

#### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>An <b>event</b> is the receipt of some object, a time or date reached, a notification or some other trigger that initiates the business process. The event might be consumed and transformed (for example a customer order) or simply act as a catalyst (for example, nightly batch job).</p>  <p>The diagram illustrates the flow from an Actor to an Event and then to a Business Process. An Actor (represented by a stick figure) has a downward arrow pointing to an Event (represented by a rectangle with a pointed right side). From the Event, a horizontal arrow points to a Business Process (represented by a large arrow shape pointing right).</p>	<a href="#">Event</a> <sup>[1295]</sup>

### 8.3.2.1.4 Outputs

#### Topics:

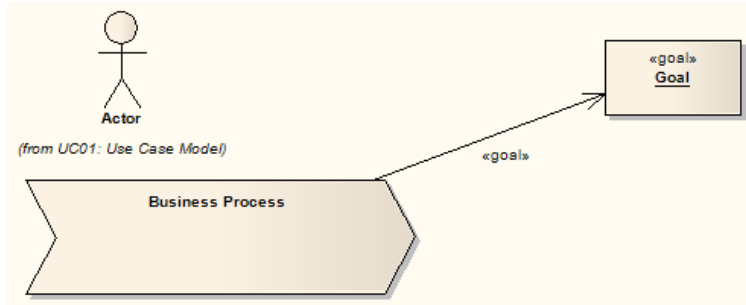

Topic	Detail	See also
<b>Abstract</b>	<p>A business process typically produces one or more outputs of value to the business, either for internal use or to satisfy external requirements. An output might be a physical object (such as a report or invoice), a transformation of raw resources into a new arrangement (a daily schedule or roster) or an overall business result such as completing a customer order.</p> <p>An output of one business process might feed into another process, either as a requested item or a trigger to initiate new activities.</p>  <p>The diagram shows a Business Process (represented by a large arrow shape pointing right) connected to an Output (represented by a rectangle). The connection is labeled «output».</p> <p>An Output connector indicates that the business process produces</p>	

Topic	Detail	See also
	some object (either physical or logical) that is of value to the organization, either as an externally visible item or as an internal product (possibly feeding another process).	

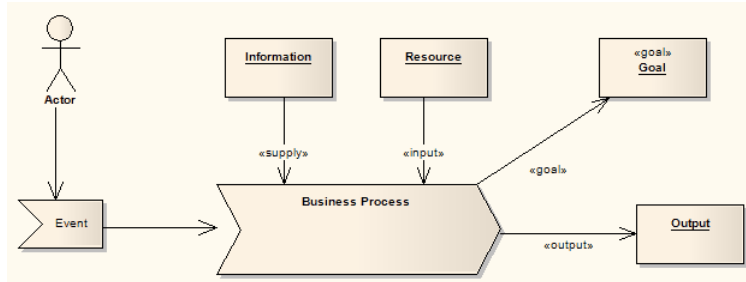

8.3.2.1.5 Goals

Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>A business process has some well defined goal. This is the reason the organization does this work, and should be defined in terms of the benefits this process has for the organization as a whole and in satisfying the business requirements.</p>  <p>(from UC01: Use Case Model)</p> <p>A Goal connector indicates that the attached object to the business process describes the goal of the process. A goal is the business justification for performing the activity.</p>	

8.3.2.1.6 A Complete Business Process

Topics:

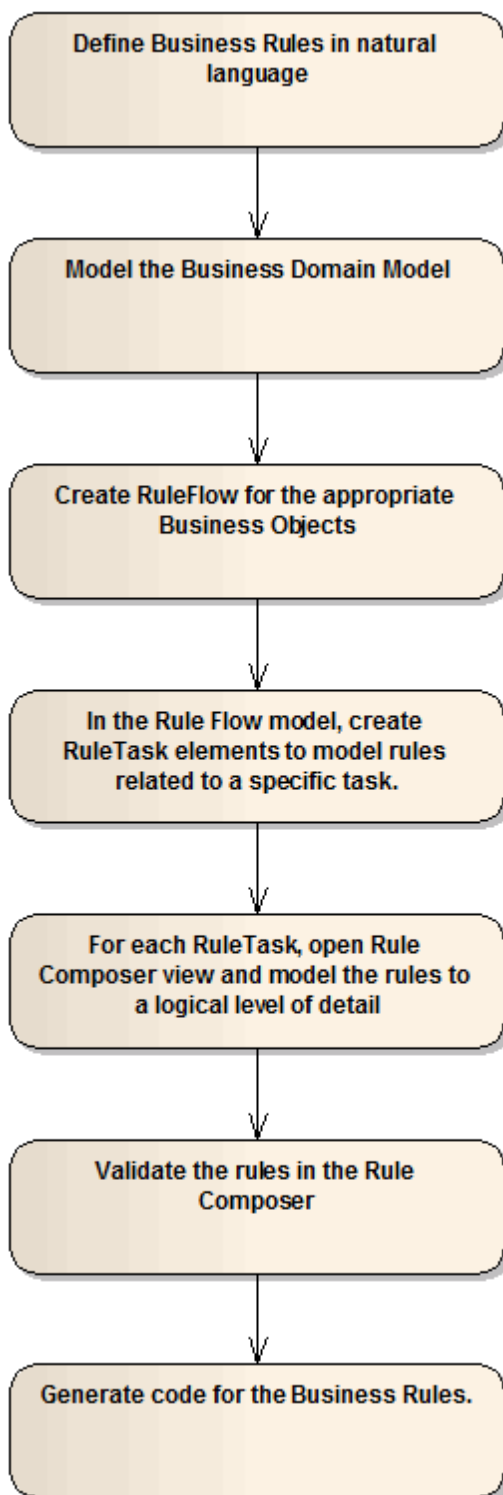

Topic	Detail	See also
<b>Abstract</b>	<p>The diagram below illustrates how the various model elements can be grouped together to produce a coherent picture of a named business process. Included are the inputs, outputs, events, goals and other resources that are of significance.</p> 	

### 8.3.3 *Business Rules*

To model Business Rules in Enterprise Architect, work through the following steps

**Example:**

These steps are represented graphically in the following flow:

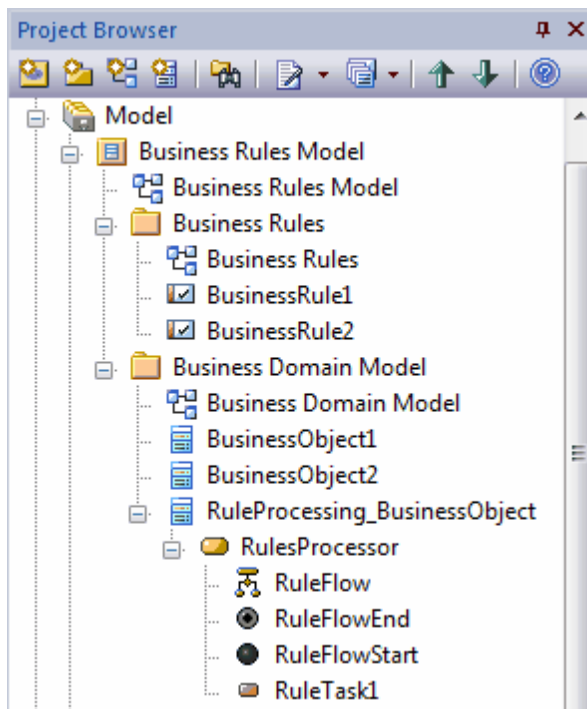

To create a Business Rule Model from a template provided with Enterprise Architect, follow the steps below

**How To:**

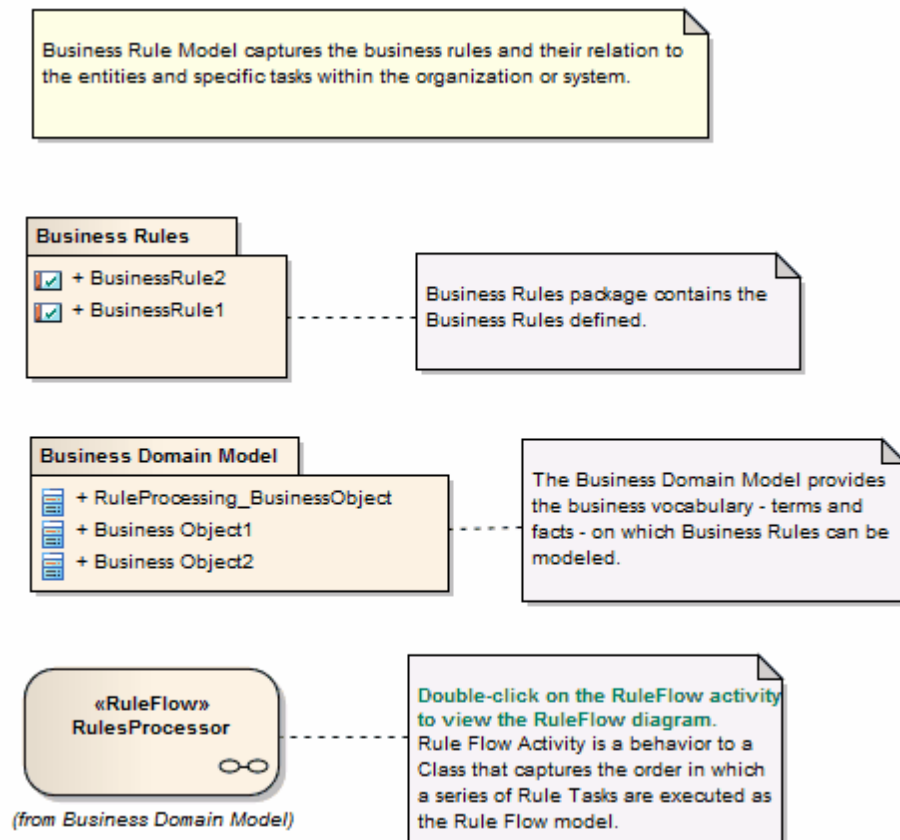

Step	Action	See Also
1	<p>In the <b>Project Browser</b>, either:</p> <ul style="list-style-type: none"> <li>Click on the <b>New Model From Pattern</b> icon in the toolbar</li> <li>Right-click on a model root node and select the <b>Add a New Model using Wizard</b> context menu option</li> <li>Right-click on a package and select the <b>Add   Add a New Model using Wizard</b> context menu option</li> </ul> <p>The <b>Select Model(s)</b> dialog displays.</p>	
2	In the <b>Select From</b> field, click on the drop-down arrow and select <b>Business Rule Model</b> . Alternatively, if it is listed in the <b>Technology</b> panel, select the <b>Business Rule Model</b> item.	
3	In the <b>Name</b> panel, select the checkbox next to the <b>Business Rule Model</b> icon.	
4	Click on the <b>OK</b> button.	

The following model structure is created in the **Project Browser**:

**Example:**

The *Business Rules Model* diagram, shown below, encapsulates the components of the Business Rules model.

**Notes:**

- Business Rule Modeling is available in the Business and Software Engineering edition and Ultimate edition of Enterprise Architect

**Learn More:**

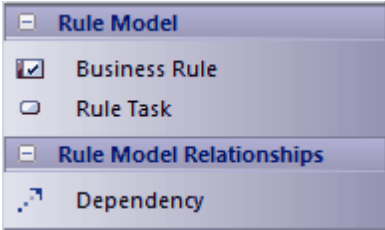

- [Create a Rule model](#) <sup>[1203]</sup>
- [Create a Business Domain Model](#) <sup>[1207]</sup>
- [Create a Rule Flow Model](#) <sup>[1209]</sup>
- [Compose Business Rules](#) <sup>[1214]</sup>
- [Validate Business Rules](#) <sup>[1219]</sup>
- [Code Generation for Business Rules](#) <sup>[1220]</sup>

**8.3.3.1 Model Business Rules For RuleTasks**

The *Rule Model* enables you to define *Business Rule* elements and associate them with a Rule Task. In the example, you might define a set of rules to perform an eligibility check for a customer, to determine if the customer is eligible to rent a car.

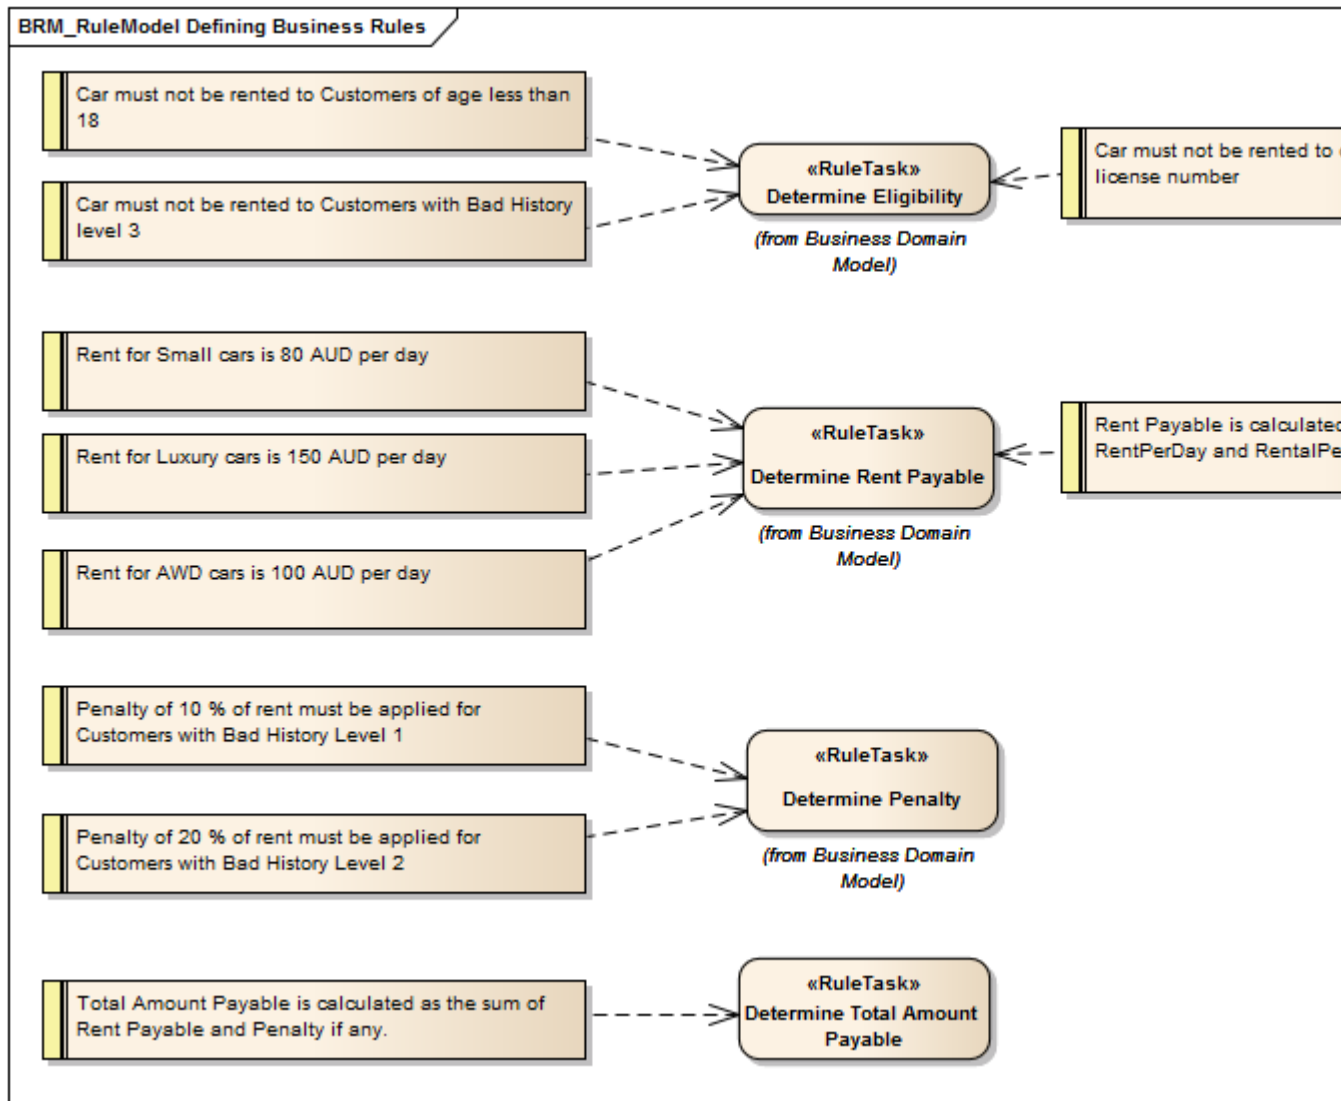

**How To:**

To define Business Rule elements and associate them with a Rule Task, follow the steps below:

Step	Action	See Also
1	Create a diagram of type <i>Rule Model</i> ; the Rule Model pages display in the Toolbox  	
2	Drag and drop a Rule Task element ( <i>Determine Eligibility</i> in the example) from the Rule Flow Activity diagram package onto the Rule Model diagram	
3	Drag as many Business Rule elements as necessary from the Toolbox (or Project Browser if they exist already) onto the diagram  You type the rule as the element name here, then define the parameters of the rules using the Rule Composer	<a href="#">Composing Business Rules</a> <small>1214</small>
4	Create a Dependency relationship between each Business Rule element and the Rule Task element  However, when you bring the rule into the Rule Composer, it automatically creates the Dependency relationship anyway	
5	Repeat steps 2 - 4 for the next Rule Task element	

**Example:**

The resulting Rule Model resembles the following diagram:

After you have modeled rules for all the Rule Task elements in the Rule Flow diagram, the Business Domain model is ready for **code transformation**. The code templates for generating technology-specific rule code work hand-in-hand with the **EASL code templates** to generate the code for the Rule Flow diagram.

**Learn More:**

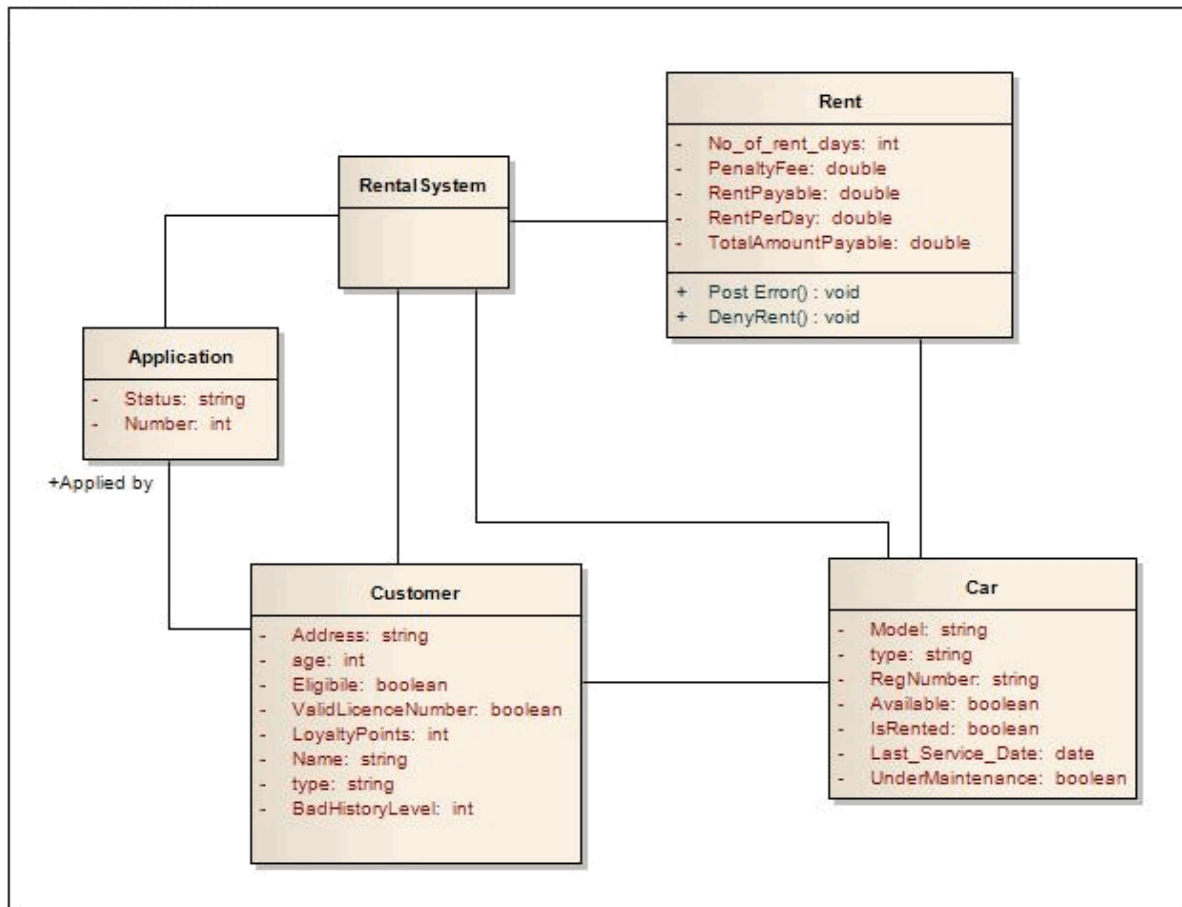

- [Code Generation for Business Rules](#) <sup>[1220]</sup>
- [EASL code templates](#) <sup>[1139]</sup>

**8.3.3.2 Create a Business Domain Model**

The *Business Domain Model* provides the business vocabulary - terms and facts - on which Business Rules can be modeled. In Enterprise Architect a Business Domain model is created as a conceptual Class diagram.

**Example:**

The following diagram shows an example Business Domain model, for a Car Rental system.

In the example Business Domain model, the Classes *Rent*, *Customer*, *Car* and *Application*, together with their attributes and operations, provide the terms for the business vocabulary. The Class *Rental System* processes the rules. To make *Rental System* process the rules, you add a **RULE FLOW ACTIVITY** as a behavior for this Class.

When you create a Rule Flow behavior (Activity) under a Class you can model the rules as *Rule Tasks* (Actions). When code is generated the rule flow behavior is rendered as a method inside the corresponding Class.

Alternatively, if you have existing operations in the Class that already suit the purpose, you can **model business rules in those operations**. When code is generated for the Class the rules logic is generated as the method body for the corresponding operation.

#### Notes:

- When you create Classes in the Business Domain model, select the correct language for code generation to ensure that the correct data type is set for attributes and operation parameters
- Business Rules code generation is supported for the following languages:
  - C++
  - C#
  - Java
  - VB.Net

#### Learn More:

- [Create a Rule Flow Activity](#)<sup>[1209]</sup>
- [Model Rules in an Operation](#)<sup>[1212]</sup>

### 8.3.3.3 Create a Rule Flow Model

You create a *Rule Flow Activity* as a behavior for a Class, to enable that Class to process a set of rules.

To add a Rule Flow Activity to a Class, follow the steps below

**How To:**

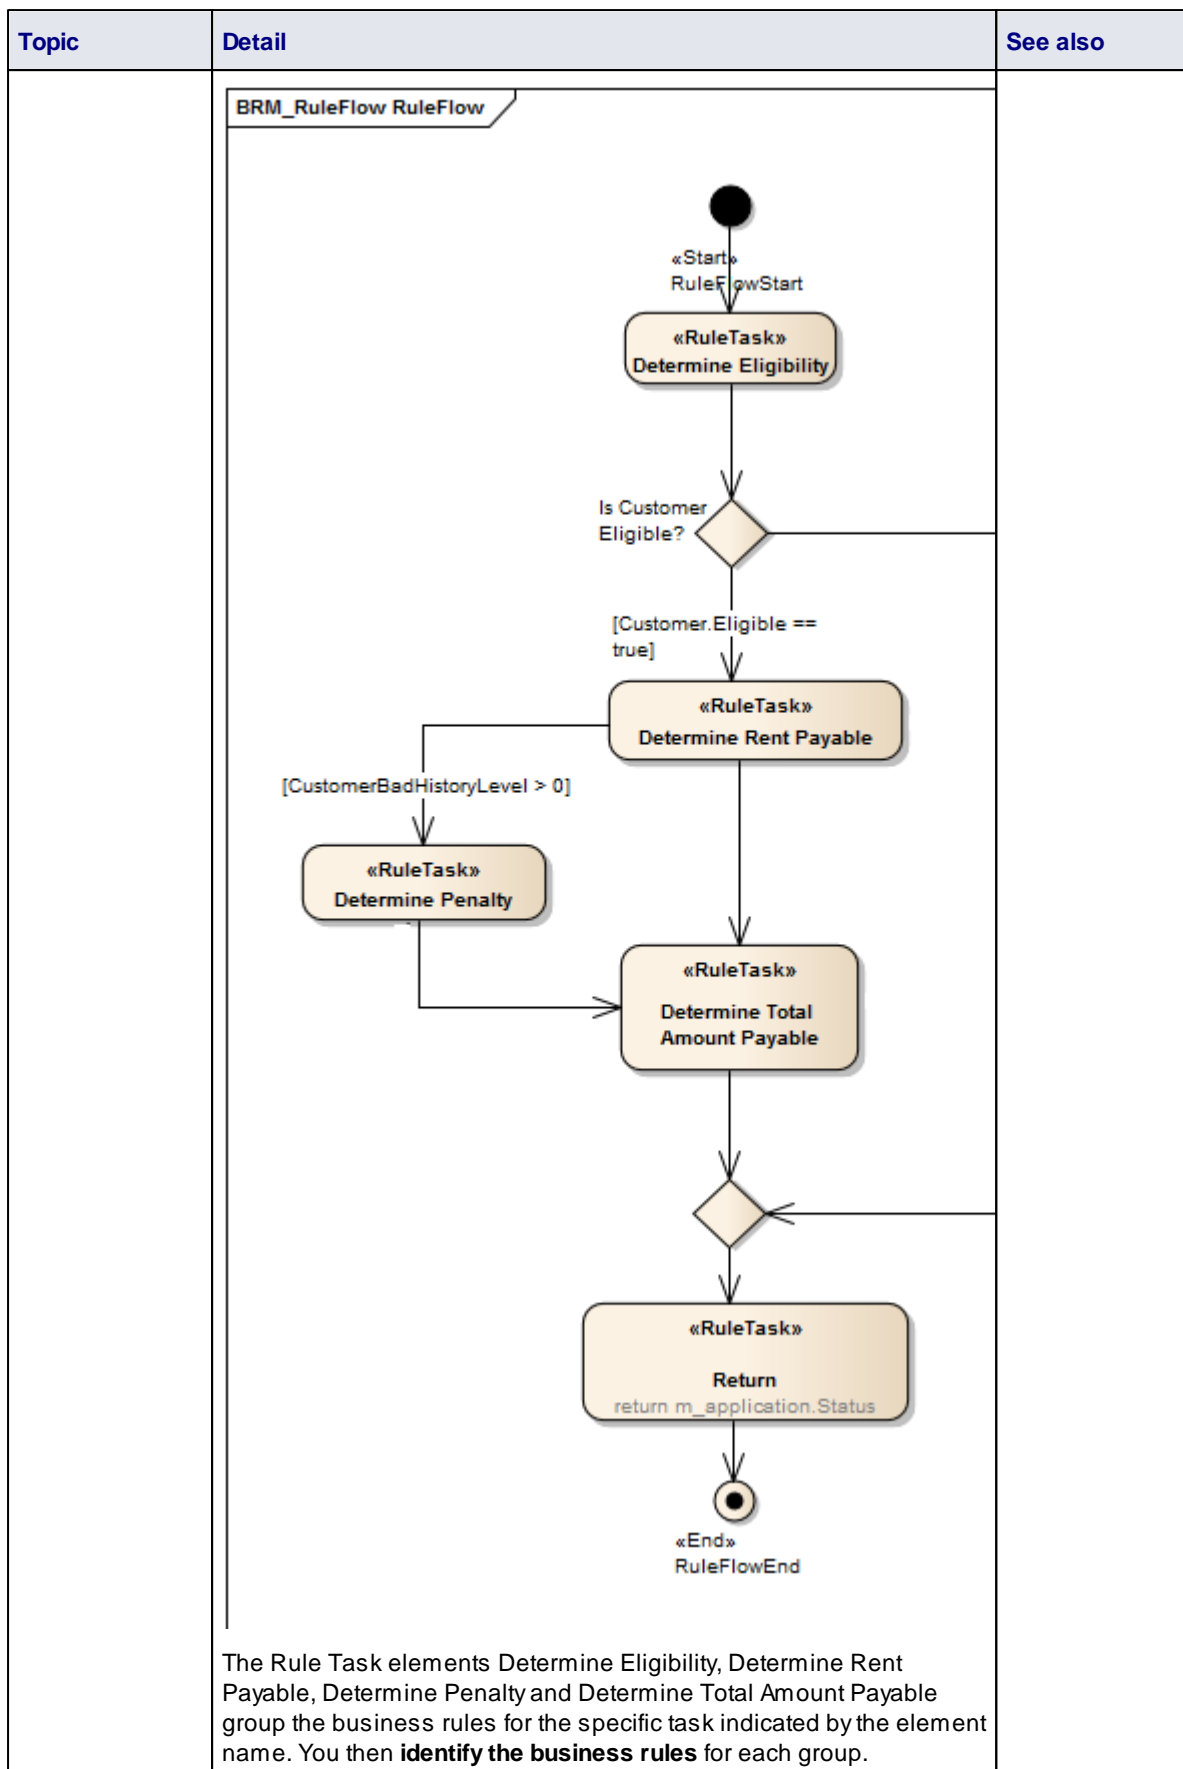

Step	Action	See Also
1	On the Business Domain model diagram, right-click on the Class that processes the rules (in the example, <i>Rental System</i> ).	
2	From the context menu select the <b>Add   RuleFlow</b> Activity menu option.	

A new Rule Flow Activity with a *Rule Flow diagram* is created as a behavior for the selected Class. The Rule Flow diagram models the sequence in which a series of *Rule Tasks* are executed.

Code generation for a Rule Flow model renders each RuleFlow Activity as a set of operations or methods. Depending on what you want these methods to do, you might want to pass in some parameters to be used within the Rule Flow Activity. See the **Pass Parameters to Rule Flow Activity** topic.

**Topics:**

Topic	Detail	See also
<b>Add a Rule Task</b>	<p>A Rule Task is a stereotyped Action that groups Business Rules for a specific task. You create Rule Task elements in a <b>Rule Flow</b> diagram using the associated Rule Flow pages of the <b>Toolbox</b>.</p>  <p>The following illustration is of a possible Rule Flow diagram for the car rental example.</p>	<p><a href="#">Model Business Rules</a> <sup>[1205]</sup></p>

**Notes:**

- In a Rule Flow diagram, every Decision Node has a matching *Merge Node* to ensure proper code generation
- For code generation, the Rule Task elements must be grouped inside the appropriate Rule Flow Activity in the **Project Browser**. However, Rule elements can be defined anywhere in the model, as they can be used in more than one Rule Task

**Learn More:**

- [Pass Parameters to Rule Flow Activity](#)<sup>[1211]</sup>

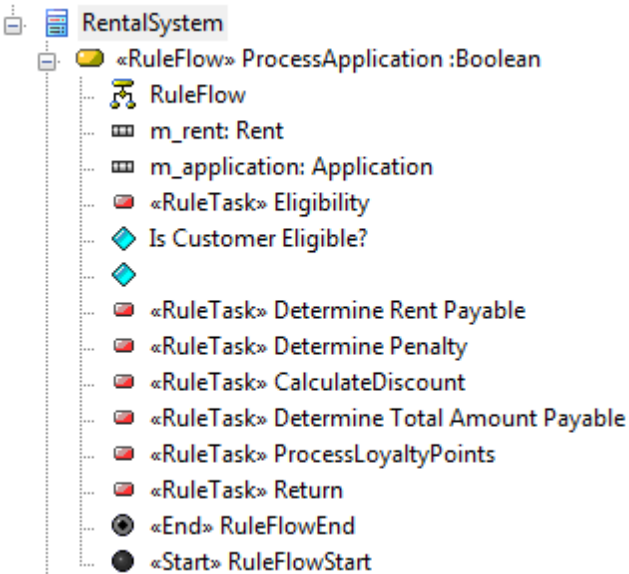

**8.3.3.3.1 Pass Parameters to Rule Flow Activity****How To:**

To pass in parameters to be used within a Rule Flow Activity, follow the steps below:

Step	Action	See Also
1	In the <b>Project Browser</b> , double-click on the Rule Flow Activity The element <b>Properties</b> dialog displays	
2	Click on the <b>Behavior</b> tab	
3	Click on the <b>Edit Parameters</b> button The <b>Parameters</b> dialog displays	
4	<b>Create and define</b> each parameter, setting Type and Default values	<a href="#">Parameters Dialog</a> <sup>[719]</sup>
5	Save each parameter and, when you have finished setting the parameters, close both dialogs	

**Topics:**

Topic	Detail	See also
<b>Rule Flow Activity Parameters</b>	The Rule Flow Activity parameters can be accessed by the Rule Tasks within the parent Rule Flow Activity. In the following hierarchy, the parameters <i>m_rent</i> and <i>m_application</i> can be used by any of the Rule Tasks under the <i>ProcessApplication</i> Rule Flow Activity.	<a href="#">Compose Business Rules</a> <sup>[1214]</sup>

Topic	Detail	See also
	 <p>You can use the parameters as condition variables or action variables in the Business Rule <b>Decision Table</b>, or as rule variables in the <b>Computation Table</b> for any of the Rule Tasks. If the Activity parameter is not accessible to a Rule Task, Enterprise Architect displays an error message.</p>	

### 8.3.3.2 Model Rules In an Operation

You can model business rules either in the **Business Rule** elements attached to the Rule Task element in a **RuleFlow Activity** diagram, or in the operations of the rule Class in the **Business Domain model**.

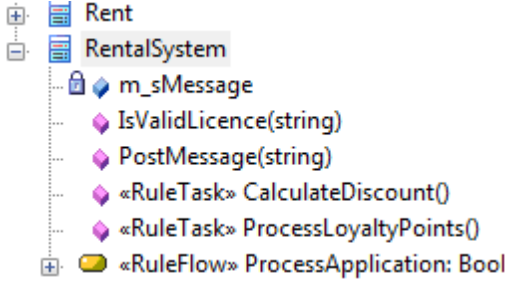

To model business rules for an operation:

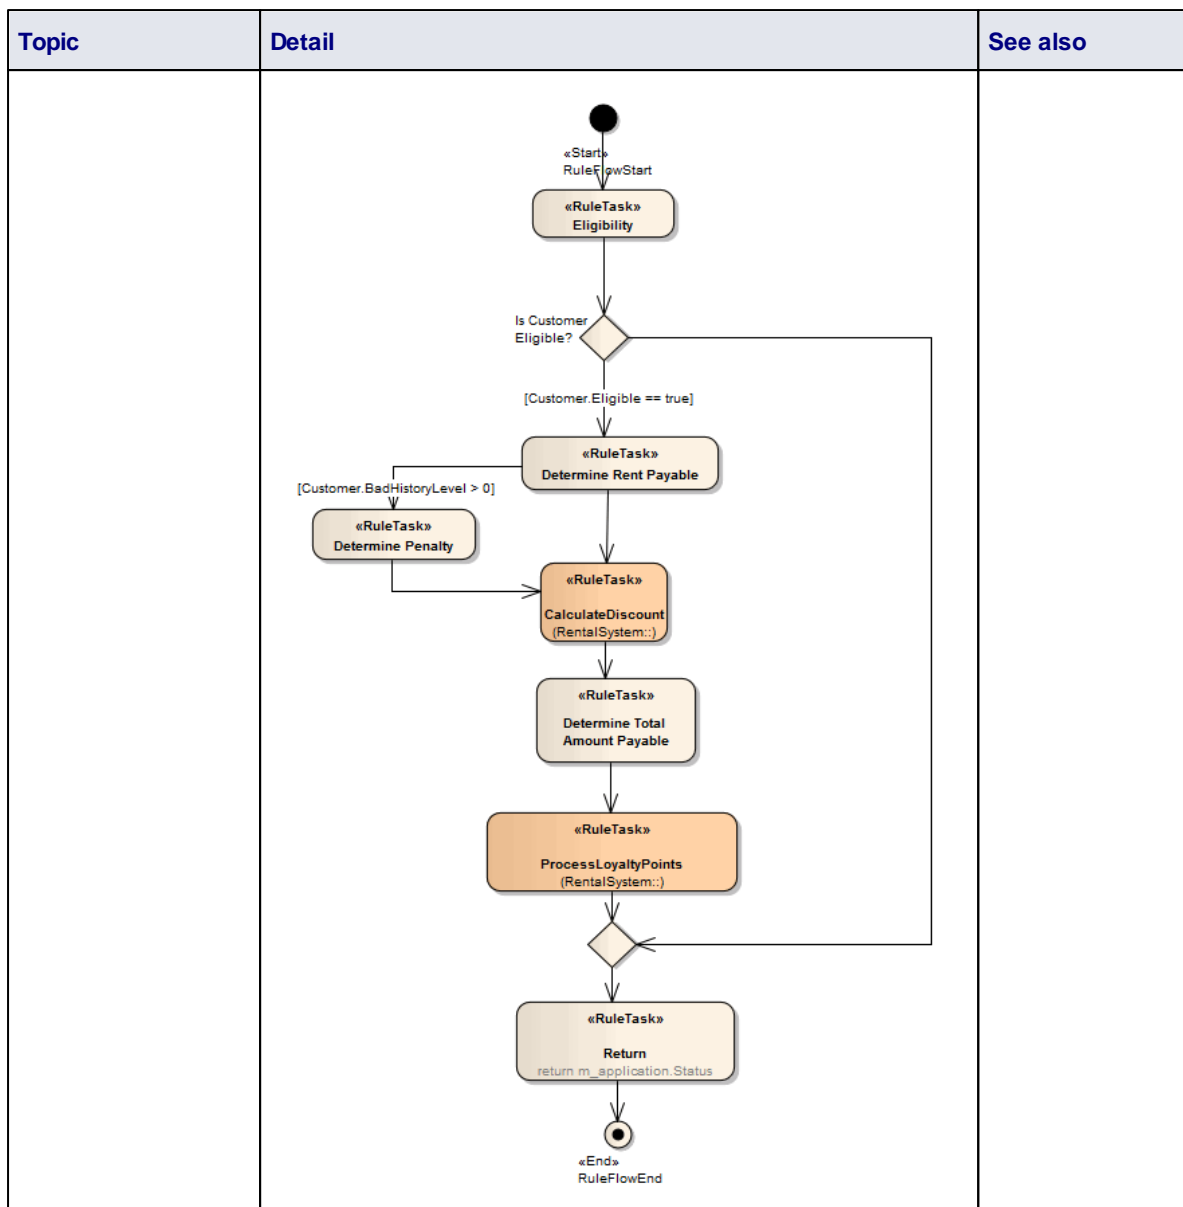

#### How To:

Step	Action	See Also
1	Open the <b>Properties</b> dialog for the operation and, in the <b>Stereotype</b> field on the <b>General</b> tab, type the value <b>RuleTask</b>	
2	In the <b>Project Browser</b> , right-click on the operation and select the <b>Rule Composer</b> option to open the <b>Rule Composer</b>	
3	Model the rules for the operation	<a href="#">Compose Business Rules</a> 1213

#### Topics:

Topic	Detail	See also
Usage	The operations appear in the <b>Project Browser</b> as shown below:	<a href="#">Behaviour Calls</a> 1717

Topic	Detail	See also
	 <p>On code generation, the code for rules logic is generated in the method body.</p> <p>When you drag and drop a RuleTask operation onto a Rule Flow diagram, an <b>operation call behavior action</b> is created. To pass the parameters for this operation call, open the Properties dialog and select the Call tab. Set the <b>Behavior</b> field to the operation to be called. Under the <b>Arguments</b> field, click on the <b>Edit Arguments</b> button and <b>edit the argument values</b> to be passed.</p> <p>On the diagram, the call behavior actions for the RuleTask operations are indicated as shown below:</p>	<p><a href="#">Behaviour Call Arguments</a> <sup>718</sup></p>

**8.3.3.4 Compose Business Rules**

You use the **Rule Composer** to define a business rule written in plain text within a Business Rule element or Class operation. The **Rule Composer** enables you to model conceptual-level business rules at a logical level in tabulated format, which assists in transforming the rules to technology-specific rules (code).

You can also **download** the contents of the **Rule Composer** to a spreadsheet application such as Microsoft Excel, via a **CSV** file.

**Topics:**

Topic	Detail	See also
<b>Access The Rule Composer</b>	<p>To access the <b>Rule Composer</b>, right click on a Rule Task element and select the <b>Rule Composer</b> context menu option. The <b>Rule Composer</b> displays in the central work area on its own tab.</p> <p>The <b>Rule Composer</b> consists of:</p> <ul style="list-style-type: none"> <li>• a <b>Rule Statements</b> list</li> <li>• a <b>Decision Table</b> and</li> <li>• a <b>Computation Rule Table</b></li> </ul> <p>To assist with traceability, as the <b>Rule Composer</b> is completed, selections in one table automatically highlight the corresponding rows and columns of the other tables. For example, If a Rule Statement is selected, the related rule column in the <b>Decision Table</b> and row in the <b>Computation Rule Table</b> are highlighted. Similarly, if a Computational Rule is selected, the corresponding column in the <b>Decision Table</b> and row in the <b>Rule Statements</b> list are highlighted.</p>	
<b>Rule Statements Table</b>	<p>The <b>Rule Statements</b> table lists the rules associated with the selected Rule Task. You add a rule to the table by dragging an existing Business Rule element from the <b>Project Browser</b> onto an empty row in the <b>Rule Statements</b> table. You cannot create new rules within the table.</p>	
<b>Decision Table</b>	<p>The <b>Decision Table</b> enables you to model <i>conditional</i> rules (for example: <i>Cars must not be rented to customers of age less than 18</i>).</p> <p>The table has three sections:</p> <ul style="list-style-type: none"> <li>• <b>Rule Conditions</b> – to model condition variables</li> <li>• <b>Rule Actions</b> – to model action variables</li> <li>• <b>Rule Bindings</b> – to link the rule in the rule table</li> </ul>	
<b>Computation Rule Table</b>	<p>The <b>Computation Rule</b> table enables you to model rules involving computations.</p> <p>The table has the following columns:</p> <ul style="list-style-type: none"> <li>• <b>Computation Rule Actions</b></li> <li>• <b>Expression</b></li> <li>• <b>Rule Bindings</b></li> <li>• <b>Rule Dependency</b></li> </ul>	

**How To:**

To define a business rule associated with the selected Rule Task, follow the steps below

Step	Action	See Also
1	For the first rule, select the text within the Business Rule element and drag it onto the empty row.	
2	For a subsequent rule, click on the <b>No</b> column and select the <b>Add Row</b> context menu option. An empty row is added to the <b>Rule Statements</b> table.	

Step	Action	See Also
3	Drag the required Business Rule element from the <b>Project Browser</b> onto the new row. If the Business Rule element is not already on the diagram, this adds the element to the diagram and creates a Dependency relationship between the Business Rule and Rule Task elements.	

To remove a rule that is no longer required in the **Rule Composer**, right-click on the appropriate **No** field and select the **Remove Rule** context menu option. This removes the rule from the **Rule Composer** and deletes the Dependency relationship with the Rule Task element. However, it does not remove the Business Rule element from either the diagram or the **Project Browser** (where, in either case, it might be in use with other Rule Task elements).

To model Rule Conditions in the Rule Conditions Section, follow the steps below

Step	Action	See Also
1	The Business Domain model defines the business terms (such as <i>Customer</i> ) and their associated attributes. From the appropriate Class element in the <b>Project Browser</b> , drag and drop the required condition attribute (such as age) or operation (such as <i>IsValidLicense()</i> ) onto the <b>Rule Conditions</b> column. <ul style="list-style-type: none"> <li>The <b>Rule Condition</b> field enables you to use intellisense to display a list of possible entries for the field. Press ( <b>Ctrl+Spacebar</b> ) in the field to display the list of entries</li> <li>If the Rule Condition is of type <i>enum</i>, the <b>Allowable Values</b> fields are automatically set with the <i>enum</i> literals. The procedure then ends here</li> </ul>	
2	Define a range of accepted values for the Rule Condition.	
3	Right-click on the <b>Allowable Values</b> column and select the <b>Edit Allowable Values</b> context menu option. The <b>Edit Allowable Values</b> dialog displays.  Type each required value or range of values in the <b>Value</b> field, and click on the <b>Save</b> button to display the value in the <b>Allowable Values</b> list box; for example:  age could have the values: <b>&lt;18</b> <b>&gt;18 and &lt;50</b> <b>&gt;50</b>  <i>IsValidLicense()</i> could return: <b>True</b> <b>False</b>	
4	Click on the <b>OK</b> button to save the values and close the dialog. A new constraint <i>AllowableValues</i> is created for the attribute. <ul style="list-style-type: none"> <li>You can check this constraint by opening the <b>Properties</b> dialog for the attribute and selecting the <b>Constraints</b> tab</li> <li>If the Rule Condition references an enumeration, the enum literals are not editable in the <b>Edit Allowable Values</b> dialog</li> </ul>	
5	If the Rule Condition is an operation, you can pass parameters to it. Right click on the <b>Allowable Values</b> field, and select the <b>Edit Parameters</b> context menu option. The <b>Edit Parameters</b> dialog displays. Select the parameters	

Step	Action	See Also
	<p>and type their values into the <b>Value</b> text box. Click on the <b>OK</b> button to cancel the dialog.</p> <ul style="list-style-type: none"> <li>You can add an operation as a Rule Condition more than once, to allow calling the operation with different sets of parameters.</li> <li>To add another Rule Condition, right-click on the <b>No</b> column and select the <b>Add Row</b> context menu option. An empty row is added to the table.</li> </ul> <p>To remove a Rule Condition from the table, right-click on the appropriate <b>No</b> field and select the <b>Delete Row</b> context menu option. This does not affect the original attribute or <i>the new constraint</i> in the model. You can either re-use the attribute with its constraint, or use the attribute <b>Properties</b> dialog to remove the constraint.</p>	

To model Rule Actions in the Rule Actions section, follow the steps below:

Step	Action	See Also
1	<p>In the <b>Rule Actions</b> section, when a specific value of a Rule Condition calls an operation (such as <i>post error</i>) or decision attribute (such as <i>Eligible - Yes/No</i>), you assign the operation or attribute as an action.</p> <p>From a business term Class element in the <b>Project Browser</b>, drag and drop the required attribute or operation onto the <b>Rule Actions</b> field.</p> <p>The <b>Rule Actions</b> field enables you to use intellisense to display a list of possible entries for the field. Press ( <b>Ctrl+Spacebar</b> ) in the field to display the list of entries.</p>	
2	<p>For an attribute, double-click on the <b>Allowable Values/Parameters</b> field. The <b>Edit Allowable Values</b> dialog displays; type the range of values in the text box (such as <b>Yes, No</b>; or <b>Accept, Reject</b>), click on the <b>Save</b> button and close the dialog. Select the appropriate response in the <b>Result</b> column fields.</p> <p>If the dropped action variable is of type <i>enum</i>, the <b>Allowable Values/Parameters</b> fields are automatically set with the enum literals.</p>	
3	<p>For an operation, a checkbox displays in each of the <b>Result</b> column fields. To call the operation, select the checkbox in the appropriate column.</p> <p>To pass parameters to the operation, double-click on the <b>Allowable Values/Parameters</b> field. The <b>Edit Parameters</b> dialog displays. Select the parameters and type the values into the <b>Value</b> text box. Click on the <b>Save</b> button and close the dialog.</p> <p>You can add an operation as a Rule Action more than once, to allow calling the operation with different sets of parameters.</p>	
4	<p>Click on the <b>Save</b> button in the <b>Rule Composer</b> toolbar to save the values.</p> <p>Alternatively, you can <i>right-click</i> on an <b>Allowable Values/Parameters</b> field to display a context menu with two options:</p> <ul style="list-style-type: none"> <li>If the Rule Action is an attribute, the <b>Edit Allowable Values</b> option is enabled and this displays the <b>Edit Allowable Values</b> dialog</li> <li>If the Rule Action is an operation, the <b>Edit Parameters</b> option is enabled and this displays the <b>Edit Parameters</b> dialog</li> </ul> <p>To add another Rule Action, right-click on the <b>No</b> column and select the <b>Add</b></p>	

Step	Action	See Also
	<p><b>Row</b> context menu option. An empty row is added to the table.</p> <p>To remove a Rule Action from the table, right-click on the appropriate <b>No</b> field and select the <b>Delete Row</b> context menu option. This does not affect the original attribute or operation in the model.</p>	

To bind a rule in the Rule Bindings Section, follow the steps below

Step	Action	See Also
1	<p>The <b>Rule Bindings</b> section lies on top of the <b>Rule Conditions</b> section. It binds the Rule Condition and Rule Action values to the appropriate rule in the Rule Table.</p> <p>Select the rule number in the Rule Bindings field over one of the <b>Value&lt;n&gt;</b> or <b>Result&lt;n&gt;</b> columns.</p>	
2	<p>Ensure that the values set in the <b>Value&lt;n&gt;</b> or <b>Result&lt;n&gt;</b> field for the Rule Condition or Rule Action, underneath the rule number, all satisfy the rule.</p>	
3	<p>Click on the <b>Save</b> icon in the Rule Composer toolbar.</p> <p>For example, (referring to the screen diagram at the top of this <i>Rule Composer</i> topic) if rule 2 is <i>Car must not be rented to Customers of age less than 18</i>:</p> <ul style="list-style-type: none"> <li>• Select <b>2</b> in the <b>Rule</b> field over the <b>Value1</b> column</li> <li>• Select <b>&lt; 18</b> against <i>Customer.age</i> in the <b>Value1</b> column in the Rule Conditions table</li> <li>• Select <b>No</b> against <i>Customer.Eligible</i> in the <b>Result1</b> column in the Rule Action table</li> <li>• Select <b>Reject</b> against <i>Application.Status</i> in the <b>Result1</b> column in the Rule Action table</li> </ul>	

To define a computation rule, follow the steps below:

Step	Action	See Also
1	<p>From the <b>Project Browser</b>, drag and drop the appropriate attribute from a Class in the <i>Fact</i> model into the <b>Computation Rule Actions</b> field.</p> <p>Both the <b>Computation Rule Actions</b> field and the <b>Expression</b> field enable you to use intellisense to display a list of possible entries for the fields. Press ( <b>Ctrl+Spacebar</b> ) in the field to display the list of entries.</p>	
2	<p>In the <b>Expression</b> field, type the expression to be evaluated.</p>	
3	<p>In the <b>Rule Bindings</b> field, type the rule number from the <b>Rule</b> table of the rule being modeled, to link the table data to the rule.</p>	
4	<p>If the rule depends on another rule being satisfied first, type the number of that rule in the <b>Rule Dependency</b> field.</p>	
5	<p>Click on the <b>Save</b> icon in the <b>Rule Composer</b> toolbar to save the computation rule.</p>	

Step	Action	See Also
	If the computation rule is also a Rule Conditions rule, add the condition variable in the <b>Decision</b> table and bind the appropriate rule in the <b>Rule Bind</b> section.	

To export the contents of the Rule Composer to a CSV file, follow the steps below

Step	Action	See Also
1	Click on the <b>Export to CSV</b> icon (  ) in the <b>Rule Composer</b> toolbar. The Windows <b>Browser</b> dialog displays.	
2	Browse to the required file location and type in a .CSV filename to export to.	
3	Click on the <b>Save</b> button to export the data.

### 8.3.3.5 Validate Business Rules

Topics:

Topic	Detail	See also
<b>Usage</b>	<p>It is recommended practice to validate the business rules in the <b>Rule Composer</b> before you generate code for the Rule Task elements. To do this, click on the <b>Validation</b> (green tick) icon in the <b>Rule Composer</b> toolbar.</p>  <p>The business rules on the <b>Rule Composer</b> are parsed and any errors or warnings that might indicate incomplete or unfavorable code generation are displayed on a <b>Rule Composer Validation</b> tab on the <b>Output</b> screen.</p> <p>To highlight and investigate the faulty data in the <b>Rule Composer</b>, double-click on the appropriate warning or error message.</p>	

### 8.3.3.6 Code Generation For Business Rules

After you have modeled the business rules for all the Rule Task elements in the Rule Flow diagram, you can generate code from the Rule Flow behavior.

#### How To:

To return a value from the Rule Flow behavior, follow the steps below:

Step	Action	See Also
1	Double-click on the last Rule Task element before the end node of the Rule Flow diagram. The element's <b>Properties</b> dialog displays.	
2	Click on the <b>Effect</b> tab.	
3	In the <b>Effect</b> field, type the <i>return</i> statement; for example, <i>return true</i> .	
4	Click on the <b>Save</b> button, and on the <b>OK</b> button to close the dialog.  <b>Generate code for the Class</b> containing the rule flow behavior (in our initial example, <b>Rental System</b> ). The code for business rules logic is generated, with the rule statements expressed in natural language as comments.	<a href="#">Generate code for a single class</a> <sup>[1506]</sup> <a href="#">Create a Business Domain Model</a> <sup>[1207]</sup>

#### Example:

The following code snippet was generated from the *Rental System* Class element in our example:

```

////////////////////////////////////
// RentalSystem.cs
// Implementation of the Class RentalSystem
// Generated by Enterprise Architect
// Created on:      08-May-2009 2:39:23 PM
////////////////////////////////////

public class RentalSystem {

    public Customer m_Customer;
    public Car m_Car;
    public Rent m_Rent;

    public RentalSystem() {

    }

    ~RentalSystem() {

    }

    public virtual void Dispose() {

    }

    /* Begin - EA generated code for Activities and Interactions */
    public bool ProcessApplication(Rent m_rent, Application m_application)
    {
        // behavior is an Activity

        /* CAR MUST NOT BE RENTED TO CUSTOMERS WITHOUT A VALID

```

```

LICENCE NUMBER*/
    if( m_Customer.ValidLicenceNumber == "FALSE" )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
/* CAR MUST NOT BE RENTED TO CUSTOMERS OF AGE LESS THAN
18*/
    if( m_Customer.age < 18 )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
/* CAR MUST NOT BE RENTED TO CUSTOMERS WITH BAD HISTORY
LEVEL 3*/
    if( m_Customer.BadHistoryLevel == 3 )
    {
        m_application.Status = "Reject";
        m_Customer.Eligible = false;
    }
    if ( Customer.Eligible == true)
    {

        /* RENT FOR SMALL CARS IS 80 AUD PER DAY*/
        if( m_Car.type == Small )
        {
            m_rent.Rent Per Day = 80;
        }
        /* RENT FOR AWD CARS IS 100 AUD PER DAY*/
        if( m_Car.type == AWD )
        {
            m_rent.Rent Per Day = 100;
        }
        /* RENT FOR LUXURY CARS IS 150 AUD PER DAY*/
        if( m_Car.type == Luxury )
        {
            m_rent.Rent Per Day = 150;
        }
        /* RENT PAYABLE IS CALCULATED AS THE PRODUCT OF
RENTPERDAY AND RENTALPERIOD IN DAYS*/
        m_rent.Rent Payable = m_rent.Rent Per Day * m_rent.
No_of_rent_days;
        if ( Customer.BadHistoryLevel > 0)
        {

            /* PENALTY OF 20 % OF RENT MUST BE APPLIED FOR
CUSTOMERS WITH BAD HISTORY LEVEL 2*/
            if( m_Customer.BadHistoryLevel == 2 )
            {
                m_rent.PenaltyFee = m_rent.Rent Payable
* 0.2;
            }
            /* PENALTY OF 10 % OF RENT MUST BE APPLIED FOR
CUSTOMERS WITH BAD HISTORY LEVEL 1*/
            if( m_Customer.BadHistoryLevel == 1 )
            {
                m_rent.PenaltyFee = m_rent.Rent Payable
* 0.1;
            }
        }
    }
else
{

}

/* TOTAL AMOUNT PAYABLE IS CALCULATED AS THE SUM OF
RENT PAYABLE AND PENALTY IF ANY.*/
    m_rent.Total Amount Payable = m_rent.Rent Per Day +
m_rent.PenaltyFee;
}
else

```

```

    {
    }
    return m_application.Status;
}

/* End - EA generated code for Activities and Interactions */

} // end Rental System

```

### 8.3.4 BPMN Models

The BPMN notation is specifically targeted at the business modeling community and has a direct mapping to UML through BPMN Profiles integrated with the Enterprise Architect installer. Through use of these profiles, Enterprise Architect enables you to develop BPMN diagrams quickly and simply.

The Enterprise Architect installer for releases later than 8.0 provides you with separate versions of the MDG Technology for BPMN that support BPMN versions 1.0, 1.1 and 2.0, and BPEL.

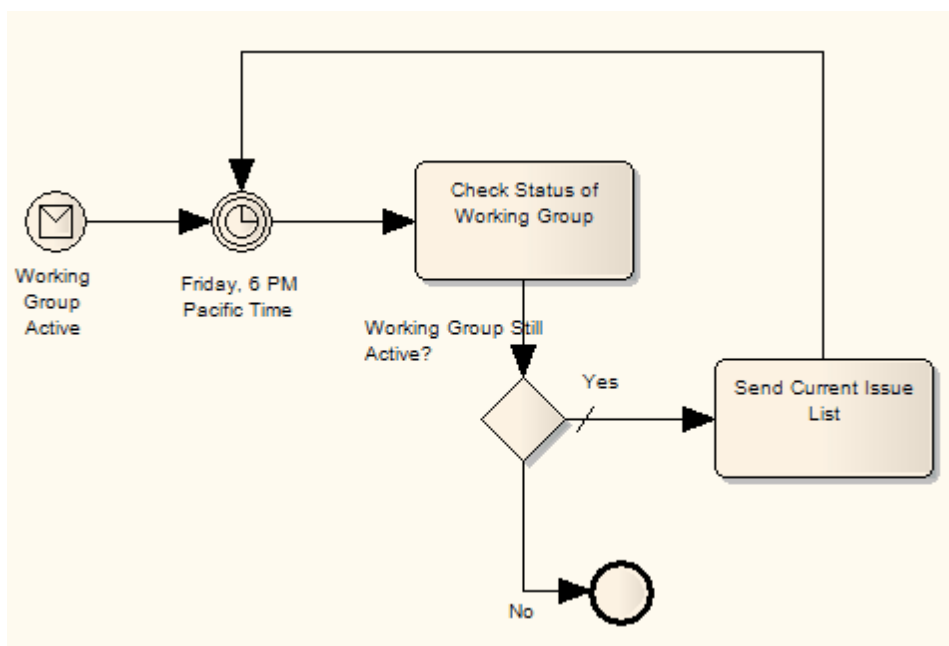

#### Use To:

- Maintain existing diagrams created in BPMN 1.0 format, and create new diagrams in BPMN 1.0
- Create and maintain diagrams in the BPMN 1.1 and BPEL formats
- Create and maintain diagrams in the BPMN 2.0 and BPEL formats
- Migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1

**Access:** The BPMN facilities are provided in the form of:

- A BPMN diagram type, accessed through the New Diagram dialog
- BPMN pages in the Toolbox
- BPMN element and relationship entries in the Toolbox **Shortcut** menu and Quick Linker

Specifications of BPMN elements and relationships are defined by Tagged Values (for example, to define the *Message*, *Timer* and *Default Path (/)* symbols in the diagram below).

**BPMN Toolbox Pages:**

You can access the BPMN Toolbox pages through the **View | Toolbox: More tools...** option; select the **BPMN 1.0, 1.1** or **2.0** options as appropriate.

You can also set BPMN as the active default technology to access the Toolbox pages directly.

#### **Disable BPMN:**

If you prefer not to use BPMN in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

#### **Learn More:**

- [BPEL Models](#) <sup>[1238]</sup>
- [New Diagram dialog](#) <sup>[570]</sup>
- [Set Technology as Active Default](#) <sup>[1036]</sup>

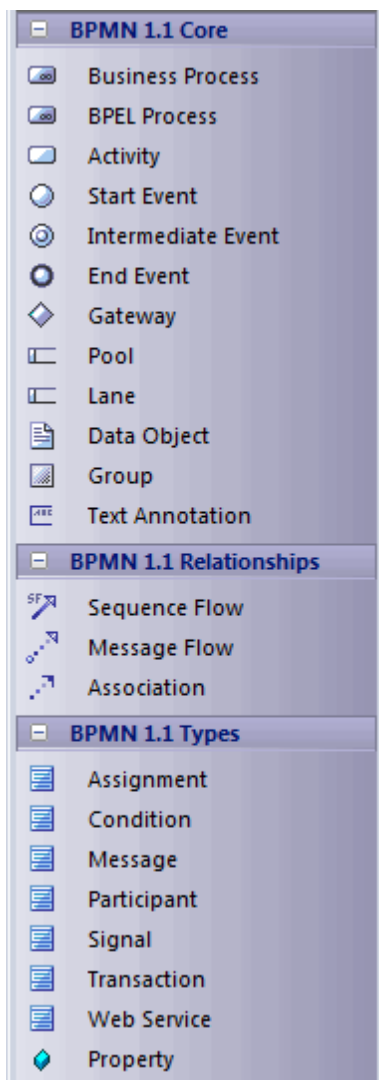

### **8.3.4.1 BPMN 1.0 and 1.1 Toolbox Pages**

The BPMN 1.0 and BPMN 1.1 pages of the Diagram Toolbox enable you to create graphical (Core) and non-graphical (Types) BPMN elements and relationships on business process diagrams in BPMN 1.0, BPMN 1.1 and BPEL formats.

**Access:** **View | Toolbox: More tools | BPMN 1.0**  
**View | Toolbox: More tools | BPMN 1.1**

The elements and relationships available are shown below, and described in the following table.

#### **Example:**

Page	Item	Action
Core	<b>Business Process</b>	Extend a <i>composite Activity</i> that defines a business process
	<b>BPEL Process</b>	Define the behavior of an executable or abstract business process
	<b>Activity</b>	Define an activity within a business process
	<b>Start Event</b>	Define the initiating event in a process
	<b>Intermediate Event</b>	Define an intermediate event in a process
	<b>End Event</b>	Define the terminating event in a process
	<b>Gateway</b>	Define a decision point in a business process If a condition is <b>true</b> , then processing continues one way; if not, then another
	<b>Pool</b>	Extend a <i>Partition</i> element to logically organize an Activity
	<b>Lane</b>	Extend a <i>Partition</i> element to subdivide a Pool

Page	Item	Action
	<b>Data Object</b>	Extend an <i>Artifact</i> element to define a physical piece of information used or produced by a system
	<b>Group</b>	Extend a <i>Boundary</i> element to group other elements
	<b>Text Annotation</b>	Create a comment
<b>Relationships</b>	<b>Sequence Flow</b>	Extend a <i>Control Flow</i> relationship to define the flow of activity
	<b>Message Flow</b>	Extend a <i>Control Flow</i> relationship to define the flow of communications in the process
	<b>Association</b>	Associate information and artifacts with flow objects
<b>Types</b>	<b>Assignment</b>	Define the <i>properties</i> (Tagged Values) of the Core BPMN 1.1 elements such as Activities, Events and Gates
	<b>Condition</b>	
	<b>Message</b>	
	<b>Participant</b>	
	<b>Signal</b>	
	<b>Rule</b>	
	<b>Transaction</b>	
	<b>Web Service</b>	
	<b>Property</b>	

### 8.3.4.2 BPMN 2.0 Toolbox Pages

The BPMN 2.0 pages of the Diagram Toolbox enable you to create BPMN elements and relationships on business process diagrams in BPMN 2.0 and BPEL formats.

**Access:** [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#)

Enterprise Architect provides a set of pages for each of the following BPMN 2.0 diagram types:

Topic	Link
<b>Business Process</b> - contains the constructs needed to build Business Process models (and, effectively, Collaboration models)	<a href="#">Business Process</a> <sup>[1225]</sup>
<b>Choreography</b> - contains the constructs needed to build Choreography models	<a href="#">Choreography</a> <sup>[1227]</sup>
<b>Conversation</b> - contains the constructs needed to build Conversation models	<a href="#">Conversation</a> <sup>[1228]</sup>
<b>Types</b> - contains the constructs common to all BPMN 2.0 diagrams	<a href="#">Type</a> <sup>[1230]</sup>

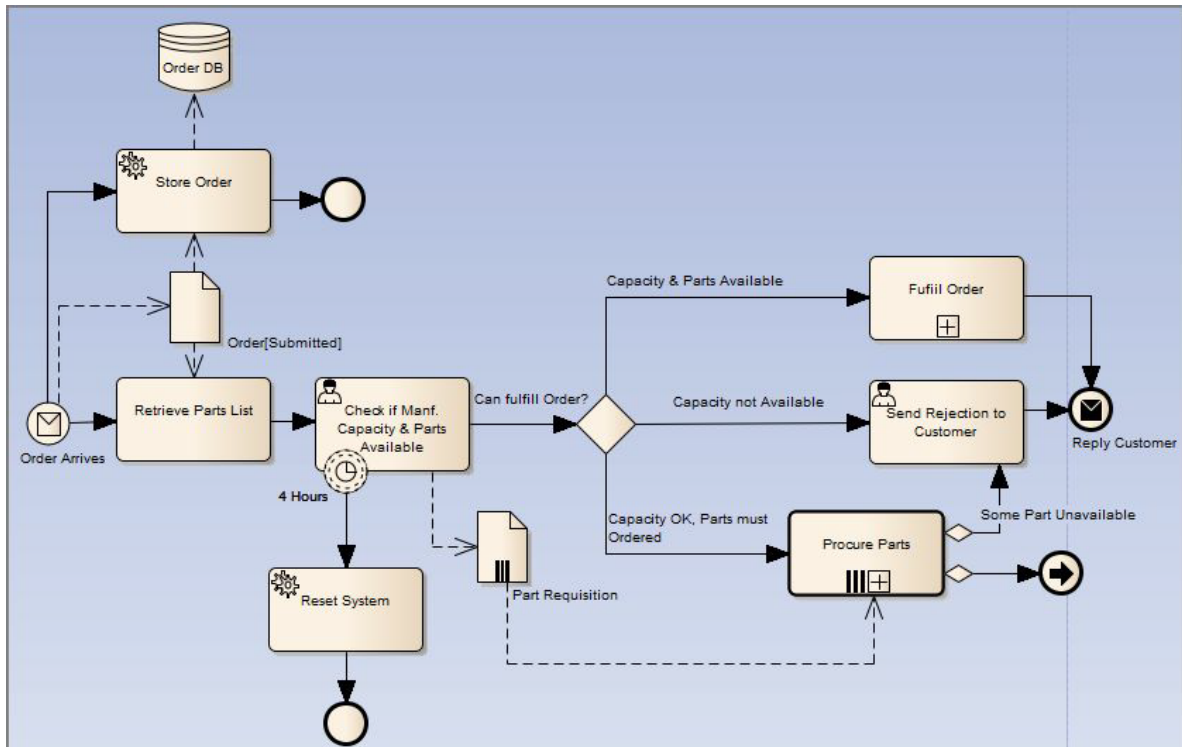

#### 8.3.4.2.1 BPMN 2.0 Business Process Toolbox Pages

The BPMN 2.0 Business Process pages of the Diagram Toolbox enable you to create BPMN elements and relationships on business process diagrams in BPMN 2.0 and BPEL formats.

**Access:** [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Business Process](#)

Page	Item	Use to
<b>BPMN 2.0 Business Process</b>	<b>Business Process</b>	Extend a composite Activity that defines a business process
	<b>BPEL</b>	Define the behavior of an executable or abstract business process
	<b>Activity</b>	Define an activity within a business process
	<b>Choreography</b>	Extend an Activity element to represent a process unit of information exchange between Participants Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task
	<b>Conversation</b>	Extend a Class element to group a set of Message Flows together based on a certain concept
	<b>Data Object</b>	Provide or store the information for an Activity
	<b>Data Store</b>	Represent a mechanism for an Activity to retrieve or update stored information
	<b>Start Event</b>	Define the initiating event in a process
	<b>Intermediate Event</b>	Define an intermediate event in a process
	<b>End Event</b>	Define the terminating event in a process
	<b>Gateway</b>	Define a decision point in a business process If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another
	<b>Pool</b>	Extend a Partition element to logically organize an Activity
	<b>Lane</b>	Extend a Partition element to subdivide a Pool
	<b>Message</b>	Represent the contents of a communication between two Participants
	<b>Group</b>	Extend a Boundary element to group other elements
<b>Text Annotation</b>	Create a comment	
<b>BPMN 2.0 Business Process Connectors</b>	<b>Sequence Flow</b>	Extend a Control Flow relationship to define the flow of activity
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process
	<b>Data Association</b>	Move data between Data Objects, Data Store, Properties and Activities, Processes
	<b>Association</b>	Link the information and Artifacts with BPMN graphic elements
	<b>Conversation Link</b>	Connect a Conversation Node with a Participant, in either direction

Example of a BPMN 2.0 Business Process Diagram:

**Notes**

- The appearance and specification of some elements and connectors are defined by Tagged Values

**Learn More:**

- [Change BPMN Element Appearance](#)<sup>[123]</sup>

**8.3.4.2.2 BPMN 2.0 Choreography Toolbox Pages**

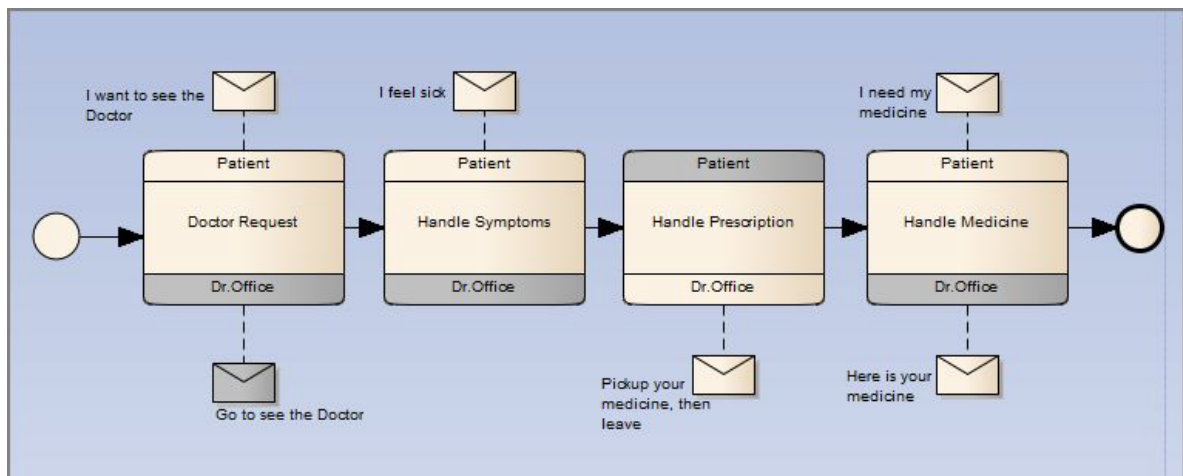

The BPMN 2.0 Choreography pages of the Diagram Toolbox enable you to create BPMN elements and relationships on Choreography diagrams in BPMN 2.0 and BPEL formats.

**Access:** [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Choreography](#)

Page	Item	Use to
BPMN 2.0 Choreography	<b>Choreography Model</b>	Extend a composite Activity that defines a Choreography process
	<b>Choreography</b>	Extend an Activity element to represent a process unit of information exchange between Participants  Enterprise Architect currently supports two to four participant bands within one Choreography Activity/Task
	<b>Start Event</b>	Define the initiating event in a process
	<b>Intermediate Event</b>	Define an intermediate event in a process
	<b>End Event</b>	Define the terminating event in a process

Page	Item	Use to
	<b>Gateway</b>	Define a decision point in a business process If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another
	<b>Message</b>	Represent the contents of a communication between two Participants
	<b>Pool</b>	Extend a Partition element to logically organize an Activity
	<b>Text Annotation</b>	Create a comment
<b>BPMN 2.0 Choreography Connectors</b>	<b>Sequence Flow</b>	Define the order of activity in a Choreography
	<b>Association</b>	Link the information and Artifacts with BPMN graphic elements
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process

#### Example of a BPMN 2.0 Choreography Diagram:

#### Notes

- The appearance and specification of some elements and connectors are defined by Tagged Values

#### Learn More:

- [Change BPMN Element Appearance](#)<sup>[123]</sup>

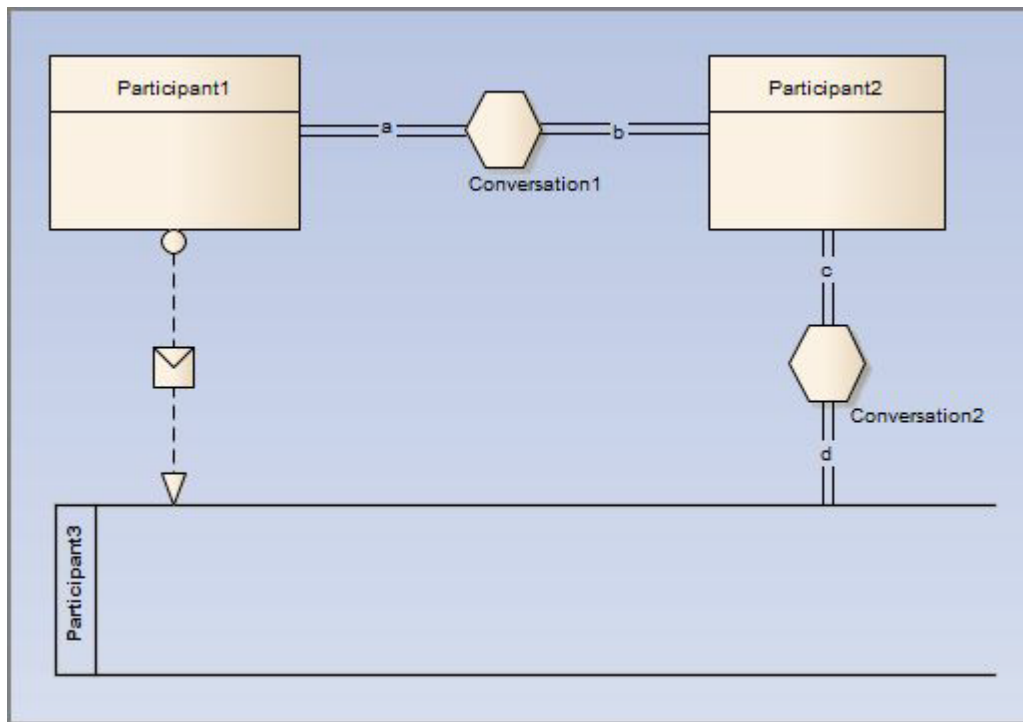

#### **8.3.4.2.3 BPMN 2.0 Conversation Toolbox Pages**

The BPMN 2.0 Conversation pages of the Diagram Toolbox enable you to create BPMN elements and relationships on Conversation diagrams in BPMN 2.0 and BPEL formats.

**Access:** [View](#) | [Toolbox: More tools](#) | [BPMN 2.0](#) | [BPMN 2.0 Conversation](#)

Page	Item	Use to
<b>BPMN 2.0 Conversation</b>	<b>Conversation Model</b>	Extend a composite Activity that defines the logical relationship of Message exchanges between two or more business entities
	<b>Conversation</b>	Extend a Class element to group a set of Message Flows together based on a certain concept
	<b>Participant</b>	Represent a specific organization or individual that is involved in a business process
	<b>Pool</b>	Extend a Partition element to logically organize an Activity
	<b>Activity</b>	Define an activity within a business process
	<b>Start Event</b>	Define the initiating event in a process
	<b>Intermediate Event</b>	Define an intermediate event in a process
	<b>End Event</b>	Define the terminating event in a process
	<b>Gateway</b>	Define a decision point in a business process If a condition is <b>true</b> then processing continues one way; if <b>false</b> , then another
	<b>Text Annotation</b>	Create a comment
<b>BPMN 2.0 Conversation Connectors</b>	<b>Conversation Link</b>	Connect a Conversation Node to or from a Participant
	<b>Message Flow</b>	Extend a Control Flow relationship to define the flow of communications in the process
	<b>Sequence Flow</b>	Extend a Control Flow relationship to define the flow of activity
	<b>Association</b>	Link the information and artifacts with BPMN graphic elements

Example of a BPMN 2.0 Conversation Diagram:

#### Notes

- The appearance and specification of some elements and connectors are defined by Tagged Values

### 8.3.4.3 Change BPMN Element Appearance

A number of Tagged Values directly affect the appearance of the BPMN element or relationship they apply to. Therefore, by changing the value of the tag you can change the appearance of the object.

**Access:** [View | Tagged Values](#)

#### **How To:**

To define the appearance of BPMN elements and relationships, follow the steps below:

Step	Action	See Also
1	Open the Tagged Values window	<a href="#">Tagged Values</a> [764]
2	Select the required element or relationship in a diagram The Tagged Values window shows the appropriate Tagged Values and provides a list of values to assign to each one	
3	Set the required value, based on the value descriptions in the table below	

Reference:

Element	Tags	Values Setting
Activity	<i>activityType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Task</b> for no decoration</li> <li>• <b>Sub-Process</b> to display the <i>plus-in-box</i> decoration on the bottom edge of the shape</li> </ul>
	<i>adHoc</i>	Set to <b>true</b> to display the <i>tilde</i> decoration on the bottom edge of the shape, indicating that this is an ad-hoc Activity
	<i>adHocOrdering</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Parallel</b> to display three vertical lines on the bottom edge of the shape</li> <li>• <b>Sequential</b> to display three horizontal lines on the bottom edge of the shape</li> <li>• <b>Unspecified</b> to display no lines on the bottom edge of the shape</li> </ul> <p>The <i>adHoc</i> tag must first be set to <b>true</b></p>
	<i>isACallActivity</i>	Set to <b>true</b> to show the boundary of the Activity element as a thick line, indicating that this is a Call Activity
	<i>isATransaction</i>	Set to <b>true</b> to give the Activity element a double-lined border, indicating that this is a Transaction
	<i>isForCompensation</i>	Set to <b>true</b> to display the <i>rewind</i> icon on the bottom edge of the shape, indicating that this is a Compensation Activity
	<i>isSequential</i>	Set to <b>true</b> to display three horizontal bars on the bottom edge of the shape <p>The <i>loopCharacteristics</i> tag must first be set to <b>Multinstance</b></p>
	<i>loopCharacteristics</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Standard</b> to display three vertical bars at the bottom edge of the shape</li> <li>• <b>Multinstance</b> to display a loop icon at the bottom edge of the shape</li> </ul>
	<i>taskType</i>	When set to different value, the associated decoration is displayed at the top-left corner of the shape
	<i>triggeredByEvent</i>	Set to <b>true</b> to show the boundary of the Activity element as a dotted line
Choreography	<i>choreographyType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Task</b> for no decoration</li> <li>• <b>Sub-Process</b> to display the <i>plus-in-box</i> decoration on the bottom edge of the shape</li> </ul>
	<i>initiatingParticipant</i>	Set a value to show the corresponding participant band in a light color, which indicates that this is the initiating participant
	<i>isACallChoreography</i>	Set to <b>true</b> show the boundary of the Choreography element as

Element	Tags	Values Setting
		a thick line
	<i>loopType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Standard</b> to display three vertical bars at the bottom edge of the shape</li> <li>• <b>MultilInstance</b> to display a loop icon at the bottom edge of the shape</li> </ul> Each Participant has its own MultilInstance setting
	<i>numberOfParticipants</i>	Set to the appropriate numerical value to indicate the number of Participant bands for a choreography Activity or Task
	<i>participantA</i> or <i>participantARef</i>	<i>participantA</i> - Type the name of the Participant to show on the Participant band of the Choreography  If the Participant is known and referenced, use the <i>participantARef</i> tag and leave the <i>participantA</i> tag blank; the name of the referenced Participant is shown on the Participant band of the Choreography  The same usage is applied to other Participant bands
<b>Conversation</b>	<i>isACallConversation</i>	Set to <b>true</b> to show the boundary of the Conversation element as a thick line
	<i>isComposite</i>	Set to <b>true</b> to display a <i>plus-in-box</i> decoration on the bottom edge of the shape, indicating that the Conversation is a composite element
<b>Data Object</b>	<i>dataInOut</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Input</b> to add a light-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Input element</li> <li>• <b>Output</b> to add a dark-colored arrow at the top-left corner of the Data Object, indicating that it represents a Data Output element</li> </ul>
	<i>isCollection</i>	Set to <b>true</b> to add three vertical lines at the bottom edge of the shape, indicating that the object is a collection
<b>Event</b>	<i>cancelActivity</i>	For Intermediate Event only  Set to <b>false</b> to show the Intermediate Event border as a dashed line
	<i>catchOrThrow</i>	For Intermediate Event only  Set to: <ul style="list-style-type: none"> <li>• <b>Catch</b> or</li> <li>• <b>Throw</b></li> </ul>
	<i>eventDefinition</i>	Use to change the decoration of a Start Event, Intermediate Event or End Event
	<i>isInterrupting</i>	For Start Event only  Set to <b>false</b> to show the border of the Start Event as a dashed line, indicating that the Start Event is not an interrupting event

Element	Tags	Values Setting
Gateway	<i>eventGatewayType</i>	Use to define two types of Event-based Gateway: <ul style="list-style-type: none"> <li>• <b>Exclusive</b> and</li> <li>• <b>Parallel</b></li> </ul>
	<i>gatewayType</i>	Set to: <ul style="list-style-type: none"> <li>• <b>Exclusive</b> to render the Gateway as a diamond shape without any marker in the middle; if you also set the <i>markerVisible</i> tag to <b>true</b>, the Gateway is rendered as a diamond shape with an X inside</li> <li>• <b>Complex</b> to render the Gateway as a diamond shape with an asterisk (*) inside</li> <li>• <b>Inclusive</b> to render the Gateway as a diamond shape with a circle (o) inside</li> <li>• <b>Parallel</b> to render the Gateway as a diamond shape with a plus (+) inside</li> <li>• <b>Event</b> to define the Gateway as Event-based</li> </ul>
	<i>instantiate</i>	Use only to define the Exclusive and Parallel Event-based Gateway
Message	<i>IsInitiate</i>	Set to <b>true</b> to make the envelope color gray, indicating that this is an initiating Message
Message Flow	<i>messageVisible</i>	<ul style="list-style-type: none"> <li>• Set to <b>Unspecified</b> to make the Message Flow connector without decoration</li> <li>• Set to <b>Initiating</b> to add a white envelope to the Message Flow connector</li> <li>• Set to <b>Non-Initiating</b> to add a gray envelope to the Message Flow connector</li> </ul>
Participant	<i>participantMultiplicity</i>	Set to <b>true</b> to display three vertical bars at the bottom edge of a rectangle Pool element.  Participant is rendered as a normal UML Class shape exclusively on Conversation diagrams
Pool	<i>blackBoxPool</i>	Set to <b>true</b> to render the Pool element as a rectangle, which is used in a Main Pool diagram
	<i>participantMultiplicity</i>	Set to <b>true</b> to display three vertical bars at the bottom edge of a rectangle Pool element
Sequence Flow	<i>conditionType</i>	<ul style="list-style-type: none"> <li>• Set to <b>Expression</b> to show an unfilled diamond marker at the source end of the connector</li> <li>• Set to <b>Default</b> to show a slash marker at the source end of the connector</li> </ul>

**Notes:**

- Some BPMN elements changed in appearance between BPMN version 1.0 and BPMN version 1.1
- In Enterprise Architect releases later than 7.1, if you work on a BPMN 1.0 model created in an earlier release, existing elements default to their version 1.0 appearance; new elements assume the BPMN version 1.1 appearance and automatically have a Tagged Value BPMNVersion set to 1.1
- If you want a new element to revert to the BPMN version 1.0 appearance, set the BPMNVersion Tagged Value to 1.0
- Conversely, if you want an older element to assume the BPMN version 1.1 appearance, assign the BPMNVersion Tagged Value to it, with the value 1.1

### 8.3.4.4 Migrate BPMN 1.0 Model to BPMN 1.1

Enterprise Architect enables you to migrate a BPMN 1.0 model (or part of a model) to BPMN 1.1 or BPMN1.1::BPEL, using the Automation Interface. There are two functions you can use:

- *MigrateToBPMN11()*
  - `proj.MigrateToBPMN11 sGUID, "BPMN"`
  - `proj.MigrateToBPMN11 sGUID, "BPEL"`
- *Migrate()*
  - `proj.Migrate sGUID, "BPMN", "BPMN1.1"`
  - `proj.Migrate sGUID, "BPMN", "BPMN1.1::BPEL"`

These functions update the Tagged Values and, if required, stereotypes to BPMN 1.1 for all elements, attributes, connectors and diagrams under the selected package or element.

#### Example:

The following VB script calls the *MigrateToBPMN11()* function to migrate the Tagged Values to BPMN 1.1:

```
Sub MigrateElement (sGUID, lngPackageID)

    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.MigrateToBPMN11 sGUID, "BPMN"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If

End Sub

Sub MigrateSelectedItem

    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package

    selType = GetTreeSelectedItemType

    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Complete", 0, "BPMN 1.1 Migration"

    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 1.1 Migration"

    End If

End Sub

Sub Main

    MigrateSelectedItem

End Sub

Main
```

**Notes:**

- In BPMN 1.0, various tags have free-text direct-entry value fields, and you can provide additional information on these tags in the Tagged Value Note dialog, for display at the bottom of the Tagged Values window

In BPMN 1.1, some of these tags (such as the *Categories* tag on a *BusinessProcess* stereotyped element) have been changed to memo type, and you use the Tagged Value Note dialog to enter the value; therefore, you cannot have additional notes for these tags, all information must be within the tag's value

- For such tags, when migrating from BPMN 1.0 to BPMN 1.1, the BPMN 1.0 tag value is moved into the BPMN 1.1 tag notes field and the BPMN 1.0 tag notes are discarded; if you want to preserve the tag notes text, take a copy of the BPMN 1.0 model before migration to enable you to copy the tag notes text into the tag value after migration

**Learn More:**

- [MigrateToBPMN11\(\)](#)<sup>[1957]</sup>
- [Migrate\(\)](#)<sup>[1957]</sup>

**8.3.4.5 Migrate BPMN 1.1 Model to BPMN 2.0**

Enterprise Architect enables you to migrate a BPMN 1.1 model (or part of a model) to BPMN 2.0, using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to BPMN 2.0 for all elements, attributes, connectors and diagrams under the selected package or element.

**Example:**

The following VB script calls the *Migrate()* function to migrate the package or element to BPMN 2.0:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "BPMN1.1", "BPMN2.0"

    'refresh the model
    If lngPackageID > 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "BPMN 2.0 Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "BPMN 2.0 Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "BPMN 2.0 Migration"
    End If
End Sub

Sub Main
```

```

    MigrateSelectedItem
End Sub

Main

```

**Notes:**

- Please backup your project before you run the BPMN 2.0 Migrator
- Normalization occurs on the following tags:
  - BPMN1.1::Activity::InMessageRef
  - BPMN1.1::Activity::OutMessageRef
  - BPMN1.1::Activity::IORules
  - BPMN1.1::Activity::InputSets
  - BPMN1.1::Activity::OutputSets
  - BPMN1.1::Activity::ComplexML\_FlowCondition
  - BPMN1.1::Activity::Performers
  - BPMN1.1::BusinessProcess::InputSets
  - BPMN1.1::BusinessProcess::OutputSets
  - BPMN1.1::BusinessProcess::Performers
  - BPMN1.1::EndEvent::ErrorCode
  - BPMN1.1::IntermediateEvent::ErrorCode

Taking *BPMN1.1::Activity::InMessageRef* as an example, the following steps take place:

- (1) Create a new element *BPMN2.0::Operation*
- (2) Insert the reference tag *BPMN2.0::Activity::operationRef*
- (3) Migrate *BPMN1.1::Activity::InMessageRef* to *BPMN2.0::Operation::InMessageRef*

- Denormalization occurs on the following tags:
  - BPMN1.1::Transaction::TransactionProtocol
  - BPMN1.1::WebService::Operation
  - BPMN1.1::WebService::Interface
  - BPMN1.1::WebService::ParticipantRef
  - BPMN1.1::Condition::ConditionExpression
  - BPMN1.1::BPELProcess::InputSets
  - BPMN1.1::BPELProcess::OutputSets

Taking *BPMN1.1::Transaction::TransactionMethod* as an example, the following steps take place:

- (1) Find element *BPMN1.1::Transaction* by '*BPMN1.1::Transaction::TransactionProtocol*
- (2) Migrate *BPMN1.1::Transaction::TransactionMethod* to *BPMN2.0::transactionMethod*
- (3) Migrate *BPMN1.1::Transaction::TransactionProtocol* to *BPMN2.0::transactionProtocol*

- If a BPMN1.1 stereo tag is discarded in BPMN2.0, it is preserved if the tag has a value

**Learn More:**

- [Migrate\(\)](#)<sup>[1957]</sup>

**8.3.4.6 BPMN 2.0 XML**

Enterprise Architect supports serializing **BPMN 2.0 Models** in **BPMN 2.0 XML**. The serialized XML file contains both the model semantics as well as the diagram-interchange information.

**Access:** Click on a package in the Project Browser, then:

**Project | Model Publisher**

**Project | Model Import/Export | Export Package to XMI File: Publish, or  
Right-click | Import/Export | Export Package to XMI: Publish**

**How To:**

Step	Action	See Also
1	Open the Publish Model Package dialog	<a href="#">Publish Model Package</a> [323]
2	In the <b>XML Type</b> field, select <b>BPMN 2.0 XML</b>	
3	Click on the <b>Export</b> button to initiate the BPMN 2.0 XML serialization	

**Notes:**

1. The package being serialized is assumed to be self-contained
2. Only the contents of the selected package are considered for serialization - child packages (and their contents) are ignored
3. Serialization of the *Group* element in the BPMN 2.0 Business Process Tool-box is not supported
4. Serialization of the following items in the BPMN 2.0 Types section of the Tool-box is not supported :
  - *InputOutputBinding*
  - *Participant Association*
  - *Conversation Association*

**Learn More:**

- [XML Schema for BPMN 2.0 XML](#) (Online Resource)
- [BPMN 2.0 Toolbox Pages](#) [1225]

### 8.3.5 BPEL Models

The following text is derived from the **BPEL** entry in the online Wikipedia:

**Business Process Execution Language (BPEL)**, short for **Web Services Business Process Execution Language (WS-BPEL)**, is an executable language for specifying interactions with **Web Services**. Processes in Business Process Execution Language export and import information by using Web Service interfaces exclusively.

Web service interactions can be described in two ways :

1. Executable business processes, which model the actual behavior of a participant in a business interaction.
2. Abstract business processes, which are partially specified processes that are not intended to be executed. An Abstract Process may hide some of the required concrete operational details.

**BPEL** is an **Orchestration** language, serialized in XML, which specifies an executable process that involves message exchanges with other systems. This messaging facility depends on the use of the **Web Services Description Language (WSDL) 1.1** to describe outgoing and incoming messages.

**BPEL in Enterprise Architect:**

Enterprise Architect supports generating **BPEL** from executable processes in the **Business and Software Engineering** and the **Ultimate** editions. Although there is no standard graphical notation for **WS-BPEL**, Enterprise Architect uses **BPMN** profile as a graphical front-end to capture **BPEL Process** descriptions. With the help of the **BPMN Profile**, Enterprise Architect enables you to develop **BPEL** diagrams quickly and simply.

While **BPMN** provides a graphical notation for visualizing business process, **BPEL** provides a way for visualizing this graphical business process in XML.

Enterprise Architect supports generating:

- BPEL 1.1<sup>[1239]</sup> from models created using constructs in BPMN 1.1 Profile
- BPEL 2.0<sup>[1257]</sup> from models created using constructs in BPMN 2.0 Profile

**Notes:**

- BPEL is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Enable BPMN 1.1 Technology for BPEL 1.1 and BPMN 2.0 Technology for BPEL 2.0 modeling in the MDG Technologies dialog ( **Settings | MDG Technologies** ).

**Learn More:**

- [BPEL](#) (Online Resource)
- [Orchestration](#) (Online Resource)
- [BPEL 1.1 Model](#)<sup>[1239]</sup>
- [BPEL 2.0 Model](#)<sup>[1257]</sup>
- [BPMN Model](#)<sup>[1222]</sup>

**8.3.5.1 BPEL 1.1 Model**

Enterprise Architect uses **BPMN 1.1** as a graphical front-end to capture **BPEL 1.1 Process** description ( as **BPEL 1.1** does not have not a standard graphical notation ). Enterprise Architect uses the partial mapping specified in the **OMG BPMN 1.1** specification to map **BPMN 1.1** constructs to **BPEL 1.1**.

**How To:**

Step	Action	See Also										
1	<p>Create a <b>BPEL 1.1 Package Structure</b></p> <p><b>Alternative:</b></p> <table border="1"> <thead> <tr> <th>Step</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>a</td> <td>Create a package in the <b>Project Browser</b></td> </tr> <tr> <td>b</td> <td>Click on the <b>New Diagram</b> icon in the <b>Project Browser</b></td> </tr> <tr> <td>c</td> <td>Select <b>BPMN 1.1</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b></td> </tr> <tr> <td>d</td> <td>Click on the <b>BPEL Process</b> icon from the <b>BPMN 1.1 Core</b> toolbox at the created <b>BPEL</b> diagram</td> </tr> </tbody> </table>	Step	Action	a	Create a package in the <b>Project Browser</b>	b	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>	c	Select <b>BPMN 1.1</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b>	d	Click on the <b>BPEL Process</b> icon from the <b>BPMN 1.1 Core</b> toolbox at the created <b>BPEL</b> diagram	<p><a href="#">BPEL 1.1 Package Structure</a><sup>[1241]</sup></p> <p><a href="#">Project Browser Toolbar</a><sup>[454]</sup></p>
Step	Action											
a	Create a package in the <b>Project Browser</b>											
b	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>											
c	Select <b>BPMN 1.1</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b>											
d	Click on the <b>BPEL Process</b> icon from the <b>BPMN 1.1 Core</b> toolbox at the created <b>BPEL</b> diagram											
2	Open the <b>BPEL</b> diagram under the <i>BPELProcess</i> stereotyped element											
3	<p>Model the <i>BPEL Process</i> using the constructs in the <b>BPMN 1.1 Core</b> toolbox. Use the following constructs in this toolbox to model <b>BPEL 1.1</b>:</p> <p><b>BPMN 1.1 - Core</b> page:</p> <ul style="list-style-type: none"> <li>• BPEL Process</li> <li>• Activity</li> <li>• Start Event</li> <li>• Intermediate Event</li> </ul>	<p><a href="#">BPMN 1.1 Core Toolbox</a><sup>[1223]</sup></p> <p><a href="#">Model BPEL 1.1 Process</a><sup>[1243]</sup></p>										

	<ul style="list-style-type: none"> <li>• End Event</li> <li>• Gateway</li> <li>• Pool</li> </ul> <p><b>BPMN 1.1 - Relationships</b> page:</p> <ul style="list-style-type: none"> <li>• Sequence Flow</li> <li>• Message Flow</li> <li>• Association</li> </ul> <p><b>BPMN 1.1 Types</b> page:</p> <ul style="list-style-type: none"> <li>• Assignment</li> <li>• Condition</li> <li>• Message</li> <li>• Participant</li> <li>• Web Service</li> </ul>	
4	Create <b>Web Service</b> for the <i>BPEL Process</i> and other related <i>Pools</i> , if required	<a href="#">BPEL Web Service</a> <small>[1254]</small>
5	Generate <b>BPEL 1.1</b> code from the <i>BPEL Process</i>	<a href="#">Generate BPEL 1.1</a> <small>[1256]</small>

**Notes:**

- Generating **BPEL 1.1** from a **BPMN 1.1** model is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Ensure that **BPMN 1.1** Technology is enabled in the **MDG Technologies** dialog ( **Settings | MDG Technologies** ).

**BPEL 1.1 Example:**

- The Enterprise Architect Example file ( **EAExample.EAP** ) has a sample **BPMN 1.1** model from which **BPEL 1.1** can be generated.
- If you have installed Enterprise Architect at the default location, open this file: **C:\Program Files\Sparx Systems\EA\EAExample.EAP**
- The **BPMN 1.1** model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 1.1 Model**.

**Modeling Restrictions:**

1. Every *BPEL Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*.
  - A *Start Event* or an *End Event* should not be attached to the boundary of a *Sub-Process*.
2. *Sequence Flow* Looping is not supported - only *Activity* looping is supported. All *Sequence Flows* should flow downstream and not upstream.
3. Mapping of an *Intermediate Event* with multiple triggers to **BPEL 1.1** is not supported.
4. Mapping of *Multi-Instance Parallel While* loops to **BPEL 1.1** is not supported.
5. Mapping of *Independent Sub-Process* to **BPEL 1.1** is not supported.
6. *Pools* are treated as *black box* ( i.e., they do not expose any details ) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors.

### 8.3.5.1.1 Create BPEL 1.1 Model Structure

A **BPEL 1.1** model consists of a *BPEL Process* ( containing a **BPEL** diagram and mappable **BPMN 1.1** constructs ) and other supporting elements ( like **BPMN 1.1 Assignment**, **BPMN 1.1 Web Service** ) required for generating **BPEL 1.1** code. A sample **BPEL 1.1** package structure can be created in the **Project Browser**, using the **Select Model(s)** (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

#### Access:

- Right-click on a package in the **Project Browser** and select the following context menu : **Add | Add a New Model using Wizard** ( or )
- Select the **New Model from Pattern** icon in the **Project Browser** toolbar

#### Use to:

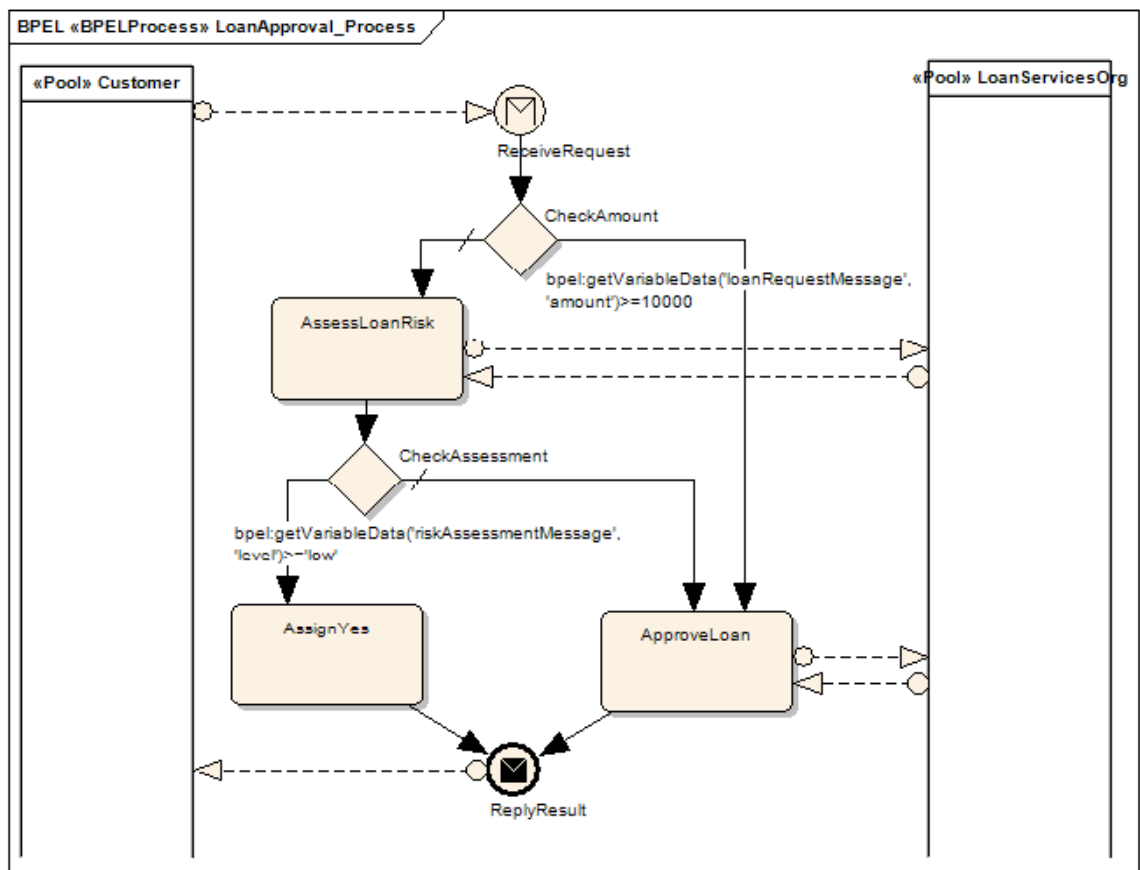

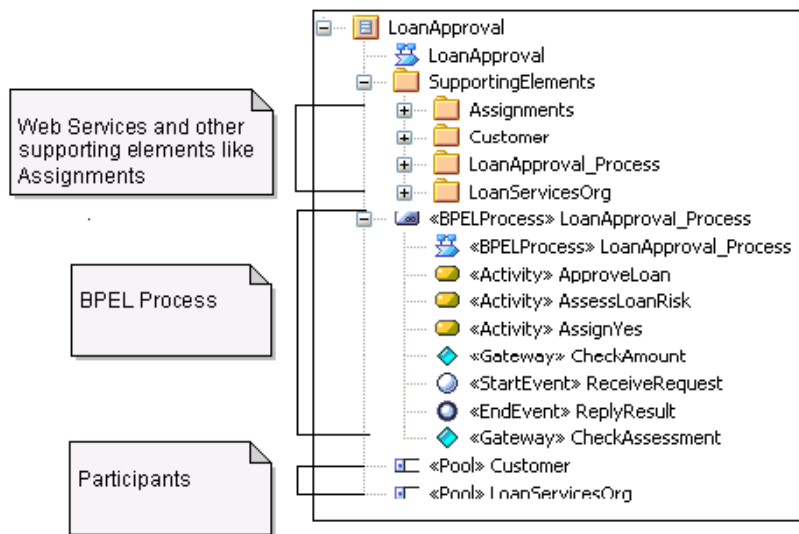

- Create a new **BPEL 1.1** package structure that can be used as a starting point for developing your *BPEL Process*.

#### How to:

Step	Action	See also
1	Select the root node or a package in the <b>Project Browser</b>	
2	Click on the <b>New Model from Pattern</b> icon in the <b>Project Browser</b>	<a href="#">Project Browser Toolbar</a> [454]
3	Select the value <b>BPMN 1.1</b> in the <b>Technology</b> section	<a href="#">Model Wizard</a> [520]
4	Check the option <b>BPEL 1.1 Model</b> in the <b>Name</b> section	
5	Click on the <b>OK</b> button to create the sample <b>BPEL 1.1</b> package structure	

#### Example BPEL 1.1 Package Structure:

The *BPEL Process* **LoanApproval\_Process** acts as container for the **BPEL** diagram and elements. The *SupportingElements* package contains supporting components like **Assignments** and **Web Services**.

#### Learn More:

- [Model a BPEL 1.1 Process](#) <sup>[1243]</sup>
- [Create a BPEL 1.1 Web Service](#) <sup>[1254]</sup>
- [Generate BPEL 1.1](#) <sup>[1256]</sup>

### 8.3.5.1.2 Model a BPEL 1.1 Process

The *BPEL Process* in Enterprise Architect represents the top-level container for the BPMN 1.1 elements, from which BPEL 1.1 can be generated. Conceptually it maps to the BPEL *process* element.

#### BPEL Properties:

- Double-click on the *BPEL Process* in the **BPEL** diagram
- Right-click on the *BPEL Process* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL Properties**

#### Reference:

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for the <i>BPEL Process</i>

#### Learn More:

The *BPEL Process* element acts as a container for the following **BPMN 1.1** constructs:

- [Start Event](#) [1243]
- [Intermediate Event](#) [1245]
- [Activity](#) [1247]
- [Gateway](#) [1249]
- [End Event](#) [1250]
- [Sequence Flow](#) [1251]

The following **BPMN 1.1** constructs can be optionally used in **BPEL** modeling :

- [Pool](#) [1252]
- [Assignment](#) [1253]

#### 8.3.5.1.2.1 Start Event

A **BPMN 1.1 Start Event** indicates where a particular *Process* begins. Every *Process* in Enterprise Architect must begin with a *Start Event*.

#### BPEL Properties:

- Double-click on the *Start Event* in the **BPEL** diagram ( or )
- Right-click on the *Start Event* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL Properties**

<b>General</b>	Open the UML Properties dialog		<a href="#">Properties</a> <sup>[662]</sup>

**Notes:**

- **Cancel**, **None** and **Signal Event** types cannot be mapped to **BPEL 1.1**.
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields.
- For a **Compensation Intermediate Event** edge-mounted on an *Activity*, create a **BPMN 1.1 Association** from this event to the **Compensation Activity**. Ensure that the *IsCompensation* tag for the *Activity* is set to true.
- **Link Intermediate Event** can be used either as a GOTO or an off-page connector. So, this event can have either incoming or outgoing *Sequence Flows* - but not both.

**8.3.5.1.2.3 Activity**

A **BPMN 1.1 Activity** represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other **BPMN 2.0** elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit.

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The **OMG BPMN 2.0 Specification** defines two types of *Looping construct*:

- **Standard Loop** ( *while* or *until* )
- **Multi-Instance Loop** ( *for each* )

**BPEL Properties:**

- Double-click on the *Activity* in the **BPEL** diagram
- Right-click on the *Activity* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

**Reference:**

<b>General</b>	Open the UML Properties dialog	<a href="#">Properties</a> <sup>[662]</sup>

**8.3.5.1.2.7 Pool**

A **BPMN 1.1 Pool** represents a **Participant** in a *Process* and does not map to any specific **BPEL 1.1** element. Enterprise Architect uses *Pools* to represent external **Participants**, with which the *BPEL Process* communicates. These are 'black box' *pools* i.e., they are abstract and do not expose any details ( they do not contain any **BPMN 1.1** elements inside them ).

BPEL Properties:

- Double-click on the *Pool* in the **BPEL** diagram
- Right-click on the *Pool* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL Properties**

Reference:

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for the <i>Pool</i>	
<b>OK</b>	Save the values entered in the dialog	
<b>Cancel</b>	Discard the values entered in the dialog	
<b>Help</b>	Display this Help topic	

General	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> [662]
---------	---------------------------------------	-------------------------------------

**Notes:**

- A *BPEL Process* should not contain a *Pool* as its child element.
- A **BPEL** diagram under a *BPEL Process* contains an implicit *Pool* - so it is invalid to add a *Pool* in this **BPEL** diagram to represent the *BPEL Process*.
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors.

**8.3.5.1.2.8 Assignment**

A **BPMN 1.1 Assignment** element enables data to be copied between messages and new data to be inserted, using expressions within a *BPEL Process*. A **BPMN 1.1 Assignment** element maps to a **BPEL 1.1 assign** activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the **Assignments** package in **SupportingElements** [1259]. If they are created elsewhere, they cannot be enacted correctly.

**Access:** [View | Toolbox > More tools | BPMN 1.1 | BPMN 1.1 Types](#)

**BPEL Properties:**

- Double-click on the *Assignment* in the **BPEL** diagram
- Right-click on the *Assignment* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL Properties**

**Reference:**

Field/Button	Usage	See Also
Name	Specify the name for the <i>Assignment</i>	
Assign Time	Select either <b>Start</b> or <b>End</b> to determine whether the assignment occurs at the start or end of an <i>Activity/Event</i> .	
<b>Copy From</b> section		
Type	Depending on the value selected in this field, further details are required	
Literal	Specify a literal value	
Expression / Message	Select a <b>BPMN 1.1 Message</b> in the package representing the <i>BPEL Process / Pool</i> under the <b>SupportingElements</b> package	<a href="#">Create BPEL 1.1 Model Structure</a> [1241] <a href="#">Create a BPEL 1.1 Web Service</a> [1254]
Part	Select a <b>BPMN 1.1 Property</b> belonging to the selected <b>Message</b> ( Optional )	
<b>Copy To</b> section

	package	<a href="#">Create a BPEL 1.1 Web Service</a> <sup>[1254]</sup>
<b>Part</b>	Select a <b>BPMN 1.1 Property</b> belonging to the selected <b>Message</b> ( Optional )	
<b>OK</b>	Save the values entered in the dialog	
<b>Cancel</b>	Discard the values entered in the dialog	
<b>Help</b>	Display this Help topic	
<b>General</b>	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> <sup>[662]</sup>

**Notes:**

- Messages are created when you create a **Web Services**
- If you select **Expression**, Enterprise Architect uses the **getVariableData XPATH 1.0** function to create the expression from the selected **Message** and **Part**.

**8.3.5.1.3 Create BPEL 1.1 Web Service**

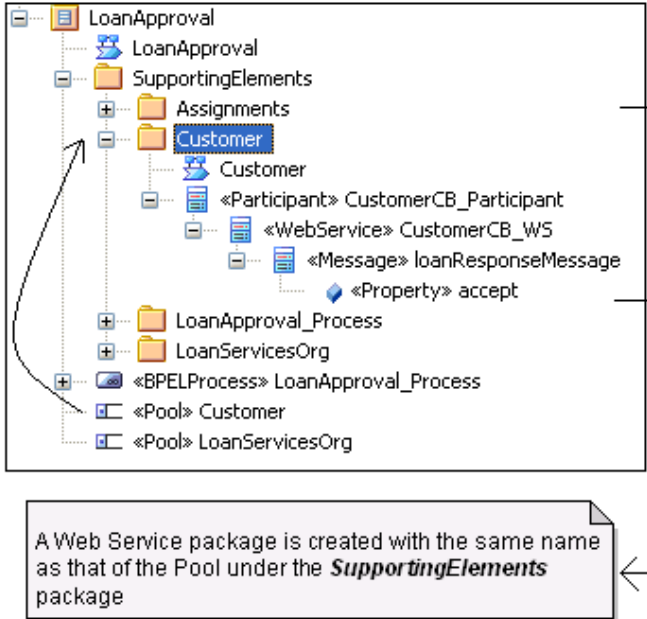

**BPEL** is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. **BPEL 1.1** supports **WSDL 1.1 one-way** and **request-response** operations only ( and not **solicit-response** and **notification** operations ). Enterprise Architect enables you to create, for **BPEL Process** and **Pool** elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

**Access:** Right-click on a **BPEL Process** or **Pool** and select the following context menu : **BPEL | Create WebService**

**Reference:**

Field/Button	Usage	See Also						
<b>Operation</b>	Specify whether to create a new Web Service or create one from an existing WSDL created / imported into EA ( using the <b>Import WSDL</b> dialog ) by selecting either : <ul style="list-style-type: none"> <li>• <b>Create New</b> ( or )</li> <li>• <b>Create from existing WSDL</b></li> </ul>	<a href="#">Model WSDL</a> <sup>[1621]</sup> <a href="#">Import WSDL</a> <sup>[1631]</sup>

### 8.3.5.2 BPEL 2.0 Model

Enterprise Architect uses **BPMN 2.0** as a graphical front-end to capture **BPEL 2.0 Process** description ( as **BPEL 2.0** does not have not a standard graphical notation ). Enterprise Architect uses the partial mapping specified in the **BPMN 2.0** specification to map **BPMN 2.0** constructs to **BPEL 2.0**.

How To:

Step	Action	See Also										
1	<p>Create a <b>BPEL 2.0 Package Structure</b></p> <p><b>Alternative:</b></p> <table border="1"> <thead> <tr> <th>Step</th> <th>Action</th> </tr> </thead> <tbody> <tr> <td>a</td> <td>Create a package in the <b>Project Browser</b></td> </tr> <tr> <td>b</td> <td>Click on the <b>New Diagram</b> icon in the <b>Project Browser</b></td> </tr> <tr> <td>c</td> <td>Select <b>BPMN 2.0</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b></td> </tr> <tr> <td>d</td> <td>Click on the <b>BPEL</b> icon from the <b>BPMN 2.0 - Business Process</b> to into the created <b>BPEL</b> diagram</td> </tr> </tbody> </table>	Step	Action	a	Create a package in the <b>Project Browser</b>	b	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>	c	Select <b>BPMN 2.0</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b>	d	Click on the <b>BPEL</b> icon from the <b>BPMN 2.0 - Business Process</b> to into the created <b>BPEL</b> diagram	<p><a href="#">BPEL 2.0 Package Structure</a><sup>[1259]</sup></p> <p><a href="#">Project Browser Toolbar</a><sup>[454]</sup></p>
Step	Action											
a	Create a package in the <b>Project Browser</b>											
b	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>											
c	Select <b>BPMN 2.0</b> in the <b>Select From</b> field and <b>BPEL</b> in the <b>Diagram</b>											
d	Click on the <b>BPEL</b> icon from the <b>BPMN 2.0 - Business Process</b> to into the created <b>BPEL</b> diagram											
2	Open the <b>BPEL</b> diagram under the <i>BPELProcess</i> stereotyped element											
3	<p>Model the <i>BPEL Process</i> using the constructs in the <b>BPMN 2.0 - Business Process</b> toolbox. Use the following constructs in this toolbox to model <b>BPEL 2.0</b>:</p> <p><b>BPMN 2.0 - Business Process</b> page:</p> <ul style="list-style-type: none"> <li>• BPEL</li> <li>• Activity</li> <li>• Data Object</li> <li>• Start Event</li> <li>• Intermediate Event</li> </ul>	<p><a href="#">BPMN 2.0 Business Process Toolbox</a><sup>[1225]</sup></p> <p><a href="#">Model BPEL 2.0 Process</a><sup>[1260]</sup></p>										

	<ul style="list-style-type: none"> <li>• Event</li> <li>• Gateway</li> <li>• Pool</li> </ul> <p><b>BPMN 2.0 - Business Process Connectors</b> page:</p> <ul style="list-style-type: none"> <li>• Sequence Flow</li> <li>• Association</li> <li>• Message Flow</li> </ul> <p><b>BPMN 2.0 Types</b> page:</p> <ul style="list-style-type: none"> <li>• Assignment</li> <li>• Error</li> <li>• Interface</li> <li>• Operation</li> <li>• Participant</li> <li>• Property</li> </ul>	
4	Create <b>Web Service Operations</b> for the <i>BPEL Process</i> and other related <i>Pools</i> , if required	<a href="#">Web Service Operation</a> <small>[127]</small>
5	Generate <b>BPEL 2.0</b> code from the <i>BPEL Process</i>	<a href="#">Generate BPEL 2.0</a> <small>[127]</small>

**Notes:**

- Generating **BPEL 2.0** from a **BPMN 2.0** model is supported in the **Business and Software Engineering** and the **Ultimate** editions of Enterprise Architect.
- Ensure that **BPMN 2.0** Technology is enabled in the **MDG Technologies** dialog ( **Settings | MDG Technologies** ).

**BPEL 2.0 Example:**

- The Enterprise Architect Example file ( *EAExample.EAP* ) has a sample **BPMN 2.0** model from which **BPEL 2.0** can be generated.
- If you have installed Enterprise Architect at the default location, open this file: **C:\Program Files\Sparx Systems\EA\EAExample.EAP**
- The **BPMN 2.0** model package is in: **Project Models | Analysis and Business Modeling | BPEL Example | BPEL 2.0 Model**.

**Modeling Restrictions:**

1. Every *BPEL Process* and *Sub-Process* should start with a *Start Event* and end with an *End Event*.
  - *Boundary Start* and *End Events* are not supported
2. *Sequence Flow* Looping is not supported in both **Normal** and **Exception Paths**.
  - All *Sequence Flows* should flow downstream and not upstream.
3. *Sub-Process* cannot be a **Loop** node and have boundary *Intermediate Events*.
4. *Event Sub-Process* cannot act as a **Loop** Node.
5. *Assignments* are not supported on :
  - *Start Events* on *Event Sub-Process*
  - *End Events*
  - *Sub-Process*
  - Boundary *Intermediate Event*
  - *Gateway*
  - *Task* and *Intermediate Event* that immediately follow an *XOR Event Gateway*
6. **Exception Path** has to merge back into the **Normal Path**.
  - An exception to this rule is boundary *Compensation Intermediate Event* which should have a **BPMN 2.0 Association** to a *Compensation Activity* ( that has no incoming or outgoing *Sequence Flows* )

- Multiple **Exception Paths** from an *Activity* must join at the same location in the **Normal Path**
  - An **Exception Path** should not cross another **Exception Path**.
7. *Activities* in an **Exception Path** cannot have boundary **Intermediate Events**.
8. *Pools* are treated as *black boxes* ( i.e., they do not expose any details ) and hence they cannot contain any child elements or have any incoming/outgoing *Sequence Flow* connectors.

### 8.3.5.2.1 Create BPEL 2.0 Model Structure

A **BPEL 2.0** model consists of a *BPEL Process* ( containing a **BPEL** diagram and mappable **BPMN 2.0** constructs ) and other supporting elements ( like **BPMN 2.0 Assignment**, **BPMN 2.0 Operation** ) required for generating a **BPEL 2.0** code. A sample **BPEL 2.0** package structure can be created in the **Project Browser**, using the **Select Model(s)** (Model Wizard) dialog. You can use this package structure as a template for developing your *BPEL Process*.

#### Access:

- Right-click on a package in the **Project Browser** and select the following context menu : **Add | Add a New Model using Wizard** ( or )
- Select the **New Model from Pattern** icon in the **Project Browser** toolbar

#### Use to:

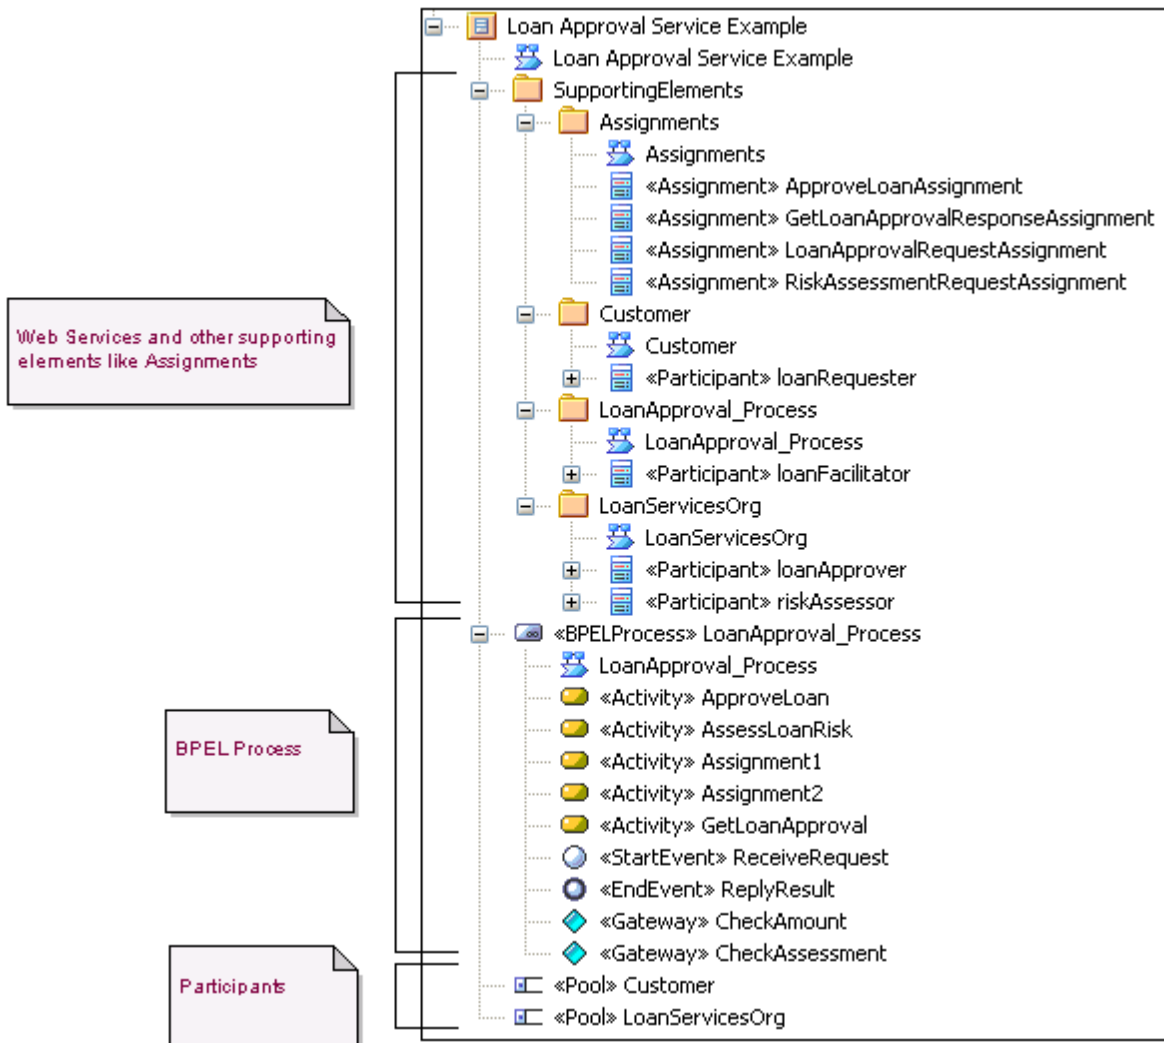

- Create a new **BPEL 2.0** package structure that can be used as a starting point for developing your *BPEL Process*.

#### How to:

Step	Action	See also
1	Select the root node or a package in the <b>Project Browser</b>	
2	Click on the <b>New Model from Pattern</b> icon in the <b>Project Browser</b>	<a href="#">Project Browser Toolbar</a> [454]
3	Select the value <b>BPMN 2.0</b> in the <b>Technology</b> section	<a href="#">Model Wizard</a> [520]
4	Check the option <b>BPEL 2.0 Model</b> in the <b>Name</b> section	
5	Click on the <b>OK</b> button to create the sample <b>BPEL 2.0</b> package structure	

#### Example BPEL 2.0 Package Structure:

The *BPEL Process* **LoanApproval\_Process** acts as container for the **BPEL** diagram and elements. The **SupportingElements** package contains supporting components like **Assignments** and **Web Service Operations**.

**Learn More:**

- [Model a BPEL 2.0 Process](#)<sup>[1260]</sup>
- [Create a Web Service Operation](#)<sup>[1271]</sup>
- [Generate BPEL 2.0](#)<sup>[1274]</sup>

**8.3.5.2.2 Model a BPEL 2.0 Process**

The *BPEL Process* in Enterprise Architect represents the top-level container for the **BPMN 2.0** elements, from which **BPEL 2.0** can be generated. Conceptually it maps to the BPEL *process* element.

**BPEL Properties:**

- Double-click on the *BPEL Process* in the **BPEL** diagram ( or )
- Right-click on the *BPEL Process* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

**Reference:**

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for the <i>BPEL Process</i>	
<b>Query Language</b>	Specify the value of the language used in the <i>BPEL Process</i> for the selection of nodes in <i>Assignments</i> . Defaults to <b>XPath 1.0</b>	
<b>OK</b>	Save the values entered in the dialog	
<b>Cancel</b>	Discard the values entered in the dialog	
<b>Help</b>	Display this Help topic	
<b>General</b>	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> [662]

**Learn More:**

The *BPEL Process* element acts as a container for the following **BPMN 2.0** constructs:

- [Start Event](#) [1261]
- [Intermediate Event](#) [1262]
- [Activity](#) [1264]
- [Gateway](#) [1266]
- [End Event](#) [1267]
- [Data Object](#) [1268]
- [Property](#) [1269]
- [Sequence Flow](#) [1269]

The following BPMN 2.0 constructs can be optionally used in BPEL modeling:

- [Pool](#) [1252]
- [Assignment](#) [1253]

**8.3.5.2.2.1 Start Event**

A **BPMN 2.0 Start Event** indicates where a particular *Process* begins. Every *Process* in Enterprise Architect must begin with a *Start Event*.

**BPEL Properties:**

- Double-click on the *Start Event* in the **BPEL** diagram ( or )
- Right-click on the *Start Event* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

**Reference:**

<b>General</b>	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> <sup>[662]</sup>				

**Notes:**

- **Cancel, Conditional, Escalation, Multiple, None, Parallel Multiple** and **Signal** event type cannot be mapped to **BPEL 2.0**
- **Assignments** tab is not available on *Intermediate Events* that are attached to the boundary of an *Activity*
- Either set **Time Cycle** or **Time Date** for **Timer Trigger Type** but not both as they are mutually exclusive fields.
- **Error** event type is valid only on an *Intermediate Event* attached to the boundary of an **Activity**
- **Compensation** event type is valid only on an *Event Sub-Process* or when attached to the boundary of an *Activity*
- **Link Intermediate Event** can be used either as a *GOTO* or an *off-page* connector. So, this event can have either incoming or outgoing *Sequence Flows* - but not both.

**8.3.5.2.2.3 Activity**

A **BPMN 2.0 Activity** represents work that is performed within a *Process*. An *Activity* can be modeled as a:

- **Sub-Process** - a compound *Activity* that is defined as a flow of other **BPMN 2.0** elements or
- **Task** - an atomic *Activity* that cannot be broken down into a smaller unit.

Activities - both *Tasks* and *Sub-Processes* - can also, optionally, act as *Looping constructs*. The **OMG BPMN 2.0 Specification** defines two types of *Looping* construct:

- **Standard Loop** ( *while* or *until* )
- **Multi-Instance Loop** ( *for each* )

**BPEL Properties:**

- Double-click on the *Activity* in the **BPEL** diagram

---------	---------------------------------------	------------------------------------

**Notes:**

1. The target of the outgoing *Sequence Flows* of this **Event Exclusive Gateway** must be either an:
  - **Receive Task**
  - **Message** or **Timer Intermediate Event**
2. If a **Message Task** is one of the targets of the outgoing *Sequence Flow* of an **Event Exclusive Gateway**, then a **Message Intermediate Event** cannot be the target of the other outgoing *Sequence Flows* of this **Event Exclusive Gateway**

**8.3.5.2.2.5 End Event**

A **BPMN 2.0 End Event** indicates where a particular *Process* ends. Every *Process* in Enterprise Architect must end with an End Event.

**BPEL Properties:**

- Double-click on the *End Event* in the **BPEL** diagram
- Right-click on the *End Event* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

**Reference:**

<b>Help</b>	Display this Help topic	
<b>General</b>	Open the UML Properties dialog	<a href="#">Properties</a> [662]

#### 8.3.5.2.2.9 Pool

A **BPMN 2.0 Pool** represents a **Participant** in a *Process* and does not map to any specific **BPEL 2.0** element. Enterprise Architect uses *Pools* to represent external **Participants**, with which the *BPEL Process* communicates. These are 'black box' *pools* i.e., they are abstract and do not expose any details ( they do not contain any **BPMN 2.0** elements inside them ).

##### BPEL Properties:

- Double-click on the *Pool* in the **BPEL** diagram
- Right-click on the *Pool* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

##### Reference:

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for the <i>Pool</i>	
<b>OK</b>	Save the values entered in the dialog	
<b>Cancel</b>	Discard the values entered in the dialog	
<b>Help</b>	Display this Help topic	
<b>General</b>	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> [662]

##### Notes:

- A *BPEL Process* should not contain a *Pool* as its child element.
- A **BPEL** diagram under a *BPEL Process* contains an implicit *Pool* - so it is invalid to add a *Pool* in this **BPEL** diagram to represent the *BPEL Process*.
- *Pool* cannot have any incoming or outgoing *Sequence Flow* connectors - it can have only incoming or outgoing *Message Flow* connectors.

#### 8.3.5.2.2.10 Assignment

A **BPMN 2.0 Assignment** element enables data to be copied between messages and variables within a *BPEL Process*. An *Assignment* element maps to a **BPEL 2.0 assign** activity and copies the specified value from the source to the target.

In Enterprise Architect, *Assignment* elements should be created in the **Assignments** package in **SupportingElements**<sup>[1259]</sup>. If they are created elsewhere, they cannot be enacted correctly.

**Access:** **View | Toolbox > More tools | BPMN 2.0 | BPMN 2.0 Business Process | BPMN 2.0 Types**

##### BPEL Properties:

- Double-click on the *Assignment* in the **BPEL** diagram
- Right-click on the *Assignment* in the **BPEL** diagram ( or the **Project Browser** ) and select the following context menu : **BPEL | BPEL 2.0 Properties**

Reference:

Notes:

- Messages are created when you create a **Web Service Operation**

**8.3.5.2.3 Create BPEL 2.0 Web Service Operation**

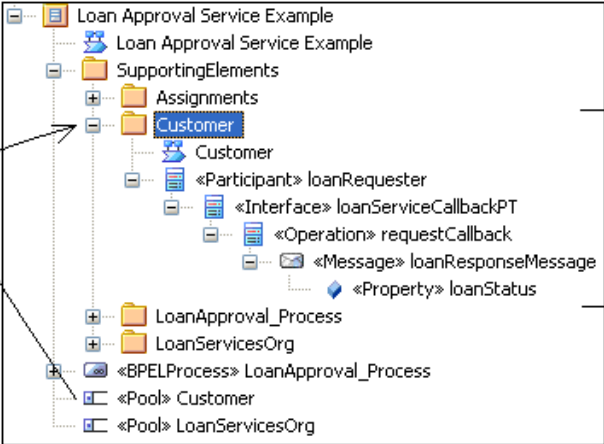

**BPEL** is an **Orchestration** language, which orchestrates services that are exposed using **WSDL 1.1**. It coordinates the execution of the various operations of these involved services. **BPEL 2.0** supports **WSDL 1.1 one-way** and **request-response** operations only ( and not **solicit-response** and **notification** operations ). Enterprise Architect enables you to create, for *BPEL Process* and *Pool* elements, **Web Service Operations** that support either *synchronous* (request-response) or *asynchronous* (one-way) interactions.

**Access:** Right-click on a BPEL Process or Pool and select the following context menu: **BPEL | Create WebService**

**Reference:**

Field/Button	Usage	See Also																
<b>Operation</b>	Specify whether to create a new Web Service Operation or create one from an existing WSDL created / imported into EA ( using the <b>Import WSDL</b> dialog ) by selecting either : <ul style="list-style-type: none"> <li>• <b>Create New</b> ( or )</li> <li>• <b>Create from existing WSDL PortType Operation</b></li> </ul>	<a href="#">Model WSDL</a> <small>[1621]</small> <a href="#">Import WSDL</a> <small>[1631]</small>

------	-------------------------	--

**Notes:**

- The Output tab is not applicable for an Asynchronous operation

**8.3.5.2.4 Generate BPEL 2.0**

**BPEL 2.0** code can be generated from a *BPEL Process*. Enterprise Architect validates the *BPEL Process* before generating the **BPEL 2.0** code. In addition to generating the **BPEL 2.0** code, **WSDL 1.1** files are generated for the *BPEL Process* and all the involved *Pools* (provided **Web Service Operations** are defined for them).

**Access:** Right-click on a BPEL Process and select the following context menu: **BPEL | Generate BPEL 2.0**

**Reference:**

Field/Button	Usage	See Also
<b>File Name</b>	Specify the path where the <b>BPEL 2.0</b> file is to be generated	
<b>Namespace Details</b>	Double-click on an entry ( if any ) in this field to open the <b>Namespace Details</b> dialog and add / edit the namespace details  The entry <b>DefaultPool</b> represents the current <i>BPEL Process</i>	
<b>Generate BPEL</b>	Validate the model and generate <b>BPEL 2.0</b>	<a href="#">BPEL Model Validation</a> <sup>[1274]</sup>
<b>Close</b>	Close this dialog	
<b>Help</b>	Display this Help topic	
<b>View BPEL</b>	View the generated <b>BPEL 2.0</b> file	

**Learn More:**

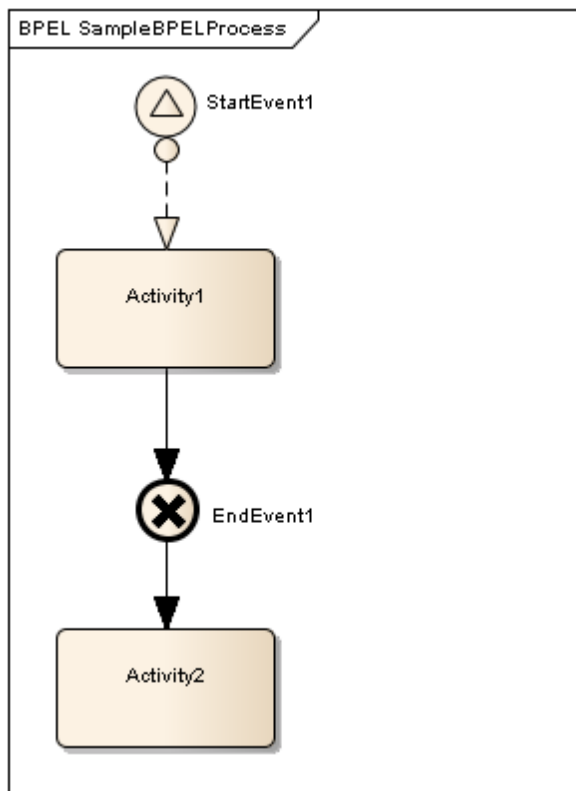

- [Model a BPEL 2.0 Process](#) <sup>[1260]</sup>
- [Create a Web Service Operation](#) <sup>[1274]</sup>

**8.3.5.3 BPEL Model Validation**

The **BPEL** model is validated for both *syntax* and *semantic* errors before generating the **BPEL** code. Upon successful validation, the **BPEL** file ( and the associated **WSDL 1.1** files, if any ) are generated. The results of the validation, as well as the progress of the **BPEL** generation, are displayed in the BPEL Progress tab of the Output window.

**Example BPEL Model Violation**

The following model shows several basic **BPEL** violations:

1. *StartEvent1* is of type **Signal**, which cannot be mapped to **BPEL**.
2. The *Message Flow* connector between *StartEvent1* and *Activity1* is invalid, as *Message Flow* cannot be used to connect *Activities* or *Events* within a *Process*.
3. *EndEvent1* is of type **Cancel**, which cannot be mapped to **BPEL**.
4. *EndEvent1* cannot have any outgoing *Sequence Flow* connector, as it represents the end of a *Process*.
5. *Activity2* is not valid, as only an *End Event* represents the end of a *Process*.

**Notes:**

- Double-click on a validation error entry in the BPEL Progress tab of the Output window to go to the source of the error in the Project Browser

**Learn More:**

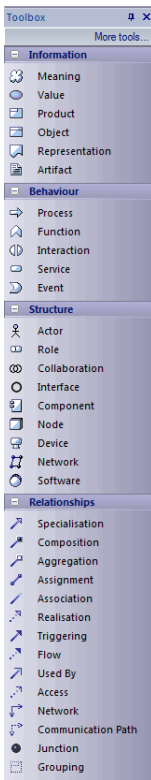

- [Generate BPEL 1.1](#)<sup>[1256]</sup>
- [BPEL 1.1 Modeling Restrictions](#)<sup>[1239]</sup>

- [BPEL 2.0 Modeling Restrictions](#)<sup>[1257]</sup>
- [System Output Window](#)<sup>[128]</sup>

### 8.3.6 ArchiMate

*ArchiMate* is an open-standard enterprise architecture language from The Open Group, based on the IEEE 1471 standard. It offers a common language for describing the construction and operation of business processes, organizational structures, information flows, IT systems and technical infrastructure, enabling Enterprise Architects to describe, analyse and visualize the relationships among business domains in an unambiguous way.

**Access:** From the Toolbox select: **More Tools | ArchiMate**

**Topics:**

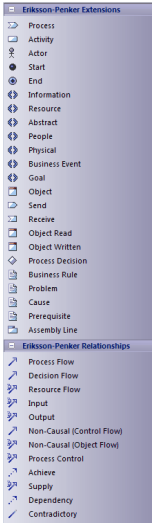

Images	Topic	Detail	See also
	<b>ArchiMate in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop ArchiMate diagrams quickly and simply, through use of an ArchiMate MDG Technology integrated with the Enterprise Architect installer. The ArchiMate facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• An ArchiMate diagram type, accessed through the <b>New Diagram</b> dialog</li> <li>• A set of <b>ArchiMate</b> pages in the <b>Toolbox</b></li> <li>• ArchiMate element and relationship entries in the <b>Toolbox Shortcut</b> Menu and <b>Quick Linker</b></li> </ul>	<p><a href="#">New Diagram</a> <sup>[570]</sup></p> <p><a href="#">Toolbox Shortcut</a> <sup>[553]</sup></p> <p><a href="#">Quick Linker</a> <sup>[624]</sup></p>
	<b>ArchiMate Toolbox Pages</b>	<p>The toolbox pages provide three categories of elements - Information, Behavior and Structure - and a page of connectors that are largely based on the UML connectors.</p> <p>The appearance of elements can be modified with the use of Tagged Values, as suggested below:</p> <ul style="list-style-type: none"> <li>• For <i>Artifact, Process, Function, Interaction, Service, Event, Actor, Role, Collaboration, Interface, Component, Node</i> and <i>Device</i> elements:</li> <li>• <i>iconstyle=true</i> shows the iconic representation of the element</li> <li>• <i>iconstyle=false</i> shows a rectangle with a decoration in the top corner</li> <li>• An Interface element (if <i>iconstyle=true</i>) can be provided, required, symmetric or assembly, and can be rotated, by setting the Tagged Values</li> <li>• A Function element (if <i>iconstyle=true</i>) can be rotated</li> <li>• An Actor element (if <i>iconstyle=false</i>) can be compound</li> <li>• Process and Function elements can be marked <i>atomic</i></li> </ul> <p>Because there is a large range of ArchiMate elements, you should make good use of the <b>Quick Linker</b> arrow to guide you in selecting appropriate source and target elements and relationship types to model your enterprise architecture.</p>	
	<b>Disable ArchiMate</b>	<p>If you prefer not to use ArchiMate in Enterprise Architect, you can disable it (and subsequently re-enable it) using the <b>MDG Technologies</b> dialog (<b>Settings   MDG Technologies</b>).</p>	<p><a href="#">MDG Technologies</a> <sup>[1035]</sup></p>

### 8.3.7 Eriksson-Penker Extensions

*Eriksson-Penker* extensions (developed by H. E. Eriksson and M. Penker) provide a framework for UML business processing model extensions, to which an enterprise architect can add stereotypes and properties appropriate to their business.

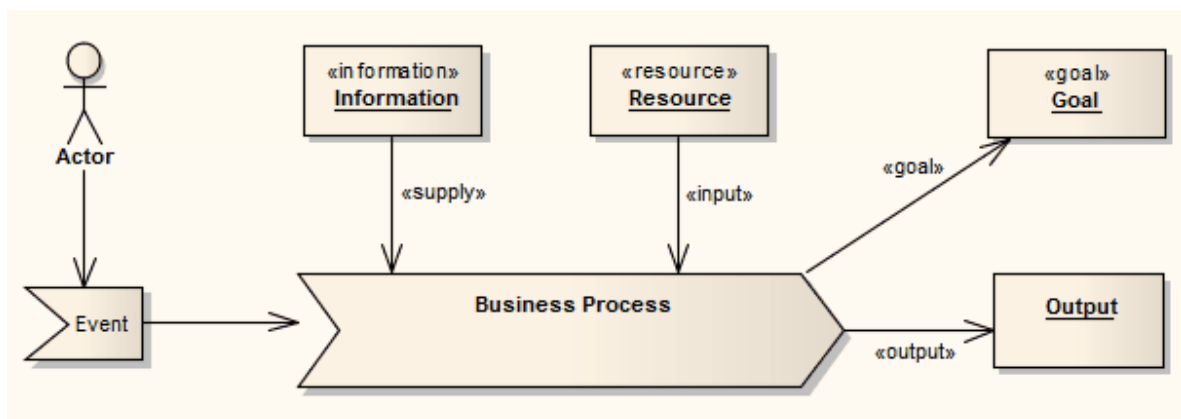

**Access:** From the Toolbox select: **More Tools | Eriksson-Penker Extensions**

**Topics:**

Images	Topic	Detail	See also
	<p><b>Eriksson-Penker in Enterprise Architect</b></p>	<p>Enterprise Architect provides - through the integration of MDG Technologies with the installer - two well-respected and proven UML extensions that further enhance the capture of business activities, processes, objects and information flows. One of these is <b>Business Process Modeling Notation (BPMN)</b>. The other is the Eriksson-Penker profile which, through a set of stereotypes, provides a unique and powerful means of visualizing and communicating business processes and the necessary flow of information within an organization.</p> <p>The Eriksson-Penker extensions are provided in the form of:</p> <ul style="list-style-type: none"> <li>• An Eriksson-Penker diagram type, accessed through the <b>New Diagram</b> dialog</li> <li>• An Eriksson-Penker page in the <b>Toolbox</b></li> <li>• Eriksson-Penker element and relationship entries in the <b>Toolbox Shortcut Menu</b> and <b>Quick Linker</b></li> </ul>	<p><a href="#">Business Process Modeling Notation</a><sup>[1222]</sup></p> <p><a href="#">New Diagram</a><sup>[570]</sup></p> <p><a href="#">Toolbox Shortcut</a><sup>[553]</sup></p> <p><a href="#">Quick Linker</a><sup>[624]</sup></p>

## 8.4 Data Models

Data Modelers and Information Architects are challenged with creating data models that span multiple levels of abstraction - from concept to physical implementation. They might also be responsible for maintaining traceability between these models. Enterprise Architect helps to meet these challenges with easy-to-use tools for building and maintaining all of the fundamental data models: Conceptual, Logical and Physical data models.

### Topics:

Topic	Detail	See also
<b>Conceptual Data Models</b>	<p><b>Conceptual data models</b>, also called Domain models, establish the basic concepts and semantics of a given domain and help to communicate these to a wide audience of stakeholders</p> <p>Conceptual models also serve as a common vocabulary during the analysis stages of a project; they can be created in Enterprise Architect using Entity-Relationship or UML Class models</p>	
<b>Logical Data Models</b>	<p><b>Logical data models</b> add further detail to conceptual model elements and refine the structure of the domain; they can be defined using UML Class models</p> <p>One benefit of a Logical data model is that it provides a foundation on which to base the Physical model and subsequent database implementation</p>	
<b>Physical Data Models</b>	<p><b>Physical data models</b> in Enterprise Architect help you visualize your database structure and automatically derive the corresponding database schema; you use Enterprise Architect's UML Profile for Data Modeling specifically for this purpose</p> <p>The profile provides useful extensions of the UML standard that map database concepts of tables and relationships onto the UML concepts of Classes and Associations; you can also model database keys, triggers, constraints, referential integrity and other relational database features</p> <p>Because Enterprise Architect lets you visualize each type of data model in the same repository, you can easily manage dependencies between each level of abstraction; this helps you maximize traceability and verify completeness of system implementation</p>

- [Conceptual data modeling](#)<sup>[1281]</sup>
- [Logical data modeling](#)<sup>[1282]</sup>
- [Physical data modeling](#)<sup>[1352]</sup>

### 8.4.1 Table

#### Description:

A Table is a stereotyped Class. It is drawn with a small table icon in the upper right corner. You typically use this element in Data Modeling diagrams.

A Table element has a special Properties dialog, with settings for database type and the ability to set column information and data-related operations such as triggers and indexes. When setting up a Table, make sure you set the default database type for that Table, otherwise you do not have any data types to choose from when creating columns.

#### Toolbox Icon:

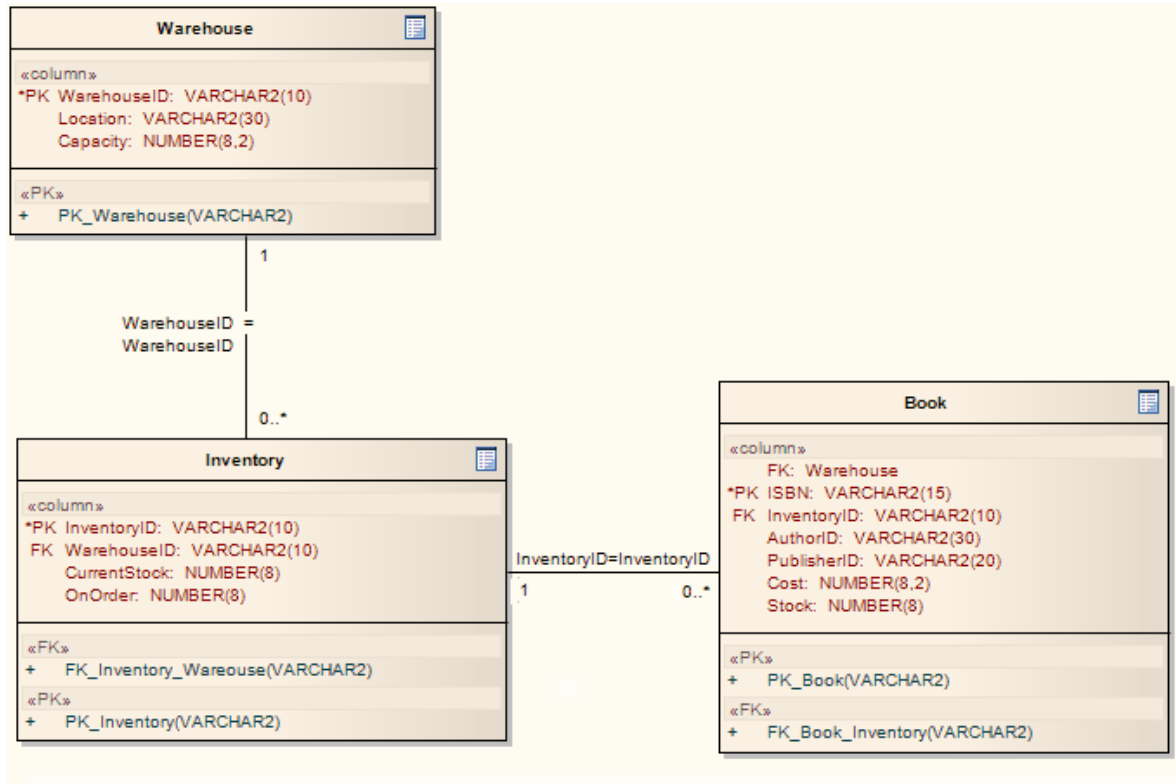

#### Learn More:

- [Data Modeling Diagram](#)<sup>[1287]</sup>
- [Set the Default Database Type](#)<sup>[1354]</sup>

### 8.4.2 Database Schema

The following diagram shows an example Database Schema represented by a **Physical Data Model**.

**Learn More:**

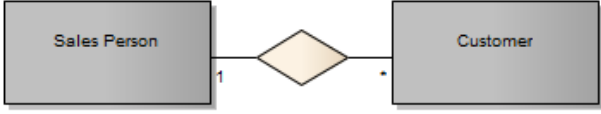

- [Physical Data Model](#)<sup>[1352]</sup>
- [Data Modeling Toolbox](#)<sup>[568]</sup>

### 8.4.3 Conceptual Data Model

A Conceptual data model is the most abstract form of data model. It is helpful for communicating ideas to a wide range of stakeholders because of its simplicity. Therefore platform-specific information, such as data types, are omitted from a Conceptual data model. Other implementation details, such as procedures and interface definitions, are also excluded. Below is an example of a Conceptual data model that is rendered using two of the notations supported by Enterprise Architect.

Using Entity-Relationship (ER) notation, we represent the data concepts "Sales Person" and "Customer" as Entities with a 1-many relationship between them.

**Topics:**

Topic	Detail	See also
Example	 <p>A Conceptual data model that uses Entity-Relationship notation</p> <p>We can represent the exactly the same semantic information using UML Classes and Associations</p> <p>Whether you use UML or ER notation to represent data concepts in your project depends on the experience and preferences of the stakeholders involved</p>  <p>An equivalent model using UML Class notation</p> <p>The detailed structure of the data concepts illustrated above is defined later by the <b>Logical data model</b></p>	

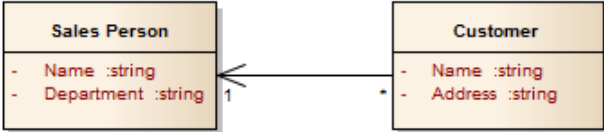

Learn more:

- [Logical data models](#)<sup>[1282]</sup>
- [Entity Relationship modeling](#)<sup>[1388]</sup>
- [UML Class modeling](#)<sup>[800]</sup>

### 8.4.4 Logical Data Model

Logical data models help to define the detailed structure of the data elements in a system and the relationships between data elements. They refine the data elements introduced by a Conceptual data model and form the basis of the Physical data model. In Enterprise Architect, a Logical data model is typically represented using the UML Class notation.

Topics:

Topic	Detail	See also
Example	<p>A simple example of a Logical data model is provided below</p> <p>Note that the data elements "Sales Person" and "Customer" contain UML Attributes; the Attribute types, however, remain platform-independent</p>  <p>A Logical data model defined using UML Class notation</p> <p>Platform-specific Attribute types and other meta-data that relate to</p>

- [UML Class modeling](#) <sup>800</sup>

## 8.5 User Interface Models

User Interface Diagrams are customized UML diagrams used to visually mock-up a system's user interface using forms, controls and labels.

**Example Diagram:** [Example User Interface Diagram](#) 

### Tools:

Select User Interface diagram elements and connectors from the User Interface pages of the Toolbox.

User Interface Diagram Elements	User Interface Diagram Connectors
 Package	 Associate
 Screen	 Aggregate
 UI Control	 Generalize
 Object	 Realize

### Notes:

- The Enterprise Architect Professional, Corporate and Suite editions also include the MDG Win32 UI Technology, which enables you to design user interface components that render more precisely as Win32® User Interface elements

### Learn More:

- [Win32 UI Technology](#) 

### 8.5.1 Screen

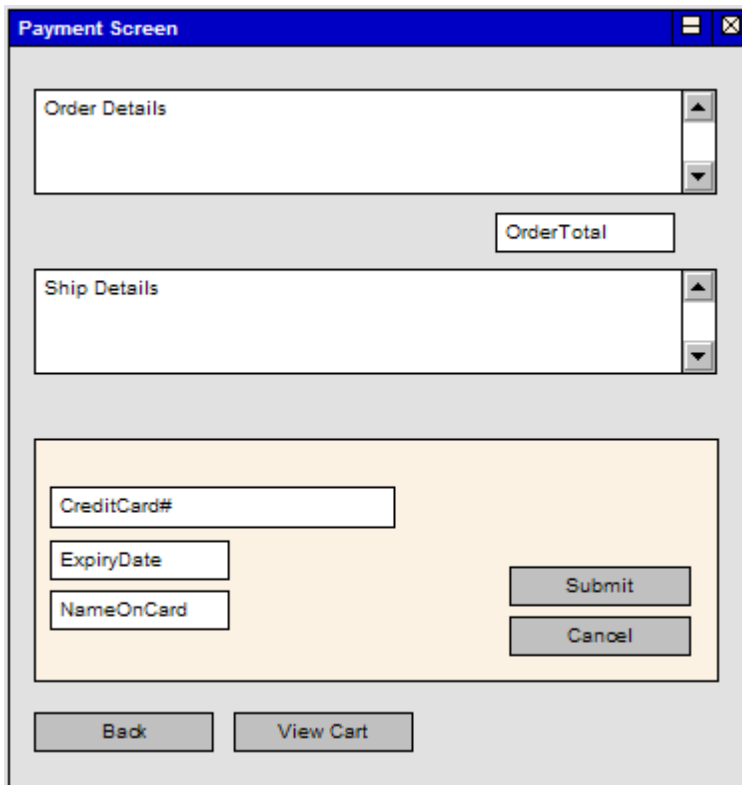

#### Description

A Screen is used to prototype User Interface screen flow. By using UML features such as requirements, constraints and scenarios against User Interface diagram elements, you can build up a solid and detailed understanding of user interface behavior without having to use code. This becomes an excellent means of establishing the precise behavior the system has from a user perspective, and in conjunction with the Use Case model, defines exactly how a user gets work done.

Web pages can also be prototyped and specified rigorously using Enterprise Architect's custom interface extensions.

#### Example

The example diagram below illustrates some features of Enterprise Architect's screen modeling extensions that support web page prototyping. By adding requirements, rules, scenarios and notes to each element, a detailed model is built up of the form or web page, without having to resort to GUI builders or HTML.

Enterprise Architect displays [UI Controls](#) <sup>[1285]</sup> as a range of special icons, depending on the stereotype used; for example, a Control stereotyped as a «list» displays with a vertical scroll bar.

### Toolbox Icon

### Learn More:

- [User Interface Diagram](#) <sup>[1284]</sup>
- [UI Controls](#) <sup>[1285]</sup>

## **8.5.2 UI Control Elements**

### Description

A UI Control element represents a user interface control element (such as an edit box). It is used for capturing the components of a screen layout and requirements in a Custom or User Interface diagram.

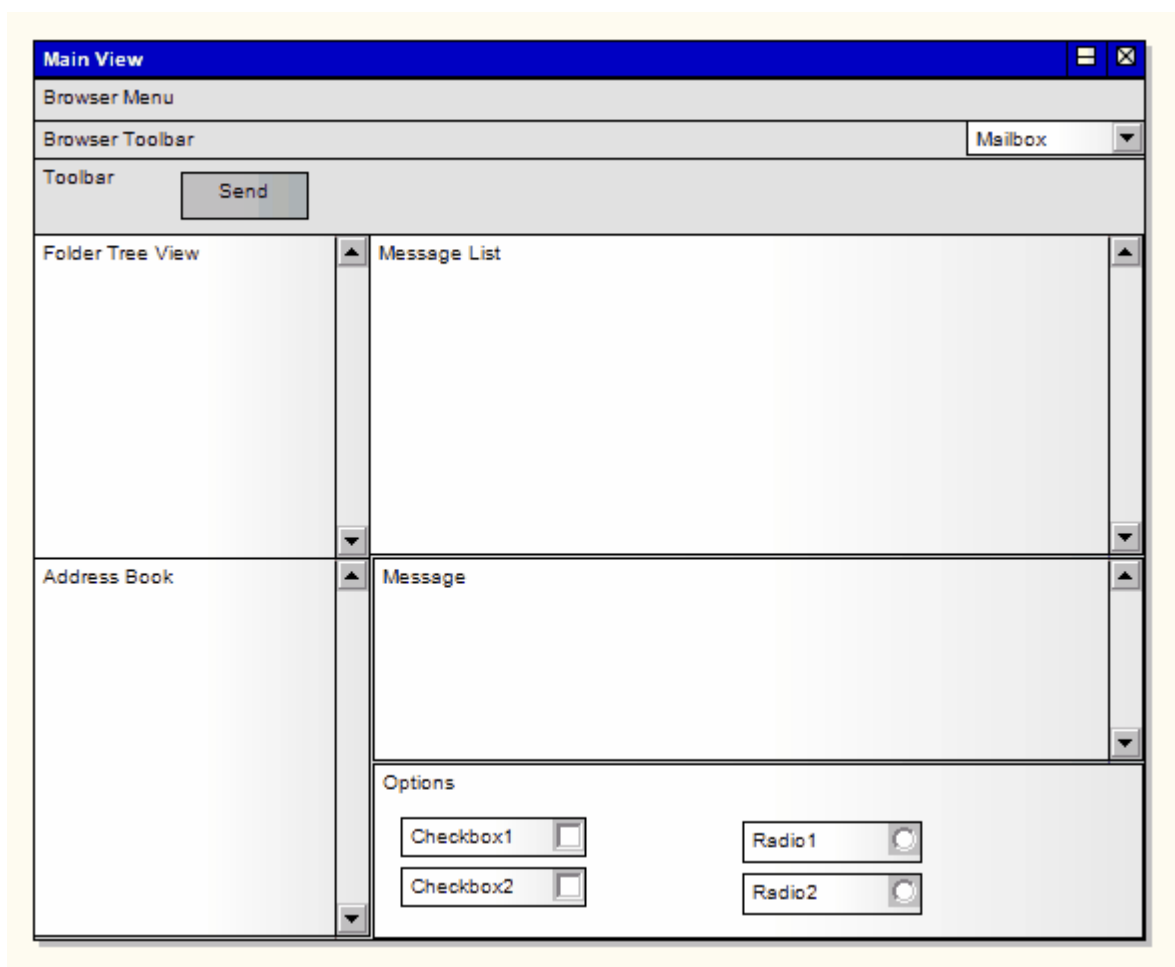

There are a number of UI Control elements available in the User Interface page of the Toolbox. These include:

- List
- Table
- Text Box
- Label
- Form
- Panel

- Button
- Combobox
- Checkbox
- Checkbox (left hand side)
- Radio button
- Radio button (left hand side)
- Vertical Line
- Horizontal Line.

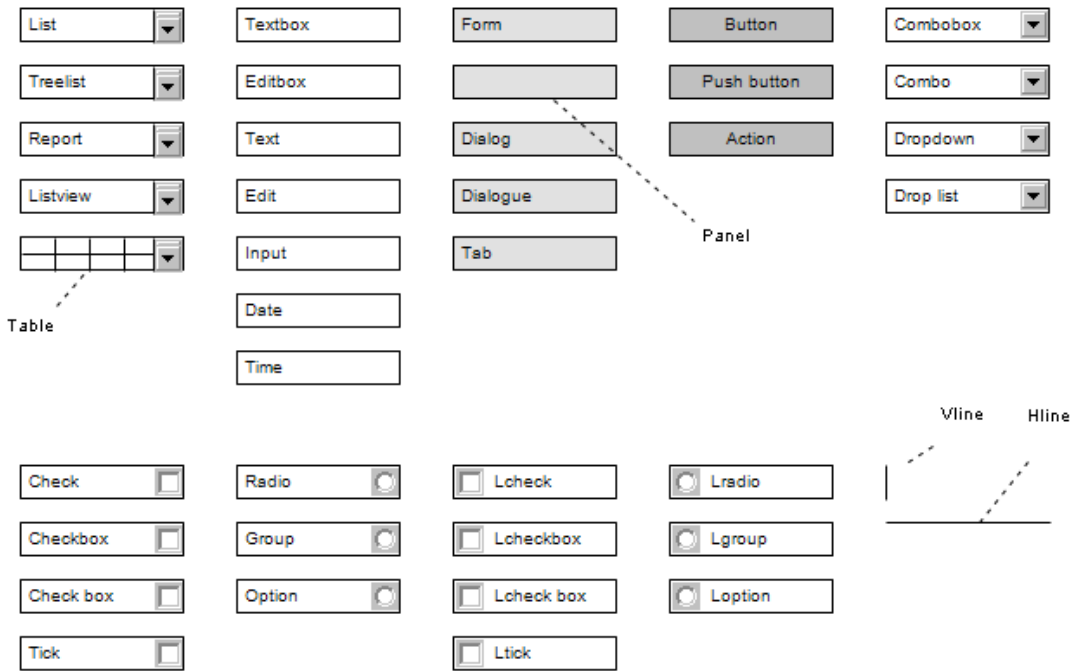

### Example

The icons can be combined on a Screen icon to represent the appearance of a user interface screen, as shown:

You can also extend the available icons by selecting other stereotypes in the UI Control Element Properties dialog. The full set of available stereotypes is shown below; type or select the text in the **Stereotype** field to create the corresponding icon.

ui User Interface

Toolbox Icon

(where **UI Control** is the name of the user interface element type)

Learn More

- [User Interface](#)<sup>[1284]</sup>
- [Screen](#)<sup>[1284]</sup>

**8.5.3 Web Stereotypes**

Description

Enterprise Architect supports a number of stereotypes for web page modeling, the graphical elements for which display with a **graphical icon** instead of the usual «*stereotype*» format. These stereotypes are only supported for Class elements. The image below indicates the various graphical icons and their associated stereotypes.

A similar set of web modeling elements and their relationships are also available through dedicated Web Modeling pages in the Toolbox.

#### How To:

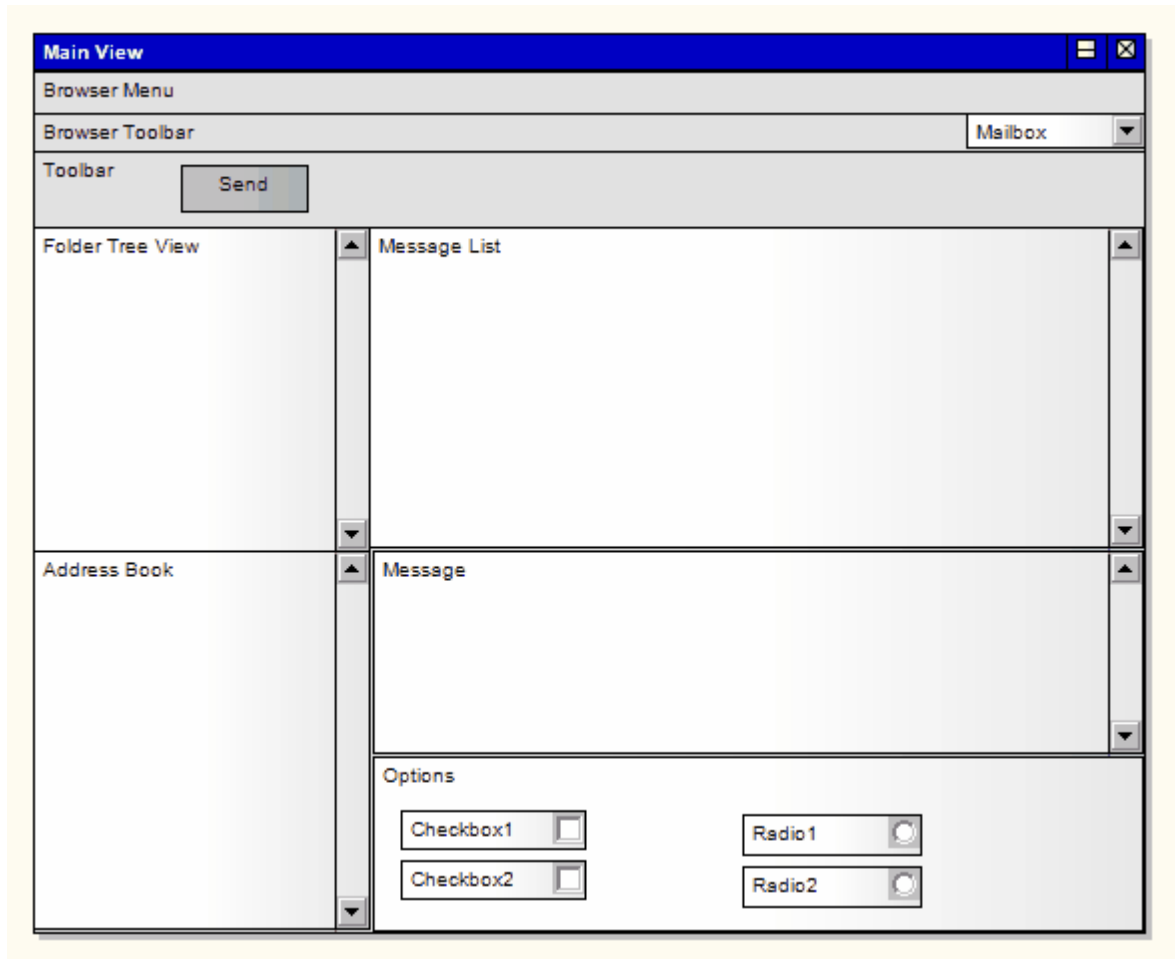

To set a web icon, follow the steps below:

Step	Action
1	Create a new Class element in a diagram
2	Display the Class Properties dialog
3	In the <b>Stereotype</b> field, either type in the required stereotype name or click on the drop-down arrow and select the required stereotype (as named above)
4	Click on the <b>OK</b> button The Class displays as in one of the examples above

### 8.5.4 Example User Interface Diagram

In the example User Interface diagram below, forms, controls and labels are arranged on the diagram to describe its appearance. UI Control elements can also be traced to other model elements linking the UI with the underlying implementation.

### 8.5.5 Win32 UI Technology

The MDG Win32 UI Technology enables you to design user interface screens that render as Win32® user interface elements.

#### Use To:

- Create and maintain User Interface diagrams in the Win32® User Interface formats

**Access:** The Win32 UI facilities are provided in the form of:

- A Win32 User Interface diagram type, accessed through the New Diagram dialog
- Win32® User Interface pages in the Toolbox
- Win32 User Interface element and relationship entries in the Toolbox **Shortcut** menu and Quick Linker

#### Win32 User Interface Toolbox Pages:

You can access the Win32 User Interface Toolbox pages through the **View | Toolbox: More tools... User Interface - Win32** option.

You can also set Win32® User Interface Modeling as the active default technology to access the Toolbox pages directly.

**Disable Win32 User Interface Technology:**

If you prefer not to use the Win32® UI Technology in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog (**Settings | MDG Technologies**).

**Notes:**

- The MDG Win32® User Interface Technology is available in the Enterprise Architect Professional, Corporate and Suite editions

## 8.6 Other Stereotypes

There are many other UML elements that you can also work with in Enterprise Architect, most of which are basic elements extended by the use of stereotypes. This topic gives a brief introduction to some of these elements.

- [Analysis Stereotypes](#) <sup>[1189]</sup>
- [Boundary](#) <sup>[1291]</sup>
- [Composite Elements](#) <sup>[649]</sup>
- [Control](#) <sup>[1292]</sup>

- [Event](#) <sup>[1295]</sup>
- [Feature](#) <sup>[1169]</sup>
- [Hyperlinks](#) <sup>[1295]</sup>
- [Image](#) <sup>[1298]</sup>
- [N-Ary Association](#) <sup>[1299]</sup>
- [Packaging Component](#) <sup>[1300]</sup>
- [Process](#) <sup>[1300]</sup>
- [Requirement](#) <sup>[1157]</sup>
- [Risk](#) <sup>[1301]</sup>
- [Screen](#) <sup>[1284]</sup>
- [Task](#) <sup>[1302]</sup>
- [Test Case](#) <sup>[1302]</sup>
- [Test Cut](#) <sup>[1303]</sup>
- [Test Set](#) <sup>[1304]</sup>
- [Test Suite](#) <sup>[1304]</sup>
- [Table](#) <sup>[1280]</sup>
- [UI Control Elements](#) <sup>[1285]</sup>
- [Web Stereotypes](#) <sup>[1287]</sup>

### Learn More:

- [UML Stereotypes](#) <sup>[1018]</sup>

### 8.6.1 Boundary

#### Description

A Boundary is a stereotyped Object that models some system boundary, typically a user interface screen. You can also create a Boundary as a stereotyped Class. See the Create a Boundary topic. Boundary elements are used in analysis to capture user interactions, screen flows and element interactions (or 'collaborations').

A Boundary is used in the conceptual phase to capture users interacting with the system at a screen level (or some other boundary interface type). It is often used in Sequence and Robustness (Analysis) diagrams. It is the View in the Model-View-Controller pattern.

#### Toolbox Icon

#### Learn More:

- [Create a Boundary](#)<sup>[1292]</sup>
- [Analysis Stereotypes](#)<sup>[1189]</sup>
- [Sequence Diagram](#)<sup>[85]</sup>
- [Communication Diagram](#)<sup>[86]</sup>
- [Object Diagram](#)<sup>[80]</sup>
- [Analysis Diagram](#)<sup>[1190]</sup>

### 8.6.1.1 Create a Boundary

To create a Boundary element on a diagram as an Object, follow the steps below

Step	Action
1	In the <b>Toolbox</b> , select the <b>More tools   Analysis</b> menu option.
2	From the <b>Analysis Elements</b> page, drag the Boundary element onto the diagram.

To create a Boundary element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the <b>Properties</b> context menu option; the <b>Properties</b> dialog displays.
3	In the <b>Stereotype</b> field, type the value <b>boundary</b> .
4	Click on the <b>Apply</b> and <b>OK</b> buttons.
5	Save the diagram ( <b>Ctrl+S</b> ).

### 8.6.2 Control

#### Description

A Control is a stereotyped Object that models a controlling entity or manager. A Control organizes and schedules other activities and elements, typically in Analysis (including Robustness), Sequence and Communication diagrams. It is the controller of the Model-View-Controller pattern.

You can also create a Control as a stereotyped Class.

### Toolbox Icon

### Learn More:

- [Create a Control Element](#)<sup>[1293]</sup>
- [Analysis Stereotypes](#)<sup>[1189]</sup>
  - [Sequence Diagram](#)<sup>[85]</sup>
  - [Communication Diagram](#)<sup>[86]</sup>
  - [Object Diagram](#)<sup>[80]</sup>
  - [Analysis Diagram](#)<sup>[1190]</sup>

## 8.6.2.1 Create a Control Element

### How to:

To create a Control element on a diagram as an Object, follow the steps below

Step	Action
1	In the Toolbox, select the <b>More tools   Analysis</b> menu option
2	From the Analysis Elements page, drag the Control element onto the diagram

To create a Control element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class
2	Right-click on the element and select the <b>Properties</b> context menu option The Properties dialog displays
3	In the <b>Stereotype</b> field, type the value <b>control</b>
4	Click on the <b>Apply</b> and <b>OK</b> buttons
5	Save the diagram ( <b>Ctrl+S</b> )

## 8.6.3 Entity

### Description

An Entity is a stereotyped Object that models a store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.

You can also create an Entity as a stereotyped Class. See the Create an Entity topic.

### Toolbox Icon

### Learn More:

- [Create an Entity](#) <sup>[1294]</sup>
- [Analysis Stereotypes](#) <sup>[1189]</sup>
- [Sequence Diagram](#) <sup>[851]</sup>
- [Communication Diagram](#) <sup>[861]</sup>
- [Object Diagram](#) <sup>[801]</sup>
- [Analysis Diagram](#) <sup>[1190]</sup>

#### 8.6.3.1 Create an Entity

To create an Entity element on a diagram as an Object, follow the steps below

Step	Action
1	In the <b>Toolbox</b> , select the <b>More tools   Analysis</b> menu option.
2	From the <b>Analysis Elements</b> page, drag the <i>Entity</i> element onto the diagram.

To create an Entity element as a stereotyped Class, using the Class Properties dialog, follow the steps below

Step	Action
1	Insert a new Class.
2	Right-click on the element and select the <b>Properties</b> context menu option; the <b>Properties</b> dialog displays.
3	In the <b>Stereotype</b> field, type the value <b>entity</b> .
4	Click on the <b>Apply</b> and <b>OK</b> buttons.
5	Save the diagram ( <b>Ctrl+S</b> ).

## 8.6.4 Event

### Description:

Two elements are used to model *Events*; the:

- *Send Event* which models the generation of a stimulus in the system and the passing of that stimulus to other elements, either within the system or external to the system
- *Receive Event*, depicted as a rectangle with a recessed 'V' on the left side, which indicates that an event occurs in the system due to some external or internal stimulus; typically this invokes further activities and processing

Send and Receive Events can be added from the Analysis and Activity Element pages of the Toolbox.

If you should select the wrong type of event, or otherwise want to change the type, right-click on the Event and select the **Advanced | Make Sender** or **Advanced | Make Receiver** context menu option, as appropriate.

### Toolbox Icon:

## 8.6.5 Hyperlinks

### Description

You can place a *Hyperlink* element onto a diagram. This element is a type of text element, but one that can contain a pointer to a range of objects such as associated document files, web pages, Help, model features and even other Enterprise Architect model files. When you double-click on the element, Enterprise Architect executes the link. To add a Hyperlink element, drag the *Hyperlink* icon from the **Common** page of the **Toolbox** onto the diagram.

(Alternatively, click on the **Hyperlink** icon in the **UML Elements** toolbar and then click on the diagram.)

### Configure the Hyperlink:

When you add the Hyperlink to the diagram, the **Hyperlink Details** dialog displays. If you want to display the information in a more readable layout, you can resize the dialog.

You first select the type of object to link to; click on the drop-down arrow in the **Type** field and select a type. The **Hyperlink Details** dialog then displays the appropriate fields, prompts or dialog to enable you to specify the object to link to. For example, if you intend to hyperlink to:

- an attribute, the Set Attribute dialog displays to enable you to select that attribute
- a file, the **Action** field displays to enable you to specify whether to **Open** the file in read only mode, or **Edit** the file; in either case the file is opened within Enterprise Architect if possible, or, if not possible, with the Windows default viewer/editor for the file type. For example, if you hyperlink to a .rtf file, you can view it in whichever viewer is appropriate; however, you cannot *edit* .rtf files in Enterprise Architect, so the file always opens in the *Windows* default .rtf editor.
- a diagram, the **Select a Diagram** dialog displays, which enables you to select the diagram from anywhere in the project; you can filter the selection to diagrams of certain types.

In most cases you define the location of the hyperlinked object in the **Address** field, either by overtyping the field or by clicking on the ( ... ) (Browse) button. You can use full paths or local (path substitution) paths.

If you select **EA Command** as the link type, the **Address** field is replaced by a drop-down list of Enterprise Architect commands. You can select **LocalPath** and click on the ( ... ) (Browse) button to display the **Local Paths** dialog, which you complete as required. Subsequently, when you click on the hyperlink the **Local Paths** dialog immediately displays and you can apply, switch, expand or update the current path.

In the **Alias** field, type the text to display in the hyperlink. If you do not provide an alias, either the text defaults to the link itself, or (for certain link targets such as a matrix profile) the dialog generates a simple text instruction.

If you prefer to display only the hyperlink text, without the icon, select the **Hide Icon** checkbox.

#### Notes:

- If required, you can create a number of empty hyperlinks to complete later; if you then double-click on an empty hyperlink, the **Hyperlink Details** dialog displays and you can enter the details
- Once you have created the hyperlink, you can also edit the hyperlink text by clicking once on the field and once on the text, then right-clicking and selecting the **Edit Selected** context menu option
- You can add notes to the hyperlink, which display in the **Hyperlink Details** dialog when you right-click on the hyperlink and select the **Properties** context menu option; you can format these notes using the **Notes** toolbar

#### Learn More:

- [Hyperlinks to Files](#)<sup>[1296]</sup>
- [Hyperlinks to Scripts](#)<sup>[1297]</sup>
- [Add Action as a Hyperlink](#)<sup>[1297]</sup>
- [Hyperlinks between Diagrams](#)<sup>[1297]</sup>

### 8.6.5.1 Hyperlinks To Files

To create a hyperlink on a diagram to an external file, simply click on the file in a file list (such as Windows Explorer) or on your Desktop and drag it onto the diagram.

A short context menu displays with two options - **Hyperlink** and **Artifact**. Click on the **Hyperlink** option to create the hyperlink on the diagram.

The link is effective immediately, and you can right-click on it to add or change properties as necessary.

Files of most types - including .sql and .ddl - are opened within the appropriate Enterprise Architect code editor.

#### Learn More:

- [Hyperlinks](#)<sup>[1295]</sup>

### 8.6.5.2 Script Hyperlinks

You can create a hyperlink on a diagram to execute a script. Simply drag the required script from the [Execution Analyzer](#)<sup>[1400]</sup> window onto the diagram. A context menu displays, from which you select whether the script to be executed is a Build, Test, Run, Debug or Deploy script. The hyperlink is effective immediately; when you click on it, the script executes.

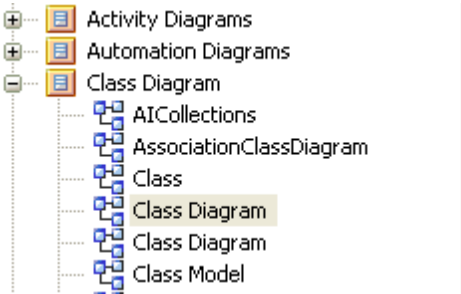

### 8.6.5.3 Add Action As Hyperlink

To create an Action element to represent a wide range of behaviors and actions, including a hyperlink, follow the steps below

Step	Action
1	Drag an Action element from the Activity page of the Toolbox onto the diagram A context menu immediately displays
2	Select the <b>Other</b> menu option The New Action dialog displays, with the <b>Other</b> radio button selected
3	Click on the drop down arrow on the field in the Select Kind panel, and click on the <b>Hyperlink</b> option
4	Click on the <b>OK</b> button The <i>Hyperlink Action</i> element displays on the diagram
5	Right click on the element and select the <b>Advanced   Set Hyperlink</b> menu option The Hyperlink Details dialog displays
6	<a href="#">Set the hyperlink's properties</a> <sup>[1295]</sup>

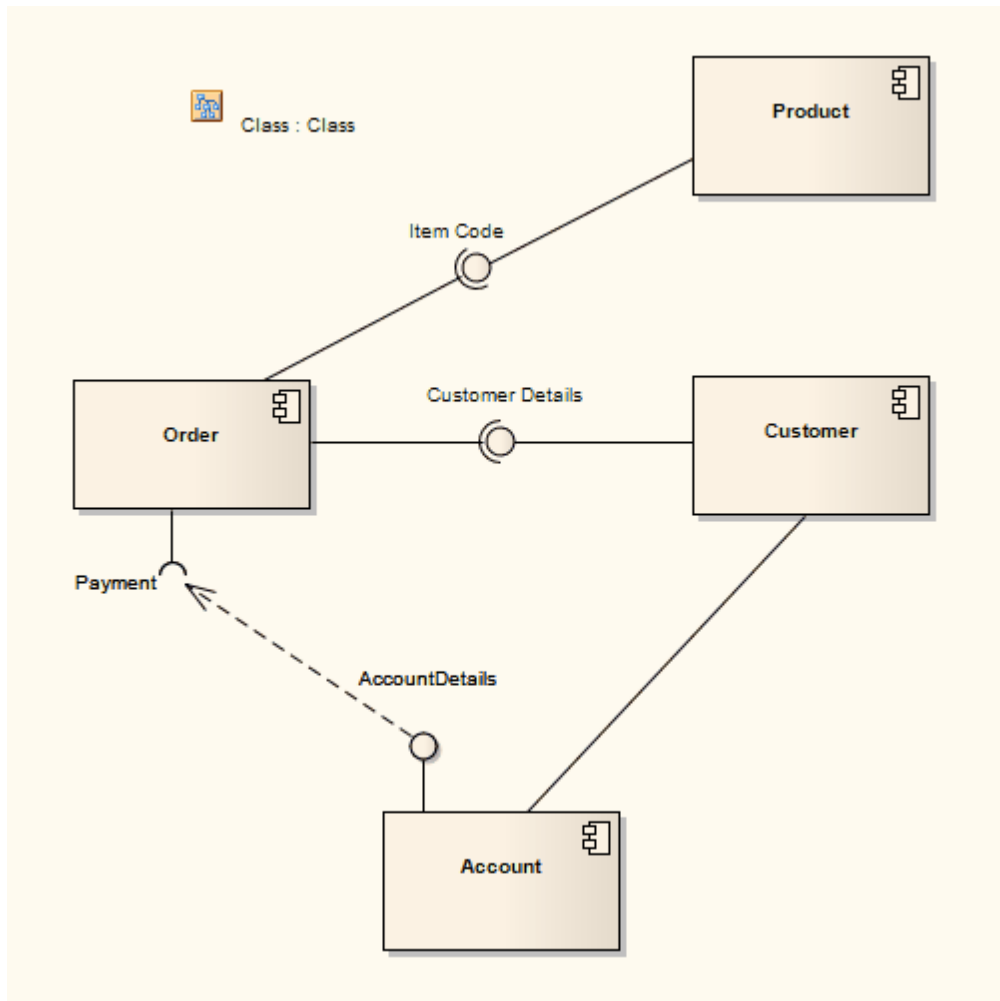

### 8.6.5.4 Hyperlinks Between Diagrams

To create a hyperlink between diagrams, follow the steps below

Step	Action
1	Open the diagram in which to display the hyperlink to another diagram From the Project Browser select the diagram you want to create a hyperlink to 
2	Drag the diagram on to the current diagram The Select Type dialog displays
3	Select the <b>Hyperlink</b> option and click on the <b>OK</b> button

Step	Action
	The final hyperlinked diagram should resemble the diagram below, where the Class diagram is the diagram to which the Product Order diagram hyperlinks (notice that the hyperlink icon is different)

### Example

### Notes:

- If the hyperlink appears as a Sub Activity, select the **Tools | Options | Diagram | Behavior** menu option and deselect the **Use Automatic SubActivities** checkbox

### 8.6.6 Image

**Description:**

An Image is a System Boundary element that automatically displays first the Boundary Properties dialog and then the Select Alternate Image dialog to change its representation to an imported image. You can use it as an icon for an element or group of elements, or as a diagram background.

Image elements are available from the Common page of the Toolbox.

**Toolbox Icon:****Learn More:**

- [System Boundary](#)<sup>933</sup>

### 8.6.7 N-Ary Association

**Description**

An *n*-Ary Association element is used to model complex relationships between three or more elements, typically in a Class diagram. It is not a commonly-employed device, but can be used to good effect where there is a dependant relationship between several elements. It is generally used with the Association connector, but the relationships can include other types of connector.

In the example above there is a relationship between a *Company*, an *Employee* and a *Salary*.

**Toolbox Icon**

**Learn More:**

- [Class Diagram](#) <sup>[800]</sup>
- [Association](#) <sup>[972]</sup>

### 8.6.8 Process

**Description:**

A Process is an Activity element with the stereotype **process**, which expresses the concept of a business process. Typically this involves inputs, outputs, work flows, goals and connections with other Processes. The Process element is typically used in Analysis diagrams.

Business processes typically range across many parts of the organization and span one or more systems.

**Toolbox Icon:****Learn More:**

- [Analysis diagram](#) <sup>[1190]</sup>

### 8.6.9 Packaging Component

**Description**

A *Packaging Component* is an element that appears very similar to a Component in a diagram but behaves as a Package in the **Project Browser** (that is, it can be version controlled and can contain other Packages and elements). It is typically used in Component diagrams.

In the **Project Browser**, the three elements display as shown below:

The Component element cannot contain child Packages or Packaging Components.

### Toolbox Icon

### Learn More:

- [Component diagrams](#) <sup>[809]</sup>
- [Component](#) <sup>[950]</sup>
- [Package](#) <sup>[962]</sup>

## 8.6.10 Risk

### Description

A Risk is defined as the effect of uncertainty on objectives. In Project Management, it is necessary to try to identify risks and assess:

- the likelihood that they have a negative effect on a project and
- how large that effect is likely to be.

Those risks with a high probability of occurrence and/or a large impact on the project can be mitigated.

A Risk Management process might consist of the following five steps:

1. Identify risks and represent each with a Risk element.
2. Identify which elements (e.g. Components, Use Cases, Features) are vulnerable to each risk. You might decide to create «trace» dependencies from these elements to the Risk elements.
3. Assess the likelihood and magnitude of the risks.
4. Identify ways to mitigate the risks.
5. Prioritize the risk reduction measures based on their likelihood, magnitude and ease of mitigation.

Risk *elements* are not the same as the risks that you assign *to* an element through the Project Management

window. Such risks are internal to the selected element, whilst a Risk element can be associated with a number of elements, either in a logical group or totally separate.

Risk elements are available from the Requirements page of the Toolbox.

**Notes:**

- Risk elements can be displayed with or without an identifying **R** in the top right corner of the element; to toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page.

**Toolbox Icon**

### 8.6.11 Task

**Description:**

A Task element represents a task that must be performed in relation to an element. The Task element enables you to assign resources to the task itself, rather than just to the parent element.

You can create a hierarchy or tree structure of Task elements to break a large task into separate parts and assign different resources to each part.

**Toolbox Icon:**

**Learn More:**

- [Resource Management](#)<sup>[350]</sup>
- [Relationship Matrix](#)<sup>[1734]</sup>

### 8.6.12 Test Case

**Description:**

A *Test Case* is a stereotyped Use Case element. You might use it to extend the facilities of the Testing window, by applying element properties and capabilities to the tests of a feature represented by another element or - more appropriately - set of elements. That is, you can define in one go - in the Testing window for the Test Case element - the details of the tests that apply to each of several elements, instead of recording the details separately in each element.

Within the Test Case element properties you can define test requirements and constraints, and associate the test with test files. You can also link the element to Document Artifacts or (in the Corporate, Business and Software Engineering, System Engineering and Ultimate editions) directly to linked documents, such as a Test Plan.

The Test Case element enables you to give greater visibility to tests, in the Project Browser, Diagram List, Package Browser, Model Search, Relationship Matrix, Traceability window and reports.

The Test Case element is available through the Use Case and Maintenance pages of the Toolbox.

#### Toolbox Icon:

#### Learn More:

- [The Testing Workspace](#)<sup>[1707]</sup>

### 8.6.13 Test Cut

#### Description:

A Test Cut element is a stereotyped Object element.

A task, such as 'Print', might involve operations on different Classes. In order to create a 'Print' test, you would want to include only the 'Print' operations of these Classes and exclude any other operations.

A Test Cut enables you to capture only the operations that represent the behavior (in this case, 'Print') defined for a single Class. You might then place the Test Cut from each of several Classes into a single task as a Test Set.

When you drag a Test Cut element onto a Test Domain diagram, you create a Dependency relationship with the required Class element. As a result, when you select the *Test Cut* element on the Testpoints Window, the operations of the *Class* are listed in the window, each with a checkbox. You then select the checkbox against each Class operation to include in the Test Cut.

#### Toolbox Icon:

**Learn More:**

- [Test Set](#)<sup>[1304]</sup>
- [The Testpoints Window](#)<sup>[1686]</sup>
- [Combine Testpoints](#)<sup>[1691]</sup>

### 8.6.14 Test Set

**Description:**

A *Test Set* element is a stereotyped Use Case element used to aggregate one or more groups of methods (Test Cuts), which perhaps span multiple Classes, into a single task. Test Sets can also be aggregated into Test Suites.

You link the Test Cut elements to the Test Set using Dependency connectors.

**Toolbox Icon:****Learn More:**

- [Test Cut](#)<sup>[1303]</sup>
- [Test Suite](#)<sup>[1304]</sup>
- [Combine Testpoints](#)<sup>[1691]</sup>

### 8.6.15 Test Suite

**Description:**

A *Test Suite* element is a stereotyped Use Case element, used to aggregate one or more groups of tasks (Test Sets).

You link the Test Set elements to the Test Suite using Dependency connectors.

**Toolbox Icon:**

**Learn More:**

- [Test Set](#)<sup>[1304]</sup>

## 9 Model Transformation

Model Driven Architecture (MDA) Transformations provide a fully configurable way of converting model elements and model fragments from one domain to another. This typically involves converting Platform-Independent Model (PIM) elements to Platform-Specific Model (PSM) elements. A single element from the PIM can be responsible for creating multiple PSM elements across multiple domains.

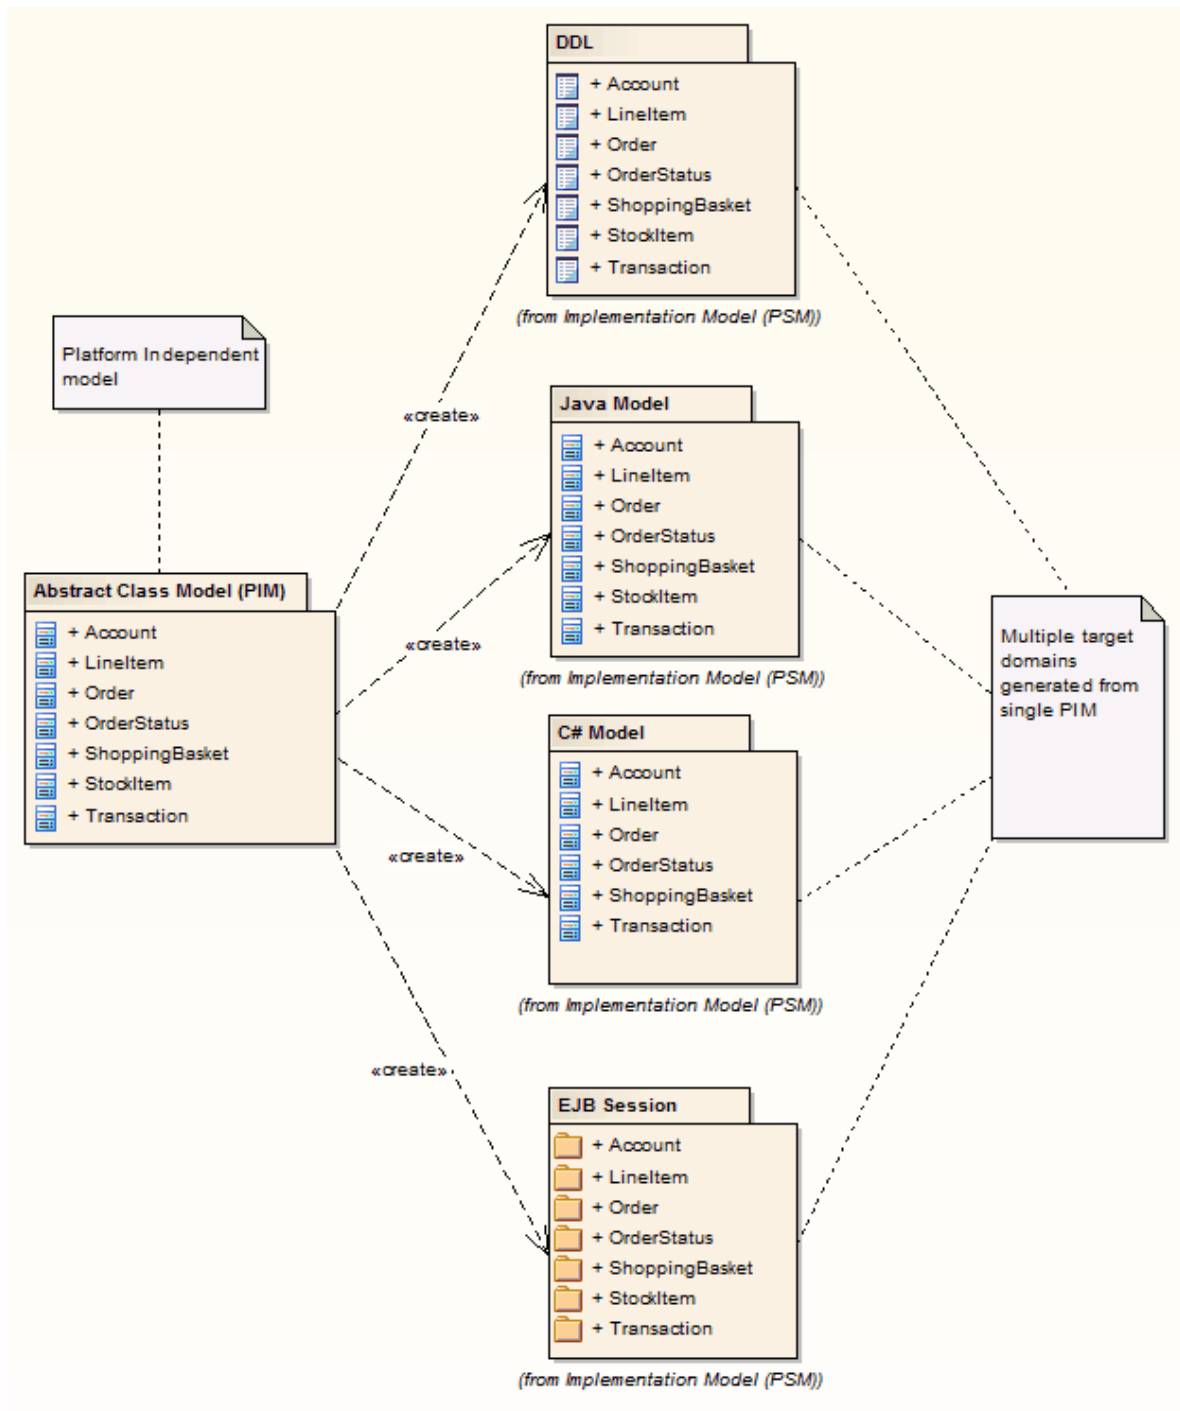

### Topics:

Topic	Detail	See also
<b>Overview</b>	<p>Transformations are a huge productivity boost, and reduce the necessity of manually implementing stock Classes and elements for a particular implementation domain; for example, database tables generated from persistent PIM Classes</p> <p>Enterprise Architect includes a number of basic built-in Transformations (see <i>Included Transformations</i>, below); Sparx Systems intend to make further Transformations available over time, either as built in Transformations or as downloadable modules from the Sparx Systems website</p> <p>For a further productivity boost, Enterprise Architect can automatically generate code for your transformed Classes that target code languages; see the <b>Generate Code on result</b> option on the Model Transformation dialog</p> <p>A Transformation is defined using Enterprise Architect's simple code generation template language, and involves no more than writing a template to create a simple intermediary source file; Enterprise Architect reads the source file and binds that to the new PSM</p>	<a href="#">Transform Elements</a> <sup>[131]</sup>
<b>Transformation Dependencies</b>	<p>Enterprise Architect also creates internal bindings (Transformation Dependencies) between each PSM created and the original PIM</p> <p>This is essential, as it enables you to forward synchronize from the PIM to the PSM many times, adding or deleting features as you go; for example, adding a new attribute to a PIM Class can be forward synchronized to a new column in the Data Model</p> <p>You can observe the Transformation Dependencies for a package using the Traceability window; this enables you to check the impact of changes to a PIM element on the corresponding elements in each generated PSM, or to verify where a change required in a PSM should be initiated in the PIM (and also to reflect back in other PSMs)</p>	<a href="#">Traceability</a> <sup>[495]</sup>

Topic	Detail	See also
	<p>The Transformation Dependencies are a valuable tool in managing the traceability of your models</p> <p>Enterprise Architect does not delete or overwrite any element features that were not originally generated by the transform; therefore, you can add new methods to your elements, and Enterprise Architect does not act on them during the forward generation process</p>	
<p><b>Included Transformations</b></p>	<p>Transformations that are currently built-in include:</p> <ul style="list-style-type: none"> <li>• <b>C#</b> - Converts a PIM to a standard C# implementation set</li> <li>• <b>Data Model to ERD</b> - Transforms a Data Model to an Entity Relationship Diagram (ERD)</li> <li>• <b>DDL</b> - Transforms platform-independent Class elements to platform-specific table elements</li> <li>• <b>EJB Entity</b> - Transforms platform-independent Class elements to packages containing the Class and Interface elements that comprise an EJB Entity Bean</li> <li>• <b>EJB Session</b> - Transforms platform-independent Class elements to packages containing the Class and Interface elements that comprise an EJB Session Bean</li> <li>• <b>ERD to Data Model</b> - Transforms an Entity Relationship Diagram into a Data Model</li> <li>• <b>Java</b> - Transforms platform-independent elements to Java language elements</li> <li>• <b>JUnit</b> - Converts a Java model to a model where test methods are created for each public method of any original Class</li> <li>• <b>JUnit</b> - Converts a .Net language specific model to a model where test methods are created for each public method of any original Class</li> <li>• <b>WSDL</b> - Converts a simple representation of a WSDL interface into the elements required to generate that interface</li> <li>• <b>XSD</b> - Transforms platform-independent elements to XSD elements</li> </ul>	

**Example:**

The following diagram highlights how Transformations work and how they can significantly boost your productivity:

**Notes:**

- If you are using the Corporate, Business and Software Engineering, System Engineering or Ultimate edition, if security is enabled you must have **Transform Package** access permission to perform an MDA Transform on a package

**Learn More:**

- [Permission List](#)<sup>206</sup>

- [Transform Elements](#) [1311]
- [Import Transformations](#) [1337]
- [Transformation Templates](#) [1338]
- [Built-in Transformations](#) [1315]
- [Write Transformations](#) [1338]
- [Chaining Transformations](#) [1312]

## 9.1 Transform Elements

There are two modes for initiating a Model Transformation, each of which can be started in two ways.

**Access:**

To transform selected elements on a diagram: **Tools | Model Transformation (MDA) | Transform Selected Elements**

**Class context menu | Transform (Ctrl + H)**

To transform elements in the package currently selected in the Project Browser:

**Package** **Tools | Model Transformation (MDA) | Transform Current**

**Current Package** **Project Browser package context menu | Transform**

**Use To:**

- Transform elements
- Transform packages

**Reference:**

Field	Usage	See also
<b>Elements</b>	Indicates the individual elements to be included in the transformation	
<b>All</b>	Indicates all of the elements from the list to be included in the transformation	
<b>None</b>	Deselects all of the elements from the list	
<b>Include child packages</b>	Specifies inclusion of elements in child packages of the selected package	
<b>Transformations</b>	Indicates which transformations to perform and the package each of them should be transformed to (use the ( ... ) button to select the package in which the transformed elements are being created)	
<b>Generate Code on result</b>	Specify whether or not to automatically generate code for transformed Classes that target code languages  Automatically generating code helps boost productivity in development  With this option selected, the first time you transform to the selected Class Enterprise Architect enables you to select a filename to generate to; subsequent transformations automatically generate any Class with a filename set	
<b>Perform Transformations on result</b>	Specify if transformations previously done on target Classes should be automatically executed	<a href="#">Chaining Transformations</a> <sup>[1312]</sup>
<b>Intermediary File</b>	Specify the filename of the intermediary file (if any)	

Field	Usage	See also
<b>Write Always</b>	Write the intermediary file to disk	
<b>Write Now</b>	Generate the intermediary file but do not perform the transform	
<b>Do Transform</b>	Execute the transform command	

**Notes:**

- When the dialog displays, all elements are selected and all transformations previously performed from any of these Classes are checked

**9.1.1 Chaining Transformations**

Chaining transformations provide an extra degree of flexibility and power to transformations.

**Topics:**

Topic	Detail	See also
<b>Example</b>	Two transformations have a common element; you might separate this element out into its own transformation, and then perform the original transformations from the common point  The separated transform could even produce a useful model itself	
<b>Setting</b>	Enterprise Architect provides for chaining transformations, by enabling you to set transformations that have already been performed on target Classes to be performed automatically next time that Class is transformed to  To do this, select the <b>Perform Transformations on result</b> checkbox in the Model Transformation dialog	

## 9.2 Built-in Transformations

Enterprise Architect provides a number of built-in transformations. These transformations are intended to be useful to as many users as possible, acting as a good base to modify to include the specifics of your custom domain, and to be good examples of how to write transformations.

The following transformations are included in Enterprise Architect:

Transformations	Detail	See also
<b>C#</b>	Converts Platform-Independent Model (PIM) elements to language-specific C# Class elements	<a href="#">C# Transformation</a> [1313]
<b>Data Definition Language</b>	Creates a data model from the logical model, generating a model targeted at the default database type that is ready for DDL generation	<a href="#">DDL Transformation</a> [1316]
<b>Entity Relationship Diagram to Data Model</b>	Creates a data model from the ERD logical model, generating a model targeted at the default database type ready for DDL generation	<a href="#">ERD To Data Model Transformation</a> [1323]
<b>Data Model to Entity Relationship Diagram</b>	A reverse of the ERD to Data Model transformation	<a href="#">Data Model To ERD Transformation</a> [1318]
<b>EJB Session Bean</b>	Generates a single Class elements to EJB session	<a href="#">EJB Transformations</a> [1320]
<b>EJB Entity Bean</b>	Generates a single Class elements to EJB entity	<a href="#">EJB Transformations</a> [1320]
<b>Java</b>	Converts Platform-Independent Model (PIM) elements to language-specific Java Class elements	<a href="#">Java Transformation</a> [1325]
<b>JUnit</b>	Creates a Class with test methods for all public methods of an existing Java Class	<a href="#">JUnit Transformation</a> [1327]
<b>NUnit</b>	Creates a Class with test methods for all public methods of an existing .Net compatible Class	<a href="#">NUnit Transformation</a> [1329]
<b>WSDL</b>	Creates an expanded model of a WSDL interface from a simple model, which is suitable for generation	<a href="#">WSDL Transformation</a> [1331]
<b>XSD</b>	Converts Platform-Independent Model (PIM) elements to UML Profile for XML elements as an intermediary step to creating an XML Schema	<a href="#">XSD Transformation</a> [1332]

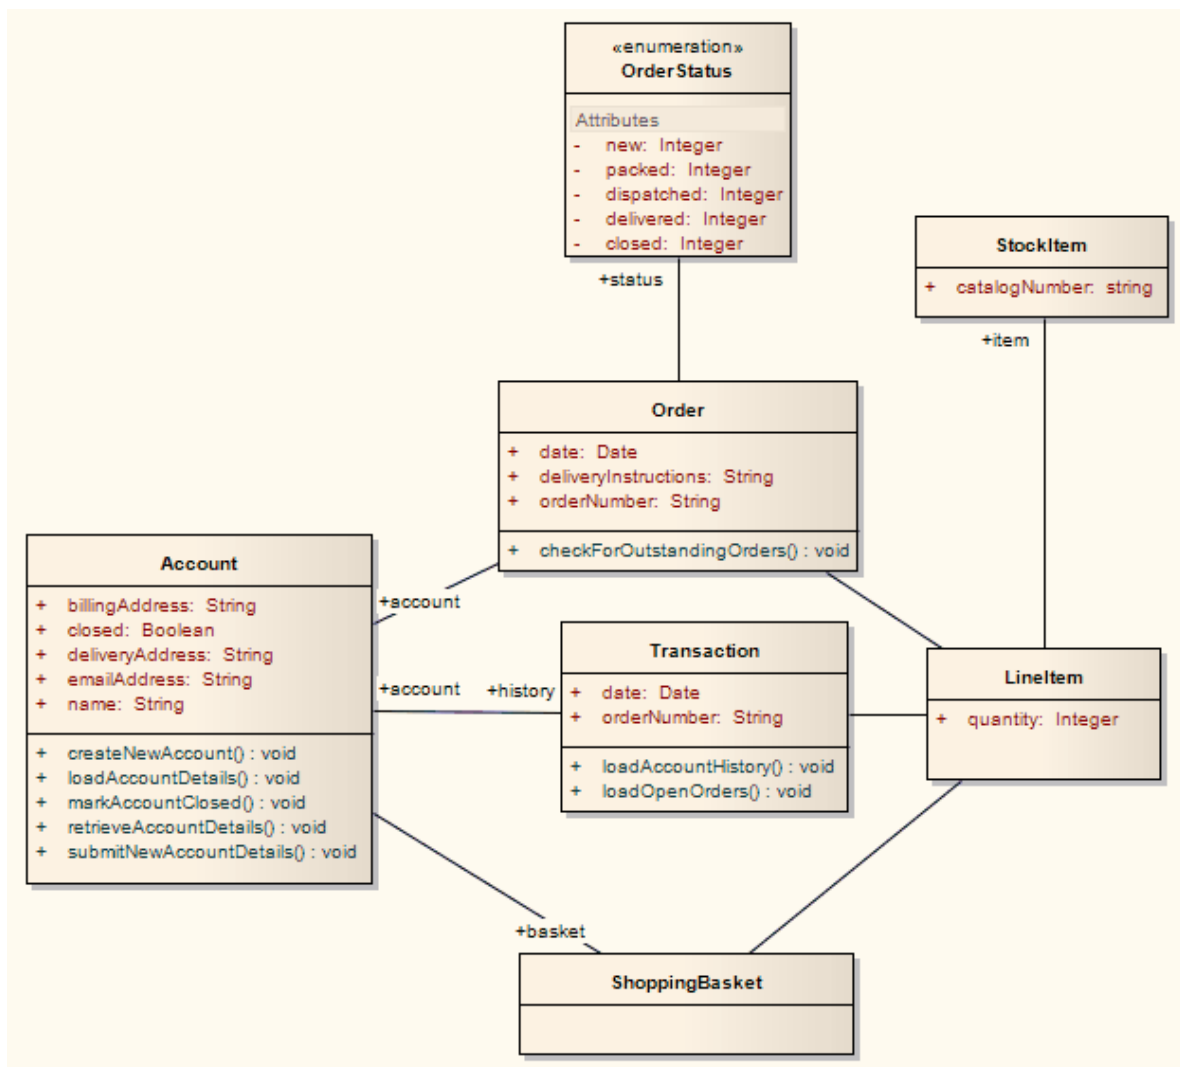

### 9.2.1 C# Transformation

The **C# transformation** converts Platform-Independent Model (PIM) elements to language-specific C# Class elements.

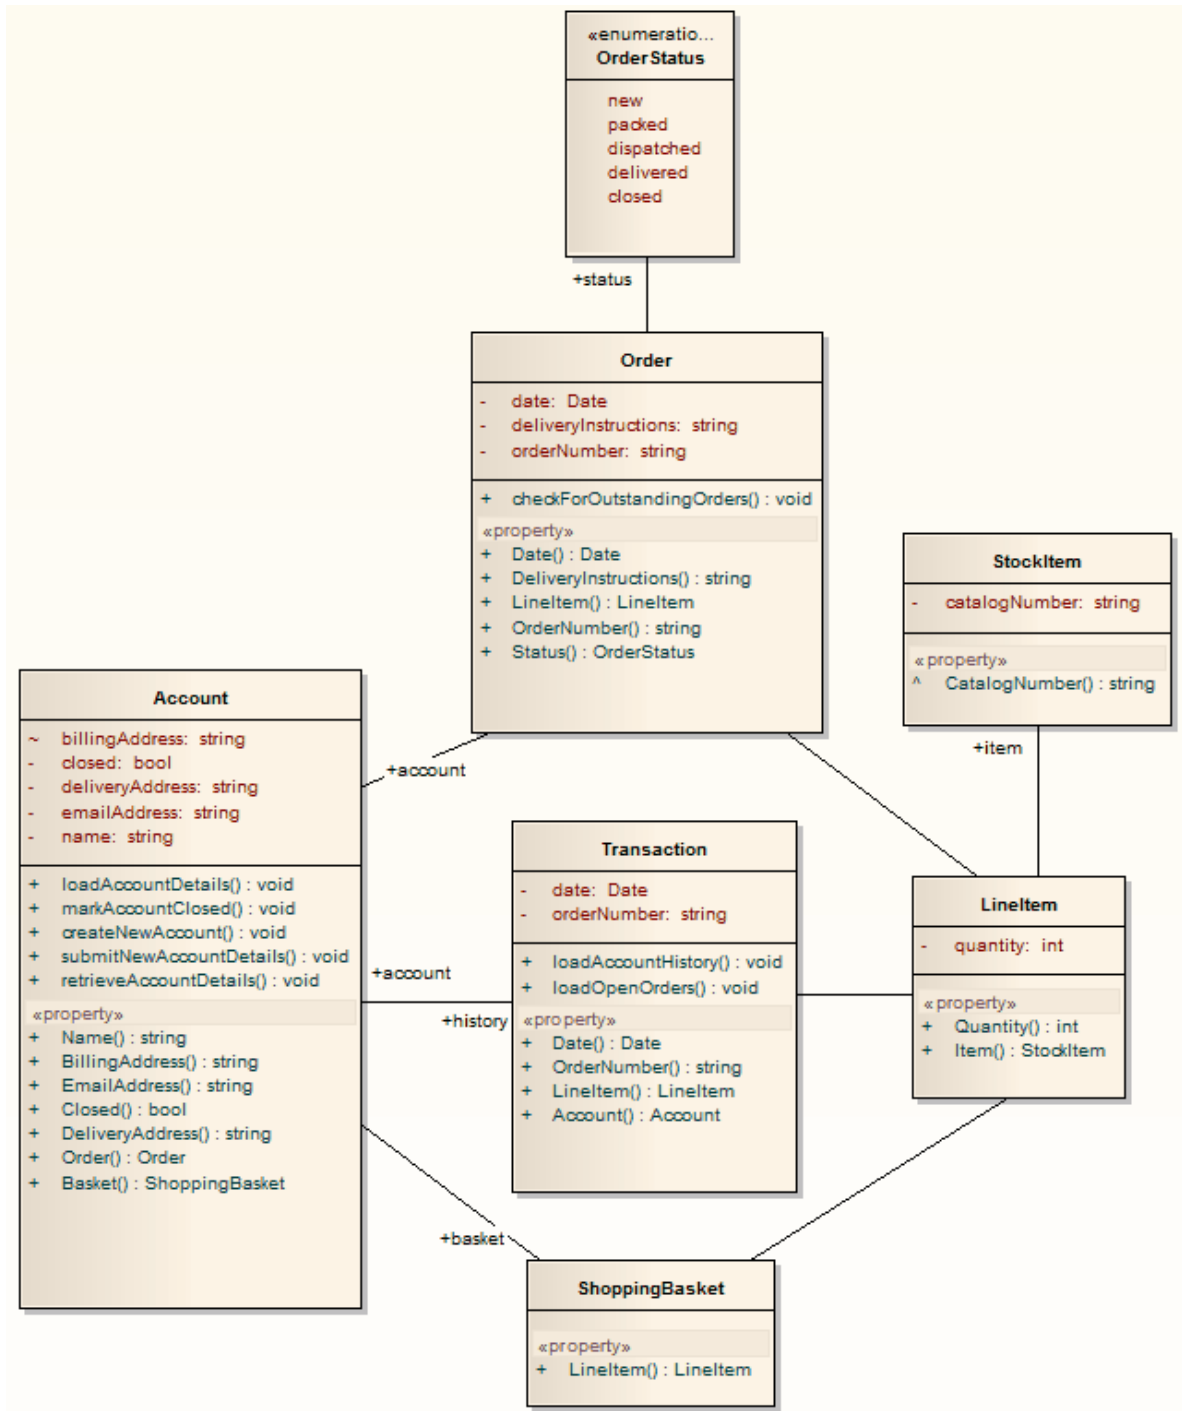

The transformation converts PIM model types to C# types and creates encapsulation according to Enterprise Architect's options for creating properties from C# attributes, which you set on the C# Specifications page of the Options dialog.

Example:

The Platform-Independent Model (PIM):

After transformation, becomes the PSM:

**Learn More:**

- [C# Options Page](#) 1541

## 9.2.2 Data Model To ERD Transformation

The **Data Model to ERD transformation** is a reverse engineering of the **ERD to Data Model transformation**.

The transformation uses and demonstrates support in the intermediary language for the following database-specific concepts:

### Reference:

Concept	Definition	See also
Entity	Mapped one-to-one onto table elements.	
Attribute	Mapped one-to-one onto columns.	
Primary Key	Comes from the PrimaryKey type of column.	

### Notes:

- Sometimes you might want to limit the stretch of the diamond-shape Relationship connectors. Simply pick a Relationship connector, right-click to display the context menu, and select the **Bend Line at Cursor** option

### Learn More:

- [ERD to Data Model Transformation](#)<sup>[1323]</sup>

## 9.2.3 DDL Transformation

The purpose of the **DDL transformation** is to create a data model from the logical model, generating a model targeted at the default database type that is ready for DDL generation. The data model can then be used to automatically generate DDL statements to run in one of the Enterprise Architect supported database products.

The **DDL Transformation** uses and demonstrates support in the **intermediary language** for the following database-specific concepts:

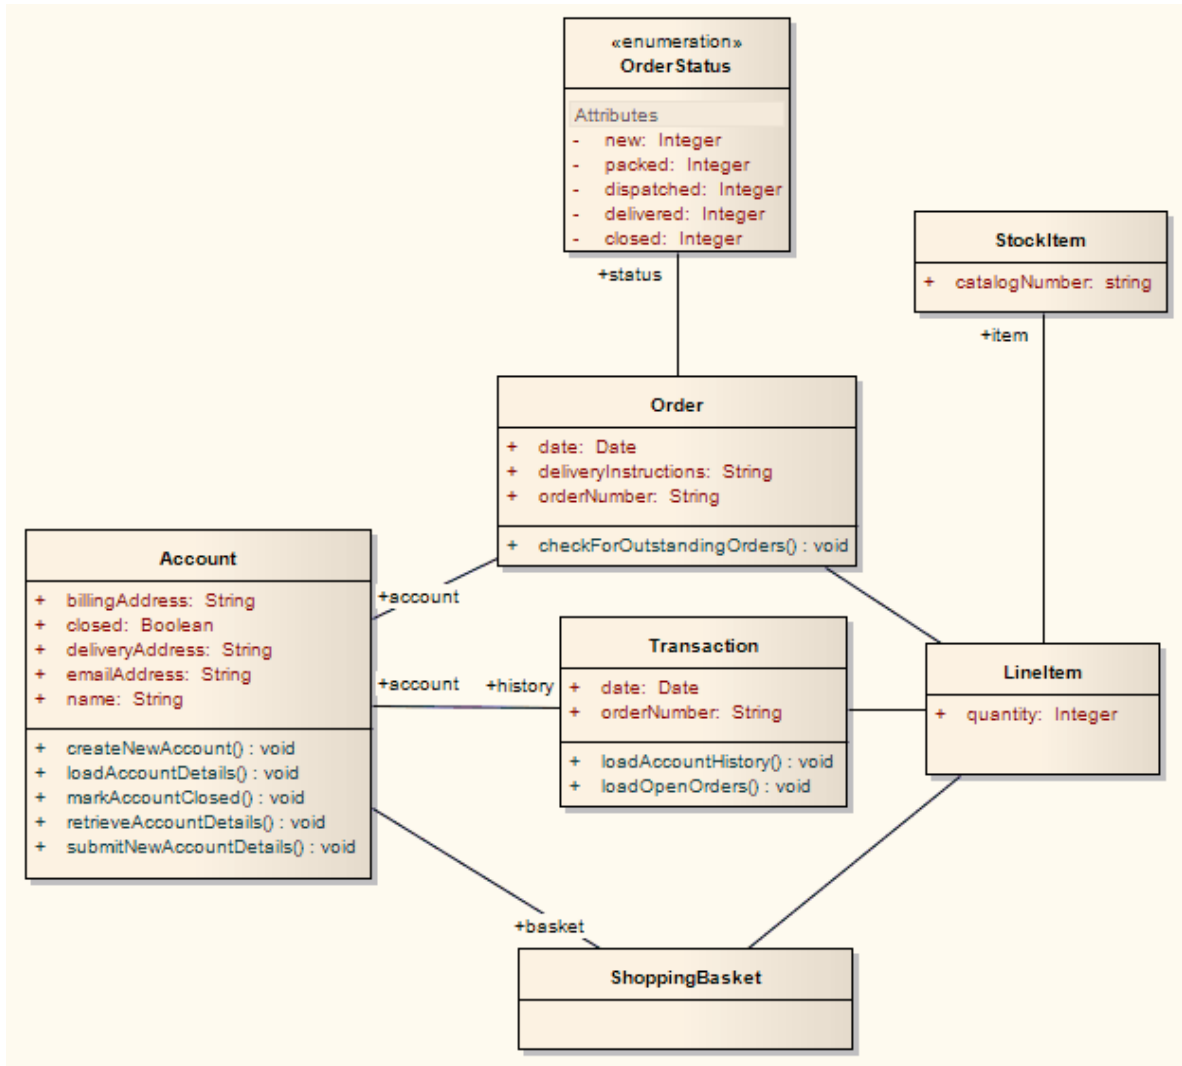

### Reference:

Concept	Definition	See also
Table	Mapped one-to-one onto Class elements.	
Column	Mapped one-to-one onto attributes.	
Primary Key	Lists all the columns involved; this ensures that they exist in the Class and creates a primary key method for them.	
Foreign Key	This is a special sort of connector. The <i>Source</i> and <i>Target</i> sections list all of the columns involved; this ensures that they exist and that a matching primary key exists in the destination Class, and that the transformation creates the appropriate foreign key.	

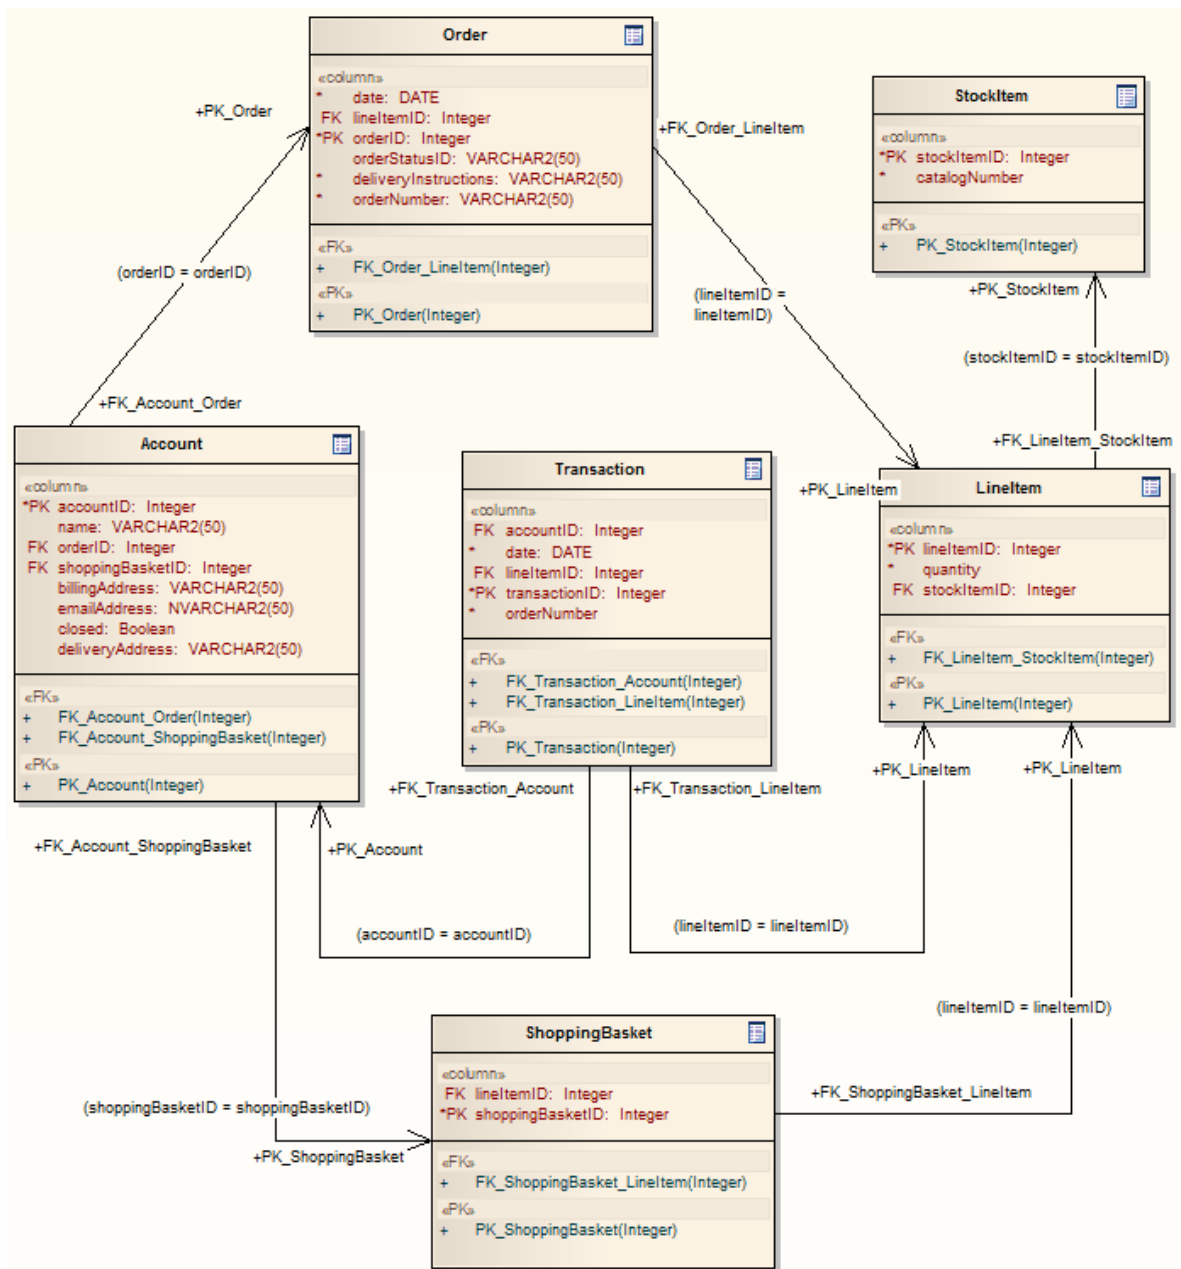

**Example:**

The following two diagrams show a typical PIM to Data Model Transformation.

**The Platform-Independent Model (PIM):**

After transformation becomes the PSM:

Generalizations are handled by providing the child element with a foreign key to the parent element, as in the following diagram. Copy-down inheritance is not supported.

**Learn More:**

- [Intermediary Language](#) I1339

## 9.2.4 EJB Transformations

The purpose of the **EJB Session Bean transformation** and the **EJB Entity Bean transformation** is to reduce the work required in generating the internals of Enterprise Java Beans, thus enabling you to concentrate on modeling at a higher level of abstraction.

### Topics:

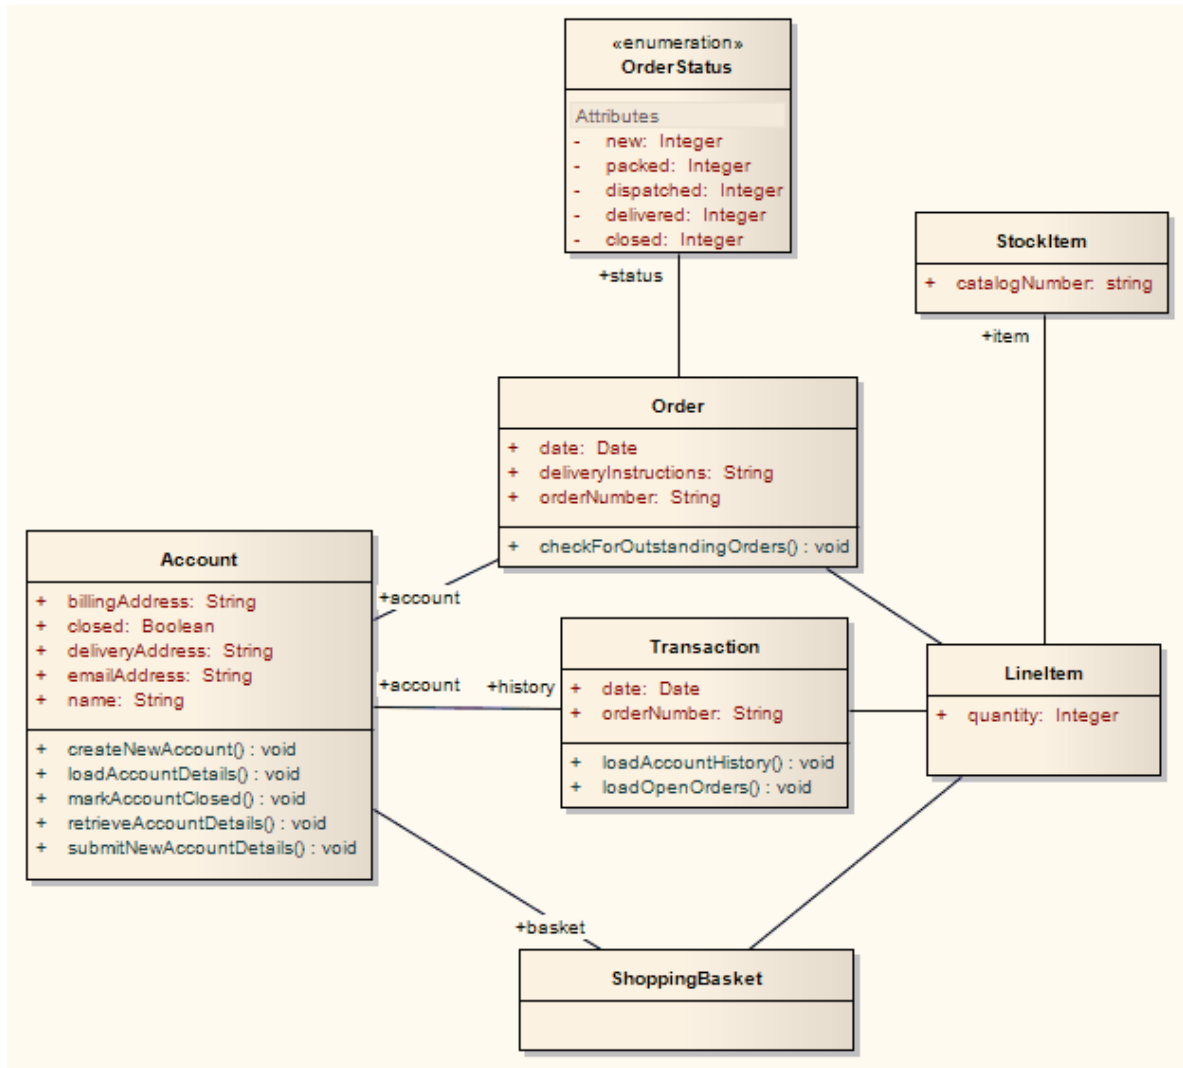

Topic	Detail	See also
<b>EJB Session Bean transformation</b>	The <b>EJB Session Bean transformation</b> generates the following from a single Class element containing the attributes, operations and references required for code generation by the <code>javax.ejb.*</code> package: <ul style="list-style-type: none"><li>• An implementation Class element</li><li>• A home interface element</li><li>• A remote interface element</li></ul>	
<b>EJB Entity Bean transformation</b>	The <b>EJB Entity Bean transformation</b> generates the following from a single Class element containing the attributes, operations and references required for code generation by the <code>javax.ejb.*</code> package: <ul style="list-style-type: none"><li>• An implementation Class element</li><li>• A home interface element</li><li>• A remote interface element</li><li>• A primary key element</li></ul>	

Both transformations also generate a META-INF package containing a deployment descriptor element.

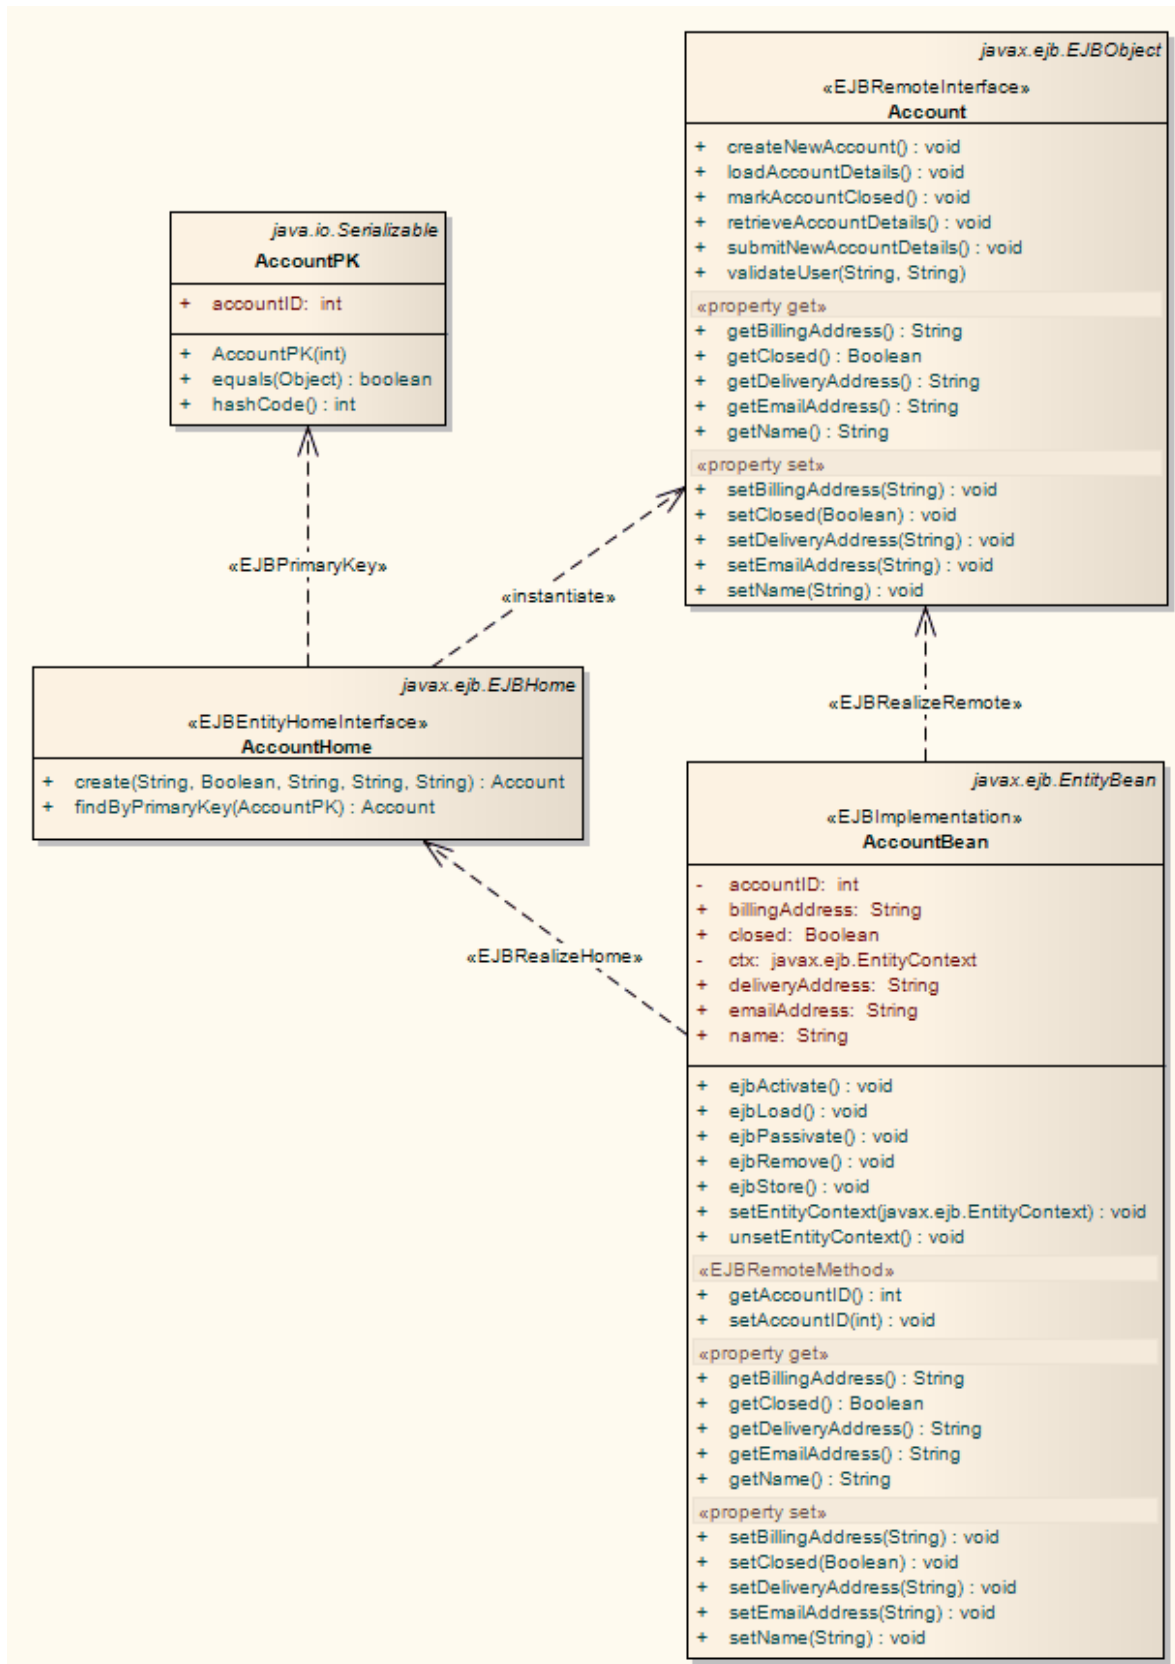

### Example:

The Platform-Independent Model (PIM):

After transformation generates a set of Entity Beans, where each one takes the following form (for the Account Class):

## 9.2.5 ERD To Data Model Transformation

The purpose of the **Entity Relationship Diagram (ERD) to Data Model transformation** is to create a data model from the ERD logical model, generating a model targeted at the default database type ready for DDL generation. Before doing the transformation, make sure you have defined the common data type for each attribute and selected a database type as the default database. The data modeling diagram can then be automatically generated. This data model can be used for generating DDL statements to run in one of the Enterprise Architect supported database products.

The transformation uses and demonstrates support in the intermediary language for the following database-specific concepts:

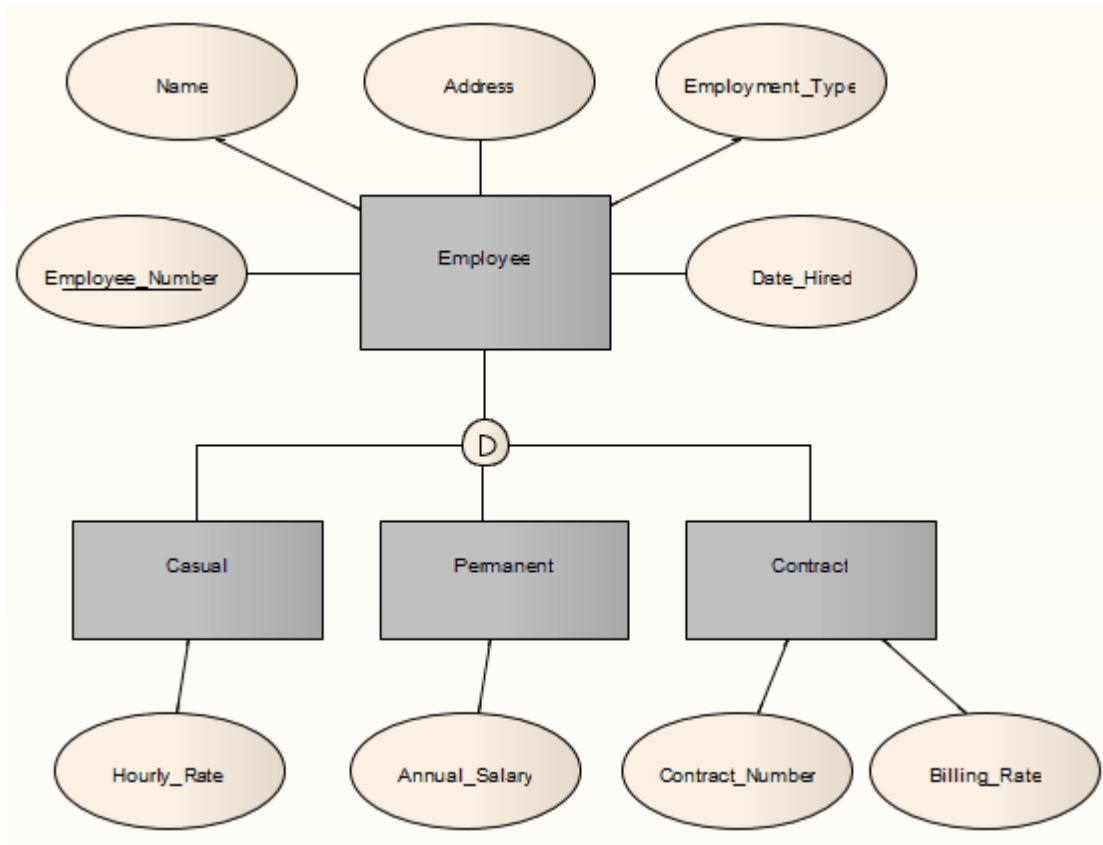

### Reference:

Concept	Definition	See also
<b>Table</b>	Mapped one-to-one onto Class elements.	
<b>Column</b>	Mapped one-to-one onto attributes.	
<b>Primary Key</b>	Lists all the columns involved; this ensures that they exist in the Class and creates a primary key method for them.	
<b>Foreign Key</b>	This is a special sort of connector. The <i>Source</i> and <i>Target</i> sections list all of the columns involved; this ensures that they exist and that a matching primary key exists in the destination Class, and that the transformation creates the appropriate foreign key.	

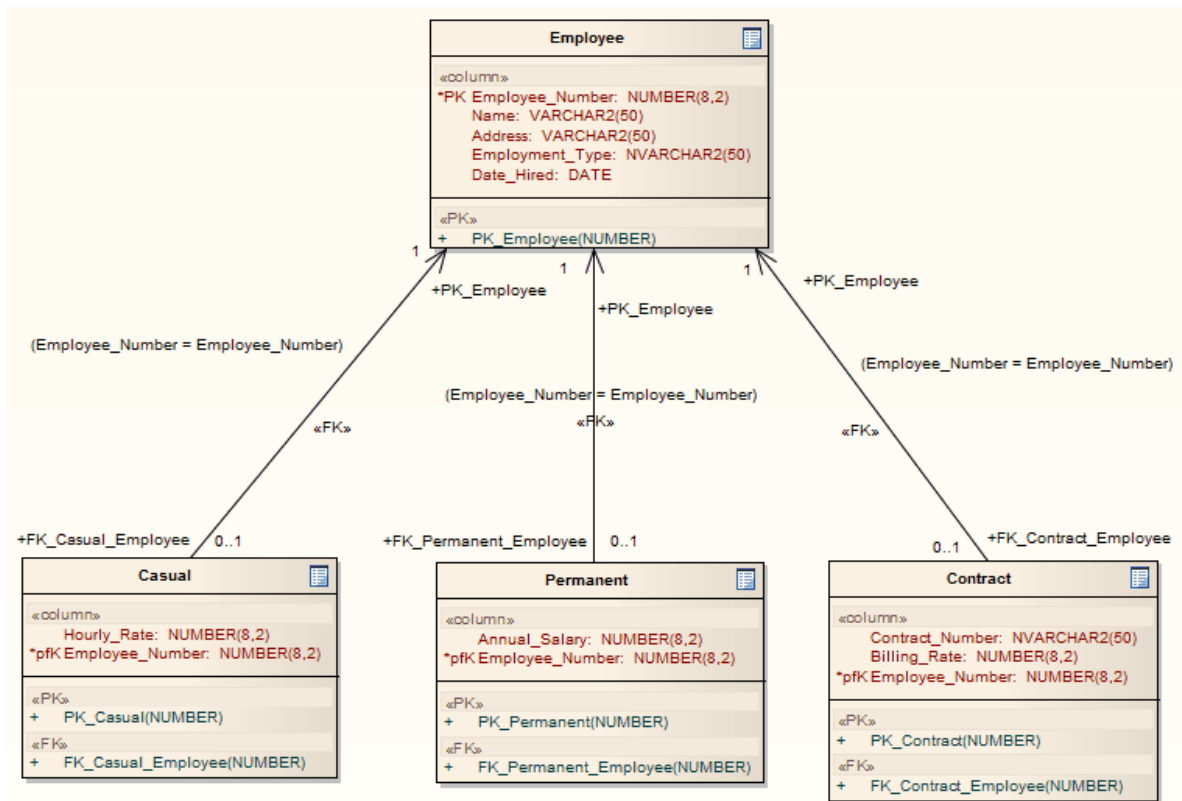

### Generalization

Generalization can be handled in ERD technology, as illustrated by the following example. Note that the copy-down inheritance is currently supported with two levels only.

### Example:

This transforms to:

**Notes:**

- Sometimes you might go back to the ERD, make some changes and then want to do another transformation. To achieve better results, always delete the previous transformation package before doing the next transformation

**9.2.6 Java Transformation**

The purpose of the **Java transformation** is to convert Platform-Independent Model (PIM) elements to language-specific Java Class elements. The transformation converts the PIM model types to Java types and creates encapsulation according to Enterprise Architect's options for creating properties from Java attributes; that is, producing the getters and setters according to the rules you have defined. Notice that the *public* attributes in the PIM are converted to *private* attributes in the PSM.

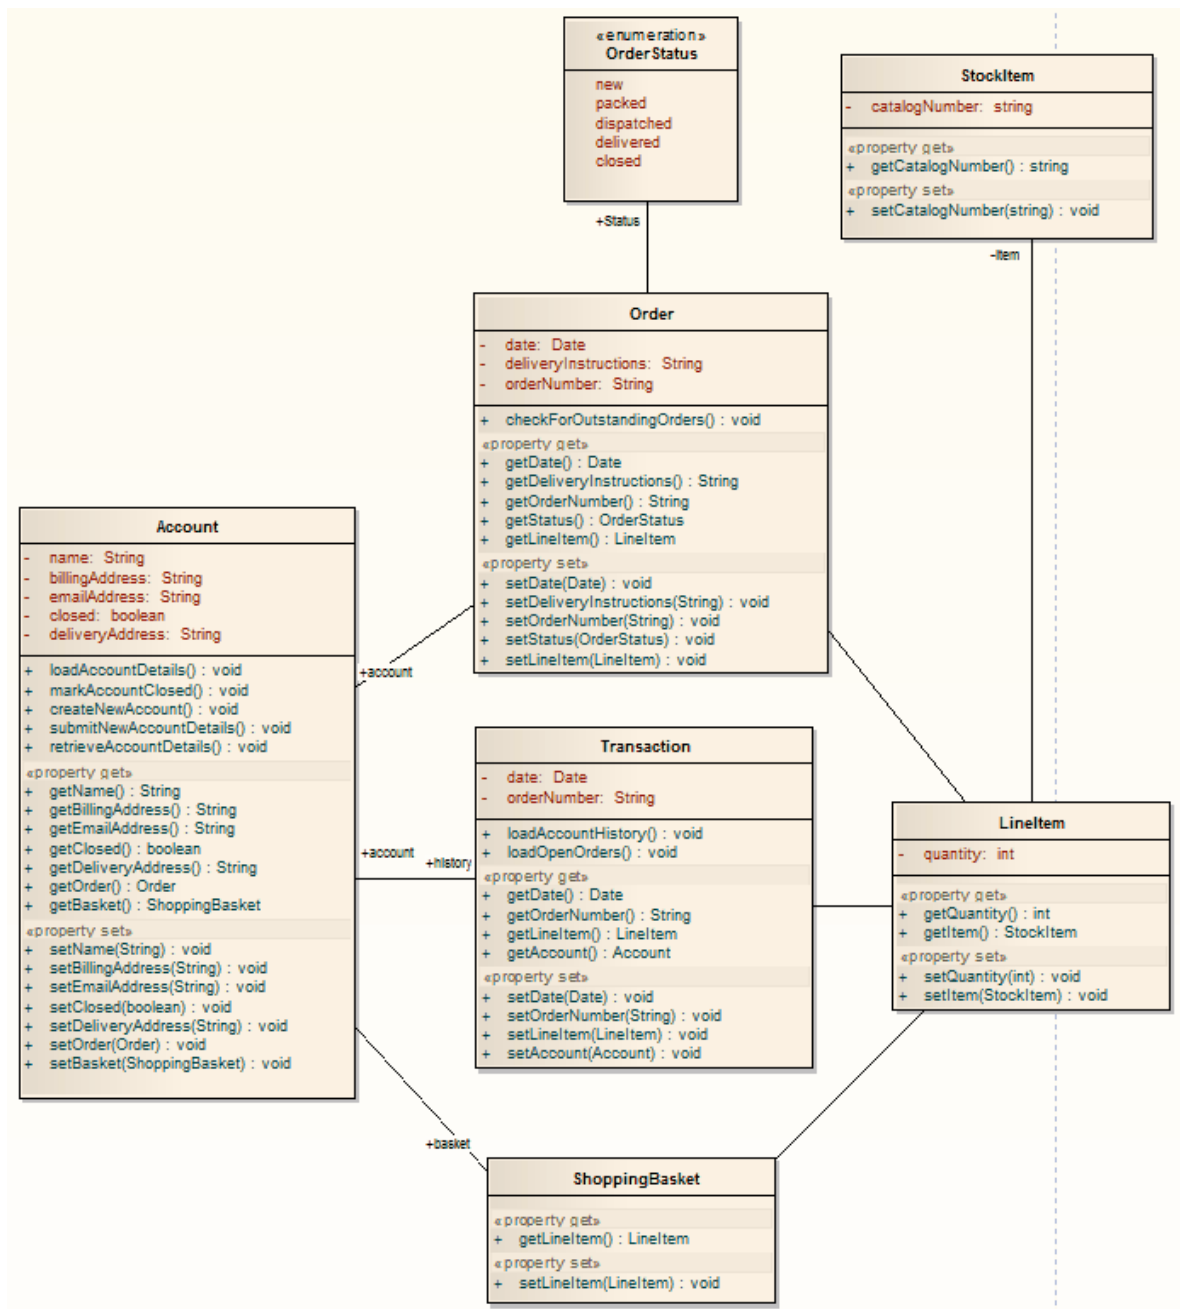

You set the code generation options for Java code generation on the **Java Specifications** page of the **Options** dialog.

**Example:**

## The Platform-Independent Model (PIM):

After transformation becomes the PSM:

**Learn More:**

- [Java Options](#) 

## 9.2.7 JUnit Transformation

The purpose of the **JUnit transformation** is to create a Class with test methods for all public methods of an existing Java Class. The resulting Class can then be generated and the tests filled out and run by JUnit.

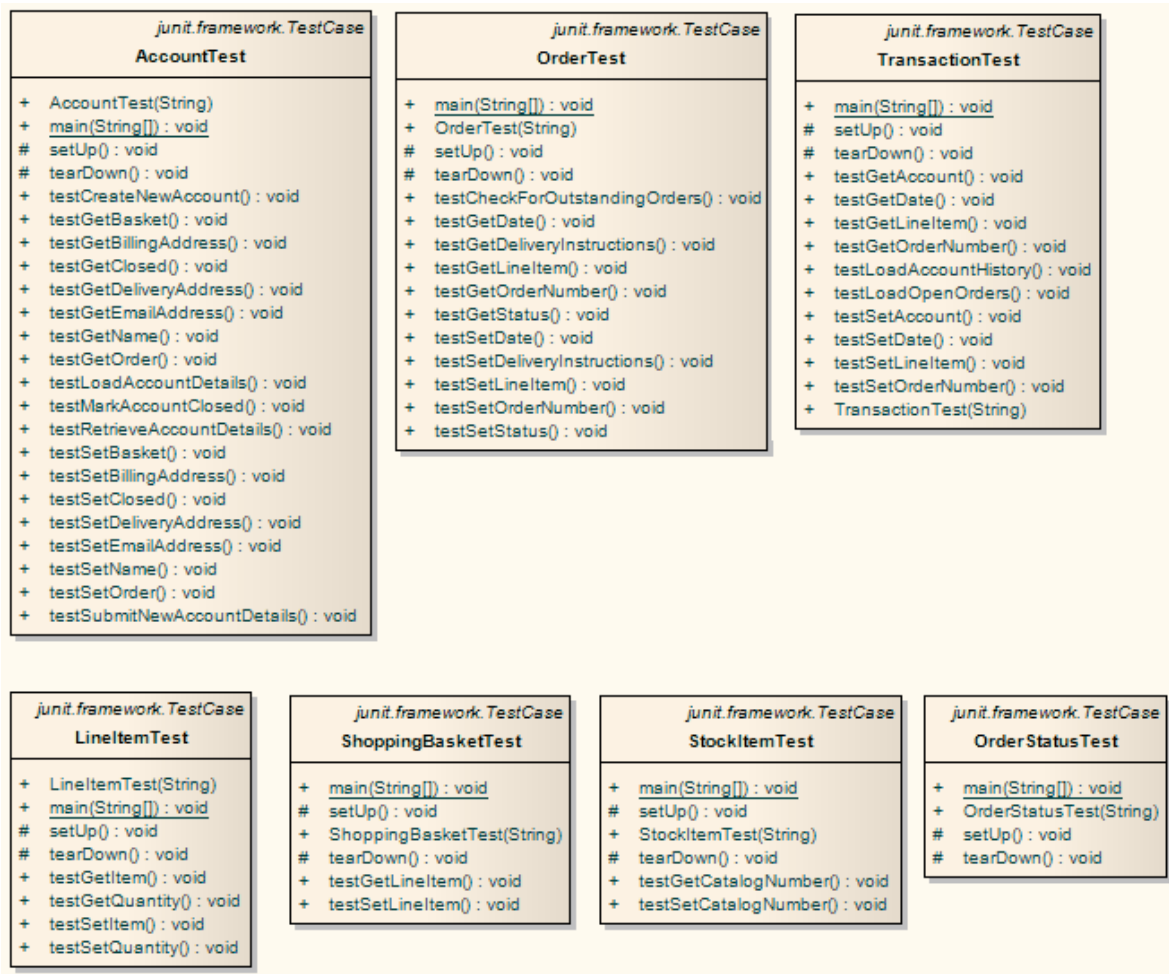

**Example:**

The Java model originally transformed from the PIM:

After transformation becomes the PSM:

#### Notes:

- Note that for each Class in the Java model, a corresponding test Class has been created. Each of these test Classes contains a test method for every public method in the source Class, plus the methods required to appropriately set up the tests. It is your responsibility to fill in the details of each test

#### Learn More:

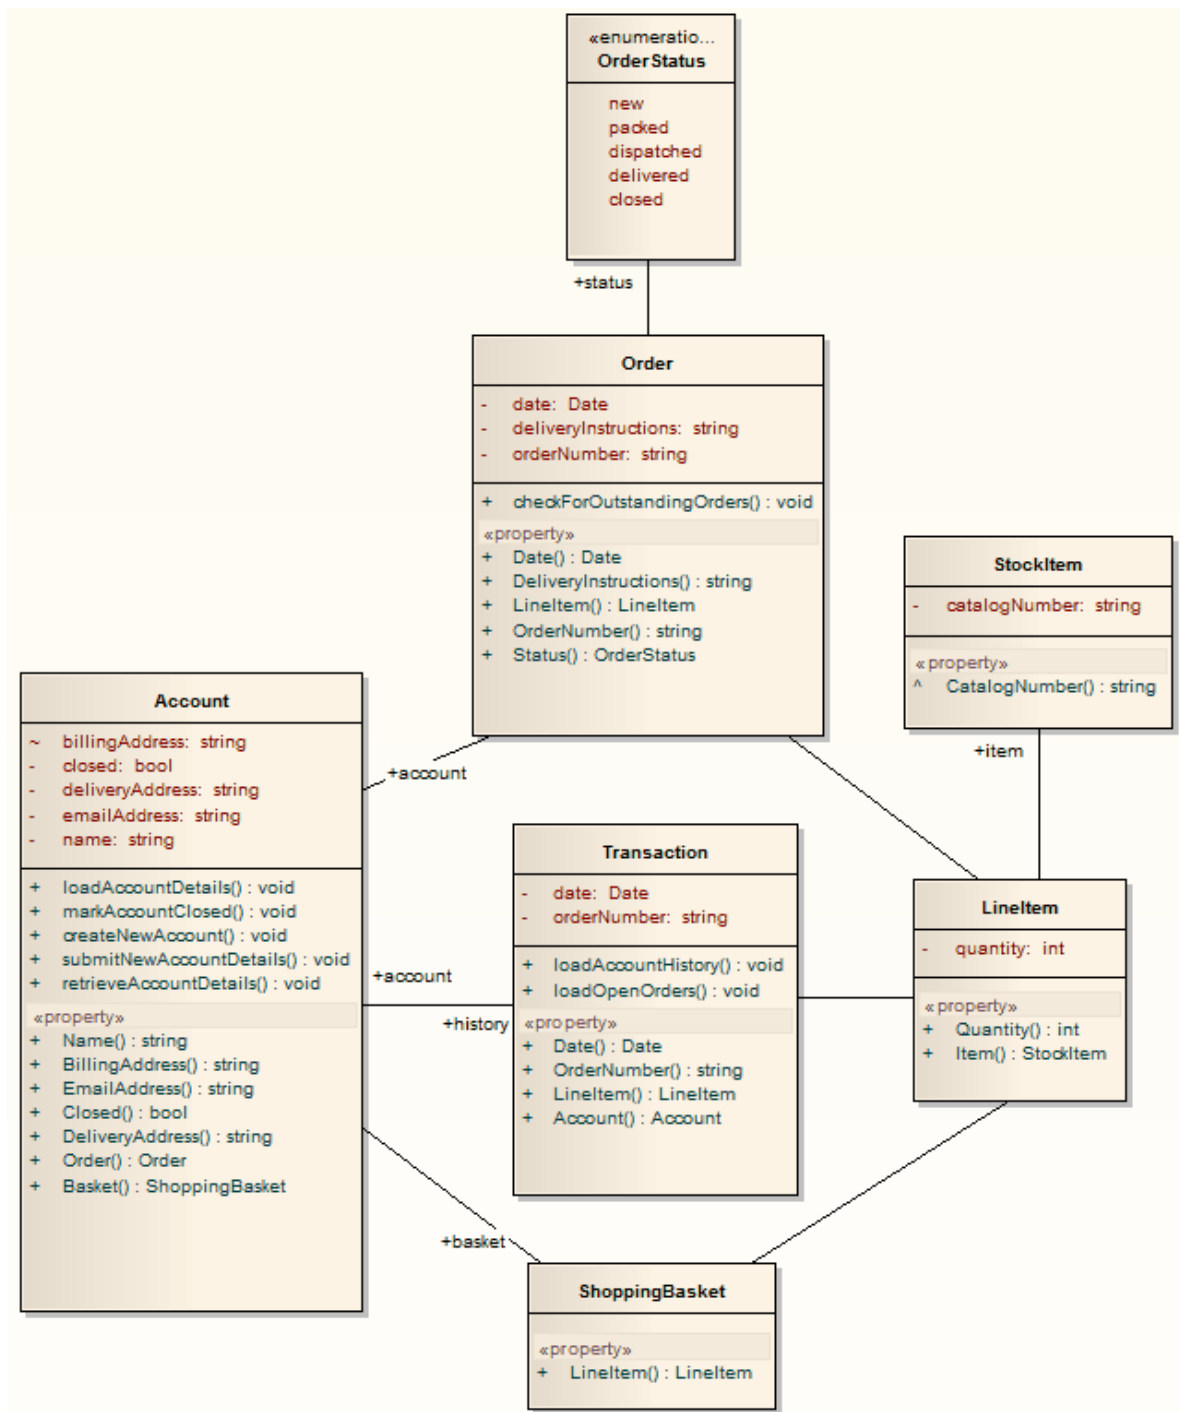

- [Unit Testing](#)<sup>[1680]</sup>

## 9.2.8 NUnit Transformation

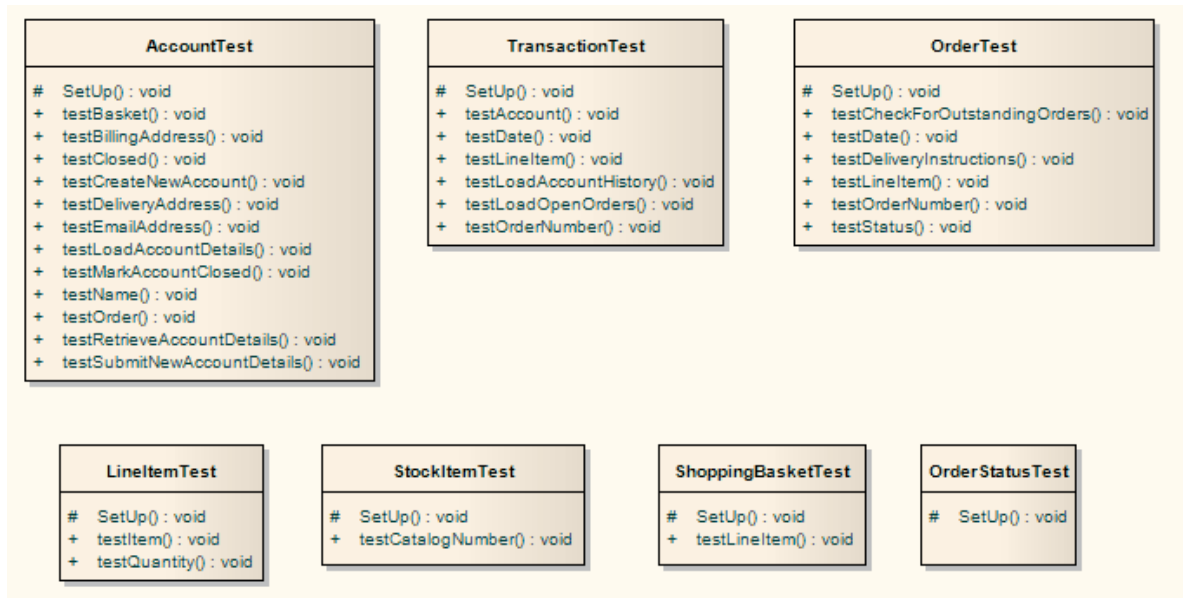

The purpose of the **NUnit transformation** is to create a Class with test methods for all public methods of an existing .Net compatible Class. The resulting Class can then be generated and the tests filled out and run by NUnit.

#### Example:

The C# model originally transformed from the PIM:

After transformation becomes the PSM:

**Notes:**

- Note that for each Class in the C# model, a corresponding test Class has been created. Each of these test Classes contains a test method for every public method in the source Class, plus the methods required to appropriately set up the tests. It is your responsibility to fill in the details of each test

**Learn More:**

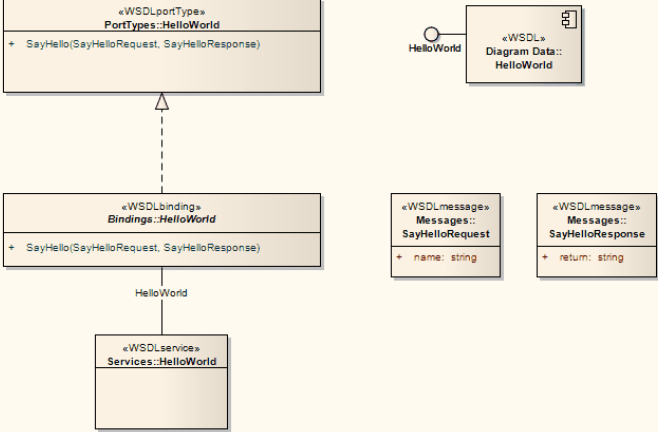

- [Unit Testing](#)<sup>[1680]</sup>

**9.2.9 WSDL Transformation**

The purpose of the **WSDL transformation** is to create from a simple model an expanded model of a WSDL interface that is suitable for generation.

**Topics:**

Topic	Detail	See also
WSDL Transformation	<p>Take the following example interface:</p> <pre> classDiagram     class HelloWorld {         &lt;&lt;interface&gt;&gt;         + SayHello(name :string) : string     }     </pre> <p>This generates the corresponding WSDL component, service, port type, binding and messages as follows.</p> <ul style="list-style-type: none"> <li>• Classes are handled in the same way as the XSD</li> </ul>	<p><a href="#">XSD Transformation</a><sup>[1332]</sup></p> <p><a href="#">WSDL Generation</a><sup>[1630]</sup></p>

Topic	Detail	See also
	<p>Transformation</p> <ul style="list-style-type: none"> <li>All <i>in</i> parameters are transformed into WSDL <i>Message Parts</i> in the <i>Request</i> message</li> <li>The return value and all <i>out</i> and <i>return</i> parameters are transformed into WSDL <i>Message Parts</i> in the <i>Response</i> message</li> <li>All methods where a value is returned are transformed into <i>Request-Response</i> operations while all methods not returning a value are transformed into <i>OneWay</i> operations</li> <li>The transformation does not handle generation of <i>Solicit-Response</i> and <i>Notification</i> methods or faults</li> </ul>  <p>The resulting package can then have the specifics filled out using the WSDL editing capabilities of Enterprise Architect, and finally be generated using WSDL generation.</p>	

#### Learn More:

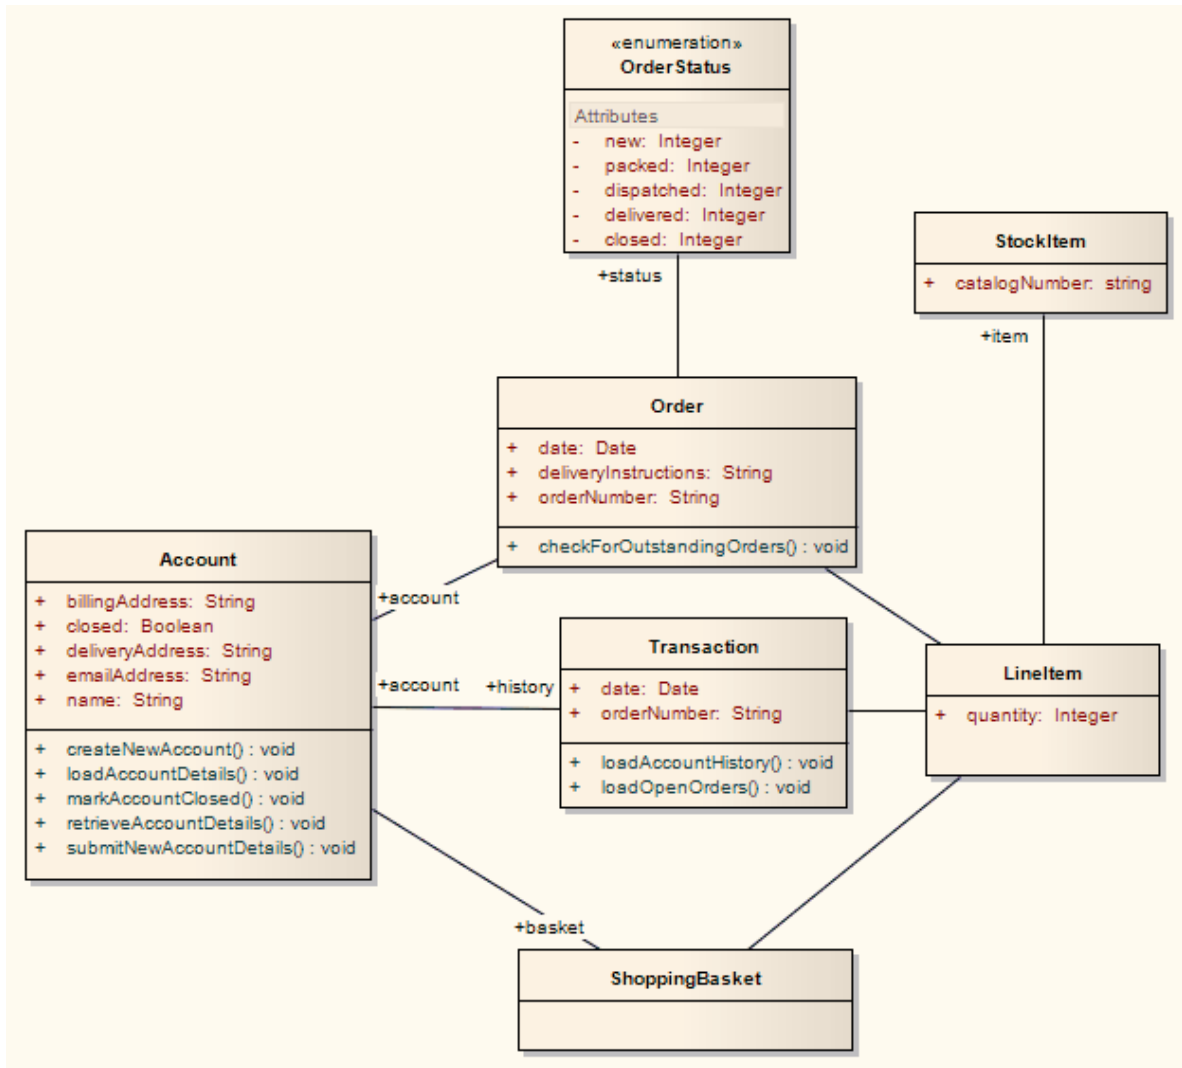

- [WSDL Model Structure](#) <sup>[1620]</sup>
- [Model WSDL](#) <sup>[1621]</sup>

### 9.2.10 XSD Transformation

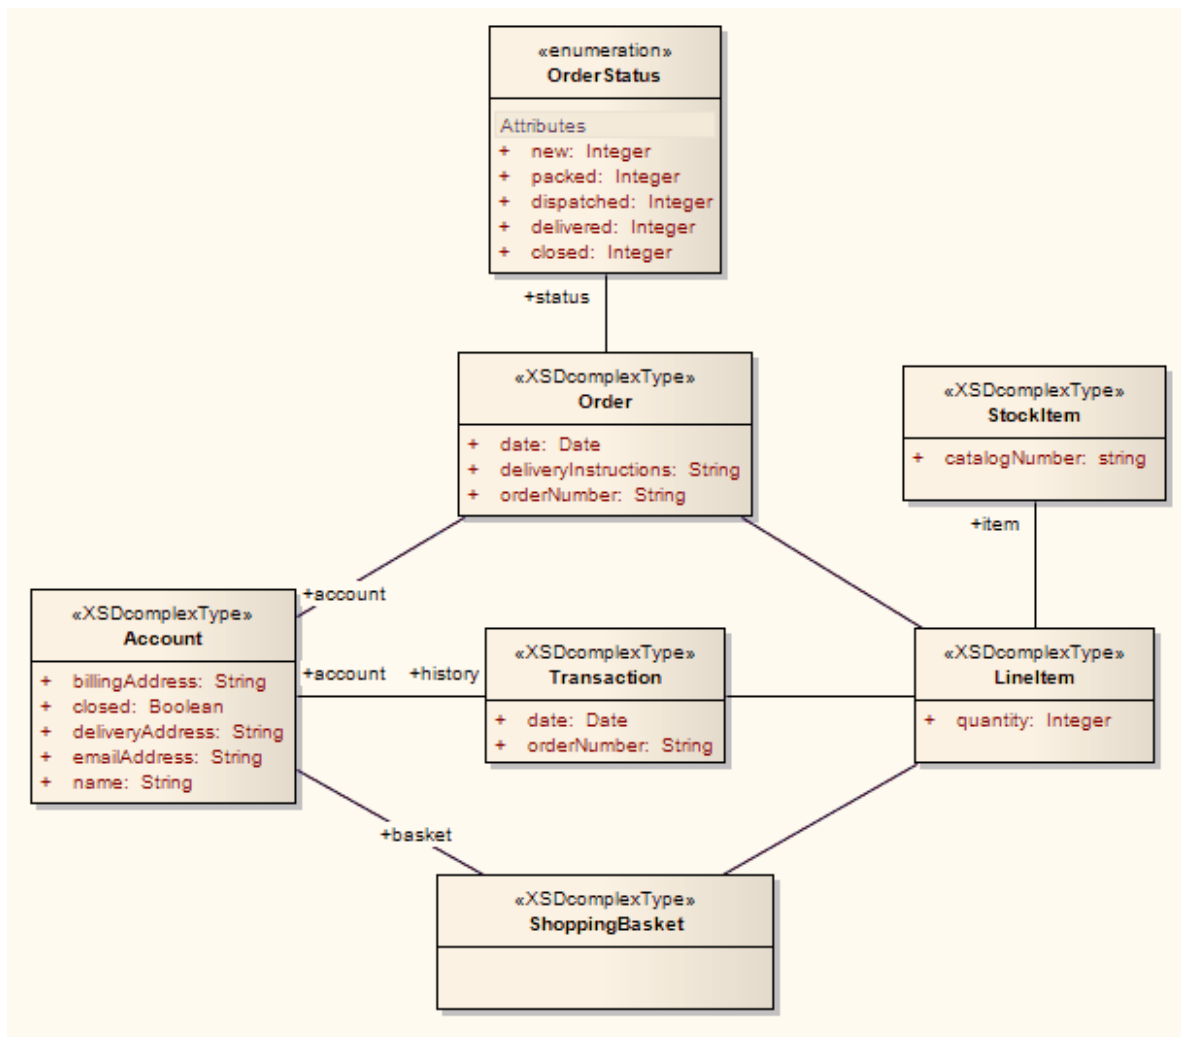

The purpose of the **XSD transformation** is to convert Platform-Independent Model (PIM) elements to UML Profile for XML elements as an intermediary step to creating an XML Schema. Each selected PIM Class element is converted to an «*XSDcomplexType*» element.

#### Example:

The Platform-Independent Model (PIM):

After transformation becomes the PSM:

Which in turn generates the following XSD:

```

<?xml version="1.0" encoding="ISO-8859-1" ?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema" >
  <xs:element name="Account" type="Account" />
  <xs:complexType name="Account" >
    <xs:sequence>
      <xs:element name="name" type="xs:string" />
      <xs:element name="billingAddress" type="xs:string" />
      <xs:element name="emailAddress" type="xs:string" />
      <xs:element name="closed" type="xs:boolean" />
      <xs:element name="deliveryAddress" type="xs:string" />
      <xs:element ref="Order" />
      <xs:element ref="ShoppingBasket" />
    </xs:sequence>
  </xs:complexType>
  <xs:element name="LinelItem" type="LinelItem" />
  <xs:complexType name="LinelItem" >
    <xs:sequence>
      <xs:element name="quantity" type="xs:integer" />
      <xs:element ref="StockItem" />
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Order" type="Order" />
  <xs:complexType name="Order" >
  
```

```

    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="deliveryInstructions" type="xs:string"/
>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="LineItem"/>
      <xs:element name="status" type="OrderStatus"/>
    </xs:sequence>
  </xs:complexType>
  <xs:simpleType name="OrderStatus">
    <xs:restriction base="xs:string">
      <xs:enumeration value="new"/>
      <xs:enumeration value="packed"/>
      <xs:enumeration value="dispatched"/>
      <xs:enumeration value="delivered"/>
      <xs:enumeration value="closed"/>
    </xs:restriction>
  </xs:simpleType>
  <xs:element name="ShoppingBasket" type="ShoppingBasket"/>
  <xs:complexType name="ShoppingBasket">
    <xs:sequence>
      <xs:element ref="LineItem"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="StockItem" type="StockItem"/>
  <xs:complexType name="StockItem">
    <xs:sequence>
      <xs:element name="catalogNumber" type="xs:string"/>
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Transaction" type="Transaction"/>
  <xs:complexType name="Transaction">
    <xs:sequence>
      <xs:element name="date" type="xs:date"/>
      <xs:element name="orderNumber" type="xs:string"/>
      <xs:element ref="Account"/>
      <xs:element ref="LineItem"/>
    </xs:sequence>
  </xs:complexType>
</xs:schema>

```

### Learn More:

## 9.3 Transformation Templates

Note that the Transformation Template mechanism is based very strongly on the Code Generation Template mechanism. For further information on Transformation Templates see the Code Template Editor section and also - for information on the Common Code Editor and intellisense - the Code Editors topic.

**Access:** [Settings | Transformation Templates](#)

To modify Transformation templates, follow the steps below

### How To:

Step	Action	See also
1	Select the <b>Settings   Transformation Templates</b> menu option. The Transformation Templates Editor displays.	
2	In the <b>Language</b> field, type or select the name of the transformation to modify.	
3	Select a template from the <b>Templates</b> list, and edit its contents in the editor pane.	
4	Click on the <b>Save</b> button.	

### Reference:

Field	Usage	See also
<b>Language</b>	Select the name of the transformation.	
<b>Template</b>	Display the contents of the active template. Provide the editor for modifying templates.	
<b>Templates</b>	List the base transformation templates. The active template is highlighted. The <b>Modified</b> field indicates whether you have changed the default template for the current transformation.	
<b>New Transformation Type</b>	Create a new transformation.	
<b>Stereotype Overrides</b>	List the stereotyped templates, for the active base template. The <b>Modified</b> field indicates whether you have modified a default stereotyped template.	
<b>Add New Stereotyped Override</b>	Invoke a dialog for adding a stereotyped template, for the currently selected base template.	
<b>Add New Custom Template</b>	Invoke a dialog for creating a custom stereotyped template.	
<b>Help</b>	Launch the Enterprise Architect Help topic for this dialog.	
<b>Get Default</b>	Update the editor display with the default version of the active	

Field	Usage	See also
Template	template.	
Save	Overwrite the active templates with the contents of the editor.	
Delete	If you have overridden the active template, delete the override and replace it with the corresponding default transformation template.

- [Code Template Editor](#)<sup>[1494]</sup>
- [Code Editors](#)<sup>[1403]</sup>

### 9.3.1 Import Transformations

**Access:** Project | Model Import/Export | Import Reference Data

Use To:

- Transfer **Transformation templates** between models

To import a Transformation template, follow the steps below

How To:

Step	Action	See also
1	Select the <b>Project   Model Import/Export   Import Reference Data</b> menu option. The <b>Import Reference Data</b> dialog displays.	
2	Click on the <b>Select File</b> button and browse to a .XML file containing the required Transformation template.	
3	Select the name of one or more template datasets and click on the <b>Import</b> button.	

## 9.4 Write Transformations

This topic provides help in writing your own transformations. Subjects covered are:

<b>Code Editors</b>	Provides the list of editors supported by Enterprise Architect	<a href="#">Code Editors</a> <sup>[1403]</sup>

### Notes:

- Further hints and tips can be gleaned from a close study of the Transformation Templates provided with Enterprise Architect; writing transformations is very similar to writing code generation templates, so an understanding of the Code Template Framework can greatly assist in understanding transformations
- The Transformation Template editor provides the facilities of the Common Code Editor
- Transformation Templates are accessed from the **Settings | Transformation Templates** menu option

### 9.4.1 Default Transformation Templates

In most transformations, there is a lot of information that is simply copied to the target model. In order to make writing new transformations simpler, Enterprise Architect provides a default set of transformation templates. These templates perform a simple copy of the source model to the target model. This means that in order to write a new transformation you can modify the default templates to make the required changes.

**Notes:**

- When creating a new transformation you must modify at least one template before the transformation becomes available

**9.4.2 Intermediary Language**

All transformations in Enterprise Architect work by generating an intermediary text form of the model to generate.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Any element is represented in this language by the type of element (for example, Class, Action, Method, Generalization or Tag) followed by the properties of the element and the elements that it is made from; the grammar for this resembles the following:</p> <pre> element :     element Name { ( element Property   element ) * }  element Property:     packageName     stereotype     propertyName = " propertyValueSymbol * "  packageName:     name = " propertyValueSymbol * " ( . " propertyValueSymbol * " ) * stereotype:     stereotype = " propertyValueSymbol * " ( , " propertyValueSymbol * " ) *  propertyValueSymbol :     \ \     \ "     Any character except " ( U+0022 ), \ ( U+005C)  • <i>elementName</i> is any one of the set of element types • <i>propertyName</i> is any one of the set of properties  Literal strings can be included in property values by escaping a quote character; for example: default = "\" Some string value.\""</pre>	<p><a href="#">Objects</a> <small>[1339]</small></p> <p><a href="#">Connectors</a> <small>[1344]</small></p>

**9.4.3 Objects**

**Topics:**

Topic	Detail	See also
<b>Objects</b>	<p>Objects are created in Enterprise Architect by generating text in the following form:</p> <pre> object Type {     object Properties } where:</pre>	<p><a href="#">XRef element</a> <small>[1348]</small></p>

Topic	Detail	See also
	<p>obj ect Type is one of the following object types:</p> <ul style="list-style-type: none"> <li>• <i>Action</i></li> <li>• <i>ActionPin</i></li> <li>• <i>Activity</i></li> <li>• <i>ActivityParameter</i></li> <li>• <i>ActivityPartition</i></li> <li>• <i>ActivityRegion</i></li> <li>• <i>Actor</i></li> <li>• <i>Association</i></li> <li>• <i>Change</i></li> <li>• <i>Class</i></li> <li>• <i>Collaboration</i></li> <li>• <i>CollaborationUse</i></li> <li>• <i>Component</i></li> <li>• <i>DeploymentSpecification</i></li> <li>• <i>DiagramFrame</i></li> <li>• <i>Decision</i></li> <li>• <i>EntryPoint</i></li> <li>• <i>Event</i></li> <li>• <i>ExceptionHandler</i></li> <li>• <i>ExecutionEnvironment</i></li> <li>• <i>ExitPoint</i></li> <li>• <i>ExpansionNode</i></li> <li>• <i>ExpansionRegion</i></li> <li>• <i>ExposedInterface</i></li> <li>• <i>GUIElement</i></li> <li>• <i>InteractionFragment</i></li> <li>• <i>InteractionOccurrence</i></li> <li>• <i>InteractionState</i></li> <li>• <i>Interface</i></li> <li>• <i>InterruptibleActivityRegion</i></li> <li>• <i>Issue</i></li> <li>• <i>Iteration</i></li> <li>• <i>Object</i></li> <li>• <i>ObjectNode</i></li> <li>• <i>MessageEndpoint</i></li> <li>• <i>Node</i></li> <li>• <i>Package</i></li> <li>• <i>Parameter</i></li> <li>• <i>Part</i></li> <li>• <i>Port</i></li> <li>• <i>ProvidedInterface</i></li> <li>• <i>RequiredInterface</i></li> <li>• <i>Requirement</i></li> <li>• <i>Sequence</i></li> <li>• <i>State</i></li> <li>• <i>StateMachine</i></li> <li>• <i>StateNode</i></li> <li>• <i>Synchronization</i></li> <li>• <i>Table</i></li> <li>• <i>TimeLine</i></li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <i>Trigger</i></li> <li>• <i>UMLDiagram</i></li> <li>• <i>UseCase</i></li> </ul> <p><b>objectProperties</b> is zero, or one or more of the following properties:</p> <ul style="list-style-type: none"> <li>• <i>Abstract</i></li> <li>• <i>Alias</i></li> <li>• <i>Arguments</i></li> <li>• <i>Author</i></li> <li>• <i>Cardinality</i></li> <li>• <i>Classifier</i></li> <li>• <i>Complexity</i></li> <li>• <i>Concurrency</i></li> <li>• <i>Filename</i></li> <li>• <i>Header</i></li> <li>• <i>Import</i></li> <li>• <i>IsActive</i></li> <li>• <i>IsLeaf</i></li> <li>• <i>IsRoot</i></li> <li>• <i>IsSpecification</i></li> <li>• <i>Keyword</i></li> <li>• <i>Language</i></li> <li>• <i>Multiplicity</i></li> <li>• <i>Name</i></li> <li>• <i>Notes</i></li> <li>• <i>Persistence</i></li> <li>• <i>Phase</i></li> <li>• <i>Scope</i></li> <li>• <i>Status</i></li> <li>• <i>Stereotype</i></li> <li>• <i>Version</i></li> <li>• <i>Visibility</i></li> </ul> <p>and zero, or one or more of the following elements:</p> <ul style="list-style-type: none"> <li>• <i>Attribute</i></li> <li>• <i>Classifier</i></li> <li>• <i>Parameter</i></li> <li>• <i>Operation</i></li> <li>• <i>Parent</i></li> <li>• <i>Tag</i></li> <li>• <i>XRef</i></li> <li>• <i>Any object</i></li> </ul> <ul style="list-style-type: none"> <li>• Some of the above only apply to certain object types</li> <li>• Every object created in a transformation should include an XRef element, as it enables Enterprise Architect to synchronize with the element and makes it possible to create a connector to that Class in a transformation</li> </ul>	
<b>Classes</b>	<p>A simple Class can be created as follows:</p> <pre>Cl ass</pre>	

Topic	Detail	See also
	<pre> {   name = " Example" } </pre> <p>It is then easy to add to this; the following example sets the language to C++, and adds a Tagged Value and an attribute:</p> <pre> Class {   name = " Example"   language = " C++"   Tag   {     name = " default CollectionClass"     value = " List"   }   Attribute   {     name = " count"     type = " int"   } } </pre>	
<b>Attributes</b>	<p>Attributes are created with the same structure as objects, and include the following properties:</p> <ul style="list-style-type: none"> <li>• <i>Alias</i></li> <li>• <i>Classifier</i></li> <li>• <i>Collection</i></li> <li>• <i>Container</i></li> <li>• <i>Containment</i></li> <li>• <i>Constant</i></li> <li>• <i>Default</i></li> <li>• <i>Derived</i></li> <li>• <i>LowerBound</i></li> <li>• <i>Name</i></li> <li>• <i>Notes</i></li> <li>• <i>Ordered</i></li> <li>• <i>Scope</i></li> <li>• <i>Static</i></li> <li>• <i>Stereotype</i></li> <li>• <i>Type</i></li> <li>• <i>UpperBound</i></li> <li>• <i>Volatile</i></li> </ul> <p>and the following elements:</p> <ul style="list-style-type: none"> <li>• <i>Classifier</i></li> <li>• <i>Tag</i></li> <li>• <i>XRef</i></li> </ul>	
<b>Operations</b>	<p>Operations are created with the same structure as objects, and include the following properties:</p> <ul style="list-style-type: none"> <li>• <i>Abstract</i></li> <li>• <i>Alias</i></li> <li>• <i>Behavior</i></li> <li>• <i>Classifier</i></li> <li>• <i>Code</i></li> <li>• <i>Constant</i></li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <i>IsQuery</i></li> <li>• <i>Name</i></li> <li>• <i>Notes</i></li> <li>• <i>Pure</i></li> <li>• <i>ReturnArray</i></li> <li>• <i>Scope</i></li> <li>• <i>Static</i></li> <li>• <i>Stereotype</i></li> <li>• <i>Type</i></li> </ul> <p>and the following elements:</p> <ul style="list-style-type: none"> <li>• <i>Classifier</i></li> <li>• <i>Parameter</i></li> <li>• <i>Tag</i></li> <li>• <i>XRef</i></li> </ul>	
<b>Parameters</b>	<p>Parameters are created with the same structure as objects, and include the Tag element and the following properties:</p> <ul style="list-style-type: none"> <li>• <i>Classifier</i></li> <li>• <i>Default</i></li> <li>• <i>Fixed</i></li> <li>• <i>Name</i></li> <li>• <i>Notes</i></li> <li>• <i>Kind</i></li> <li>• <i>Stereotype</i></li> </ul>	
<b>Packages</b>	<p>Packages differ from other objects in the following ways:</p> <ul style="list-style-type: none"> <li>• A reduced set of properties of <i>alias</i>, <i>author</i>, <i>name</i>, <i>namespaceRoot</i>, <i>notes</i>, <i>scope</i>, <i>stereotype</i> and <i>version</i></li> <li>• The extra property <i>namespaceRoot</i></li> <li>• Must have a name specified</li> <li>• <i>Name</i> can be a qualified name; when a qualified name is specified the properties given are applied only to the final package</li> <li>• Can contain other packages</li> <li>• Can't contain attributes and operations</li> </ul>	
<b>Tables</b>	<p>Tables are a special sort of object, with the following differences from other object types:</p> <ul style="list-style-type: none"> <li>• Can include columns and primary keys</li> <li>• Cannot include attributes</li> </ul>	
<b>Columns</b>	<p>Columns are similar to attributes, but have an <i>autonumber</i> element containing <i>Startnum</i> and increment, and the following added properties:</p> <ul style="list-style-type: none"> <li>• <i>Length</i></li> <li>• <i>NotNull</i></li> <li>• <i>Precision</i></li> <li>• <i>PrimaryKey</i></li> <li>• <i>Scale</i></li> <li>• <i>Unique</i></li> </ul> <p>In the column definition, you cannot assign a value to the <i>NotNull</i>, <i>PrimaryKey</i> or <i>Unique</i> properties</p>	

## 9.4.4 Connectors

Creating connectors in a transformation can be complex, but the process has the same form as creating elements. The difference is that you must also specify each end.

### Topics:

Topic	Detail	See also
<b>Connector Types</b>	<p>The different connectors that can be created are as follows:</p> <ul style="list-style-type: none"> <li>• Aggregation</li> <li>• Assembly</li> <li>• Association</li> <li>• Collaboration</li> <li>• ControlFlow</li> <li>• Connector</li> <li>• Delegate</li> <li>• Dependency</li> <li>• Deployment</li> <li>• ForeignKey</li> <li>• Generalization</li> <li>• InformationFlow</li> <li>• Instantiation</li> <li>• Interface</li> <li>• InterruptFlow</li> <li>• Manifest</li> <li>• Nesting</li> <li>• NoteLink</li> <li>• ObjectFlow</li> <li>• Package</li> <li>• Realization</li> <li>• Sequence</li> <li>• Transition</li> <li>• UseCase</li> <li>• Uses</li> </ul> <p>There are two different types of Class that you can use as a connector end: one created by a transformation, and one for which you already know the GUID</p>	
<b>Connect to a Class Created by a Transformation</b>	<p>The most common connection is to connect to a Class created by a transformation; to do this you must have three items of information:</p> <ul style="list-style-type: none"> <li>• The original Class GUID</li> <li>• The name of the transformation</li> <li>• The name of the transformed Class</li> </ul> <p>This type of connector is created using the <b>TRANSFORM_REFERENCE</b> function macro; when the element is in the current transformation, it can be safely omitted from the transformation</p> <p>The simplest example of this is when you have created multiple Classes from a single Class in a transformation and want a connector between them; consider this example from the EJB Entity transformation:</p> <pre> Dependency { </pre>	<a href="#">Cross References</a> <small>[1348]</small>

Topic	Detail	See also
	<pre> %TRANSFORM_REFERENCE( " EJBReal i zeHome" , classGUID) % stereotype=" EJBReal i zeHome" Source {   %TRANSFORM_REFERENCE( " EJBEnt i tyBean" , classGUID) % } Target {   %TRANSFORM_REFERENCE( " EJBHomeI nt erface" , classGUID) % } } </pre> <p>There are three uses of the <b>TRANSFORM_REFERENCE</b> macro: one to identify this connector for synchronization purposes and the other two to identify the ends; all three use the same source GUID, because they all come from the one original Class</p> <p>None of the three have to specify the transformation because the two references are referencing something in the current transformation - each of them then only has to identify the transform name</p> <p>Of course, it is also possible to create a connector from another connector</p> <p>You can create a connector template and list over all connectors connected to a Class from the Class level templates; you don't have to worry about only generating it once, because if you have created a <b>TRANSFORM_REFERENCE</b> for the connector then Enterprise Architect automatically synchronizes them</p> <p>The following copies the source connector:</p> <pre> %connector Type% {   %TRANSFORM_CURRENT( ) %   %TRANSFORM_REFERENCE( " Connector" , connector GUID) % Source {   %TRANSFORM_REFERENCE( " Cl ass" , connector SourceGUID) %   %TRANSFORM_CURRENT( " Source" ) % } Target {   %TRANSFORM_REFERENCE( " Cl ass" , connector Dest GUID) %   %TRANSFORM_CURRENT( " Target" ) % } } </pre>	
<p><b>Connecting to a Class for which you know the GUID</b></p>	<p>The second type of Class that you can use as a connector end is one for which you know the current GUID</p> <p>To do this, specify the GUID of the target Class in either the source or target end; the following example creates a dependency from a Class created in a transformation, to the Class it was transformed from:</p> <pre> Dependency {   %TRANSFORM_REFERENCE( " SourceDependency" , classGUID) % stereotype=" t r a n s f o r m e d F r o m" Source { </pre>	

Topic	Detail	See also
	<pre> %TRANSFORM_REFERENCE( " Cl ass" , cl ass GUI D) % } Target {   GUI D=%qt %%c l ass GUI D%%qt % } } </pre>	

**Notes:**

- *ForeignKey* is a special case where not just a connector is created - you must also list the columns involved in the transformation; in addition, tags specified on the connector are actually created on the foreign key operation in the source Class, and a cascade property can be added - for example, *cascade="update","delete"*
- Also, the *nullable* property of the foreign key is set to **true** if either end has a multiplicity that includes zero; this can be overridden by setting *nullable="1"* or *nullable="0"* in the source section of the foreign key
- Each connector is transformed at both end objects, therefore the connector might appear twice in the transformation; this is nothing to be concerned about, but you should check carefully that the connector is generated exactly the same way, regardless of which end is on the current Class

### 9.4.5 Copy Information

In many transformations there is a substantial amount of information to be copied.

It would be tedious to type all of the common information into a template so that it is copied to the transformed Class; the alternative is to use the **TRANSFORM\_CURRENT** and **TRANSFORM\_TAGS** function macros.

**Reference:**

Topic	Detail	See also
<b>TRANSFORM_CURRENT</b>	<p><b>TRANSFORM_CURRENT(&lt;listOfExcludedItems&gt;)</b></p> <p>The function generates an exact copy of all the properties of the current item, except for the items named in <i>&lt;listOfExcludedItems&gt;</i></p> <p>Another form of the function is available when transforming connectors that enables either end of the connector to be copied:</p> <ul style="list-style-type: none"> <li>• <b>TRANSFORM_CURRENT(&lt;connectorEnd&gt;, &lt;listOfExcludedItems&gt;)</b></li> </ul> <p>This generates an exact copy of the connector end specified by <i>&lt;connectorEnd&gt;</i> except for the items named in <i>&lt;listOfExcludedItems&gt;</i>, where <i>&lt;connectorEnd&gt;</i> is either <b>Source</b> or <b>Target</b></p>	
<b>TRANSFORM_TAGS</b>	<p><b>TRANSFORM_TAGS(&lt;listOfExcludedItems&gt;)</b></p> <p>The function generates an exact copy of all the Tagged Values of the current item, except for the items named in <i>&lt;listOfExcludedItems&gt;</i></p>	

## 9.4.6 Convert Types

### Topics:

Topic	Detail	See also
<b>Synopsis</b>	<p>Different target platforms almost certainly require different data types, so you often require a method of converting between types, as offered by the following macro:</p> <ul style="list-style-type: none"> <li>• <b>CONVERT_TYPE(&lt;destinationLanguage&gt;, &lt;originalType&gt;)</b></li> </ul> <p>This function converts &lt;originalType&gt; to the corresponding type in &lt;destinationLanguage&gt;, using the datatypes and common types defined in the model, where <b>&lt;originalType&gt;</b> is assumed to be a platform independent common type</p> <p>A similar macro is available when transforming common datatypes to the datatypes for a specified database:</p> <ul style="list-style-type: none"> <li>• <b>CONVERT_DB_TYPE(&lt;destinationDatabase&gt;, &lt;originalType&gt;)</b></li> </ul> <p>This function converts &lt;originalType&gt; to the corresponding datatypes in &lt;destinationDatabase&gt;, which is defined in the model; &lt;originalType&gt; refers to a platform independent common datatype</p>	

## 9.4.7 Convert Names

Different target platforms use different naming conventions. As a result you might not want to copy the names of your elements directly into the transformed models. To facilitate this requirement, Enterprise Architect's transformation templates provide a CONVERT\_NAME function macro.

Another way in which you can transform a name is to remove a prefix from the original name, with the REMOVE\_PREFIX macro.

### Topics:

Topic	Detail	See also
<b>CONVERT_NAME &lt;originalName&gt;, &lt;originalFormat&gt;, &lt;targetFormat&gt;)</b>	<p>This macro converts &lt;originalName&gt;, which is assumed to be in &lt;originalFormat&gt;, to &lt;targetFormat&gt;.</p> <p>The supported formats are:</p> <ul style="list-style-type: none"> <li>• Camel Case: New words start with a capital letter except for the first word, which begins with a lower case letter; for example, <i>myVariableTable</i></li> <li>• Pascal Case: Same as Camel Case but the first letter of the first word is upper case; for example, <i>MyVariableTable</i></li> <li>• Spaced: Words are separated by spaces; the case of letters is ignored</li> <li>• Underscored: Words are separated by underscores; the case of letters is ignored</li> </ul> <p>The original format might also specify a list of delimiters to be used. For example a value of ' _ ' breaks words whenever either a space or underscore is found.</p>	

Topic	Detail	See also
	<p>The target format might also use a format string that specifies the case for each word and a delimiter between them. It takes the following form:</p> <pre>&lt;firstWord&gt;&lt;delimiter&gt;&lt;otherWords&gt;</pre> <ul style="list-style-type: none"> <li>• <i>&lt;firstWord&gt;</i> controls the case of the first word (see below)</li> <li>• <i>&lt;delimiter&gt;</i> is the string generated between words</li> <li>• <i>&lt;otherWords&gt;</i> applies to all words after the first word</li> </ul> <p><i>&lt;firstWord&gt;</i> and <i>&lt;otherWords&gt;</i> are both a sequence of two characters. The first character represents the case of the first letter of that word, and the second character represents the case of all subsequent letters. An upper case letter forces the output to upper case, a lower case letter forces the output to lower case, and any other character preserves the original case.</p> <p><b>Example 1:</b> To capitalize the first letter of each word and separate multiple words with a space:</p> <pre>" Ht ( ) Ht " to output " My Var i abl e Tabl e "</pre> <p><b>Example 2:</b> To generate the equivalent of Camel Case, but reverse the roles of upper and lower case; that is, all characters are upper case except for the first character of each word <i>after</i> the first word:</p> <pre>" HT( ) hT " to output " MY vARI ABLE t ABLE "</pre>	
<b>REMOVE_PREFIX</b> ( <b>&lt;originalName&gt;</b> , <b>&lt;prefixes&gt;</b> )	<p>This macro removes any prefix found in <i>&lt;prefixes&gt;</i> from <i>&lt;originalName&gt;</i>. The prefixes are specified in a semi-colon separated list.</p> <p>The macro is often used in conjunction with the <i>CONVERT_NAME</i> macro. For example, this code creates a get <i>property name</i> according to the options for Java.</p> <pre>\$pr oper t yName=%REMOVE_PREFI X( at t Name, genOpt Pr oper t yPr efi x) % %i f genOpt GenCapi t ali sedPr oper t i es==" T" % \$pr oper t yName=%CONVERT_NAME (\$pr oper t yName, " camel case", " pascal case" ) % %end l f %</pre>	

**Notes:**

- Acronyms are not supported when converting from Camel Case or Pascal Case

**9.4.8 Cross References****Topics:**

Topic	Detail	See also
<b>Abstract</b>	Cross References are an important part of transformations. They are used to:	<a href="#">DDL Transformation</a>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Find the transformed Class to synchronize with</li> <li>• Create connectors between transformed Classes</li> <li>• Specify a classifier of a type</li> <li>• Determine where to transform to for future transformations</li> </ul> <p>Each cross reference has three different parts:</p> <ul style="list-style-type: none"> <li>• A <i>Namespace</i>, corresponding to the transformation that generated the element</li> <li>• A <i>Name</i>, which is a unique reference to something that can be generated in the above transformation</li> <li>• A <i>Source</i>, which is the GUID of the element that this element was created from</li> </ul> <p>When writing the templates for a transformation, it is easiest to create the cross references using the <b>TRANSFORM_REFERENCE</b> macro that is defined for this purpose. It has three optional parameters.</p> <p><b>TRANSFORM_REFERENCE(&lt;name&gt;, &lt;sourceGuid&gt;, &lt;namespace&gt;)</b></p> <p>Generates a reference that can be used in the ways described above. It resembles the following.</p> <pre>XRef{namespace="&lt;namespace&gt;" name="&lt;name&gt;" source="&lt;sourceGuid&gt;"</pre> <p>Where:</p> <ul style="list-style-type: none"> <li>• If &lt;name&gt; is not specified it gets the name of the current template</li> <li>• If &lt;sourceGUID&gt; is not specified it gets the GUID of the current Class</li> <li>• If &lt;namespace&gt; is not specified it gets the name of the current transformation</li> </ul> <p>The only time that this should be specified is when creating a connector to a Class created in a different transformation.</p> <p>A good example of the use of cross references is in the DDL templates provided with Enterprise Architect. In the Class template a cross reference is created with the name table. Then up to two different connectors can be created, each of which must identify the two Classes it connects using cross references while having its own unique cross reference.</p>	
<b>Specify Classifiers</b>	<p>Objects, attributes, operations and parameters can all reference another element in the model as their type. When this type is created from a transformation you must use a cross reference to specify it, using the <b>TRANSFORM_CLASSIFIER</b> macro.</p> <p><b>TRANSFORM_CLASSIFIER(&lt;name&gt;, &lt;sourceGuid&gt;, &lt;namespace&gt;)</b></p> <p>Generates a cross reference within a classifier element, where the parameters are identical to the <b>TRANSFORM_REFERENCE</b> macro but the name Classifier is generated instead of <i>XRef</i>.</p> <p>If the target classifier already exists in the model before the transformation, a <b>TRANSFORM_CLASSIFIER</b> is inappropriate and instead the GUID can be given directly to a classifier attribute.</p> <p>If a classifier is specified for any type it overrides the type specified.</p>

## 10.1 Physical Data Model

The Physical data model visually represents the structure of the data as implemented by a relational database schema.

### Topics:

Topic	Detail	See also
<b>Benefit</b>	In addition to providing a visual abstraction of the database structure, an important benefit of defining a Physical data model is that you can automatically derive the database schema from the model; this is possible due to the richness of meta-data captured by a Physical data model and its close mapping to aspects of the database schema, such as tables, columns, primary and foreign keys	
<b>Example</b>	<p>The following is an example of a Physical data model that could be used to automatically generate a database schema</p> <p>Each table is represented by a UML Class; columns, including Primary and Foreign Keys, are modeled using UML Attributes and Operations</p>  <p>A Physical data model defined using a UML Profile and the Information Engineering notation</p> <p>The above model is defined using Enterprise Architect's <i>UML Profile for Data Modeling</i>; the relationship between the tables uses the Information Engineering notation</p> <p>Information Engineering is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships</p>

### 10.1.1 Tables and Columns

The basic structural element of a relational database is the *table*, which represents a set of records, or rows, that have the same structure. Each row contains one or more *columns*. Every individual item of data entered into a relational database is represented by a value in a column of a row in a table. Enterprise Architect's *UML Profile for Data Modeling* represents database tables as Classes with a stereotype of <<table>>. Columns are represented by Attributes with a stereotype of <<column>>. Tables and columns form the basis of Physical data models.

Enterprise Architect can generate simple DDL scripts to create the tables in your model. You can also perform Model Driven Architecture (MDA) Transformations to DDL - Enterprise Architect provides a template specifically for DDL transformations.

To help you map Class Attributes to Table fields, you can create connectors between specific attributes (features) in the Class element and the column Attributes in the Table element.

A simple example of a Physical data model in Enterprise Architect is shown below. The example consists of two tables represented by UML Classes, named *SalesPerson* and *Customer*. The table stereotype is denoted by the icon in the top-right corner of each Class. The tables each define three columns using UML Attributes typed appropriately for the target DBMS, which happens to be MySQL.

A simple Data model consisting of two tables, represented by UML Classes

So far, Primary Key and Foreign Key information modeling is not discussed; this is considered in later topics.

**Learn more:**

- [Create a Table](#)<sup>[1353]</sup>
- [Model Transformation](#)<sup>[1307]</sup>
- [DDL Transformation](#)<sup>[1316]</sup>
- [Connect to Element Feature](#)<sup>[744]</sup>
- [Create Columns](#)<sup>[1357]</sup>
- [Primary and Foreign Keys](#)<sup>[1363]</sup>

#### 10.1.1.1 Create a Table

**How To:**

To add a Table to your data model, follow the steps below:

Step	Action	See Also
1	Open a diagram.	
2	Select the <b>More tools   Data Modeling</b> menu option on the Toolbox.	

Step	Action	See Also
3	Click on the <i>Table</i> element in the list of elements, then click on the diagram. The Table element is displayed on the diagram.	
4	Use the Table Properties dialog to set the table name and other properties as required.	

**Learn more:**

- [Set the properties of a Table](#) <sup>[1354]</sup>

#### 10.1.1.1.1 Working with Table Properties

Once you have created a table, you must set its properties to define database-specific information that can be used to generate the schema in DDL.

Table properties, including the database type, for all supported DBMSs are set using the Properties dialog.

For MySQL and Oracle, some additional properties are defined using Tagged Values, such as the Table Owner and DBMS-specific options. Additional table properties for other DBMSs are not yet supported.

Once the table properties are defined, you are ready to add columns.

**Topics:**

Topic	Link
<p><b>Set the Database type for a table</b> - other than the table name, the most important property to set for a table is the database type, which defines:</p> <ul style="list-style-type: none"> <li>• The list of data types that are available for defining columns, and</li> <li>• Which dialect of DDL is generated</li> </ul>	<a href="#">Set the Database Type</a> <sup>[1354]</sup>
<p><b>Set the Table Owner</b> - Some relational databases enable you to assign a table to one of several <i>owners</i> within the database; Enterprise Architect enables you to model this using the <i>Owner</i> Tagged Value, so that in the generated DDL script the table name is prefixed by the owner name</p>	<a href="#">Set Table Owner/Schema</a> <sup>[1355]</sup>
<p><b>Example MySQL options</b> - To make use of foreign keys in MySQL, you must declare the table type as InnoDB</p>	<a href="#">Set MySQL Options</a> <sup>[1355]</sup>
<p><b>Example Oracle options</b> - To set additional Oracle table properties, use the table's Tagged Values</p>	<a href="#">Set Oracle Table Properties</a> <sup>[1356]</sup>

**Learn more:**

- [Create Columns](#) <sup>[1357]</sup>

#### 10.1.1.1.1.1 Set the Database Type

The most important property to set for a table (after its name) is the database type. This defines the list of data types that are available for defining columns, and also declares which dialect of DDL is generated.

**Access:** **Properties Dialog (Table element) > General page: Database**

**How To:**

Step	Action	See Also
1	Open the Property dialog for a Table element	
2	Locate the <b>Database</b> field on the General page	
3	Drop-down the list and select the required database type	
4	Save changes by clicking on the <b>Apply</b> or <b>OK</b> buttons	

**10.1.1.1.1.2 Set Table Owner/Schema**

Some relational databases enable you to assign a table to one of several schemas (or *owners*) within the same database. Enterprise Architect enables you to model this information using the *Owner* Tagged Value. By setting this optional value, you can tailor the generated DDL script, causing the table name to be prefixed by its assigned owner name.

**How To:**

Step	Action	See Also
1	Add a Tagged Value named <i>Owner</i> , to the Table element	
2	Type the owner name for this table in the <b>Value</b> field of the Tagged Value Changes are automatically saved	

**Notes:**

- For a PostgreSQL database, you should instead create a Tagged Value named OWNER TO with the corresponding value

**Learn More:**

- [How to Add a Tagged Value](#)<sup>[766]</sup>

**10.1.1.1.1.3 Set MySQL Options**

To make use of foreign keys in MySQL, you must declare the table type as InnoDB.

**How To:**

Step	Action	See Also
1	Add a Tagged Value named <b>Type</b> , to the table	
2	Set the <b>Value</b> field to <b>InnoDB</b>	

When you generate DDL for this table, the table type is included in the SQL script.

To allow for later versions of MySQL, additional table options that can be added in the same manner include:

Tag	Value (Example)
ENGINE	InnoDB
CHARACTER SET	latin1
CHARSET	latin1
COLLATE	latin1_german2_ci

#### Learn More

- [How to Add a Tagged Value](#)<sup>[766]</sup>

#### 10.1.1.1.4 Set Oracle Table Properties

To set additional Oracle table properties, you use the table's Tagged Values

#### How To:

Step	Action	See Also
1	Add one or more Tagged Values to the table, using the names provided in the <b>Property/Tag</b> column of the reference table below	
2	Specify the appropriate value for each tag  Examples are provided in the <b>Value</b> column of the reference table below	

The same properties can be added to indexes and constraints, by highlighting the index or constraint Operation and adding the appropriate Tagged Values.

#### Reference:

Property/Tag	Value
BUFFER_POOL	DEFAULT
CACHE	NOCACHE
DBVERSION	9.0.111
FREELISTS	1
GRANT OWNER1	SELECT
GRANT OWNER2	DELETE, INSERT, SELECT, UPDATE
INITIAL	65536
INITRANS	1
LOGGING	LOGGING
MAXEXTENTS	2147483645
MAXTRANS	255

Property/Tag	Value
MINEXTENTS	1
MONITORING	MONITORING
OWNER	OWNER1
PARALLEL	NOPARALLEL
PCTFREE	10
PCTINCREASE	0
PCTUSED	0
SYNONYMS	PUBLIC:TABLE_PUB;OWNER2:TABLE_OWNER2
TABLESPACE	MY_TABLESPACE
TEMPORARY	YES

### Learn More

- [How to Add a Tagged Value](#)<sup>[766]</sup>

### 10.1.1.2 Create Columns

Columns are represented in the UML Data Modeling Profile as a stereotyped attribute; that is, an attribute with the *Column* stereotype.

#### How To:

To create columns, follow the steps below:

Step	Action	See Also						
1	Right-click on the required Table in a diagram, and select the <b>Attributes</b> context menu option  The Attributes dialog displays, showing the columns of the selected Table							
2	In the <b>Name</b> field, type the column name							
3	In the <b>Data Type</b> field, click on the drop-down arrow and select the data type (ensure the Table's target database is set first; this populates the <b>Data Type</b> drop-down list)  Click on the <b>Save</b> button	<a href="#">Set the Database Type</a> <sup>[1354]</sup>  <a href="#">Oracle Data Types</a> <sup>[1361]</sup>						
4	Complete the required optional fields, listed in the reference table below							
5	Click on the <b>Column Properties</b> button  The Database Columns Properties dialog displays  Supported column properties are identified below; it is assumed that you understand which data types these properties apply to:							
	<table border="1"> <thead> <tr> <th>Property</th> <th>DBMS</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td> </td> <td> </td> <td> </td> </tr> </tbody> </table>	Property	DBMS	Notes				
Property	DBMS	Notes						

Step	Action	See Also												
	<table border="1"> <tr> <td><b>Autonum</b></td> <td>Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE</td> <td>If you require a sequence, select the AutoNum and set the value to <b>True</b> and, if necessary, define the number and increment</td> </tr> <tr> <td><b>Zerofill</b></td> <td>MySQL</td> <td></td> </tr> <tr> <td><b>Unsigned</b></td> <td>MySQL</td> <td></td> </tr> <tr> <td><b>LengthType</b></td> <td>Oracle</td> <td>Character semantics</td> </tr> </table>	<b>Autonum</b>	Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE	If you require a sequence, select the AutoNum and set the value to <b>True</b> and, if necessary, define the number and increment	<b>Zerofill</b>	MySQL		<b>Unsigned</b>	MySQL		<b>LengthType</b>	Oracle	Character semantics	
<b>Autonum</b>	Oracle MySQL SQL Server DB2 PostgreSQL Sybase ASA Sybase ASE	If you require a sequence, select the AutoNum and set the value to <b>True</b> and, if necessary, define the number and increment												
<b>Zerofill</b>	MySQL													
<b>Unsigned</b>	MySQL													
<b>LengthType</b>	Oracle	Character semantics												
6	Click on the <b>OK</b> button to return to the Attributes dialog, and then click on the <b>Save</b> button													
7	Click on the: <ul style="list-style-type: none"> <li>• <b>New</b> button to define another column or</li> <li>• <b>Close</b> button to exit from the dialog</li> </ul>													

**Reference:**

Field	Description	See also
<b>Primary Key</b>	Indicates whether the column is the primary key for this table	
<b>Not Null</b>	Indicates whether empty values are forbidden for this column	
<b>Unique</b>	Indicates whether it is forbidden for any two values of this column to be identical  The unique <i>stereotype</i> applied to an <b>index</b> ensures that no two <i>combinations</i> of values across a <i>set</i> of columns can be identical	
<b>Initial</b>	A value that can be used as a default value for this column, if required	
<b>Access</b>	Determines the column's scope ( <b>Private</b> , <b>Protected</b> or <b>Public</b> ) The default value is <b>Public</b>	
<b>Alias</b>	An alternative name for the field for display and documentation purposes	
<b>Notes</b>	Additional information necessary to document the column You can format the text using the Notes toolbar at the top of the field	

**Notes:**

- For MySQL, before creating columns you must first add ENUM and SET datatypes

**Learn more:**

- [Reorder Columns](#) <sup>[1359]</sup>
- [Data Types](#) <sup>[1359]</sup>
- [MySQL Data Types](#) <sup>[1360]</sup>
- [Options - Code Editors](#) <sup>[1528]</sup>

**10.1.1.2.1 Reorder Columns**

You can change the order in which columns are listed in a table, to define the order in which columns appear in the generated DDL that defines your database schema.

**How To:**

To change the column order, follow the steps below:

Step	Action	See Also
1	In the Columns dialog, highlight a column name in the Columns panel	
2	Click on the: <ul style="list-style-type: none"> <li>•  button to move the column up one position</li> <li>•  button to move the column down one position</li> </ul>	

**10.1.2 Data Types**

Each column that you define in your data model has a data type that is appropriate to the information being stored by that column. Data types vary from one DBMS product to another and also vary between versions of a given database product. Therefore Enterprise Architect provides you with tools to add new data types to your model repository and to convert data types between DBMS products.

**Learn more:**

- [Add New Datatype to Your Model Repository](#) <sup>[1359]</sup>
- [Map Data Types between DBMS products](#) <sup>[1361]</sup>

**10.1.2.1 Add New Datatypes**

Using Enterprise Architect's Database Datatypes screen, you can add to the set of data types that are available for a particular DBMS. This enables you to include any new datatypes that are supported by later versions of the DBMS and not yet included with Enterprise Architect.

You can also add an entire DBMS product and its built-in data types. This is helpful if you want to create a physical data model for a DBMS product that is not yet supported natively by Enterprise Architect.

**Access:** [Settings | Database Datatypes](#)

**How To:**

To add a new datatype to a DBMS product, follow the steps below:

Step	Action	See Also
1	Select the <b>Database Datatypes</b> menu option The Database Datatypes screen displays	
2	In the <b>Product Name</b> field click on the drop-down arrow and select an existing DBMS If your DBMS is not listed, you can click the <b>Add Product</b> button to add it	
3	In the <b>Datatype</b> field, type a name for the data type	
4	Select the appropriate <b>Size</b> radio button and, if appropriate, specify the default and maximum values	
5	In the <b>Common Type</b> field, click on the drop-down arrow and select a common type to which your data type applies	
6	Click on the <b>Save</b> button to create your data type	

You can transport these data types between models using Enterprise Architect's Reference Data

**Learn more:**

- [Add MySQL Data Types](#) <sup>[1360]</sup>
- [Customize Oracle Data Types](#) <sup>[1361]</sup>
- [Export Data Types as Reference Data](#) <sup>[238]</sup>
- [Import Data Types as Reference Data](#) <sup>[240]</sup>

### 10.1.2.1.1 MySQL Data Types

MySQL supports the **ENUM** and **SET** data types, which must be added to your Enterprise Architect model before you can use them as the types for columns.

**Access:** [Settings | Database Datatypes](#)

**How To:**

To add the ENUM and SET data types for MySQL, follow the steps below:

Step	Action	See Also
1	Select the <b>Database Datatypes</b> menu option The Database Datatypes dialog displays	
2	In the <b>Product Name</b> field select <b>MySQL</b>	
3	Add the data types <b>ENUM</b> and <b>SET</b>	

When using these data types later in a Column's **Initial** field, type the values as a comma-separated list, in the format:

`('one','two','three')`

If one value is the default, use the format:

('one','two','three') default 'three'

### 10.1.2.1.2 Oracle Data Types

The Oracle data types **NUMBER** and **VARCHAR** have additional properties that you can model.

#### Reference:

Data Type	Detail	See also
<b>NUMBER</b>	<p>The <b>NUMBER</b> data type requires precision and scale properties</p> <p>The <b>Precision</b> and <b>Scale</b> fields are displayed on the Attributes dialog when the data type is set to <b>NUMBER</b>; if you enter information into these fields, it is displayed on your diagrams</p> <p>For example:</p> <p>create NUMBER by setting Precision = <b>0</b> and Scale = <b>0</b>            create NUMBER(8) by setting Precision = <b>8</b> and Scale = <b>0</b>            create NUMBER(8,2) by setting Precision = <b>8</b> and Scale = <b>2</b></p>	
<b>VARCHAR</b>	<p>Oracle <b>VARCHAR2(15 CHAR)</b> and <b>VARCHAR2(50 BYTE)</b> data types can be created by adding the Tagged Value <b>LengthType</b> with the value <b>CHAR</b> or <b>BYTE</b></p>	

#### Learn more:

- [How to Add a Tagged Value](#)<sup>766</sup>

### 10.1.2.2 Map Data Types between DBMS products

One of the advantages of using visual models to hide implementation details is that you can more easily change the target technology or platform when required. Enterprise Architect provides tools such as Datatype Mapping to help you do this for physical data models. For example, your project might involve migration from one DBMS platform to another.

After reverse engineering your database into a physical data model, you must remap the data types before generating the schema for the new DBMS product. Enterprise Architect provides a set of default mappings to help you automate the conversion process. However, you might want to customize the default mappings to suit your specific project requirements.

**Access:** **Settings | Database Datatypes: Datatype Map**

#### Use to:

- Streamline conversion of one implementation-specific database product to another
- Map data types from one DBMS product to another
- Maximize portability of your database designs
- Customize default mappings

#### How To:

To map data type sizes between databases, follow the steps below:

Step	Action	See Also
1	In the <b>From Product Name</b> field, click on the drop-down arrow and select the DBMS product to map data types from  The <b>Defined Datatypes for Databases</b> panel displays all the defined data types for the product and, where appropriate, their sizes and values	
2	Click on the data type to map - this must have a defined size unit and value  The <b>Datatype</b> and <b>Common Type</b> fields under the <b>From Product Name</b> field display this data type	
3	In the <b>To Product Name</b> field, click on the drop-down arrow and select the DBMS product to map data types to  The <b>Datatype</b> and <b>Common Type</b> fields under this field display the corresponding values to those in the fields for the 'From' product	
4	In the <b>Size</b> panel, click on the radio button for the appropriate size unit and type the default values in the corresponding data fields	
5	Click on the <b>Save</b> button to save the mapping.	

You can repeat this process for all the data types you want to map.

Once you are satisfied with the data type mappings, you can then convert either individual tables or an entire package of tables to the new target DBMS product.

#### 10.1.2.2.1 Data Type Conversion Procedure

Once a database schema has been set up on an Enterprise Architect diagram (either by importing through ODBC or manually setting up the tables), the DBMS can be changed to another type and the column datatypes are mapped accordingly.

To map the DBMS type of a table to another DBMS type

##### How To:

Step	Action	See Also
1	Double-click on the Table element in a diagram  The Table Properties dialog displays	
2	The <b>Database</b> field shows the current DBMS for this table.	
3	To map the column datatypes to another DBMS, select the target from the <b>Database</b> drop-down and click on the <b>Apply</b> button.	
4	The datatypes are converted to match those of the new DBMS, and these are reflected in any DDL generated from this table.	

#### 10.1.2.2.2 Data Type Conversion for a Package

The DBMS Package procedure or mapper enables you to convert a package of database tables from one DBMS type to another DBMS type, as well as providing the ability to change the ownership of tables.

**Access:** [Project Browser Package Context Menu | Code Engineering | Reset DBMS Options > Manage DBMS Options](#)

**How To:**

To map the DBMS types of a package to another DBMS type, follow the steps below:

Step	Action	See Also
1	In the <b>Current DBMS</b> field, click on the drop-down arrow and select the current DBMS	
2	In the <b>New DBMS</b> field click on the drop-down arrow and select the target DBMS	
3	Select the <b>Convert DBMS Type</b> checkbox	
4	If there are child packages that also require changing, select the <b>Process Child Packages</b> checkbox	
5	Click on the <b>OK</b> button All tables in the selected packages are mapped to the new DBMS	

To change the owner of the table or all of the tables in a package, follow the steps below:

Step	Action	See Also
1	In the <b>New Owner</b> field, type the name of the new table owner	
2	In the <b>Current Owner</b> field, click on the drop-down arrow and select either: <ul style="list-style-type: none"> <li>The current owner to change, or</li> <li><b>&lt;All&gt;</b> to change the ownership of all tables in the package to the name you typed in the <b>New Owner</b> field</li> </ul>	
3	Select the <b>Change Table Owner</b> checkbox.	
4	If there are child packages that also require changing, select the <b>Process Child Packages</b> checkbox	
5	Click on the <b>OK</b> button The ownership changes for all Tables in the selected packages that have the specified current owner	

**Learn More:**

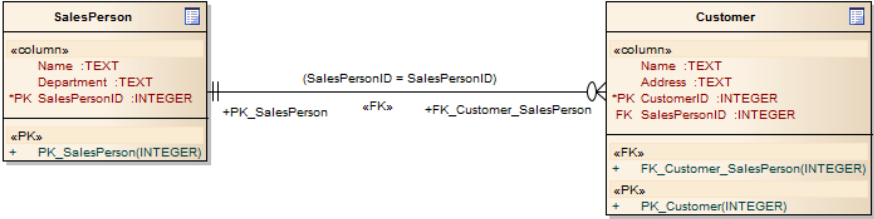

- [Set Table Owner](#)<sup>[1355]</sup>
- [Diagram Properties](#)<sup>[571]</sup>

**10.1.3 Database Keys**

Two types of key are used to access tables in a relational database: *Primary Keys* and *Foreign Keys*.

- A Primary Key uniquely identifies a record in a table
- A Foreign Key accesses data in some other related table via its Primary Key

**Topics:**

Topic	Detail	See also
<b>General Usage</b>	In Enterprise Architect, Primary Keys and Foreign Keys are represented by stereotyped UML attributes and operations  The following example shows a data model that includes both Primary Key and Foreign Key columns	
<b>Example</b>	 <p>A Physical data model defined using a UML Profile that includes Primary and Foreign Keys</p>	
<b>Primary Key</b>	In each table, one of the columns is designated as the Primary Key, indicated by the <i>PK</i> label beside the column, and a corresponding Primary Key Operation	
<b>Foreign Keys</b>	Foreign Keys are shown denoted by the <i>FK</i> labels	
<b>Association Notation</b>	The Association that defines a Foreign Key relationship between <i>SalesPerson</i> and <i>Customer</i> uses the <b>Information Engineering</b> notation; this is one of three notations that Enterprise Architect supports to help Data Modelers distinguish cardinality in relationships  Enterprise Architect also supports: <ul style="list-style-type: none"> <li>• IDEF1X notation</li> <li>• UML notation</li> </ul>	

Learn more:

- [Primary Keys](#)<sup>[1364]</sup>
- [Foreign Keys](#)<sup>[1367]</sup>

**10.1.3.1 Primary Key**

A Primary Key uniquely identifies a record in a table and can consist of one or more columns.

Topics:

Topic	Detail	See also
<b>Types of Primary Key</b>	In Enterprise Architect, a: <ul style="list-style-type: none"> <li>• Simple Primary Key (single column) is defined as the attribute of a stereotyped operation</li> <li>• Complex Primary Key (several columns) is defined as the stereotyped operation itself</li> </ul> <p>For example, a column <i>LastName</i> might not be unique within a table, so a Primary Key is created from the <i>LastName</i>, <i>FirstName</i> and <i>DateOfBirth</i> columns</p>	

**Learn more:**

- [Create a Primary Key](#)<sup>[1365]</sup>
- [Define a Primary Key Name Template](#)<sup>[1366]</sup>
- [Foreign Keys](#)<sup>[1367]</sup>

**10.1.3.1.1 Create a Primary Key****How To:**

To define a simple Primary Key consisting of a single column, follow the steps below:

Step	Action	See Also
1	Right-click on the table in a diagram and select the <b>Attributes</b> context menu option The Attributes dialog displays	
2	Select the column that makes up the Primary Key	
3	Select the <b>Primary Key</b> checkbox and click on the <b>Save</b> button A stereotyped operation is automatically created; it is this operation that defines the Primary Key for the table To remove a Primary Key, simply delete this operation	

To define a complex Primary Key, consisting of more than one column, follow the steps below:

Step	Action	See Also
1	Follow the steps above to create a Simple Primary Key; it doesn't matter which column you choose	
2	Right-click on the table in a diagram and select the <b>Operations</b> context menu option The Operations dialog displays	
3	Select the Primary Key operation (its name begins with <b>PK_</b> ) and then click on the <b>Column</b> tab	
4	Click on the <b>New</b> button to add a column to the Primary Key, select a column from the <b>Column Name</b> list box, and then click on the <b>Save</b> button	
5	Click on the <b>Hand</b> buttons (up and down arrow) to change the order of columns in the Primary Key, if necessary	

**Learn more**

- [Creating Non-Clustered Primary Keys for SQL Server](#)<sup>[1366]</sup>

### 10.1.3.1.2 Define Primary Key Name Template

Enterprise Architect enables you to customize the way Primary Keys are named by default. This is helpful if you have specific modeling conventions that stipulate how Primary Keys are documented.

By changing the **Primary Key Name Template**, you adjust the name that Enterprise Architect assigns to the UML Operation that represents the Primary Key.

**Access:** [Tools | Options | Source Code Engineering | Code Editors: DDL Name Templates](#)

#### **How To:**

To define the name template for a Primary Key, follow the steps below:

Step	Action	See Also
1	Click on the <b>DDL Name Templates</b> button The DDL Name Template dialog displays, showing the default name templates	
2	Edit or replace the template in the <b>Primary Key Name Template</b> field For example, if you want to display the Primary Key description as <i>PK_tablename_columnname</i> then change the <b>Primary Key Name Template</b> field to <i>PK_%tablename%_%columnname%</i>	
3		
4	Click on the <b>Save</b> button	

### 10.1.3.1.3 SQL Server Non Clustered Keys

When you create a primary key in SQL Server, it is created with a 'clustered index' by default. Therefore when you model a primary key for SQL Server in an Enterprise Architect data model, the corresponding DDL creates a clustered index for that primary key by default.

Clustered indexes provide improved performance for accessing the column(s) involved, but only one clustered index is allowed per table.

In some situations, you might be more interested in the performance of columns other than the Primary Key, and therefore must change the default assignment of the clustered index. Enterprise Architect allows you to model this.

#### **How To:**

To define a Primary Key as non-clustered for a SQL Server table, follow the steps below:

Step	Action	See Also
1	Right-click on the table in a diagram and select the <b>Operations</b> context menu option The Table Operations dialog displays	

Step	Action	See Also
2	Highlight the Primary Key Operation and click on the <b>Extended Properties</b> button The <b>Database Operation Properties</b> dialog displays	
3	Select the <b>SQL Server Non Clustered Primary Key</b> checkbox	
4	Click on the <b>Save &amp; Close</b> button	

Subsequently, you can model an index for that table and define it as clustered instead.

#### Learn more

- [Indexes](#)<sup>[1372]</sup>

### 10.1.3.2 Foreign Key

A Foreign Key accesses data in some other related table via its Primary Key.

#### Topics:

Topic	Detail	See also
<b>The nature of Foreign Keys</b>	A Foreign Key consists of a collection of columns (UML Attributes) that together have some operational meaning (they enforce a relationship to the Primary Key in the other table)	
<b>Modeling</b>	Foreign keys are modeled in Enterprise Architect as operations with the stereotype <b>FK</b> The operation's parameters become the columns involved in the key	
<b>Necessity of Use</b>	It is not necessary to define a Foreign Key just to access another table through its Primary Key  Foreign Keys are a feature of some database management systems, providing 'extras' such as referential integrity checking that prevents the deletion of a record if its Primary Key value exists in some other table's Foreign Key  The same thing can be achieved programmatically	

#### Learn more

- [Create a Foreign Key](#)<sup>[1367]</sup>
- [Composite Foreign Key](#)<sup>[1370]</sup>
- [Define a Foreign Key Name Template](#)<sup>[1371]</sup>

#### 10.1.3.2.1 Create a Foreign Key

#### How To:

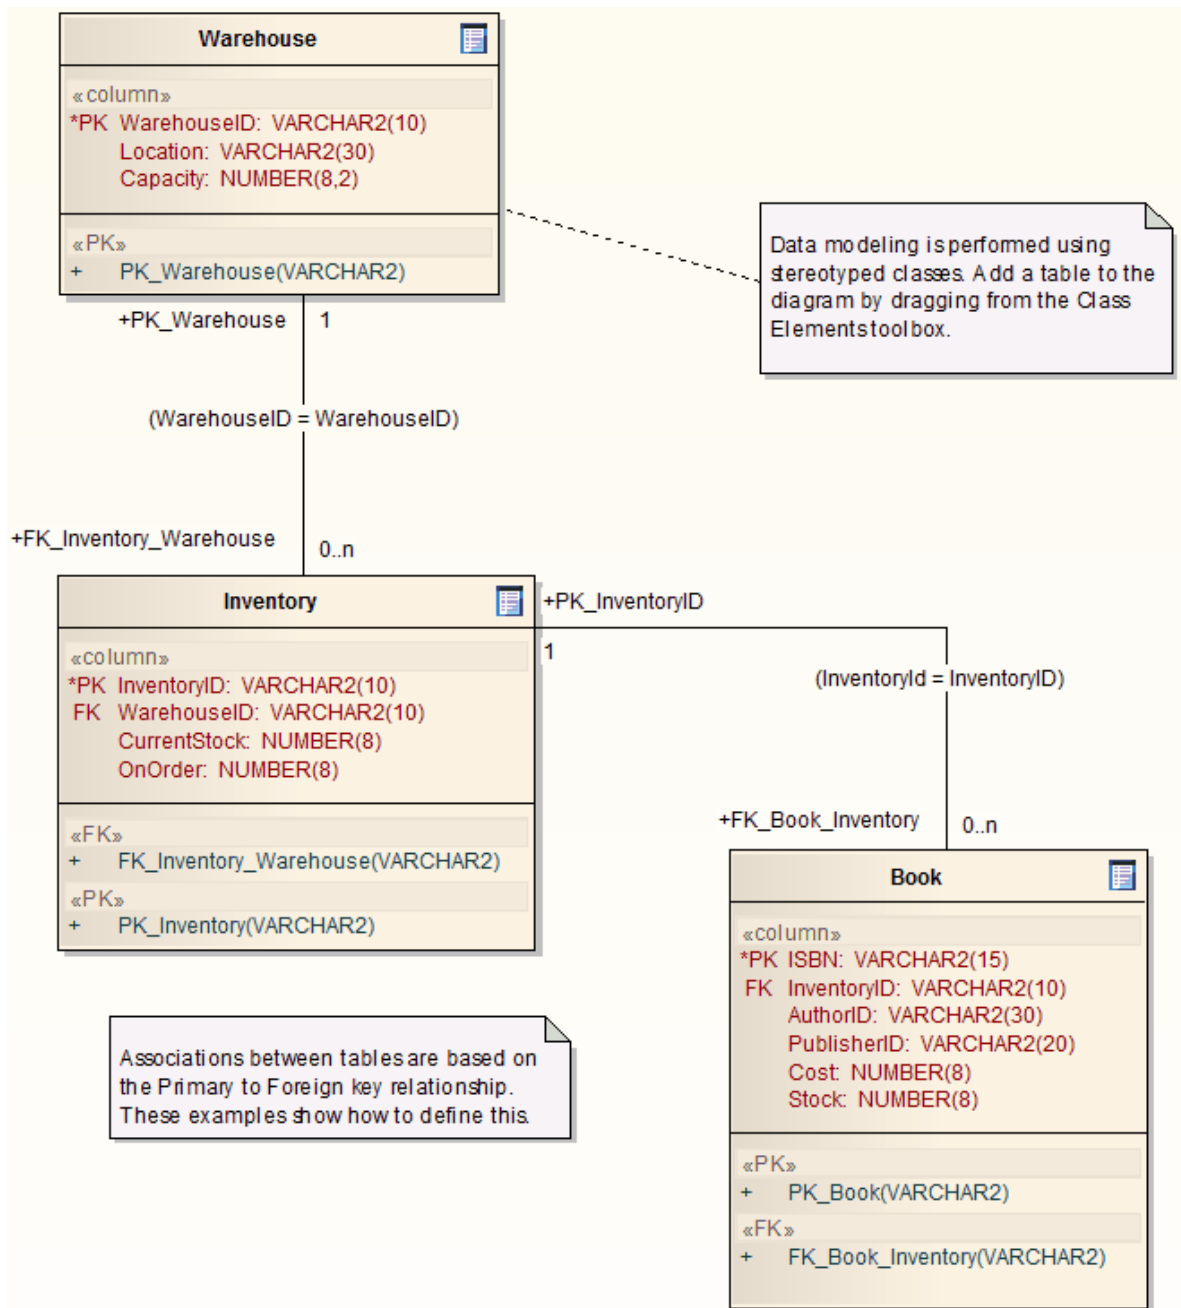

To create a Foreign Key, follow the steps below:

Step	Action	See Also
1	Locate the required Tables in a diagram Both tables must have <b>defined database types</b>	<a href="#">Set The Database Type</a> <sup>[1354]</sup>
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the other Table (target)	
4	Right-click on the connector and select the <b>Foreign Keys</b> context menu option The Foreign Key Constraint dialog displays	
5	The default foreign key name is set by the Foreign Key Name Template To change the name to something other than the default provided by the template, select the <b>Override Template</b> checkbox and edit the foreign key name	<a href="#">Define Foreign Key Name Template</a> <sup>[1371]</sup>
6	In the <b>Source:</b> panel and the <b>Target:</b> panel, click on the name of each of the two columns involved in the Foreign Key relationship	
7	From the <b>On Delete</b> and/or <b>On Update</b> combo boxes, select the appropriate referential integrity constraint	
8	Click on the <b>Apply</b> or <b>OK</b> buttons to automatically generate the Foreign Key operations	

**Example:**

The example below shows how a Foreign Key looks in a diagram:

**Notes:**

- For MySQL databases, Foreign Keys are supported for InnoDB tables only.

InnoDB is the default MySQL storage engine as of version 5.5; if you are modeling a MySQL database that is earlier than version 5.5 and you want to use Foreign Keys, you must ensure the **Engine** Tagged Value is set to **InnoDB**

**Learn More:**

- [Set MySQL Options](#) [1355]

### 10.1.3.2.2 Composite Foreign Key

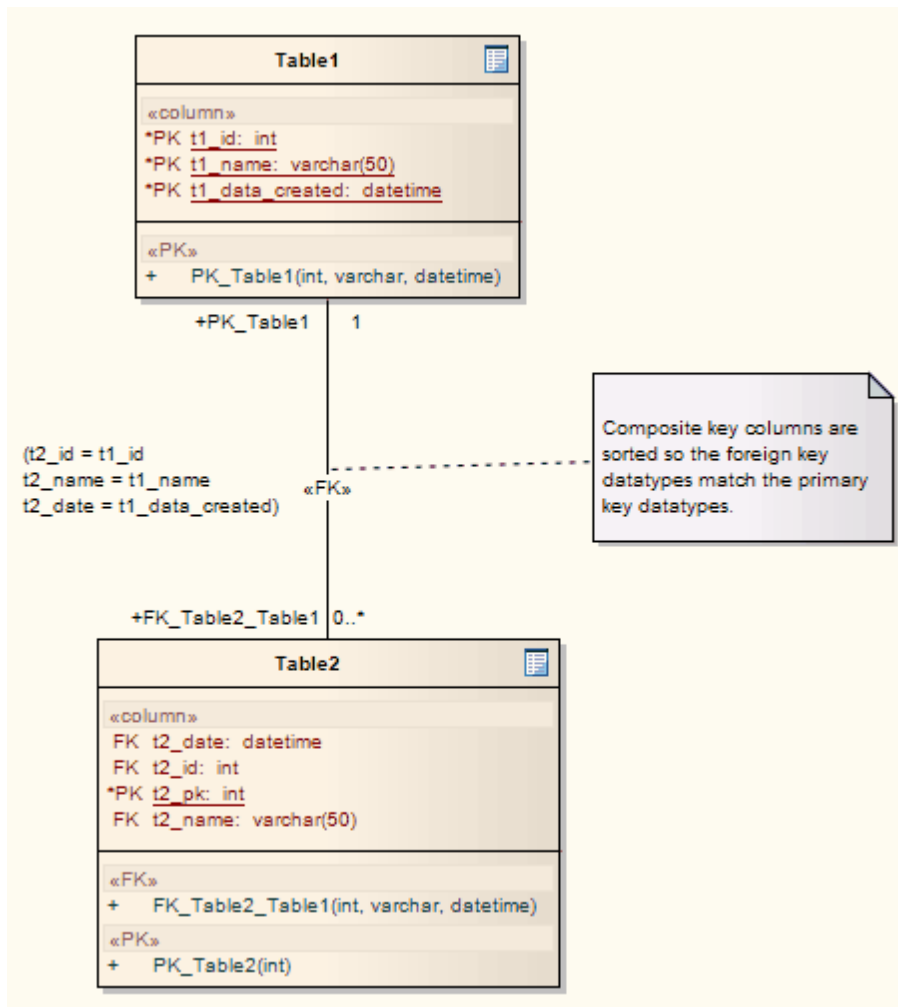

#### How To:

To create a composite Foreign Key, follow the steps below:

Step	Action	See Also
1	Locate the required Tables in a diagram Both tables must have <b>defined database types</b>	<a href="#">Set The Database Type</a> <sup>[1354]</sup>
2	Select an <i>Associate</i> connector in the Class Relationships page of the Toolbox	
3	Click on the Table to contain the Foreign Key (source) and draw the connector to the other Table (target)	
4	Right-click on the connector and select the <b>Foreign Keys</b> context menu option The Foreign Key Constraint dialog displays	
5	The default foreign key name is set by the Foreign Key Name Template To change the name to something other than the default provided by the template, select the <b>Override Template</b> checkbox and edit the foreign key name	<a href="#">Define Foreign Key Name Template</a> <sup>[1371]</sup>
6	In the <b>Source:</b> panel and the <b>Target:</b> panel, click on the names of the required columns in each panel	
7	Click on the <b>OK</b> button The Foreign Key columns are sorted according to data type to match the data types of the targeted composite Primary Key	
8	If required, you can change the order of the key columns by clicking on the  and  buttons	

#### Example:

The example below shows how a Composite Foreign Key looks in a diagram:

### 10.1.3.2.3 Define Foreign Key Name Template

Enterprise Architect enables you to customize the way Foreign Key relationships are named by default. This is helpful if you have specific modeling conventions that stipulate how Foreign Keys are documented.

By changing the **Foreign Key Name Template**, you adjust the name that Enterprise Architect assigns to the Association connector and the Operation that define the Foreign Key relationship.

**Access:** [Tools | Options | Source Code Engineering | Code Editors: DDL Name Template](#)

#### How To:

To define the name template for a Foreign Key, follow the steps below:

Step	Action	See Also
1	Select the <b>Code Editors</b> menu option The Code Editors page of the Options dialog displays	
2	Click on the <b>DDL Name Template</b> button	

Step	Action	See Also
	The DDL Name Template dialog displays, showing the default name templates	
3	<p>Edit or replace the name template in the <b>Foreign Key Name Template</b> field</p> <p>For example, if you want to display the Foreign Key description as</p> <p><i>FK_foreigntablename_FKcolumnname_primarytablename_PKcolumnname</i></p> <p>then change the <b>Foreign Key Name Template</b> field to</p> <p><i>FK_%foreigntablename%_%fkcolumnname%_%primarytablename%_%pkcolumnname%.</i></p>	
4	Click on the <b>Save</b> button.	

### 10.1.4 Stored Procedures

#### Topics:

Topic	Detail	See also
<b>What is a Stored Procedure?</b>	<p>A stored procedure is a group of SQL statements that form a logical unit and perform a particular task. Stored procedures are used to encapsulate a set of operations or queries to execute on a database server. You can compile and execute stored procedures with different parameters and results, and they can have any combination of input, output and input/output parameters.</p> <p>Enterprise Architect models stored procedures using stereotyped UML Classes and Operations.</p>	

#### Learn more

- [Create a Stored Procedure](#)<sup>[1373]</sup>

### 10.1.5 Indexes

#### Topics:

Topic	Detail	See also
<b>What is an Index?</b>	<p>An index is a sorted look-up for a table. When it is known in advance that a table must be sorted in a specific order, it is usually worth the small processing overhead to always maintain a sorted look-up list rather than sort the table every time it is required. In Enterprise Architect, an index is modeled as a stereotyped operation. On generating DDL, the necessary instructions for generating indexes are written to the DDL output.</p>	

#### Learn more

- [Create an Index](#)<sup>[1373]</sup>

### 10.1.5.1 Create a Stored Procedure

#### How To:

To create a stored procedure as a UML Class, follow the steps below.

Step	Action	See Also
1	Open the required diagram.	
2	From the <b>Data Modeling</b> page of the <b>Toolbox (More tools   Data Modeling)</b> drag the <b>Procedure</b> icon onto the diagram.	
3	If the <b>Properties</b> dialog does not automatically display, double-click on the element.	
4	In the <b>Database</b> field click on the drop-down arrow and select the target DBMS to model The field displays the default database if it has already been set	
5	In the <b>Procedure definition</b> field, type the entire procedure text.	
6	Click on the <b>OK</b> button.	
7	To rename the stored procedure, select the element, press <b>(F2)</b> and type the new name.	

#### Example:

### 10.1.5.2 Create an Index

#### How To:

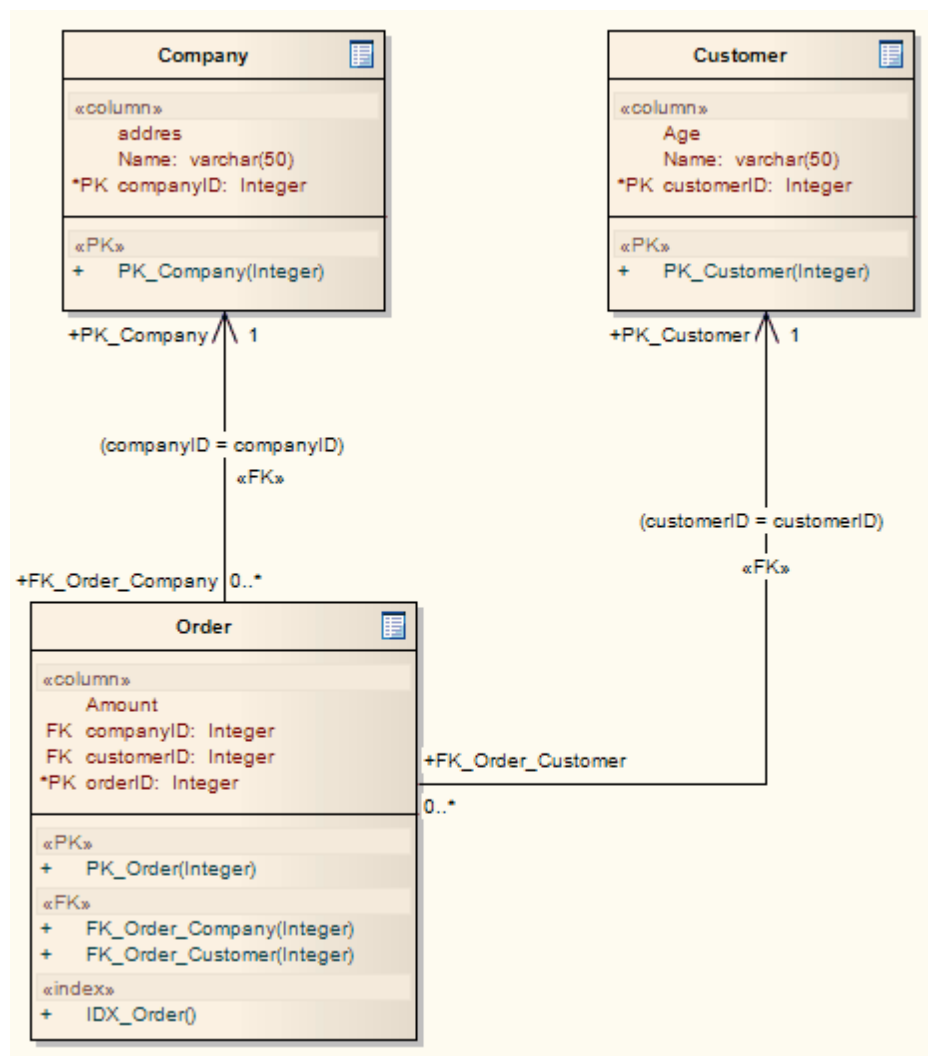

To create an Index, follow the steps below:

Step	Action	See Also
1	Ensure that the column(s) to be used in the index have already been defined in the table.	
2	Right-click on the required table either in a diagram or in the <b>Project Browser</b> .	
3	Select the <b>Operations</b> context menu option The <b>Operations</b> dialog displays.	
4	Add an operation with a name such as <i>IDX_CustomerID</i> . The <i>IDX_</i> prefix is optional, but helps to identify the operation.	

Step	Action	See Also
5	In the <b>Stereotype</b> field for the operation, select <b>index</b> ( <b>check</b> and <b>unique</b> are also supported).	
6	Click on the <b>Column</b> tab.	
7	Select the required columns from the <b>Columns</b> drop-down list in the required order	
8	Click the <b>Save</b> button to save changes.	

### Example:

In the example below, the *Order* element shows how an index looks in a diagram:

### Notes:

- The **unique** characteristic applied to a single column ensures that no two data values in the column can be identical. The **unique** stereotype applied to an index ensures that no two combinations of values across a set of columns can be identical

Learn more:

- [Define Columns](#)<sup>[1357]</sup>

## 10.1.6 Triggers

Topics:

Topic	Detail	See also
<b>What is a Trigger?</b>	A trigger is an operation automatically executed as a result of the modification of data in the database, and usually ensures consistent behavior of the database. For example, a trigger might be used to define validations that must be performed every time a value is modified, or might perform deletions in a secondary table when a record in the primary table is deleted. In Enterprise Architect, a trigger is modeled as a stereotyped operation.	

Learn more

- [Create a Trigger](#)<sup>[1375]</sup>

### 10.1.6.1 Create a Trigger

How To:

To create a Trigger, follow the steps below

Step	Action	See Also
1	Locate the required table in either a diagram or the <b>Project Browser</b>	
2	Use the context menu to open the <b>Operations</b> dialog	
3	Add an operation with a name such as <i>TRG_OnCustomerUpdate</i> The <i>TRG_</i> prefix is optional, but helps to identify the operation	
4	In the <b>Stereotype</b> field select <b>trigger</b>	
5	Click the <b>Save</b> button	
6	Select the trigger operation, then the <b>Behavior</b> tab	
7	In the <b>Initial Code</b> field, enter the entire trigger code including the <i>CREATE_TRIGGER</i> statement	
8	Click the <b>Save</b> button	

## 10.1.7 Check Constraints

### Topics:

Topic	Detail	See also
<b>What is a Check Constraint?</b>	A <i>Check Constraint</i> enforces domain integrity by limiting the values that are accepted by a column.	

### Learn more:

- [Create a Check Constraint](#)<sup>[1376]</sup>

### 10.1.7.1 Create a Check Constraint

#### How To:

To create a Constraint, follow the steps below:

Step	Action	See Also
1	Locate the required table in either a diagram or the <b>Project Browser</b>	
2	Use the context menu to open the <b>Operations</b> dialog	
3	Add an operation with a name such as <i>CHK_ColumnName</i> The <i>CHK_</i> prefix is optional, but helps to identify the operation	
4	In the <b>Stereotype</b> field select <b>check</b>	
5	Click the <b>Save</b> button	
6	Select the check constraint operation, then the <b>Behavior</b> tab	
7	In the <b>Initial Code</b> field, enter the entire check constraint clause (for example, <b>col1 &lt; 1000</b> )	
8	Click on the <b>Save</b> button	

## 10.1.8 Views

### Topics:

Topic	Detail	See also
<b>What is a Database View?</b>	A Database View defines a subset of the database, aggregated into a dynamic, 'virtual' table'. The information presented by a Database View is not physically replicated, rather it is automatically derived based on the query that defines the view.  Enterprise Architect models Database Views as stereotyped UML Classes.	

### Learn more

- [Create a View](#)<sup>[1377]</sup>

### 10.1.8.1 Create a View

#### How To:

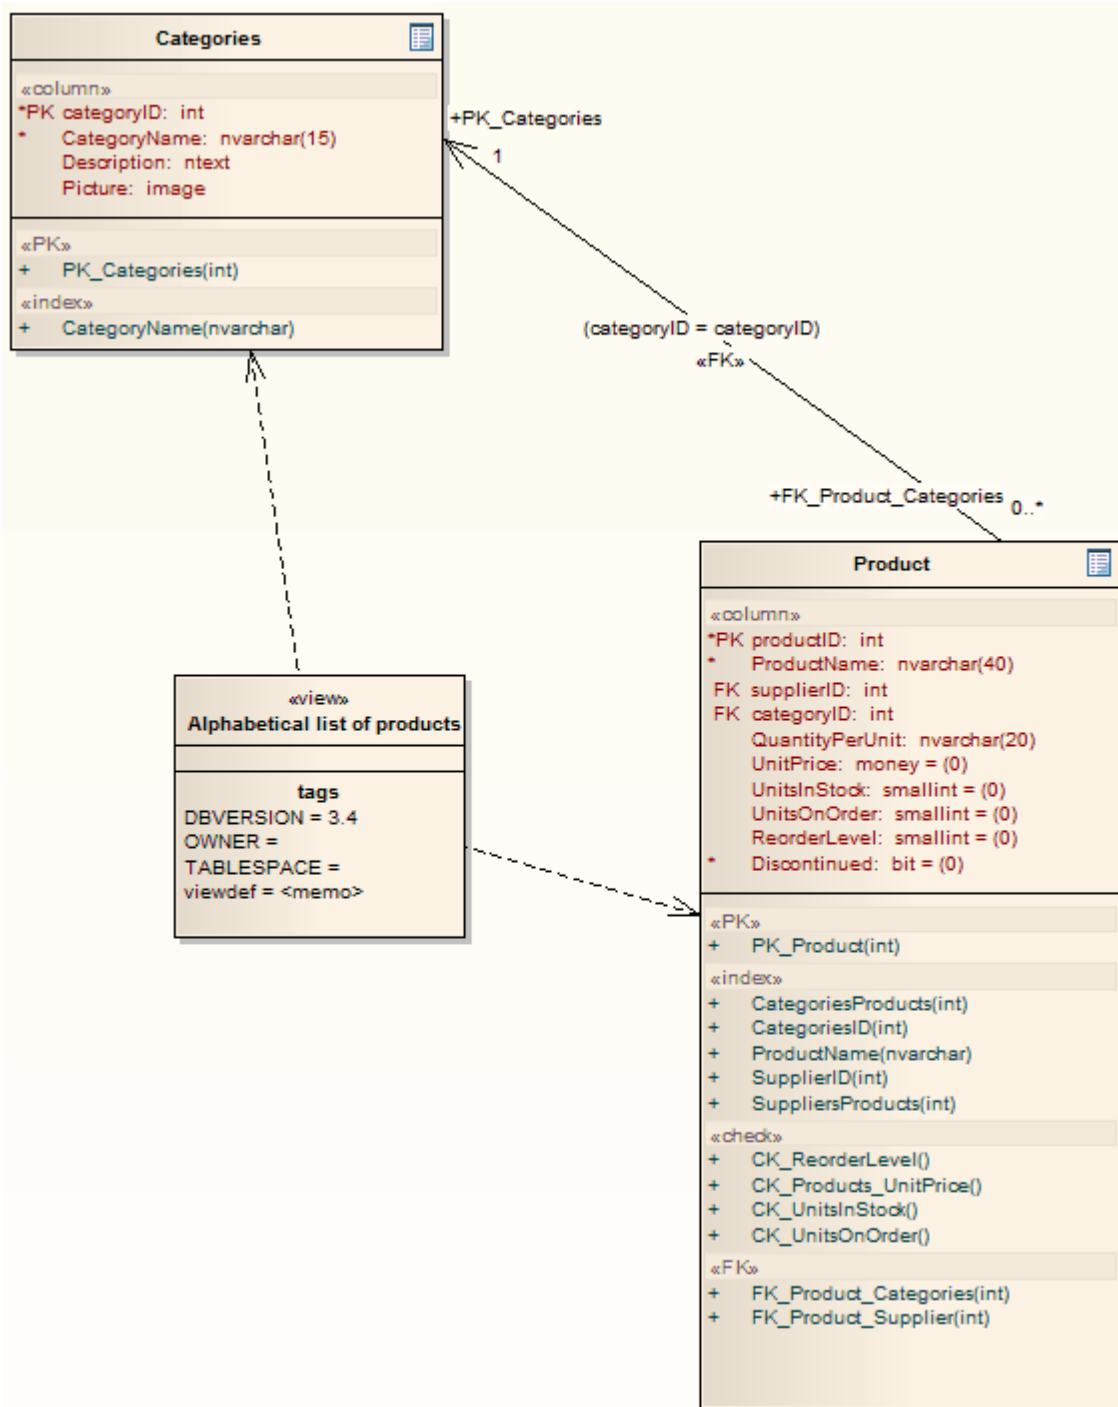

To create a database View, follow the steps below:

Step	Action	See Also
1	On the <b>Data Modeling</b> page of the <b>Toolbox (More tools   Data Modeling)</b> , drag the <b>View</b> icon onto your Data Modeling diagram	
2	If the <b>View Properties</b> dialog does not immediately display, double-click on the element	
3	From the <b>Database</b> drop-down list, select the target DBMS to model. The default database displays if it has already been set	
4	Click on the <b>OK</b> button	
5	To rename the View, select the element, press <b>(F2)</b> and type the new name	

To create the View definition, follow the steps below

Step	Action	See Also
1	Create a Dependency connector from the View to the table or tables on which the View depends	
2	Double-click on the View to display the <b>Properties</b> dialog The tables are now listed in the <b>Dependencies</b> field	
3	In the <b>View definition field</b> , type the full view definition The <b>code editor</b> provides intellisense for basic SQL keywords and functions	<a href="#">Code Editor</a> <sup>[1403]</sup>
4	Click on the <b>OK</b> button to save your definition	

#### Example:

**Notes:**

- The View definition and certain other parameters are held as Tagged Values. The View definition is held in the *viewdef* memo Tagged Value, as shown in the following example diagram. You can select and view the *viewdef* Tagged Value in the **Tagged Values** window, and include it in RTF reports by inserting the **valueOf(viewdef)** field in the *Package::Element* or *Element::Tagged Values* sections

**Learn More:**

- [Tagged Values](#) <sup>764</sup>

- [valueOf\(viewdef\)](#)<sup>[1786]</sup>

### 10.1.9 Oracle Packages

#### How To:

To create an Oracle package, follow the steps below:

Step	Action	See Also
1	Add a Class element to your data model.	
2	Open the Properties dialog for the element and, in the <b>Stereotype</b> field, type the value <b>Package</b> .	
3	For the package specification, create an Operation with the name <i>Specification</i> and with no return type.	
4	Open the Properties dialog for the <i>Specification Operation</i> and, on the <b>Behavior</b> tab, type the entire package specification into the Initial Code field.	
5	For the package body, create an Operation with the name <i>Body</i> and with no return type.	
6	Open the <b>Properties</b> dialog for the <i>Body Operation</i> and, on the <b>Behavior</b> tab, type the entire package body into the <b>Initial Code</b> field.	

#### Learn more

- [How to Use the Initial Code Field](#)<sup>[713]</sup>

### 10.1.10 Default Constraints

*Default Constraints* only apply to SQL Server, and are supported to maintain compatibility with earlier versions.

**Access:** **Table context menu | Operations**

#### Use to:

- Create a default constraint

#### How to:

To create a Default Constraint using the Operations Properties dialog, follow the steps below:

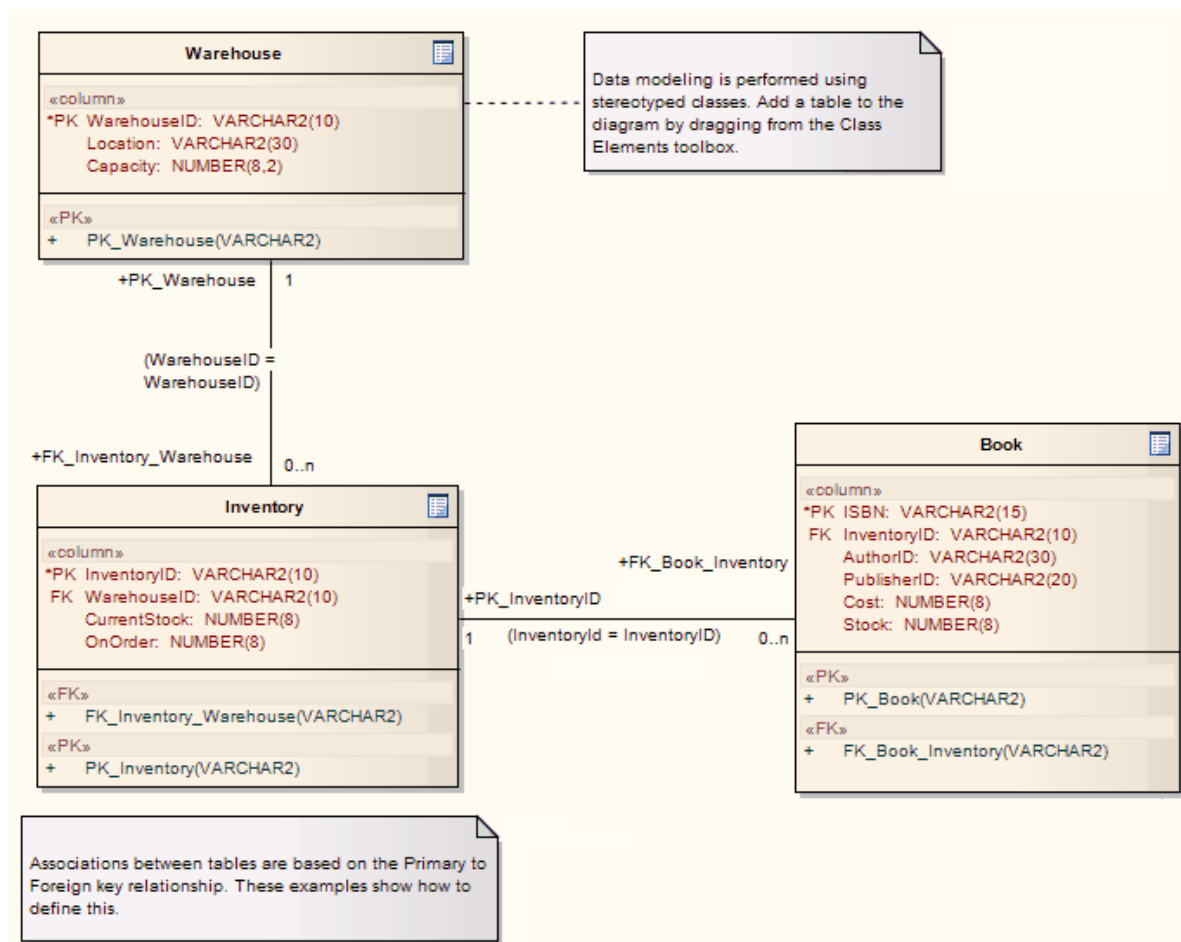

Step	Action
1	In the <b>Name</b> field, type the new operation name <b>DF_&lt;ColumnName&gt;</b> The <b>DF_</b> is optional, but helps to identify the operation
2	In the <b>Stereotype</b> field type or select the value <b>default</b>
3	Click on the <b>Save</b> button

Step	Action
4	In the <b>Operations</b> list, click on the default operation name, then click <b>Column</b> in the left panel
5	Select the appropriate column from the <b>Column Name</b> drop down list
6	Click on <b>Behavior</b> in the left-hand panel
7	In the <b>Initial Code</b> field, type the default value
8	Click on the <b>Save</b> button

### 10.1.11 A Data Model Diagram

An example of a *Data Model* diagram is provided below, showing three tables that are linked on *primary to foreign* key pairs with associated multiplicity.

#### Example:

## 10.2 Import Database Schema

Analysis of legacy database systems is possible using Enterprise Architect's reverse engineering capabilities. By connecting to a live database via ODBC, you can import the database schema into a standard UML model. Subsequent imports enable you to maintain synchronization between the data model and the live database.

Enterprise Architect supports importing database tables from an ODBC data source. Tables are imported as stereotyped Classes with suitable data definitions for the source DBMS.

### How To:

To import database schema and objects, follow the steps below

Step	Action	See Also
1	Select any package in the Logical View	
2	<p>To import into:</p> <ul style="list-style-type: none"> <li>The package only, right-click on the package to display the context menu, and select the <b>Code Engineering   Import DB Schema from ODBC</b> menu option</li> <li>A diagram, right-click on the diagram in the selected package to open the context menu, and select the <b>Import DB schema from ODBC</b> menu option</li> </ul> <p>The Import DB Schema from ODBC Source dialog displays</p>	
3	<p>In the <b>Database</b> field, click on the ( ... ) (<b>Browse</b>) button and select a suitable ODBC data source from the ODBC dialog (ODBC must be installed and configured on your machine for this to work correctly)</p> <p>When you have selected the data source, the <b>Database</b> field shows the DBMS, the database server ID and the database name, separated by full stops; that is:</p> <p><i>dbms.dbserver.database.</i></p>	<a href="#">Select a Suitable Data Source</a> <small>[1383]</small>
4	<p>You can filter objects to be retrieved from the database by schema or owner</p> <p>In the <b>Schema/Owner</b> field, type the schema/owner as a single entry, or as a comma-separated list</p> <p>The filter is useful for databases that support multiple schemas or owners, such as SQL Server 2005/2008, Oracle, PostgreSQL and DB2 Express</p> <p>By default, when importing database objects from Oracle, Enterprise Architect inserts the Oracle user name in this field to avoid unnecessary retrieval of large numbers of objects not owned by that user</p>	
5	<p>In the <b>Filter</b> panel, select the appropriate checkboxes for additional items to include in the import</p> <p>Select the appropriate checkboxes to import system tables and views, user views, triggers and/or Oracle packages</p> <p>If you select to import User Functions and/or User Sequences as individual Classes, then they are imported as separate elements and the Properties dialog is solely concerned with the Function or Sequence definition; for Stored Procedures, always select this option</p>	

Step	Action	See Also
	If you select to import User Functions and/or User Sequences as Class operations, then they are imported as operations (methods) and you view and edit them through the Operations Properties dialog of the parent Class	
6	In the Synchronization panel, select the appropriate option to determine whether the existing Classes are to be synchronized, or the database objects imported as new objects  If you select the <b>Synchronize existing classes</b> option, also select the appropriate checkboxes to determine whether model comments, column default values and/or table constraints are to be retained or overwritten with the comments, values and constraints of the imported objects	
7	Click on the <b>Import</b> button to start the import	
8	Select the database objects to import	<a href="#">Select Tables</a> <sup>[1383]</sup> <a href="#">Imported Class Elements</a> <sup>[1383]</sup>

**Notes:**

- Import of stored procedures and views is supported for: DB2; SQL Server; Firebird/Interbase; Informix; Ingres; Oracle 9i, 10g and 11g; MySQL; SQLite, PostgreSQL; Sybase Adaptive Server Enterprise (ASE) and Sybase Adaptive Server Anywhere (ASA)
- If you are importing database schema from an MS Access Jet 4.0 database, please ensure that you have selected the **Use Jet 4.0** checkbox on the General page of the Options dialog, otherwise the Jet 3.5 routines are loaded; you must restart Enterprise Architect after selecting the checkbox
- Enterprise Architect requires **32-bit ODBC** drivers to connect to a repository through ODBC; to set up the ODBC configuration on **64-bit** clients, run the 32-bit ODBC Data Source Administrator from C: \Windows\SysWOW64\odbcad32.exe
- The ODBC connection should use the ODBC driver available from the DBMS vendor, such as MySQL's ODBC driver for MySQL, and Oracle's ODBC driver for Oracle; drivers provided by third-party vendors are not supported, including the Microsoft ODBC driver for Oracle
- If setting up a ODBC connection for reverse engineering, the default settings are sufficient
- Additional data types are available from the Datamodeling Data Types section of the Resources page on the Sparx Systems website
- For importation, you can select the **Tools | Database Engineering | Import DB Schema from ODBC** menu option as an alternative
- It is only possible to import into a diagram if it is in the selected package - if a diagram from another package is open, a message displays to give the option to cancel the import or to continue importing into the package only; the Import DB Schema from ODBC Source dialog includes checkbox options to import into the diagram and package, or into the package only
- If no diagram is open, the **Package Only** radio button defaults to selected and the options are disabled; if the open diagram is in the selected package, you can select either option

**Learn More:**

- [Import Source Code](#) <sup>[1517]</sup>
- [General Settings](#) <sup>[424]</sup>
- [Data Modeling Data Types](#) (Online Resource)

## 10.2.1 Select a Data Source

### Topics:

Topic	Detail	See also
<b>General Usage</b>	<p>To import DDL from existing data sources, you must have a suitable ODBC connection installed and configured</p> <p>From the Import DB Schema from ODBC Source dialog you can select the ODBC data source using the standard windows ODBC set-up dialog; click on the data source name and then click on the <b>OK</b> button</p>	

### Learn More:

- [Connect to a Data Repository](#)<sup>[162]</sup>

## 10.2.2 Select Tables

When you have opened the ODBC data source, Enterprise Architect acquires a list of database objects suitable for importing. This is presented in a list form for you to select from.

Highlight the schema to import from the top list. Alternatively, select individual objects from the lower list.

### Topics:

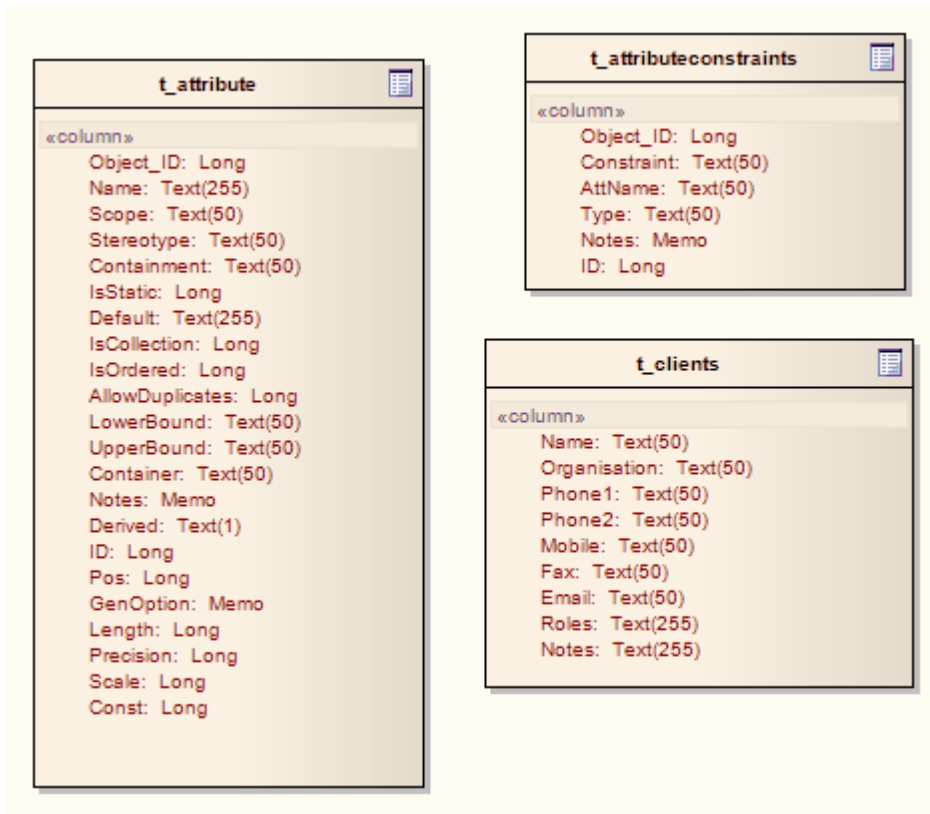

Topic	Detail	See also
<b>Selection Shortcuts</b>	<ul style="list-style-type: none"> <li>• To select all objects, click on the <b>Select All</b> button</li> <li>• To clear all objects, click on the <b>Select None</b> button</li> <li>• Hold down ( <b>Ctrl</b> ) while clicking to select multiple objects</li> <li>• Hold down ( <b>Shift</b> ) and click on the first and last objects in a range to select that range</li> </ul> <p>When you have selected the objects, click on the <b>OK</b> button</p>	

## 10.2.3 The Imported Class Elements

When you import DDL table definitions they are converted to stereotyped Classes according the *UML Data Modeling Profile*.

The image below shows some example tables imported into the model using an ODBC data connection.

### Example:

## 10.3 Generate DDL

Enterprise Architect enables you to generate DDL from your model for Tables and Packages.

### Learn More:

- [Generate DDL for Tables](#) <sup>[1385]</sup>
- [Generate DDL for Packages](#) <sup>[1385]</sup>

### 10.3.1 Generate DDL For a Table

#### How To:

To generate DDL for a table, follow the steps below:

Step	Action	See Also
1	In the diagram, right-click on the table for which to generate DDL The context menu displays	
2	Select the <b>Generate DDL</b> option The Generate DDL dialog displays	
3	In the <b>Path</b> field, use the ( ... ) (Browse) button to select the filename of the script to create	
4	To include comments in the DDL, in the <b>Comment Level</b> field select the appropriate level  For example, <b>Column</b> for comments on columns, or <b>All</b> for comments on all structures	
5	Select the checkboxes for the appropriate inclusions; for example, to include a 'drop table' command in the script, select the <b>Create Drop SQL</b> checkbox  Deselect the checkboxes for inclusions you do not require	
6	To create the DDL, click on the <b>Generate</b> button	
7	To view the output, click on the <b>View</b> button (you must configure a DDL viewer in the Local Settings dialog first)	

#### Notes:

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table; for example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ\_** and **\_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created
- If generating Oracle sequences, you must always select the **Generate Triggers** and **Generate Sequences** checkboxes - this ensures that a pre-insert trigger is generated to select the next sequence value to populate the column; also set the **AutoNum** property to **True** in the column properties
- If generating Oracle sequences, to generate the sequence name and trigger name with the syntax

*SEQ\_<sequence\_name>* and *TRG\_<trigger\_name>*, select the **SEQ\_** option; conversely, to generate them with the syntax *<sequence\_name>\_SEQ* and *SET\_<trigger\_name>*, select the **\_SEQ** option

**Learn More:**

- [Permission List](#)<sup>2061</sup>
- [Create Columns](#)<sup>1357</sup>

### 10.3.2 Generate DDL for a Package

In this procedure, you can generate DDL for a package, and also compare the DDL with the database.

**Access:** **Project Browser package context menu | Code Engineering | Generate DDL**  
**Select package Tools | Database Engineering | Generate Package DDL**

**How To:**

To generate DDL for a package, follow the steps below:

Step	Action	See Also
1	Select the menu option The Generate Package DDL dialog displays	
2	Select the checkbox against each inclusion required Deselect the checkboxes for inclusions you do not require	
3	To recursively generate DDL, select the <b>Include All Child Packages</b> checkbox	
4	Select the <b>Save Generated Order</b> checkbox to save the order in which the objects are generated  This is useful where the order is changed to resolve object dependencies; the order is saved when you click on the <b>Generate</b> button	
5	If you click the <b>Refresh</b> button with the <b>Save Generated Order</b> checkbox <i>unchecked</i> , the objects are restored to their original order	
6	Click on the <b>Generate</b> button to proceed Enterprise Architect prompts you for file names as the process executes	

To compare the generated DDL with the database, follow the steps below

Step	Action	See Also
1	On the Generate Package DDL dialog, click on the <b>Compare</b> button The Compare With Database dialog displays	
2	Click on the ( ... ) button and locate the required database on the Select Data Source dialog	
3	For an Oracle database, if required you can also specify the Owner in the <b>Schema/Owner</b> field	

Step	Action	See Also
4	Click on the <b>View</b> button to perform the comparison The Comparison Database dialog displays with the results of the comparison Click on each table name to review information on that table	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Source Code and DDL** permission to generate DDL
- Some checkboxes display only if the appropriate database is defined for the table. For example, **IF EXISTS** displays only if the database for the table is PostgreSQL, and **SEQ\_** and **\_SEQ** radio buttons display only if the database for the table is Oracle
- For a PostgreSQL database, you must select the **Generate Sequences** checkbox to enable auto increment columns to be created
- If generating Oracle sequences, you must always select the **Generate Triggers** and **Generate Sequences** checkboxes - this ensures that a pre-insert trigger is generated to select the next sequence value to populate the column; also set the **AutoNum** property to **True** in the column properties
- If generating Oracle sequences, to generate the sequence name and trigger name with the syntax **SEQ\_<sequence\_name>** and **TRG\_<trigger\_name>**, select the **SEQ\_** option; conversely, to generate them with the syntax **<sequence\_name>\_SEQ** and **SET\_<trigger\_name>**, select the **\_SEQ** option

**Learn More:**

- [Permission List](#)<sup>[206]</sup>
- [Create Columns](#)<sup>[1357]</sup>

## 10.4 Entity Relationship Diagrams (ERDs)

According to the online [Wikipedia](#):

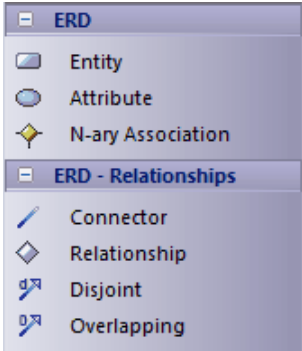

*An entity-relationship model (ERM) is an abstract and conceptual representation of data. Entity-relationship modeling is a database modeling method, used to produce a type of conceptual schema or semantic data model of a system, often a relational database, and its requirements in a top-down fashion. Diagrams created by this process are called Entity-Relationship Diagrams, ER Diagrams, or ERDs.*

### Entity Relationship Diagrams in Enterprise Architect:

Entity Relationship Diagrams in Enterprise Architect are based on Chen's ERD building blocks: entities are represented as rectangles, attributes are represented as ellipses and relationships are represented as diamond-shape connectors.

ERD technology in Enterprise Architect assists you in every stage from building conceptual data models to generating Data Definition Language (DDL) for the target DBMS.

### Topics:

Topic	Detail	See also
<b>MDG Technology for ERD and ERD Transformations</b>	<p>Enterprise Architect enables you to develop Entity Relationship diagrams quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The Entity Relationship diagram facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• An Entity Relationship diagram type, accessed through the New Diagram dialog</li> <li>• An Entity Relationship Diagram page in the Toolbox</li> <li>• Entity Relationship element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul> <p>Enterprise Architect also provides transformation templates to transform Entity Relationship Diagrams into Data Modeling Diagrams, and vice versa.</p>	<p><a href="#">New Diagram Dialog</a><sup>[570]</sup></p> <p><a href="#">Toolbox Shortcut</a><sup>[553]</sup></p> <p><a href="#">Quick Linker</a><sup>[624]</sup></p> <p><a href="#">ERD to Data Model Transformation</a><sup>[1323]</sup></p> <p><a href="#">Data Model to ERD Transformation</a><sup>[1316]</sup></p>
<b>Entity Relationship Diagram Toolbox Page</b> 	<p>You can access the Entity Relationship Diagram page of the Toolbox through the More tools   Entity Relationship Diagrams menu option.</p> <ul style="list-style-type: none"> <li>• Entity is an object or concept that is uniquely identifiable. The property of Multiplicity in the SourceRole and TargetRole definitions for the Relationship connector (below) can be used to define the cardinality of an Entity that participates in this relationship.</li> <li>• Attribute is a property of an entity or a relationship type</li> <li>• N-ary Association represents unary (many-to-many recursive) or ternary relationships and can also be used to represent relationships that have attributes among the entities; Note that the N-ary Association element should always be at the target end of a connector</li> <li>• Connector is a connector between an Entity and an</li> </ul>	

Topic	Detail	See also
	<p>Attribute, and between two Attributes</p> <ul style="list-style-type: none"> <li>Relationship is a diamond-shape connector, representing the meaningful association among entities.</li> <li>Disjoint and Overlapping represent the relationships between the super-class Entity and the sub-class Entity</li> </ul>	
<p><b>A typical Entity Relationship Diagram</b></p>		
<p><b>Disable Entity Relationship Diagrams</b></p>	<p>If you prefer not to use Entity Relationship Diagrams in Enterprise Architect, you can disable it (and subsequently re-enable it) using the <b>MDG Technologies</b> dialog (<b>Settings   MDG Technologies</b>).</p>	<p><a href="#">MDG Technologies</a> 1035</p>

**Tagged Values:**

Some of the Entity Relationship diagram components can be modified by Tagged Values, as indicated below:

Component	Tagged Value	Notes
Entity	isWeakEntity	If true, this entity is a weak entity.
Attribute	attributeType	<p>Four options:</p> <ul style="list-style-type: none"> <li>normal Attribute</li> <li>primary key attribute</li> <li>multi-valued Attribute</li> <li>derived Attribute</li> </ul>
	commonData	Defines the common data type for each attribute.

Component	Tagged Value	Notes
	taType	
	dbmsDataType	<p>Defines the customized DBMS data type for each attribute.</p> <p>You must define the customized type first through the <b>Settings   Database Datatypes</b> menu option</p> <p>Also, set the <i>commonDataType</i> tag to <b>na</b> to activate the <i>dbmsDataType</i> tag.</p>
<b>N-ary Association</b>	isRecursive	<p>If true, the N-ary Association represents the many-to-many recursive relationship.</p> <p>For one-to-many and one-to-one recursive relationships, we suggest using the normal Relationship connector.</p> <p>Sometimes you might want to limit the stretch of the diamond-shape Relationship connectors. Simply pick a Relationship connector, right-click to display the context menu, and select the Bend Line at Cursor option.</p>
<b>Relationship</b>	isWeak	If true, the Relationship is a weak relationship.
<b>Disjoin Overlapping</b>	Participation	Two options: partial and total.

**Notes:**

- Entity Relationship Diagrams are supported in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect

**Part**

#### Notes:

- Although you can generate and reverse engineer code in a range of languages, Execution Analysis debugging and recording are supported for the following platforms / languages only:
  - Microsoft Windows Native C
  - Microsoft Windows Native C++
  - Microsoft Windows Visual Basic
  - Microsoft .NET Family (C#, J#, VB)
  - Sun Microsystems Java

### 11.1.1 Overview of Development

Code Engineering with Enterprise Architect broadly encompasses various processes for generating or transforming code from your UML model and importing code into the model, to support model development in several coding languages, database development and SOA development.

**Topics:**

Topic	Detail	See also
<b>Model Driven Code Engineering</b>	<ul style="list-style-type: none"> <li>• Source code generation and reverse engineering for many popular languages, including C++, C#, Java, Delphi, VB.Net, Visual Basic, ActionScript, Python and PHP</li> <li>• A built in 'syntax highlighting' source code editor</li> <li>• Code generation templates, which enable you to customize the generated source code to your company specifications</li> </ul>	<a href="#">Software Engineering</a> <sup>[1392]</sup>
<b>Transformations for Rapid Development</b>	<ul style="list-style-type: none"> <li>• Advanced Model Driven Architecture (MDA) transformations using transformation templates</li> <li>• Built-in transformations for DDL, C#, Java, EJB and XSD</li> <li>• One Platform Independent Model can be used to generate and synchronize multiple Platform Specific Models, providing a significant productivity boost</li> </ul>	<a href="#">Model Transformations - MDA</a> <sup>[1307]</sup>
<b>Visual Execution Analysis / Debugging, Verification and Visualization</b>	<ul style="list-style-type: none"> <li>• Execute Build, test, debug, run and deploy scripts</li> <li>• Integrate UML development and modeling with source development and compilation</li> <li>• Generate NUnit and JUnit test Classes from source Classes using MDA Transformations</li> <li>• Integrate the test process directly into the Enterprise Architect IDE</li> <li>• Debug .NET, Java and Microsoft Native (C, C++ and Visual Basic) applications</li> <li>• Design and Execute Test suites based on <i>Programming by Contract</i> principles</li> </ul>	<a href="#">Visual Execution Analysis</a> <sup>[1644]</sup>
<b>Database Modeling</b>	<p>Enterprise Architect enables you to:</p> <ul style="list-style-type: none"> <li>• Reverse engineer from many popular DBMSs, including SQL Server, My SQL, Access, PostgreSQL and Oracle 9i, 10g or 11g</li> <li>• Model database tables, columns, keys, foreign keys and complex relationships using UML and an inbuilt data modeling profile</li> <li>• Forward generate DDL scripts to create target database structures</li> </ul>	<a href="#">Database Engineering</a> <sup>[1351]</sup>
<b>XML Technology Engineering</b>	<p>Enterprise Architect enables you to rapidly model, forward engineer and reverse engineer two key W3C XML technologies:</p> <ul style="list-style-type: none"> <li>• XML Schema (XSD)</li> <li>• Web Service Definition Language (WSDL)</li> </ul> <p>XSD and WSDL support is critical for the development of a complete <b>Service Oriented Architecture (SOA)</b>, and the coupling of UML 2.3 and XML provides the natural mechanism for implementing XML-based SOA artifacts within an</p>	<a href="#">XML Schema - XSD</a> <sup>[1590]</sup> <a href="#">Web Services - WSDL</a> <sup>[1620]</sup>

	organization	

### 11.1.2 Application Patterns (Model + Code)

To get you going with a code based project as fast as possible, Enterprise Architect enables you to generate starter projects including model information, code and build scripts for one of several basic application types. Patterns include:

- MFC Windows applications
- Java programs
- ASP.NET web services

**Access:** **Project | New Model (Ctrl+Shift+M) > Application Patterns**  
**Project Browser | Package context menu | Add | Add a New Model using Wizard > Application Patterns**

**Reference:**

Field	Usage	See also
<b>Technology</b>	Select the appropriate technology	
<b>Name</b>	Displays the application patterns available for the selected technology; select the required pattern to import	
description field	Displays a description of the selected pattern	
<b>Destination folder</b>	Browse for and select the directory in which to load the source code for the application	
<b>Use Local Path</b>	Enable the selection of an existing local path to place the source code under; changes the <b>Destination folder</b> field to a drop-down selection	
<b>Compiler command</b>	Displays the default compiler command path for the selected technology; you must either: <ul style="list-style-type: none"> <li>• Confirm that the compiler can be found at this path, or</li> <li>• Edit the path to the compiler location</li> </ul>	<a href="#">Local Paths</a> [1532] <a href="#">Local Paths</a> <a href="#">Dialog</a> [1533]
<b>Edit Local Paths</b>	Many application patterns specify their compiler using a local path The first time you use any pattern you must click on this button to ensure the local path points to the correct location The Local Paths dialog displays	<a href="#">Local Paths</a> [1532] <a href="#">Local Paths</a> <a href="#">Dialog</a> [1533]

**Notes:**

- If required, you can define custom application patterns by adding files to the *AppPatterns* directory where Enterprise Architect is installed; top level directories are listed as Technologies and can contain an icon file to customize the icon displayed for the technology

Directories below this are defined as groups in the patterns list; the patterns are defined by the presence of four files with a matching name: a zip file (.zip), XML file (.xml), config file (.cfg) and optional icon (.ico)

- The *config* file supports the following fields:
  - [provider], [language], [platform], [url], [description], [version] - all displayed in the description field
  - [xmrootpaths] - the root path of the source code in the exported xmi; this is replaced with the selected destination folder when the user applies the application pattern

## 11.2 Code, Build & Debug

This section discusses the integrated Model Driven Development Environment (MDDE).

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>Model Driven Development provides a more robust, accessible and faster development cycle than traditional coding-driven cycles</p> <p>A well constructed model, intimately linked with source code build, run, debug, test and deploy capabilities provides a rich, easily navigated and easily understood target architecture</p> <p>Traceability, linkage to Use Cases, Components and other model artifacts, plus the ability to readily record and document pre-existing or recently developed code, make Enterprise Architect's development environment uniquely powerful</p> <p>Enterprise Architect incorporates industry standard intelligent editing, debuggers and modeling languages</p>	<p><a href="#">Getting Started</a> <sup>[1399]</sup></p> <p><a href="#">Setup</a> <sup>[1400]</sup></p> <p><a href="#">Code Editors</a> <sup>[1403]</sup></p> <p><a href="#">Build</a> <sup>[1423]</sup></p> <p><a href="#">Clean</a> <sup>[1424]</sup></p> <p><a href="#">Debugging</a> <sup>[1425]</sup></p> <p><a href="#">Run</a> <sup>[1459]</sup></p> <p><a href="#">Testing</a> <sup>[1460]</sup></p> <p><a href="#">Deploying</a> <sup>[1462]</sup></p> <p><a href="#">Searching Files</a> <sup>[1463]</sup></p>
	<p>The MDDE provides tools to design, build and debug an application:</p> <ul style="list-style-type: none"> <li>• UML technologies and tools to model software</li> <li>• Code generation tools to generate/reverse engineer source code</li> <li>• Tools to import source code and binaries</li> <li>• Code editors that support different programming languages</li> <li>• Intellisense to aid coding</li> <li>• Analyzer scripts that enable a user to describe how to build, debug, test and deploy the application</li> </ul> <pre>pApp = new CBCGPAAppointmentDemo {     ▲ 2 of 2 ▼ CBCGPAAppointmentDemo::CBCGPAAppointmentDemo(COleDateTime&amp; dtStart,     COleDateTime&amp; dtFinish, CString&amp; strText, COLORREF clrBackground, COLORREF     clrForeground, COLORREF clrDuration)         RGB (165, 222, 99),         CLR_DEFAULT,         RGB(128, 0, 128) };</pre>	<p><a href="#">Development Tools</a> <sup>[1393]</sup></p> <p><a href="#">MDG Technologies</a> <sup>[1033]</sup></p> <p><a href="#">Modeling Basics</a> <sup>[517]</sup></p> <p><a href="#">Generate Source Code</a> <sup>[1499]</sup></p> <p><a href="#">Import Source Code</a> <sup>[1519]</sup></p> <p><a href="#">Import Binary Module</a> <sup>[1522]</sup></p> <p><a href="#">Code Editors</a> <sup>[1403]</sup></p> <p><a href="#">Intellisense</a> <sup>[1407]</sup></p> <p><a href="#">Managing Analyzer Scripts</a> <sup>[1400]</sup></p>

## 11.2.1 Getting Started

To quickly start development in the Model Driven Development Environment, check through the following topics:

- [Prerequisites](#) <sup>[1399]</sup>
- [Available Tools](#) <sup>[1399]</sup>
- [Workspace Layouts](#) <sup>[1399]</sup>
- [General Workflow](#) <sup>[1400]</sup>
- [Code Generation and Synchronization - Safeguards](#) <sup>[1400]</sup>

### 11.2.1.1 Prerequisites

Before using the Model Driven Development Environment:

- You should be using the correct edition: Enterprise Architect Professional, Corporate or extended editions
- You should be connected to the required model
- Relevant source code should be imported into the model
- An Analyzer Script should be configured
- Required External frameworks should be installed

#### Learn More:

- [Setup](#) <sup>[1400]</sup>

### 11.2.1.2 Available Tools

This section describes the tools available in the Model Driven Development Environment:

- [Workspace Layouts](#) <sup>[1399]</sup>
- [Code Engineering](#) <sup>[1392]</sup>
- [Code Editors](#) <sup>[1403]</sup>
- [Intellisense](#) <sup>[1407]</sup>
- [Application Management](#) <sup>[1400]</sup>
- [Debugger Management](#) <sup>[1425]</sup>

### 11.2.1.3 Workspace Layout

You can choose from many predefined workspace layouts, depending on the tasks you perform. When you are familiar with the environment and controls available to you, you can create your own layouts.

#### Workspace Toolbar/ Workspace Field, Start Page:

You can select from the following debug/execution analysis layouts:

- Dev - Debug
- VEA - Profile
- VEA - Record
- VEA - Simulate
- VEA - Testpoints

#### Learn More:

- [Workspace Layouts](#) <sup>[116]</sup>

#### 11.2.1.4 General Workflow

In working with the Model Driven Development Environment, you apply the following workflow as a circular process, refining as necessary in each iteration.

- Configure and set up scripts
- Model - Edit - Build - Debug - Test - Profile - Deploy - Document and Analyze

##### Learn More:

- [Managing Scripts](#) <sup>[1400]</sup>

#### 11.2.1.5 Code Generation and Synchronization - Safeguards

It is important that the model and source code are kept synchronized for the Visual Execution Analyzer to produce useful results.

Use the Code Generation tools to synchronize your model after any design changes or code editing.

Always build the application prior to any Execution Analysis session - debugging, recording or profiling.

##### Learn More:

- [Synchronize Model and Code](#) <sup>[1515]</sup>

### 11.2.2 Setup

The Enterprise Architect Execution Analyzer feature is responsible for building a project, debugging code, recording a Sequence diagram and profiling information from a running program.

In order for this feature to work, it is necessary to record information about the application. This is achieved in Enterprise Architect through the use of *Analyzer Scripts*.

An Analyzer Script is always associated with a package. The information you provide in a script controls the actions in, and provides support for:

- Building
- Debugging
- Testing
- Deployment

##### Learn More:

- [Managing Analyzer Scripts](#) <sup>[1400]</sup>
- [Analyzer Script Editor](#) <sup>[1402]</sup>
- [Build](#) <sup>[1423]</sup>
- [Debugging](#) <sup>[1425]</sup>
- [Testing](#) <sup>[1460]</sup>
- [Deploying](#) <sup>[1462]</sup>

#### 11.2.2.1 Managing Analyzer Scripts

The Execution Analyzer window enables you to manage all scripts in the model, using the window toolbar buttons to control script tasks. Many features, such as Debugging, Testing, Profiling and Simulation, depend on and function according to how the active script has been configured.

Scripts are listed by package; packages that do not have any scripts are not included.

Each user can activate one script at any time, independent of other users of the same model; one user activating a script does not impact the currently active scripts for other users or affect the scripts available to them.

**Access:** **Analyzer | Execution Analyzer (Shift + F12)**

Toolbar Button	Action	See Also
	List the Analyzer windows; select and display the required window	<a href="#">Debugging</a> <sup>[1425]</sup> <a href="#">Breakpoint and Marker Management</a> <sup>[1444]</sup> <a href="#">View the Call Stack</a> <sup>[1450]</sup> <a href="#">View the Local Variables</a> <sup>[1451]</sup> <a href="#">View Variables in Other Scopes</a> <sup>[1452]</sup> <a href="#">Inspect Process Memory</a> <sup>[1453]</sup> <a href="#">The Recording History</a> <sup>[1662]</sup> <a href="#">The Testpoints Window</a> <sup>[1686]</sup> <a href="#">Profiling Native Applications</a> <sup>[1669]</sup> <a href="#">Model Simulation</a> <sup>[1693]</sup>
	Add new Analyzer Script A prompt displays to select the parent package	<a href="#">Analyzer Script Editor</a> <sup>[1402]</sup>
	Export Scripts You can export one or more Analyzer Scripts to an XML file, which can be used to import the scripts into another model; a prompt displays for the target file name and location	
	Import Scripts You can import one or more Analyzer Scripts from a previously exported XML file; a prompt displays for the source file name and location	
	Execute the Debug command of the active script	<a href="#">Setup for Debugging</a> <sup>[1426]</sup>
	Execute the Build command of the active script	<a href="#">Add Commands</a> <sup>[1423]</sup>
	Execute the Test command of the active script	<a href="#">Add Testing Command</a> <sup>[1460]</sup>

Toolbar Button	Action	See Also
	Execute the Run command of the active script	<a href="#">Add Run Command</a> <sup>[1459]</sup>
	Execute the Deploy command of the active script	<a href="#">Add Deploy Command</a> <sup>[1462]</sup>
	Display the Help topic for this window	

### 11.2.2.2 Analyzer Script Editor

Scripts are associated with a Package. When you create an Analyzer Script you can define a number of actions. The Execution Analyzer Script Editor has a number of pages for configuring various features:

If you plan to use any of the features of the Execution Analyzer, you must complete at least the Build and Debug pages.

Task	Page	Actions	See also
<b>Build</b>	Build	Enter script or command to build the application	<a href="#">Build</a> <sup>[1423]</sup>
	Clean	Enter script or command to clean the previous build	<a href="#">Clean</a> <sup>[1424]</sup>
<b>Test</b>	Test	Enter script or command to test the application	<a href="#">Test</a> <sup>[1460]</sup>
	Testpoints	Specify where the output from a Testpoint run is sent	<a href="#">Testpoint Output</a> <sup>[1461]</sup>
<b>Debug</b>	Platform	Specify the debugging platform, the application to be debugged, and the mode of debugging (attach to process or run )	<a href="#">Debug</a> <sup>[1425]</sup>
	Tracepoints	Specify where the output from Tracepoints encountered during a debug session are sent	<a href="#">Trace Output</a> <sup>[1444]</sup>
	Workbench	Specify required information for using the Object Workbench control	<a href="#">Workbench Setup</a> <sup>[1674]</sup>
<b>Run</b>	Run	Enter a script or command to run the application	<a href="#">Run</a> <sup>[1459]</sup>
<b>Deploy</b>	Deploy	Enter a script or command to deploy the project	<a href="#">Deploy</a> <sup>[1462]</sup>
<b>Recording</b>	Recording	Exclude areas of the application from being recorded; you can specify wildcard expressions to exclude operations, Classes and modules	<a href="#">Configure Recording Detail</a> <sup>[1650]</sup>
<b>Simulation</b>	Simulation	Complete the configuration for Simulation Control	<a href="#">Model Simulation</a> <sup>[1693]</sup>

### 11.2.3 Code Editors

Enterprise Architect provides a number of editors that you can use across the development environment to maintain scripts, code and templates. Each editor has its own features, but they are all based on a common *Code Editor control*.

#### Topics:

Topic	Detail	See also
<b>Editors</b>	<p>The provided editors are:</p> <ul style="list-style-type: none"> <li>• Shape Script Editor*</li> <li>• Code Generation Template Editor*</li> <li>• Transformation Template Editor*</li> <li>• Custom SQL Search Filter Editor*</li> <li>• Database View Editor*</li> <li>• HTML Report Template Editor</li> <li>• Source Code Viewer*</li> <li>• Script Editor*</li> </ul> <p>You can have several code editors (or files within a code editor) open at the same time, as separate tabs in the central view area of the Enterprise Architect work area</p> <p>You can also close the editors individually or all together, leaving views of other types (such as diagrams or RTF reports) still open</p>	<p><a href="#">Shape Script Editor</a><sup>[1092]</sup></p> <p><a href="#">Code Generation Template Editor</a><sup>[1493]</sup></p> <p><a href="#">Transformation Template Editor</a><sup>[1336]</sup></p> <p><a href="#">Custom SQL Search Filter Editor</a><sup>[486]</sup></p> <p><a href="#">Database View Editor</a><sup>[1377]</sup></p> <p><a href="#">HTML Report Template Editor</a><sup>[1819]</sup></p> <p><a href="#">Source Code Viewer*</a><sup>[1417]</sup></p> <p><a href="#">Script Editor</a><sup>[1415]</sup></p> <p><a href="#">Diagram Tabs</a><sup>[545]</sup></p>
<b>Code Editor</b>	<p>The common Code Editor provides a variety of functions to assist with the code editing process, including:</p> <ul style="list-style-type: none"> <li>• <b>Syntax Highlighting</b></li> <li>• <b>Bookmarks</b></li> <li>• <b>Cursor history</b></li> <li>• <b>Brace matching</b></li> <li>• <b>Automatic indentation</b></li> <li>• <b>Commenting selections</b></li> <li>• <b>Scope guides</b></li> <li>• <b>Zooming</b></li> <li>• <b>Line selection</b></li> <li>• <b>intellisense</b></li> <li>• <b>Find and Replace</b></li> <li>• <b>Find in Files</b></li> </ul> <p>A range of these functions is available through keyboard key combinations and/or context menu options</p> <p>You can customize several of the Code Editor features by setting properties in the Code Editor configuration files; for example, by default the line containing the cursor is always highlighted, but you can turn the highlighting off</p> <p>Additional information is provided in the <i>Code Editor Configuration Guide</i>, located as a PDF file in the <i>Config</i> directory under your Enterprise Architect installation directory</p>	<p><a href="#">Syntax Highlighting</a><sup>[1404]</sup></p> <p><a href="#">Bookmarks</a><sup>[1404]</sup></p> <p><a href="#">Cursor history</a><sup>[1405]</sup></p> <p><a href="#">Brace matching</a><sup>[1405]</sup></p> <p><a href="#">Automatic indentation</a><sup>[1405]</sup></p> <p><a href="#">Commenting selections</a><sup>[1405]</sup></p> <p><a href="#">Scope guides</a><sup>[1406]</sup></p> <p><a href="#">Zooming</a><sup>[1407]</sup></p> <p><a href="#">Line selection</a><sup>[1407]</sup></p> <p><a href="#">intellisense</a><sup>[1407]</sup></p> <p><a href="#">Find and Replace</a><sup>[1420]</sup></p> <p><a href="#">Find in Files</a><sup>[1463]</sup></p> <p><a href="#">Code Editor Key Bindings</a><sup>[1409]</sup></p> <p><a href="#">Code Editor Context Menu</a><sup>[1412]</sup></p>

### 11.2.3.1 Syntax Highlighting

The Code Editor highlights - in colored text - the standard code syntax of most language file formats supported by Enterprise Architect. You can define how the Code Editor implements syntax highlighting, through the Code Editors page of the Options dialog.

#### Topics:

Topic	Detail	See also
<b>Supported Languages</b>	<ul style="list-style-type: none"> <li>• Ada (.ada, .ads, .adb)</li> <li>• ActionScript (.as)</li> <li>• BPEL Document (.bpel)</li> <li>• C++ (.h, .hh, .hpp, .c, .cpp, .cxx)</li> <li>• C# (.cs)</li> <li>• Delphi/Pascal (.pas)</li> <li>• Diff/Patch Files (.diff, .patch)</li> <li>• Document Type Definition (.dtd)</li> <li>• DOS Batch Files (.bat)</li> <li>• DOS Command Scripts (.cmd)</li> <li>• HTML (.html)</li> <li>• Interface Definition Language (.idl, .odl)</li> <li>• Java (.java)</li> <li>• Javascript (.javascript)</li> <li>• JScript (.js)</li> <li>• Modified Backus-Naur Form Grammar (.mbnf)</li> <li>• PHP (.php, .php4, .inc)</li> <li>• Python (.py)</li> <li>• Standard Generalized Markup Language (.sgml)</li> <li>• Structured Query Language (.sql)</li> <li>• SystemC (.sc)</li> <li>• Visual Basic 6 (.bas)</li> <li>• VB.NET (.vb)</li> <li>• VBScript (.vbs)</li> <li>• Verilog (.v)</li> <li>• VHSIC Hardware Description Language (.vhdl)</li> <li>• Visual Studio Resource Configuration (.rc)</li> <li>• eXtensible Markup Language (.xml)</li> </ul>	<a href="#">Editor Language Properties</a> <small>1529</small>

### 11.2.3.2 Bookmarks

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Bookmarks denote a line of interest in the document; you can toggle them on and off for a particular line by pressing (<b>Ctrl+F2</b>)</p> <p>Additionally, you can press (<b>F2</b>) and (<b>Shift+F2</b>) to navigate to the next or previous bookmark in the document</p>	

### 11.2.3.3 Cursor History

#### Topics:

Topic	Detail	See also
Usage	<p>The Code Editor Control keeps a history of the previous 50 cursor positions</p> <p>An entry in the history list is created when:</p> <ul style="list-style-type: none"> <li>The cursor is moved more than 10 lines from its previous position</li> <li>The cursor is moved in a <i>find/replace</i> operation</li> </ul> <p>You can navigate to an earlier point in the cursor history by pressing (<b>Ctrl+-</b>), and to a later point by pressing (<b>Ctrl+Shift+-</b>)</p>	

### 11.2.3.4 Brace Matching

#### Topics:

Topic	Detail	See also
Usage	<p>When you place the cursor over a brace or bracket, the Code Editor highlights its corresponding partner. You can then navigate to the matching brace by pressing (<b>Ctrl+E</b>)</p> <pre> 27           function GetPublishedPropertyTest4: Extended; 28           function ProtectedFunctionTest: boolean; 29           procedure ProtectedProcedureTest(a: WideString); 30           function SetPublishedPropertyTest4: Extended; </pre>	

### 11.2.3.5 Automatic Indentation

#### Topics:

Topic	Detail	See also
Usage	<p>For each supported language, the Code Editor adjusts the indentation of a new line according to the presence of control statements or scope block tokens in the lines leading up to the cursor position</p> <p>For more information on customizing automatic indentation for a language, see the <i>Configuration Guide</i></p>	<a href="#">Code Editors</a> <sup>[1403]</sup>

### 11.2.3.6 Commenting Selections

#### Topics:

Topic	Detail	See also
Usage	<p>For languages that support comments, the Code Editor can comment entire selections of code</p>	<a href="#">Code Editors</a> <sup>[1403]</sup>

Topic	Detail	See also
	<p>The Code Editor recognizes two types of commenting:</p> <ul style="list-style-type: none"> <li>Line Commenting - entire lines are commented from the start (for example:  <pre>// This is a comment</pre>)</li> <li>Stream Commenting - sections of a line are commented from a specified start point to a specified end point (for example:  <pre>/* This is a comment */</pre>)</li> </ul> <p>You can toggle comments on the current line or selection by pressing:</p> <ul style="list-style-type: none"> <li><b>(Ctrl+Shift+C)</b> for line comments, or</li> <li><b>(Ctrl+Shift+X)</b> for stream comments</li> </ul> <p>For more information on customizing selection commenting for each language, see the <i>Configuration Guide</i></p>	

### 11.2.3.7 Scope Guides

Usage	<p>If the cursor is placed over an indentation marker, the Code Editor performs a 'look back' to find the line that started the scope at that indentation level; if the line is found and is currently on screen, it is highlighted in light blue</p> <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if ( answers.size() &gt; 0 ) 96 { 97     DNSPacket responsePacket = Helpers.createResponsePacket( answers, this.theS 98     responsePacket.queryID = receivedPacket.queryID; 99 100     return responsePacket; 101 } 102 else 103 { 104     return null; 105 }</pre> <p>Alternatively if the line is off screen, a calltip is displayed advising of the line number and contents.</p> <pre> 93 // If there were any answers, then return a packet, if not then just return null 94 // to indicate the server has no response 95 if ( answers.size() &gt; 0 ) 96 Line 73: private DNSPacket processQuery(DNSPacket receivedPacket) 97     DNSPacket responsePacket = Helpers.createResponsePacket( answers, this.theS 98     responsePacket.queryID = receivedPacket.queryID; 99 100     return responsePacket; 101 } 102 else 103 { 104     return null; 105 }</pre>	

### 11.2.3.8 Zooming

#### Topics:

Topic	Detail	See also
Usage	<p>You can zoom into and out of the contents of the Code Editor using:</p> <ul style="list-style-type: none"> <li>• <b>(Ctrl) + keypad ( + )</b> and</li> <li>• <b>(Ctrl) + keypad ( - )</b></li> </ul> <p>Zoom can be restored to 100% using <b>(Ctrl) + keypad ( / )</b></p>	

### 11.2.3.9 Line Selection

#### Topics:

Topic	Detail	See also
Usage	<p>If you want to move the cursor to a specific line of code, press <b>(Ctrl + G)</b> and, in response to the prompt, type in the line number</p> <p>Press the <b>OK</b> button; the editor displays the specified line of code with the cursor at the left</p>	

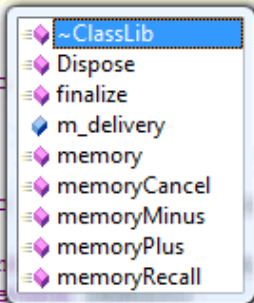

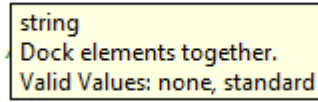

### 11.2.3.10 Intellisense

Intellisense is a feature that provides choices of code items and values as you type. Not all code editors use intellisense; those that do are indicated by an asterisk in the list of Enterprise Architect code editors. Intellisense provides you with context-based assistance through autocompletion lists, calltips and mouseover information.

Intellisense is also disabled while you record a macro in the Source Code Viewer.

### 11.2.3.11 Code Editor Key Bindings

Key	Description
<b>Ctrl + G</b>	Move cursor to a specified line
↓	Move cursor down one line
<b>Shift + ↓</b>	Extend selection down one line
<b>Ctrl + ↓</b>	Scroll down one line
<b>Alt + Shift + ↓</b>	Extend rectangular selection down one line
↑	Move cursor up one line
<b>Shift + ↑</b>	Extend selection up one line
<b>Ctrl + ↑</b>	Scroll up one line
<b>Alt + Shift + ↑</b>	Extend rectangular selection up one line
<b>Ctrl+ (</b>	Move cursor up one paragraph
<b>Ctrl+Shift+ (</b>	Extend selection up one paragraph
<b>Ctrl+ )</b>	Move cursor down one paragraph
<b>Ctrl+Shift+ )</b>	Extend selection down one paragraph
←	Move cursor left one character
<b>Shift + ←</b>	Extend selection left one character
<b>Ctrl + ←</b>	Move cursor left one word
<b>Ctrl + Shift + ←</b>	Extend selection left one word
<b>Alt + Shift + ←</b>	Extend rectangular selection left one character
→	Move cursor right one character
<b>Shift + →</b>	Extend selection right one character
<b>Ctrl + →</b>	Move cursor right one word
<b>Ctrl + Shift + →</b>	Extend selection right one word
<b>Alt + Shift + →</b>	Extend rectangular selection right one character
<b>Ctrl + /</b>	Move cursor left one word part
<b>Ctrl + Shift + /</b>	Extend selection left one word part

Key	Description
Ctrl + \	Move cursor right one word part
Ctrl + Shift + \	Extend selection right one word part
Home	Move cursor to the start of the current line
Shift + Home	Extend selection to the start of the current line
Ctrl + Home	Move cursor to the start of the document
Ctrl + Shift + Home	Extend selection to the start of the document
Alt + Home	Move cursor to the absolute start of the line
Alt + Shift + Home	Extend rectangular selection to the start of the line
End	Move cursor to the end of the current line
Shift + End	Extend selection to the end of the current line
Ctrl + End	Move cursor to the end of the document
Ctrl + Shift + End	Extend selection to the end of the document
Alt + End	Move cursor to the absolute end of the line
Alt + Shift + End	Extend rectangular selection to the end of the line
Page Up	Move cursor up a page
Shift + Page Up	Extend selection up a page
Alt + Shift + Page Up	Extend rectangular selection up a page
Page Down	Move cursor down a page
Shift + Page Down	Extend selection down a page
Alt + Shift + Page Down	Extend rectangular selection down a page
Delete	Delete character to the right of the cursor
Shift + Delete	Cut selection
Ctrl + Delete	Delete word to the right of the cursor
Ctrl + Shift + Delete	Delete until the end of the line
Insert	Toggle overtype
Shift + Insert	Paste

Key	Description
<b>Ctrl + Insert</b>	Copy selection
<b>Backspace</b>	Delete character to the left of the cursor
<b>Shift + Backspace</b>	Delete character to the left of the cursor
<b>Ctrl + Backspace</b>	Delete word to the left of the cursor
<b>Ctrl + Shift + Backspace</b>	Delete from the start of the line to the cursor
<b>Alt + Backspace</b>	Undo delete
<b>Tab</b>	Indent cursor one tab
<b>Ctrl + Shift + I</b>	Indent cursor one tab
<b>Shift + Tab</b>	Unindent cursor one tab
<b>Ctrl + keypad( + )</b>	Zoom in
<b>Ctrl + keypad( - )</b>	Zoom out
<b>Ctrl + keypad( / )</b>	Restore Zoom
<b>Ctrl + Z</b>	Undo
<b>Ctrl + Y</b>	Redo
<b>Ctrl + X</b>	Cut selection
<b>Ctrl + C</b>	Copy selection
<b>Ctrl + V</b>	Paste
<b>Ctrl + L</b>	Cut line
<b>Ctrl + Shift + L</b>	Delete line
<b>Ctrl + T</b>	Transpose line
<b>Ctrl + Shift + T</b>	Copy line
<b>Ctrl + A</b>	Select entire document
<b>Ctrl + D</b>	Duplicate selection
<b>Ctrl + U</b>	Convert selection to lowercase
<b>Ctrl + Shift + U</b>	Convert selection to uppercase

Key	Description
Ctrl + E	Move cursor to matching brace
Ctrl + Shift + E	Extend selection to matching brace
Ctrl + Shift + C	Toggle line comment on selection
Ctrl + Shift + X	Toggle stream comment on selection
Ctrl + F2	Toggle bookmark
F2	Go to next bookmark
Shift + F2	Go to previous bookmark
Ctrl + Shift + W	Toggle whitespace characters
Ctrl + Shift + L	Toggle EOL characters
Ctrl + Spacebar	Invoke autocomplete
Ctrl + -	Go backwards in cursor history
Ctrl + Shift + -	Go forwards in cursor history
F12	Start/Cancel search for keyword in file(s).
Ctrl + F	Find text
Ctrl + R	Replace

**Notes:**

- In addition to the following keys, you can assign (**Ctrl + Alt + n**) key combinations to macros that you define within the Source Code Editor

**11.2.3.12.1 Create Use Case for Method**

The code editor context menu enables you to create a Use Case element for a method that you select from the code. You can also link the Use Case directly to the method in a diagram, and hide any attributes or methods that are not the targets of feature links.

**How To:**

To create a Use Case for a method, follow the steps below:

Step	Action	See also
1	If you want to depict the Use Case and its link to the method in a diagram, click on the diagram name in the Project Browser	
2	<p>In the code editor, right click on either the method name or any part of the method body, and select the <b>Create Method for &lt;methodname&gt;</b> context menu option</p> <p>The Create Use Case for Method dialog displays</p>	
3	<p>The basic function of this dialog is to create a Use Case for the selected method:</p> <ul style="list-style-type: none"> <li>• If this is all that is required, click on the <b>OK</b> button. The Use Case element is created in the <b>Project Browser</b>, in the same package as the parent Class for the method, and with the same name as the method</li> <li>• If you intend to make the relationship tangible, continue with the</li> </ul>	

Step	Action	See also
	procedure	
4	To create a Trace connector linking the Use Case to the method, select the <b>Link Use Case to Method</b> check box.	
5	To add the method's parent Class to the diagram, if it is not already there, select the <b>Add Class to Diagram</b> check box.	
6	To add the newly-created Use Case to the diagram, select the <b>Add Use Case to Diagram</b> check box. This would now show the Use Case, Class and Trace connector on the diagram.	
7	To only show the features (attributes and methods) of the parent Class that are the targets of 'link to feature' relationships, select the <b>Display only linked features in Class</b> checkbox.  The Class might contain any number of attributes and methods, but those without a 'link to feature' relationship are hidden.	<a href="#">Connect to Element Feature</a> <sup>[744]</sup>
8	Click on the <b>OK</b> button to create and depict the Use Case and relationship. If you selected all options, the diagram now contains linked elements resembling the following:

**11.2.3.13 Script Editor**

The *Script Editor* enables you to edit scripts, and to run and stop an open script.

The editor is based on, and provides the facilities of, the common **Code Editor**.

To open the Script Editor, double-click on the required script in the **Scripts** tab of the **Scripting window**. The editor opens in the main work area.

**Use to:**

- Save changes to the current script
- Save the current script under a different name
- Run the script
- Stop the executing script
- View the script output in the **Scripts** tab of the **Output** window

**Topics:**

Topic	Detail	See also
<b>Enterprise Architect Script Objects</b>	<p>Enterprise Architect adds to the available functionality and features of the editor script language by providing inbuilt objects. These are either <i>Type Libraries</i>, providing intellisense for editing purposes, or <i>Runtime objects</i>, providing access to objects of the types described in the Type Libraries.</p> <p>The available intellisense scripting objects are:</p> <ul style="list-style-type: none"> <li>• EA</li> <li>• MathLib</li> <li>• System</li> <li>• The runtime scripting objects (below)</li> </ul> <p>The available runtime scripting objects are:</p> <ul style="list-style-type: none"> <li>• Repository ( Type: IDualRepository ) - this is the Enterprise Architect <b>automation interface</b></li> <li>• Maths ( Type: IMath )</li> <li>• Session ( Type: ISession )</li> </ul>	<a href="#">Automation Interface</a> <small>1837</small>
<b>Script Editing Intellisense (Required Syntax)</b>	<p>Intellisense is available not only in the Script Editor, but also in the Script Console. Intellisense at its most basic is presented for the inbuilt functionality of the script engine. For intellisense on the additional Enterprise Architect scripting objects listed above, you must declare variables according to syntax that specifies a type. It is not necessary to use this syntax to execute a script properly. It is only present so that the correct intellisense can be displayed for an item. The syntax can be seen in the above diagram in, for example:</p> <pre>Dim e as EA.Element</pre> <p>Then, when you type, in this case, <b>e</b>. the editor displays a list of member functions and properties of <b>e</b>'s type.</p> <p>You select one of these to complete the line of script. You might, therefore, type:</p> <pre>VBTrace( e.</pre> <p>As you type the period, the editor presents the appropriate list and you might double-click on, for example, <b>Abstract</b>. This is inserted in the line, and you continue to type or select the rest of the statement. In this case, adding the end space and parenthesis.</p> <pre>VBTrace( e. Abstract )</pre>	
<b>Keystrokes</b>	<p>In the Script Editor or Console, intellisense is presented on the following keystrokes.</p> <ul style="list-style-type: none"> <li>• Press <b>( . )</b> (period) after an item to list any members for that item's type</li> <li>• Press <b>( Ctrl ) +( Spacebar )</b> on a word to list any intellisense items with a name starting with the string at the point keystroke was pressed</li> <li>• Press <b>( Ctrl ) +( Spacebar )</b> when not on a word to display any available top level intellisense items - these are the intellisense objects described above plus any built-in methods and properties of the current scripting language</li> </ul>	

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering

and Ultimate editions

- Enterprise Architect's scripting supports declaring variables to match the EA types. This enables the editor to present **intellisense**, but is not necessary for executing the script

### 11.2.3.14 The Source Code Viewer

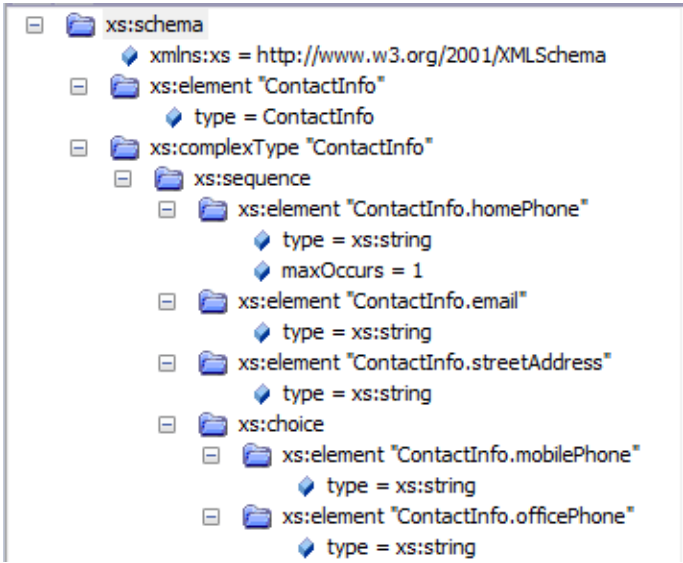

**Access:** **View | More Element Tools | Source Code (Alt+7)**  
**Tools | Open Source File (Ctrl+Alt+O)**

Use the Source Code viewer to view any source code files for an element. If a Class is selected, the Source Code viewer shows the source code for that Class, provided it has already been *generated*. For C++ a second tab displays to show the implementation file.

The Source Code viewer also displays any DDL generated for a selected table in your diagram.

A number of options change the way the Source Code viewer works. They can be altered via the Options dialog (select the **Tools | Options | Source Code Engineering | Code Editors** menu option). There are also many options for developing the code, available through the code editor context menu and through the Toolbar.

#### Topics:

Topic	Detail	See also
<b>Source Code Viewer</b>	<p>By default the Source Code viewer is set to:</p> <ul style="list-style-type: none"> <li>• Parse all opened files, and show a tree of the results</li> <li>• Show line numbers</li> </ul> <p>If you are editing an XML file, the structure tree is presented in a folder hierarchy rather than a Class structure hierarchy, as follows:</p>  <pre> xs:schema ├── xmlns:xs = http://www.w3.org/2001/XMLSchema ├── xs:element "ContactInfo" │   └── type = ContactInfo ├── xs:complexType "ContactInfo" │   └── xs:sequence │       ├── xs:element "ContactInfo.homePhone" │       │   ├── type = xs:string │       │   └── maxOccurs = 1 │       ├── xs:element "ContactInfo.email" │       │   └── type = xs:string │       ├── xs:element "ContactInfo.streetAddress" │       │   └── type = xs:string │       └── xs:choice │           ├── xs:element "ContactInfo.mobilePhone" │           │   └── type = xs:string │           └── xs:element "ContactInfo.officePhone" │               └── type = xs:string </pre>	
<b>External File Editor</b>	<p>If you intend to edit external code, XML and DDL files (that is, code not selected from the Project Browser) use the <b>Tools   Open Source File</b> menu option, or press <b>(Ctrl+Alt+O)</b>.</p>	

Topic	Detail	See also
	If you try to close the window or select another file, the editor prompts you to save your changes.	
<b>File Parsing</b>	<p>The Source Code viewer parses files for a number of reasons. The first is to enable it to jump to the location in the file at which the currently selected item is found (but not when editing external files).</p> <p>Additionally, parsing displays a structure tree showing an overview of the file in a similar fashion to the main Project Browser. You can also select anything in that and jump to the appropriate line in the editor.</p> <p>The viewer cannot parse DDL, and therefore does not show the structure tree for a DDL file.</p>	

**Notes:**

- You view source code for an element by selecting menu options in a number of places, or by pressing either ( **Ctrl+E** ) or ( **F12** ). If the element does not have a generation file (that is, code has not been or cannot be generated, such as for a Use Case), Enterprise Architect checks whether the element has a link to either an operation or an attribute of another element. If such a link exists, and that other element has source code, the code for that element displays

**11.2.3.15 Find and Replace**

Each of Enterprise Architect's code editors facilitates searching for and replacing terms in the editor, through the **Find and Replace** dialog.

**Access:**

Highlight the required text string and press:

- **(Ctrl+F)** for the find controls only, or
- **(Ctrl+R)** for both find and replace controls

In each instance, the **Find what** field is populated with the text currently selected in the editor. If no text is selected in the editor, the **Find what** field is populated with the word at the current cursor position. If no word exists at the current cursor position, the last searched-for term is used.

**Basic Operations**

Commands:

Command	Action	See also
<b>Find Next</b>	Locate and highlight the next instance (relative to the current cursor position) of the text specified in the <b>Find what</b> field.	

Command	Action	See also
<b>Replace</b>	Replace the current instance of the text specified in the <b>Find what</b> field with the text specified in the <b>Replace with</b> field, and then locate and highlight the next instance (relative to the current cursor position) of the text specified in the <b>Find what</b> field.	
<b>Replace All</b>	Automatically replace all instances of the text specified in the <b>Find what</b> field with the text specified in the <b>Replace with</b> field.	

Options:

Option	Action	See also
<b>Match Case</b>	Specify that the case of each character in the text string in the <b>Find what</b> field is significant when searching for matches in the code.	
<b>Match whole word</b>	Specify that the text string in the <b>Find what</b> field is a complete word and should not be matched with instances of the text that form part of a longer string.  For example, searches for ARE should not match those letters in instances of the words AREA or ARENA.	
<b>Search up</b>	Perform the search from the current cursor position up to the start of the file, rather than in the default direction of current cursor position to end of file.	
<b>Use Regular Expressions</b>	Evaluate specific character sequences in the <b>Find what</b> and <b>Replace with</b> fields as <i>Regular Expressions</i> (see below).	

Topics:

Topic	Detail	See also				
<b>Regular Expressions</b>	A Regular Expression is a formal definition of a search pattern, which can be used to match specific characters, words or patterns of characters. For the sake of simplicity, the Code Editor's 'find and replace' mechanism supports only a subset of the standard Regular Expression grammar.  Text in the <b>Find what</b> and <b>Replace with</b> fields is only interpreted as a Regular Expression if the <b>Use Regular Expressions</b> checkbox is selected in the <b>Find and Replace</b> dialog.					
<b>Meta sequences</b>	If the <b>Use Regular Expressions</b> checkbox is selected, most characters in the <b>Find what</b> field are treated as literals (that is, they match only themselves). The exceptions are called <i>metasequences</i> . Each <i>metasequence</i> recognized in the Code Editor <b>Find and Replace</b> dialog is described in the following table. <table border="1" data-bbox="491 1854 1177 2042"> <thead> <tr> <th>Metasequence</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>.</td> <td>Represents any single character.</td> </tr> </tbody> </table>	Metasequence	Description	.	Represents any single character.	
Metasequence	Description					
.	Represents any single character.					

Topic	Detail		See also
	Metasequence	Description	
		For example: <b>.at</b> is matched to <b>cat</b> , <b>hat</b> , <b>bat</b> and <b>rat</b> .	
	\<	Indicates that the text is the start of a word. For example: \< <b>cat</b> is matched to <b>catastrophe</b> and <b>cataclysm</b> , but not <b>concatenate</b> .	
	\>	Indicates that the text is the end of a word. For example: <b>hat</b> > is matched to <b>that</b> and <b>chat</b> , but not <b>hate</b> .	
	( ... )	Indicates alternative single characters that can be matched. The characters can be specific - ( <b>chr</b> ) - or in an alphabetical or numerical range - ( <b>a-m</b> ) .  For example: ( <b>hc</b> ) at is matched to <b>hat</b> and <b>cat</b> but not <b>bat</b> .  For example: ( <b>a-m</b> ) Class is matched to any name in the range <b>aClass</b> - <b>mClass</b> .	
	( ^... )	Indicates alternative single characters that should be excluded from a match. The characters can be specific - ( ^chr ) - or in an alphabetical or numerical range - ( ^a-m ) .  For example: ( ^ <b>hc</b> ) at is matched to <b>rat</b> and <b>bat</b> but <b>hat</b> and <b>cat</b> are excluded.  For example: ( ^ <b>a-m</b> ) Class is matched to any name in the range <b>nClass</b> to <b>zClass</b> but <b>aClass</b> to <b>mClass</b> are excluded.	
	^	Matches the start of a line.	
	\$	Matches the end of a line.	
	*	Matches the preceding character (or character set) 0 or more times.  For example: <b>ba*t</b> is matched to <b>bt</b> , <b>bat</b> , <b>baat</b> , <b>baaat</b> and so on.  For example: <b>b( ea ) *t</b> is matched to <b>bt</b> , <b>bet</b> , <b>bat</b> , <b>beat</b> , <b>beet</b> , <b>baat</b> and so on.	
	+	Matches the preceding character (or character set) 1 or more times.  For example: <b>ba+t</b> is matched to <b>bat</b> , <b>baat</b> and <b>baaat</b> but not <b>bt</b> .  For example: <b>b( ea ) +t</b> is matched to <b>bet</b> , <b>bat</b> , <b>beat</b> , <b>beet</b> and <b>baat</b> but not <b>bt</b> .	
	If a single character metasequence is preceded with a		

Topic	Detail	See also
	<p>backslash (\) it is treated as a literal character. For example:  <b>c(at)</b> matches  <b>c(at)</b> as the square brackets are treated literally.</p> <p>When the <b>Use Regular Expressions</b> checkbox is selected, a metasequence helper menu is available to the right of both of the <b>Find what</b> and <b>Replace with</b> fields. Selecting a metasequence from this menu inserts the metasequence into the field, replacing or wrapping the currently selected text as appropriate.</p>	
<b>Tagged Regions</b>	<p>When 'find and replacing' with Regular Expressions, up to nine sections of the original term can be substituted into the replacement term. The metasequences <b>\(</b> and <b>\)</b> denote the start and the end of a <i>tagged region</i>. The section of the matched text that falls within the tagged region can be included in the replacement text with the metasequence <b>\n</b> (where <i>n</i> is the tagged region number between 1 and 9).</p> <p>For example:</p> <p><b>Find what:</b>                    \ ( ( A- Za- z ) +\ ) ' s  t h i n g s</p> <p><b>Replace with:</b>                i t e m s t h a t b e l o n g t o \ 1</p> <p>Original text:                These are all Michael's things.  Replaced text:                These are all items that belong to Michael.</p>	

## 11.2.4 Build

The topics in this section describe how you specify the commands to build the project or package.

- [Add Comands](#)<sup>[1423]</sup>
- [Recursive Builds](#)<sup>[1424]</sup>

### 11.2.4.1 Add Commands

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The Build page enables you to enter commands to build your project</p> <p>You can run a single program by selecting <b>Process</b> or multiple commands by selecting <b>Batch File</b></p> <p>You can use Enterprise Architect Local Paths and environment variables in composing your command line(s)</p>	
<b>Execute Command As:</b>	<p><b>Batch File</b></p> <p>Use this option to enter multiple commands, which are executed as entered in a command window; the command window has access to your environment variables</p> <p><b>Process</b></p> <p>Use this option to run a single program</p>	

Topic	Detail	See also
	The command should specify the path to the program, plus any command line arguments; if the executable path or any arguments contain spaces, they must be surrounded by quotes	
<b>Output Parser</b>	<p>This enables you to select a method for automatically parsing the compiler output</p> <p>If you select this option, output from the script is logged in the System Output window; Enterprise Architect parses the output according to the syntax you specify</p> <p>To view the output, select the <b>View   System Output</b> menu option</p> <p>If you double-click on an error line, Enterprise Architect loads the appropriate source file and positions the cursor on the line at which the error is reported</p>	<a href="#">The Output Window</a> <sup>[128]</sup>

**Learn More:**

- [Local Paths](#)<sup>[1532]</sup>

**11.2.4.2 Recursive Builds****Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>For any project you can apply the command entered in the build script to all sub folders of the initial directory by specifying the token <code>%r</code> immediately preceding the files to be built</p> <p>The effect of this is Enterprise Architect iteratively replaces the token with any subpath found under the root and executes the command again</p>	

**11.2.5 Clean**

The topics in this section describe how you specify the commands to clean the project prior to a build.

- [Add Clean Comands](#)<sup>[1424]</sup>
- [Recursive Builds](#)<sup>[1424]</sup>

**11.2.5.1 Add Clean Commands**

This topic explains how you enter a command to clean your project. When you execute the **Rebuild** menu option on a script the command you specify here is executed followed by the build command.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	This is the command that is executed when you click the Execution Analyzer toolbar <b>Clean</b> button or select <b>Clean</b> from the script context menu	
<b>Example</b>	<code>devenv.com /Clean Debug MyProject.sln</code>	

## 11.2.6 Debugging

This section describes how you define the debugging actions:

- [How it works](#) <sup>[1425]</sup>
- [Setup for Debugging](#) <sup>[1426]</sup>
- [Tracepoint Output](#) <sup>[1444]</sup>
- [Breakpoint and Marker Management](#) <sup>[1444]</sup>
- [Debugging Actions](#) <sup>[1445]</sup>
- [Recording Actions](#) <sup>[1458]</sup>

### 11.2.6.1 How it Works

The Model Driven Development Environment provides Debuggers for the following frameworks:

- Microsoft Native Code applications
- Microsoft .NET applications
- Java applications
- PHP.exe applications

#### Checklist:

Step	Action	See also
1	A model must be open	
2	Ensure any source code for the areas of interest have been generated, or imported into the model	<a href="#">Synchronize Model and Code</a> <sup>[1515]</sup>

#### Option 1 - No Analyzer Script:

If you have *not* configured an Analyzer Script, you can still debug a process that is running.

Step	Action	See also
1	Optionally set breakpoints before debugging	
2	Use the <b>Attach</b> button on the Debug toolbar <ul style="list-style-type: none"> <li>• Select the debugging platform</li> <li>• Select the process to debug</li> </ul>	

#### Option 2 - Analyzer Script, with Debug Page Configured:

Step	Action	See also
1	Ensure the application has been built You can do this internally using the Build Script, or you can build the application externally; the important thing is that the application is built on the latest versions of the source	<a href="#">Build</a> <sup>[1423]</sup>
2	Set breakpoints	<a href="#">Set Code Breakpoints</a> <sup>[1446]</sup>

Step	Action	See also
3	Start the debugger	<a href="#">Start &amp; Stop Debugger</a> <sup>[1456]</sup>

### 11.2.6.2 Setup for Debugging

To begin debugging you must specify

- The debugger to use
- The application path
- Runtime options, if applicable

You specify these on the Debug page of the Analyzer Script dialog.

#### Learn More:

- [Operating System Specific Requirements](#)<sup>[1426]</sup>

#### 11.2.6.2.1 Operating System Specific Requirements

**Important - Please read the information provided in this topic.**

#### Topics:

Topic	Detail	See also
<b>Prerequisites</b>	Creation of an Analyzer script and configuration of the <b>Debug</b> command in that script	
<b>Supported Platforms</b>	<p>Enterprise Architect supports debugging on these platforms:</p> <p><b>.NET</b></p> <ul style="list-style-type: none"> <li>• Microsoft™ .NET Framework 1.1 and later, including .NET 4</li> <li>• Language support: C, C#, C++, J#, Visual Basic</li> </ul> <p><b>Java</b></p> <ul style="list-style-type: none"> <li>• Java 2 Platform Standard edition (J2SE) version 5.0</li> <li>• J2EE JDK 1.4 and above</li> <li>• Requires previous installation of the Java Runtime Environment and Java Development Kit from Sun Microsystems™</li> </ul> <p>Debugging is implemented through the Java Virtual Machine Tools Interface (JVMTI), which is part of the Java Platform Debugger Architecture (JPDA); the JPDA is included in the J2SE SDK 1.3 and later</p> <p><b>Windows for Native Applications</b></p> <p>Enterprise Architect supports debugging native code (C, C++ and Visual Basic) compiled with the Microsoft™ compiler where an associated PDB file is available</p> <p>You can import native code into your model, and record the execution history for any Classes and methods</p> <p>You can also generate Sequence diagrams from the resulting execution path</p>	

Topic	Detail	See also
	<p><b>PHP</b></p> <p>Enterprise Architect enables you to perform local and remote debugging with PHP.exe</p>	

**Notes:**

- Debugging under Windows Vista (x64) - if you encounter problems debugging with Enterprise Architect on a 64-bit platform, you should build a Win32 platform configuration in Visual Studio; that is, do not specify **ANY-CPU**, specify **WIN32**

**11.2.6.2.1 UAC-Enabled Operating Systems**

The Microsoft operating systems *Windows Vista* and *Windows 7* provide User Account Control (UAC) to manage security for applications.

The Enterprise Architect Visual Execution Analyser is UAC-compliant, and users of UAC-enabled systems can perform operations with the Visual Execution Analyser and related facilities under accounts that are members of only the *Users* group.

However, when attaching to processes running as services on a UAC-enabled operating system, it might be necessary to log in as an Administrator.

**How To:**

To log in as an Administrator, follow the step below:

Step	Action	See also
1	Before you run Enterprise Architect, right-click on the Enterprise Architect icon on the desktop and select the <b>Run as administrator</b> option	

Alternatively, to edit or create a link to Enterprise Architect and configure the link to run as an Administrator, follow the steps below:

Step	Action	See also
1	Right-click on the Enterprise Architect icon and select the <b>Properties</b> menu option The Enterprise Architect Properties dialog displays	
2	Click on the <b>Advanced</b> button The Advanced Properties dialog displays	
3	Select the <b>Run as administrator</b> checkbox	
4	Click on the <b>OK</b> button, and again on the Enterprise Architect Properties dialog	

### 11.2.6.2.1.2 WINE Debugging

#### How To:

To configure Enterprise Architect to debug under WINE, follow the steps below:

Step	Action	See also
1	At the command line, run <code>\$ winecfg</code>	
2	Set the library overrides for <code>dbghelp</code> to <b>(native, builtin)</b> , and accept the warning about overriding this DLL	
3	Set <code>dbghelp</code> to <b>native</b> by using <code>winecfg</code>	
4	Copy the application source code plus executable(s) to your bottle The path must be the same as the compiled version; that is:  If Windows source = <code>C:\Source\SampleApp</code> , under Crossover it must be <code>C:\Source\SampleApp</code>	
5	Copy any Side-By-Side assemblies that are used by the application	
6	Import the source code into Enterprise Architect (optional)	
7	Create a build script on a package  Set the path of the application on the Debug tab, and set the <b>Use Debugger</b> field to <b>Microsoft Native</b>	<a href="#">Build</a> <sup>[1423]</sup>
8	Open the Profiler ( <b>Analyzer   Profile</b> )	<a href="#">Visual Execution Profiler</a> <sup>[1669]</sup>
9	Click on the <b>Launch</b> button (first button on the Profiler window)	
10	If the sample didn't start, click on the <b>Sampling</b> button (third button on the Profiler window)	
11	Once you have finished profiling, shut down the application ( <i>not</i> Enterprise Architect)	
12	View the Sampler report by clicking the <b>View Report</b> button (fifth button on the Profiler window)	

#### Topics:

Topic	Detail	See also
<b>Access Violation Exceptions</b>	<p>Due to the manner in which WINE handles direct drawing and access to DIB data, an additional option is provided on the Debug window toolbar drop-down menu to ignore or process access violation exceptions thrown when your program directly accesses DIB data</p> <p>Select this option to catch genuine (unexpected) access violations; deselect it to ignore expected violations</p>	

Topic	Detail	See also
	As the debugger cannot distinguish between expected and unexpected violations, you might have to use trial and error to capture and inspect genuine program crashes	

**Notes:**

- If WINE crashes, the back traces might not be correct
- If you are using MFC remember to copy the debug side-by-side assemblies to the *C:\window\winsxs* directory
- To add a windows path to WINE, modify the Registry entry:

```
HKEY_LOCAL_MACHINE\System\Current Control Set\Control\Session
Manager\Environment
```

**11.2.6.2.2 Microsoft C++ and Native (C, VB)****Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>You can debug native code only if there is a corresponding PDB file for the executable; you normally create the PDB file as a result of building the application</p> <p>The build should include full debug information and there should be no optimizations set</p> <p>The script must specify two things to support debugging:</p> <ul style="list-style-type: none"> <li>• The path to the executable</li> <li>• Microsoft Native as the debugging platform</li> </ul>	<a href="#">General Setup</a> <small>[1429]</small>

**11.2.6.2.2.1 General Setup**

This is the general setup for debugging Microsoft Native Applications (C++, C, Visual Basic). You have two options when debugging:

- Debug an application
- Attach to an application that is running

**Option 1 -Debug an application**

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft Native</b> as the debugging platform	
<b>Mode</b>	Select the <b>Run</b> radio button	
<b>Default Directory</b>	This is set as the default directory for the process being debugged	
<b>Application</b>	Select and enter either the full or the relative path to the application executable	
<b>Command Line Arguments</b>	Parameters to pass to the application at startup	
<b>Show Console</b>	Create a console window for the debugger; not applicable for attaching	

Field	Action	See also
	to a process	
<b>Symbol Search Path</b>	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon	

#### Option 2 - Attach to an application that is running

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft .NET</b> as the debugging platform	
<b>Mode</b>	Select the <b>Attach to Process</b> radio button	
<b>Symbol Search Path</b>	Specify any additional paths to locate debug symbols for the debugger You could specify a symbol server here if you prefer; separate the paths with a semi-colon or comma	

#### 11.2.6.2.2 Debug Symbols

##### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>For applications built using <i>Microsoft Platform SDK</i>, Debug Symbols are written to an application PDB file when the application is built</p> <p>The <i>Debugging Tools for Windows</i>, an API used by the Visual Execution Debugger, uses these symbols to present meaningful information to Execution Analyzer controls</p> <p>These symbols can easily get out of date and cause errant behaviour - the debugger might highlight the wrong line of code in the editor whilst at a breakpoint; it is therefore best to ensure the application is built prior to any debugging or recording session</p> <p>The debugger must inform the API how to reconcile addresses in the image being debugged; it does this by specifying a number of paths to the API that tell it where to look for PDB files</p> <p>For system DLLs (<i>kernel32</i>, <i>mfc90ud</i>) for which no debug symbols are found, the Call Stack shows some frames with module names and addresses only</p> <p>You can supplement the symbols translated by passing additional paths to the API; you pass additional symbol paths in a semi-colon separated list in the <b>Debug</b> tab</p>	

#### 11.2.6.2.3 Java

This section describes how to set up Enterprise Architect for debugging Java applications and Web Servers.

##### Learn More:

- [General Setup for Java](#) <sup>[1431]</sup>
- [Advanced Techniques](#) <sup>[1432]</sup>
- [Working with Java Web Servers](#) <sup>[1433]</sup>

### 11.2.6.2.3.1 General Setup for Java

This is the general setup for debugging Java Applications. You have two options when debugging.

- Debug an Application
- Attach to an application that is running

#### Option 1 - Debug an Application

Field	Action	See also
<b>Debugger</b>	Select <b>Java</b>	
<b>Mode</b>	Select <b>Run</b>	
<b>Default Directory</b>	This path is added to the class path property when the Java Virtual Machine is created	
<b>Application Class</b>	<p>Identify the fully qualified Class name to debug; the Class must have a method declared with the following signature:</p> <pre>public static void main( String( ) );</pre> <p>Application Class: <input type="text" value="samples.Collector"/></p> <p>Command Line Arguments: <input \"param3\"="" param1\"="" param2="" param4"="" type="text" value="\"/></p>	
<b>Command Line Arguments</b>	<p>Specify any parameters to be passed to the main method of the Application Class above</p> <p>Parameters containing spaces should be surrounded with double quotes</p>	
<b>Java Virtual Machine Options</b>	<p>Specify command line options for Virtual Machine creation</p> <p>You also must provide a parameter (<b>jre</b>) that is a path to be searched for the jvm.dll; this is the DLL supplied as part of the Java runtime environment or Java JDK from Sun Microsystems™</p> <p>Java Virtual Machine Options:</p> <pre>jre=%JAVA%\jre,-Djava.class.path=%classpath%;,;</pre> <p>In the example above, a virtual machine is created with a new Class path property that comprises any paths named in the <i>CLASSPATH</i> environment variable plus the default directory</p> <p>If no Class path is specified, the debugger always creates the virtual machine with a Class path property equal to any path contained in the environment variable plus the path entered in the default working directory of this script</p> <p>If source files and .class files are located under different directory trees, the Class path property <b>MUST</b> include both root path(s) to the source and root path(s) to binary class files</p>	

#### Option 2 - Attach to Virtual Machine

There is very little to specify when attaching to a VM; however, the VM must have the Sparx Systems

debugging agent loaded.

Field	Action	See also
Debugger	Select <b>Java</b>	<a href="#">Attach to Virtual Machine</a> <sup>[1432]</sup>
Mode	Select <b>Attach to Virtual Machine</b>	<a href="#">Debug Tomcat Server</a> <sup>[1436]</sup>

### 11.2.6.2.3.2 Advanced Techniques

In addition to the standard Java debugging techniques, you can:

- [Attach to a Virtual Machine](#)<sup>[1432]</sup>
- [Debug Internet Browser Java Applets](#)<sup>[1432]</sup>

#### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>You can debug a Java application by attaching to process that is hosting a Java Virtual Machine; you might want to do this for attaching to a webserver such as Tomcat or JBOSS</p> <p>The <i>Java Virtual Machine Tools Interface</i> from Sun Microsystems, is the API used by Enterprise Architect; it allows a debugging agent to be specified when the JVM is created</p> <p>To debug a running JVM from Enterprise Architect, the Sparx Systems' debugging agent must have been specified as a startup option to the JVM when it was started; how this accomplished for products such as Tomcat and JBOSS should be researched from that product's own documentation</p> <p>For <i>java.exe</i>, the command line option to load the Enterprise Architect debugging agent is:</p> <pre>- agentlib: SSJavaProfiler75</pre> <p>or:</p> <pre>- agentpath: "c:\program files\sparx systems\ea\SSJavaProfiler75"</pre> <p>It is not necessary to configure an Analyzer Script when you attach to a Virtual Machine; you can just use the <b>Attach</b> button on one of the Analyzer toolbars</p> <p>If you configure an Analyzer Script, there are only two things that must be selected:</p> <ul style="list-style-type: none"> <li>• Select <b>Java</b> as the debugging platform</li> <li>• Choose the <b>Attach to Virtual Machine</b> option</li> </ul>	

This topic describes the configuration requirements and procedure for debugging Java Applets running in a browser from Enterprise Architect.

#### How To:

To attach to the browser process hosting the Java Virtual Machine (JVM) from Enterprise Architect, follow the steps below:

Step	Action	See also
1	Ensure binaries for the applet code to be debugged have been built with debug information	
2	Configure the JVM using the Java Control Panel	
3	In the Java Applet Runtime Settings panel, click on the <b>View</b> button	
4	On the installed version to use, include the following option in the <b>Runtime Parameters</b> field: <pre>- agent path : c : \ program files \ sparx systems \ ea \ SSJavaProfiler 75</pre>	
5	In this field add the required Class paths At least one of these paths should include the root path of the source files to use in debugging	
6	Set breakpoints	<a href="#">Breakpoint and Marker Management</a> <sup>[1444]</sup>
7	Launch the browser	
8	Attach to the browser process from Enterprise Architect	

### 11.2.6.2.3.3 Working with Java Web Servers

This topic describes the configuration requirements and procedure for debugging Java web servers such as JBOSS and Apache Tomcat (both Server configuration and Windows Service configuration) in Enterprise Architect.

#### How To:

To attach to the process hosting the Java Virtual Machine from Enterprise Architect, follow the steps below:

Step	Action	See also
1	Ensure binaries for the web server code to be debugged have been built with debug information	
2	Launch the server with the Virtual Machine startup option described in <i>Server Configuration</i> , below	
3	Import source code into the Enterprise Architect Model, or synchronize existing code	
4	Set breakpoints	<a href="#">Breakpoint and Marker Management</a> <sup>[1444]</sup>
5	Launch the client	
6	Attach to the process from Enterprise Architect	

#### Topics:

Topic	Detail	See also
<b>Server Configuration</b>	<p>The configuration necessary for the web servers to interact with Enterprise Architect must address the following two essential points:</p> <ul style="list-style-type: none"> <li>Any VM to be debugged, created or hosted by the server must have the Sparx Systems Agent <code>SSJavaPr of i l e r 75</code> command line option specified in the VM startup option (that is: <code>- agent l i b : SSJavaPr of i l e r 75</code>)</li> <li>The CLASSPATH, however it is passed to the VM, must specify the root path to the package source files</li> </ul> <p>The Enterprise Architect debugger uses the <code>java . c l a s s . p a t h</code> property in the VM being debugged, to locate the source file corresponding to a breakpoint occurring in a Class during execution; for example, a Class to be debugged is called:</p> <p style="padding-left: 40px;"><code>a . b . C</code></p> <p>This is located in physical directory:</p> <p style="padding-left: 40px;"><code>C : \ s o u r c e \ a \ b</code></p> <p>So, for debugging to be successful, the CLASSPATH must contain the root path:</p> <p style="padding-left: 40px;"><code>c : \ s o u r c e</code></p>	
<b>Analyzer Script Configuration</b>	<p>Using the Debug tab of the Build Script dialog, create a script for the code you have imported and:</p> <ul style="list-style-type: none"> <li>Select the <b>Attach to process</b> radio button and, in the field below, type <b>attach</b></li> <li>In the <b>Use Debugger</b> field, click on the drop-down arrow and select <b>Java</b></li> </ul> <p>All other fields are unimportant; the <b>Directory</b> field is normally used in the absence of any Class path property</p>	<a href="#">General Setup for Java</a> <sup>[143]</sup>

**How To:**

To debug, follow the steps below:

Step	Action	See also
1	<p>Ensure that the server is running, and that the server process has loaded the Sparx Systems Agent</p> <p>DLL <code>SSJavaPr of i l e r 75 . DLL</code></p> <p>(Use <i>Process Explorer</i> or similar tools to prove this)</p>	
2	In Enterprise Architect, open the source code and set some breakpoints	<a href="#">Breakpoint and Marker Management</a> <sup>[144]</sup>
3	<p>Click on the <b>Debug</b> button in Enterprise Architect</p> <p>The Attach To Process dialog displays</p>	<a href="#">Start and Stop Debugger</a> <sup>[145]</sup>
4	Select the server process hosting the application	
5	Click on the <b>OK</b> button	

Step	Action	See also
	A confirmation message displays in the Debug Output window, stating that the process has been attached	

The breakpoints could show a question mark. In this case the Class might not have been loaded yet by the VM. If the question mark remains even after you are sure the Class containing the breakpoint has been loaded, then either:

- The binaries being executed by the server are not based on the source code
- The debugger cannot reconcile the breakpoint to a source file (check class paths), or
- The JVM has not loaded the Sparx Systems agent

#### Learn More:

- [JBoss Server](#)<sup>[1435]</sup>
- [Apache Tomcat Server](#)<sup>[1436]</sup>
- [Apache Tomcat Windows Service](#)<sup>[1436]</sup>

#### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>Consider the JBoss example below; the source code for a simple servlet is located in the directory location:</p> <p><i>C:\Benchmark\Java\JBoss\Inventory</i></p> <p>The binaries executed by JBoss are located in the JAW.EAR file in this location:</p> <p><i>C:\JBoss\03b-dao\build\distribution</i></p> <p>The Enterprise Architect debugger has to be able to locate source files during debugging; to do this it also uses the CLASSPATH, searching in any listed path for a matching JAVA source file, so the CLASSPATH must include a path to the root of the package for Enterprise Architect to find the source during debugging</p> <p>The following is an excerpt from the command file that executes the JBoss server; the Class to be debugged is at:</p> <pre>com\inventory\dto\car DTO</pre> <p>Therefore, the root of this path is included in the <i>JBoss</i> classpath</p>	
<b>Example Code</b>	<pre> RUN. BAT ----- set SOURCE=C: \ Benchmark\ Java\ JBoss\ I nvent or y  set JAVAC_JAR=%JAVA_HOME%\lib\tools.jar  if "%JBoss_CLASSPATH%" == "" (     set JBoss_CLASSPATH=%SOURCE% % JAVAC_JAR% %RUNJAR% ) else (     set JBoss_CLASSPATH=%SOURCE% % JBoss_CLASSPATH% %JAVAC_JAR% %RUNJAR%</pre>

<b>Configuration</b>	<p>For users running Apache Tomcat as a Windows™ service, it is important to configure the service to enable interaction with the Desktop; failure to do so causes debugging to fail within Enterprise Architect</p> <p>Log on as:</p> <p><input checked="" type="radio"/> Local System account</p> <p><input checked="" type="checkbox"/> Allow service to interact with desktop</p> <p>Select the <b>Allow service to interact with desktop</b> checkbox</p>	

**11.2.6.2.4 .NET**

This section describes how to configure Enterprise Architect for debugging .NET applications. It covers:

- [General Setup](#)<sup>[1437]</sup>
- [Debugging Managed code in an Unmanaged Application](#)<sup>[1438]</sup>
- [Debug COM Interop](#)<sup>[1438]</sup>
- [Debug ASP .NET](#)<sup>[1439]</sup>

**11.2.6.2.4.1 General Setup for .NET**

This is the general setup for debugging Microsoft .NET applications. You have two options when debugging:

- Debug an Application
- Attach to an application that is running

**Option 1 -Debug an application**

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft .NET</b> as the debugging platform	<a href="#">Debugging Unmanaged Code</a> <sup>[1438]</sup>  <a href="#">Debugging ASP.NET</a> <sup>[1439]</sup>
<b>Mode</b>	Select the <b>Run</b> radio button	
<b>Default Directory</b>	This is set as the default directory for the process being debugged	
<b>Application</b>	Select and enter either the full or the relative path to the application executable	
<b>Command Line Arguments</b>	Parameters to pass to the application at startup	
<b>Show Console</b>	Create a console window for the debugger; not applicable to attaching to a process	
<b>Symbol Search Path</b>	Specify any additional paths to locate debug symbols for the debugger; separate the paths with a semi-colon	

**Option 2 - Attach to an application that is running**

Field	Action	See also
<b>Debugger</b>	Select <b>Microsoft .NET</b> as the debugging platform	<a href="#">Debugging Unmanaged Code</a> <sup>[1438]</sup>  <a href="#">Debugging ASP.NET</a> <sup>[1439]</sup>
<b>Mode</b>	Select the <b>Attach to Process</b> radio button	

#### 11.2.6.2.4.2 Debugging an Unmanaged Application

##### Topics:

Topic	Detail	See also
Usage	<p>If you are debugging managed code using an unmanaged application, the debugger might fail to detect the correct version of the Common Language Runtime (CLR) to load</p> <p>You should specify a config file if you don't already have one for the debug application specified in the <b>Debug</b> command of your script</p> <p>The config file should reside in the same directory as your application, and take the format:</p> <pre>name.exe.config</pre> <p>where <i>name</i> is the name of your application</p> <p>The version of the CLR you specify should match the version loaded by the managed code invoked by the debuggee</p> <p>The following is a sample config file:</p> <pre>&lt;configuration&gt;   &lt;startup&gt;     &lt;requiredRuntime       version="version" /&gt;     &lt;/startup&gt;   &lt;/configuration&gt;</pre> <p><i>Version</i> is the version of the CLR targeted by your plugin or COM code</p>	<p><a href="http://www.msdn2.microsoft.com/en-us/library/9w519wzk.aspx">http://www.msdn2.microsoft.com/en-us/library/9w519wzk.aspx</a> (Online Resource)</p>

#### 11.2.6.2.4.3 Debug COM Interop

Enterprise Architect enables you to debug .NET managed code executed using COM in either a Local or an In-Process server.

This feature is useful for debugging Plugins and ActiveX components.

##### How To:

Step	Action	See also
1	Create a package in Enterprise Architect and import the code to debug	<a href="#">Software Engineering</a> 
2	Ensure the COM component is built with debug information	
3	Create a Script for the Package	
4	In the Debug tab, you can select to either attach to an unmanaged process or specify the path to an unmanaged application to call your managed code	
5	Add breakpoints in the source code to debug	

Topics:

Topic	Detail	See also
<b>Attach to an Unmanaged Process</b>	<p>If you are using:</p> <ul style="list-style-type: none"> <li>• An In-Process COM server, attach to the client process</li> <li>• A Local COM Server, attach to the server process</li> </ul> <p>Click on the Debug window <b>Run</b> button (or press ( <b>F6</b> )) to display a list of processes from which you can choose</p>	

Notes:

- Detaching from a COM interop process you have been debugging terminates the process; this is a known issue for Microsoft .NET Framework, and information on it can be found on many of the MSDN .NET blogs

**11.2.6.2.4.4 Debug ASP .NET**Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Debugging for web services such as ASP requires that the Enterprise Architect debugger is able to attach to a running service</p> <p>Begin by ensuring that the directory containing the ASP .NET service project has been imported into Enterprise Architect and, if required, the web folder containing the client web pages</p> <p>If your web project directory resides under the website hosting directory, you can import from the root and include both ASP code and web pages at the same time</p> <p>It is necessary to launch the client first, as the ASP .NET service process might not already be running; load the client using your browser - this ensures that the web server is running</p> <p>In the debug setup you must select the <b>Attach to process</b> radio button, and then type the keyword <b>Attach</b> in the script; this keyword causes the debugger to prompt you for a process at runtime</p> <p>Click on the Debug window <b>Run</b> button to start the debugger; the Attach To Process dialog displays</p> <p>The name of the process varies across Microsoft operating systems, as explained in the <i>ASP .NET SDK</i>; for example, under Windows Vista the name of the IIS process is <i>w3wp.exe</i></p> <p>On Windows XP, the name of the process resembles <i>aspnet_wp.exe</i>, although the name could reflect the version of the .NET framework that it is supporting</p> <p>There can be multiple ASP.NET processes running under XP; you must ensure that you attach to the correct version, which would be the one hosting the .NET framework</p>	<p><a href="#">Start and Stop Debugger</a><sup>[1458]</sup></p> <p><a href="#">Breakpoint and Marker Management</a><sup>[1444]</sup></p>

Topic	Detail	See also
	<p>version that your application runs on; check the <i>web.config</i> file for your web service to verify the version of .NET framework it is tied to</p> <p>The Debug window <b>Stop</b> button should be enabled and any breakpoints should be red, indicating they have been bound</p>	

You can set breakpoints at any time in the web server code. You can also set breakpoints in the ASP web page(s) if you imported them.

**Notes:**

- Some breakpoints might not have bound successfully, but if none at all are bound (indicated by being dark red with question marks) something has gone out of sync; try rebuilding and re-importing source code

### 11.2.6.2.5 The PHP Debugger

The Enterprise Architect PHP Debugger enables you to debug PHP.exe scripts. This section discusses basic setup and the various debugging scenarios that are commonly encountered; the scenarios concern themselves with the mapping of file paths, which is critical to the success of a remote debugging session.

- Script Setup
- Local Windows Machine (Apache Server)
- Local Windows Machine (PHP.exe)
- Remote Linux Machine (Apache Server)
- Remote Linux Machine (PHP.exe)

**Topics:**

Topic	Detail	See also															
<b>Script Setup</b>	An Analyzer Script is a basic requirement for debugging in Enterprise Architect; you create a script using the toolbar of the Execution Analyzer																
	Select <b>PHPXDebug</b> as the debugging platform; when you select this platform the property page displays the following connection settings:																
	<table border="1"> <thead> <tr> <th>Field</th> <th>Value</th> <th>Meaning</th> </tr> </thead> <tbody> <tr> <td>host</td> <td>localhost</td> <td>The adaptor that Enterprise Architect listens on for connections from PHP</td> </tr> <tr> <td>port</td> <td>9000</td> <td>The port that Enterprise Architect listens on for the PHP connection</td> </tr> <tr> <td>localpath</td> <td>%LOCAL%</td> <td>Specifies the local file path to be mapped to a remote file path. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the local file path.</td> </tr> <tr> <td>remotepath</td> <td>%REMOTE%</td> <td>Specifies the remote file path that a local file path is mapped to. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the remote file path.</td> </tr> </tbody> </table>		Field	Value	Meaning	host	localhost	The adaptor that Enterprise Architect listens on for connections from PHP	port	9000	The port that Enterprise Architect listens on for the PHP connection	localpath	%LOCAL%	Specifies the local file path to be mapped to a remote file path. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the local file path.	remotepath	%REMOTE%	Specifies the remote file path that a local file path is mapped to. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the remote file path.
	Field		Value	Meaning													
	host		localhost	The adaptor that Enterprise Architect listens on for connections from PHP													
	port		9000	The port that Enterprise Architect listens on for the PHP connection													
localpath	%LOCAL%	Specifies the local file path to be mapped to a remote file path. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the local file path.															
remotepath	%REMOTE%	Specifies the remote file path that a local file path is mapped to. This is a remote debugging setting; for local debugging, the value is a placeholder; you should edit it to fit the remote file path.															

Topic	Detail	See also
<b>Local Machine Apache Server</b>	<p>In this situation, consider the following configuration:</p> <ul style="list-style-type: none"> <li>• O/S: Windows7</li> <li>• Network computer name: <i>MyPC</i></li> <li>• Network share MyShare mapped to <i>c:\myshare</i></li> <li>• Source files in Enterprise Architect have been imported from <i>c:\myshare\apache\myapp\scripts</i></li> <li>• Apache document root is set to <i>//MyPC/MyShare/apache</i></li> </ul> <p>In this scenario an Analyzer Script for the connection parameters might be configured as follows:</p> <ul style="list-style-type: none"> <li>• <b>host:</b> localhost</li> <li>• <b>port:</b> 9000</li> <li>• <b>localpath:</b> <i>c:\myshare\apache\</i></li> <li>• <b>remotepath:</b> <i>MyPC/MyShare/apache/</i></li> </ul>	
<b>Local Machine PHP.EXE</b>	<p>In this scenario an Analyzer Script for the connection parameters might be configured as follows, as file paths always map to same physical path:</p> <ul style="list-style-type: none"> <li>• <b>host:</b> localhost</li> <li>• <b>port:</b> 9000</li> <li>• <b>localpath:</b></li> <li>• <b>remotepath:</b></li> </ul>	
<b>Remote Linux Machine Apache Server</b>	<p>In this situation consider the following configuration:</p> <ul style="list-style-type: none"> <li>• Local Machine <ul style="list-style-type: none"> <li>• O/S: Windows7</li> <li>• Source files in Enterprise Architect have been imported from <i>c:\myshare\apache\myapp\scripts</i></li> </ul> </li> <li>• Remote Machine <ul style="list-style-type: none"> <li>• O/S: Linux</li> <li>• Apache document root is set to <i>home/apache/htdocs</i></li> <li>• Source files in Apache are located at <i>home/apache/htdocs/myapp/scripts</i></li> </ul> </li> </ul> <p>In this scenario an Analyzer Script for the connection parameters might be configured as follows:</p> <ul style="list-style-type: none"> <li>• <b>host:</b> localhost</li> <li>• <b>port:</b> 9000</li> <li>• <b>localpath:</b> <i>c:\myshare\apache\</i></li> <li>• <b>remotepath:</b> <i>home/apache/htdocs/</i></li> </ul>	
<b>Remote Linux Machine PHP.exe</b>	<p>In this situation consider the following configuration:</p> <ul style="list-style-type: none"> <li>• Local Machine <ul style="list-style-type: none"> <li>• O/S: Windows7</li> <li>• Source files in Enterprise Architect have been imported from <i>c:\myshare\apache\myapp\scripts</i></li> </ul> </li> <li>• Remote Machine <ul style="list-style-type: none"> <li>• O/S: Linux</li> <li>• Source files in Apache located at <i>home/myapp/scripts</i></li> </ul> </li> </ul> <p>In this scenario an Analyzer Script for the connection parameters might be</p>

### 11.2.6.2.5.1 PHP Debugger - System Requirements

This topic identifies the system requirements and operating systems for the Enterprise Architect PHP debugger.

System Requirements:

- Enterprise Architect version 9
- PHP version 5.3 or above
- PHP zend extension XDebug 2.1 or above
- For web servers such as Apache, a server version that supports the PHP version

Supported Operating Systems:

- Client (Enterprise Architect)
  - Microsoft Windows XP and above
  - Linux running Crossover Office
- Server (PHP)
  - Microsoft Windows XP and above
  - Linux

### 11.2.6.2.5.2 PHP Debugger Checklist

This topic provides a supplementary checklist and troubleshooting guide for debugging PHP scripts in Enterprise Architect.

Topics:

Topic	Detail	See also
<b>System Requirements</b>	<ul style="list-style-type: none"> <li>• Apache HTTP Web Server version 2.2</li> <li>• PHP version 5.3 or above</li> <li>• XDebug version 2.1.1</li> </ul>	<a href="http://httpd.apache.org/">http://httpd.apache.org/</a> <a href="http://windows.php.net/">http://windows.php.net/</a> <a href="http://www.xdebug.org/download.php">http://www.xdebug.org/download.php</a>
<b>Checklist</b>	<b>Enterprise Architect</b> <ul style="list-style-type: none"> <li>• The model has an Analyzer Script configured to use the PHP-XDebug platform</li> <li>• PHP source code has been imported into the model (for recording and testpoints)</li> </ul>	

Topic	Detail		See also
	<ul style="list-style-type: none"> <li>When the PHP-XDebug platform is selected from the Analyzer Script dialog, default runtime settings are listed in the <b>Connection</b> field               <ul style="list-style-type: none"> <li>local path: %LOCAL%</li> <li>remote path: %REMOTE%</li> </ul> </li> </ul> <p>Either define local paths for these default variables or edit the script to provide actual paths</p> <p><b>For example:</b> local source, remote source</p> <p><i>localpath:c:\code samples\vea\php\sample</i>  <i>remotepath:web server/sample</i></p> <p>where:</p> <ul style="list-style-type: none"> <li><i>web server</i> is a network or local share</li> <li><i>sample</i> is a folder below share</li> </ul>		
	<b>PHP</b>	<p>In order to debug PHP scripts in Enterprise Architect, it is a requirement that the PHP is configured properly to load the XDebug extension</p> <p>Settings similar to those below should be used:</p> <ul style="list-style-type: none"> <li>[xdebug]</li> <li>xdebug.extended_info=1</li> <li>xdebug.idekey=ea</li> <li>xdebug.remote_enable=1</li> <li>xdebug.remote_handler=dbgp</li> <li>xdebug.remote_autostart=1</li> <li>xdebug.remote_host=X.X.X.X</li> <li>xdebug.remote_port=9000</li> <li>xdebug.show_local_vars=1</li> </ul> <p>The IP address X.X.X.X refers to and should match the host specified in the model Analyzer Script</p> <p>The IP address is the address XDebug connects with and the same address the Enterprise Architect PHP agent listens on</p>	
	<b>Apache</b>	<p>For debugging using Apache, the following lines should be present in the Apache configuration file, <i>httpd.conf</i></p> <pre>LoadModule php5_module "php_home/ php5apache2_2.dll" AddHandler application/x-httpd-php .php PHPLibrary "php_home"</pre> <p>where <i>php_home</i> is the PHP installation path (the path where <i>php.ini</i> and <i>apache.dll</i> exist)</p>	
<b>Troubleshooting</b>	<p>To prevent both PHP and Apache timeouts during a debugging session, the settings below might require modification</p> <p>These settings were used while developing the PHP Debugging agent in Enterprise Architect</p>		
	<b>PHP</b>	<p><b>File: <i>php.ini</i></b></p> <pre>; EA prevent PHP timeouts when debugging PHP extensions</pre>	

Topic	Detail	See also
	<pre> max_execution_time = 0  ; EA prevent web server timeouts when debugging PHP extensions max_input_time = -1  ; EA log errors display_errors = On  ; EA display startup errors display_startup_errors = On </pre>	
Apache	<b>File: httpd.conf</b> <pre> ; EA prevent timeouts while debugging php extensions Timeout 60000 </pre>	

### 11.2.6.3 Tracepoint Output

The Tracepoints page of the Analyzer Script enables you to direct where the output from any Trace statements goes during a debug session.

Field	Detail	See also
Output	You can select from two options: <ul style="list-style-type: none"> <li>• <b>Screen</b> (Default) - The output is directed to the Debugger Window</li> <li>• <b>File</b> - The output is directed to file</li> </ul>	
Folder	Enter the folder to use for Trace statement log files	
Filename	Enter the name to use for the Trace statement log files	
Overwrite	If selected, the specified file is overwritten each time a debug session is started	
Auto Number	If selected, the Trace log file is composed of the filename you specify and a number  Each time you start a Debug session, the number is incremented	
Prefix trace output with function	If selected, any trace statements executed during the Debug session run are prefixed with the current function call	

### 11.2.6.4 Breakpoint and Marker Management

Breakpoints work in Enterprise Architect much like in any other debugger. Adding a breakpoint notifies the debugger to trap code execution at the point you have specified. When a breakpoint is encountered by a thread of the application being debugged, the source code is displayed in an editor window, and the line of code where the breakpoint occurred is highlighted.

Selecting a different package in the project affects which breakpoints are displayed. An Enterprise Architect model maintains breakpoints for every package having a *Build Script - Debug* command.

**Access:** [Analyzer | Breakpoints & Markers > Breakpoints & Markers](#)

The Breakpoint and Markers Toolbar:

Button	Description
	Enables all breakpoints
	Deletes all breakpoints
	Disables all breakpoints
	Limits any recording to specified relative stack depth
	Current breakpoint set. <b>Default</b> set is normally used for debugging and is personal. Other sets are shared between users of Model.
	Menu allowing management of breakpoint sets.
	Changes how breakpoints are grouped. You can select no grouping, group by file or group by class.

#### Breakpoint States:

DEBUGGER STATE			
	Running	Not running	See also
	Bound	Enabled	
	Disabled	Disabled	
	Not bound - this usually means that the DLL is not yet loaded or was not built with debug information	N/a	
	Failed - this usually means a break could not be set at this time	N/a	<a href="#">Failure to Bind Breakpoint</a> <sup>[1447]</sup>

#### 11.2.6.4.1 Breakpoint Properties

Breakpoints in Enterprise Architect support a number of additional properties that change when a breakpoint is hit, and determine what happens when it is hit.

**Access:** [Breakpoint Context Menu | Properties](#)

#### Use to:

- Change breakpoint actions.
- Move the breakpoint to another line.
- Add constraints to restrict when a breakpoint is hit.
- Add information to be logged when the breakpoint is hit.

#### Reference:

Field	Usage	See also
<b>Action</b>	Change the behavior when the breakpoint is hit	<a href="#">Marker Types</a> [1653]
<b>Line</b>	Change the line that this breakpoint is on	
<b>Constraints</b>	Associate a condition with the breakpoint  The program is allowed to run if the condition is not met when the breakpoint is encountered	
<b>Log</b>	Log information to the Debug Output window when the breakpoint is hit	

#### Specifying constraints:

You can compose constraints using any variables that are in scope at the time the breakpoint occurs. For example:

```
m_strName="John"
```

```
m_strName=""
```

```
m_nCount > 0
```

You can also join constraints using logical operands, for example:

```
m_strName="John" AND m_nCount > 0
```

You can access elements of an array or pointer, for example:

```
m_pNames[10]="John"
```

You can also nest constraints using parentheses to impose precedence, for example:

```
( x>0 AND y>0) OR (x < 0 AND y < 0)
```

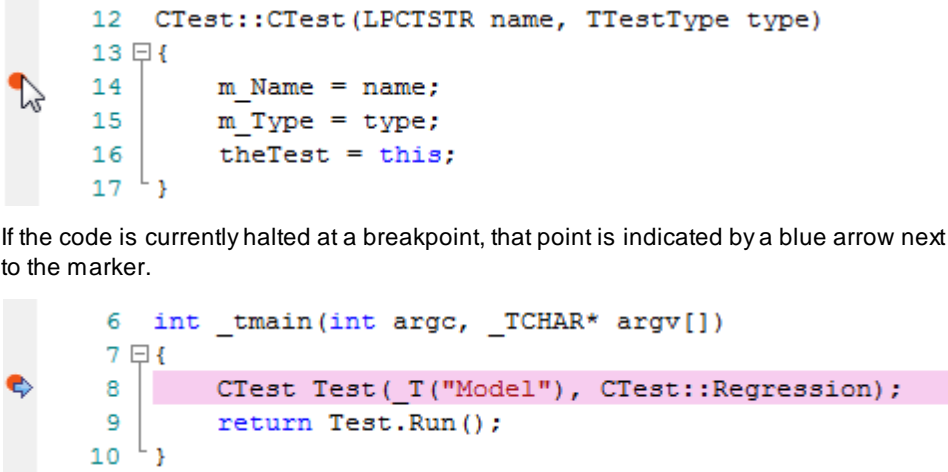

#### 11.2.6.4.2 Setting Code Breakpoints

Normal Breakpoints are typically set on a line of source code. When the Debugger hits the indicated line during normal execution, the Debugger halts execution and displays the local variables, call stack, threads and other run-time information.

#### How To:

To set a breakpoint on a line of code, follow the steps below:

Step	Action	See also
1	Open the source code to debug in the integrated source code editor;	

Step	Action	See also
2	<p>Find the appropriate code line and click in the left margin column. A solid red circle in the margin indicates that a breakpoint has been set at that position.</p>  <pre> 12 CTest::CTest(LPCTSTR name, TTestType type) 13 { 14     m_Name = name; 15     m_Type = type; 16     theTest = this; 17 }  6 int _tmain(int argc, _TCHAR* argv[]) 7 { 8     CTest Test(_T("Model"), CTest::Regression); 9     return Test.Run(); 10 } </pre> <p>If the code is currently halted at a breakpoint, that point is indicated by a blue arrow next to the marker.</p>	

#### 11.2.6.4.3 Setting Data Breakpoints

Data breakpoints enable the debugger to halt execution when the value of a pre-determined memory variable is changed. This can be useful when trying to track down the point at which a variable is modified during program execution, especially if it is not clear how program execution is affecting a particular object state.

##### Topics:

Topic	Detail	See also
<b>Setting Data Breakpoints</b>	<p>Data breakpoints can currently only be set by right-clicking on the variable in the Locals window and selecting the <b>Break When Variable is Modified</b> context menu option</p> <p>This means that in order to establish a data breakpoint you must first set a <b>normal breakpoint</b> at a point in the code that presents the required scope of local variables to choose from</p> <p>Once the program has halted execution, locate the variable of interest and select the <b>Break When Variable is Modified</b> context menu option</p>	<p><a href="#">Viewing the value of local variables</a> <sup>[145]</sup></p> <p><a href="#">Breakpoint and Marker Management</a> <sup>[144]</sup></p>

#### 11.2.6.4.4 Failure to Bind Breakpoint

##### Topics:

Topic	Detail	See also
<b>Breakpoint Failures</b>	<p>A breakpoint failure occurs if there is a problem in binding the breakpoint</p> <p>A warning message displays in the <b>Details</b> column of the Breakpoints</p>	

Topic	Detail	See also
	<p>&amp; Markers window, identifying the type of problem; for example:</p> <ul style="list-style-type: none"> <li>The source file for the breakpoint does not match the source file used to build the application image</li> <li>The time date stamp on the file is greater than that of the image</li> </ul> <p>A warning message is also output to the Debug Output window</p>	

#### 11.2.6.4.5 Delete and Disable Breakpoints

##### Topics:

Topic	Detail	See also
<b>Delete, Disable and Enable Breakpoints</b>	<p>To delete a specific breakpoint, either:</p> <ul style="list-style-type: none"> <li>If the breakpoint is enabled, click on the red breakpoint circle in the left margin of the Source Code Editor</li> <li>Right-click on the breakpoint marker in the editor and select the appropriate context menu option, or</li> <li>Select the breakpoint in the Breakpoints &amp; Markers tab and press ( <b>Delete</b> )</li> </ul> <p>Whether you are viewing the Breakpoints folder or the Breakpoints &amp; Markers window, you can right-click on an existing breakpoint and select a context menu option either to delete it or to convert it to a <b>start recording marker</b> or <b>end recording marker</b></p> <p>You can also delete all breakpoints by clicking on the <b>Delete all breakpoints</b> button on the Breakpoints &amp; Markers window toolbar</p> <p> (  )</p> <p>To disable a breakpoint, deselect its checkbox on the Breakpoints &amp; Markers window or, to disable all breakpoints, click on the <b>Disable all breakpoints</b> button in the toolbar (  ); the breakpoint is then shown as an empty grey circle</p> <p>Select the checkbox or use the <b>Enable all breakpoints</b> button to enable it again (  )</p>	<a href="#">Marker Types</a> <small>1653</small>

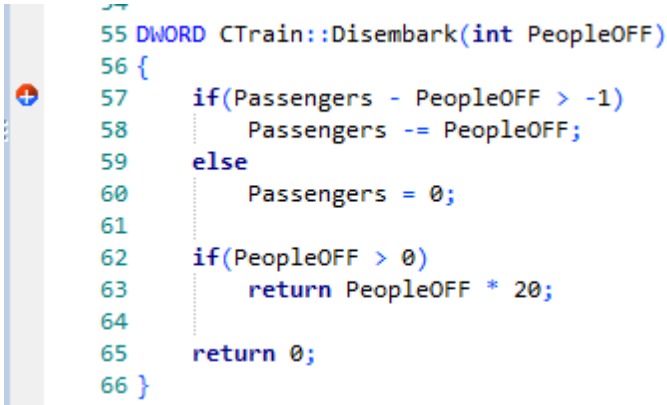

#### 11.2.6.4.6 Trace Statements

Tracepoints are set in the code editor. Like breakpoints, they are placed on a line of code. When that line of code executes, the Execution Analyzer evaluates and prints the statement either to the Debugger output window or to file, if this has been configured in the Analyzer Script.

##### How to:

To set Tracepoints, follow the steps below:

Step	Action	See also
1	Open the source code to debug in the integrated source code editor	
2	Find the appropriate code line and right click in the left margin to bring up the <b>Analyzer</b> context menu Select the <b>Add Tracepoint Marker</b> option	
3	 <pre> 55 DWORD CTrain::Disembark(int PeopleOFF) 56 { 57     if(Passengers - PeopleOFF &gt; -1) 58         Passengers -= PeopleOFF; 59     else 60         Passengers = 0; 61 62     if(PeopleOFF &gt; 0) 63         return PeopleOFF * 20; 64 65     return 0; 66 } </pre>	
4	Right-click on the Tracepoint and choose the <b>Properties</b> context menu option	
5	In the <b>Log</b> field type the statement	

#### Specifying Tracepoints:

Using the example in the image above, we could output the number of people getting off a train by using the following statement:

```
There were @Passengers before @PeopleOFF got off the train
```

To print a variable, precede the variable name with the @ token. If a variable represents a string you should precede the variable with a \$ token.

#### 11.2.6.4.7 How Markers are Stored

##### Topics:

Topic	Detail	See also
Storage	The Default always exists for a Model. It is a personal workspace and is not shared. It is stored externally. Marker Sets are stored in the model and are available to all users of the Model. They are shared,	

#### 11.2.6.5 Debugging Actions

This section describes the actions you perform in running a debug session. It covers:

- [Starting and Stopping the Debugger](#)<sup>[1456]</sup>
- [Debugging a Subsequent Process](#)<sup>[1456]</sup>
- [Stepping Over Lines of Code](#)<sup>[1457]</sup>

- [Stepping Into Function Calls](#)<sup>[1457]</sup>
- [Stepping Out of Functions](#)<sup>[1457]</sup>
- [View the Call Stack](#)<sup>[1450]</sup>
- [Viewing the Local Variables](#)<sup>[1451]</sup>
- [Viewing the Content of Long Strings](#)<sup>[1451]</sup>
- [Viewing Variables in Other Scopes](#)<sup>[1452]</sup>
- [Inspecting Process Memory](#)<sup>[1453]</sup>
- [Setting Breaks for When a Variable Changes Value](#)<sup>[1454]</sup>
- [Showing Loaded Modules](#)<sup>[1455]</sup>
- [Showing Output from the Debugger](#)<sup>[1455]</sup>
- [Debugging Tooltips in Code Editors](#)<sup>[1455]</sup>

### 11.2.6.5.1 View the Call Stack

The Call Stack window is used to display all currently running threads in a process. It can be used to identify which thread is operational immediately before program failure occurs. A Stack trace is displayed whenever a thread is suspended, through one of the step actions or through encountering a **breakpoint**. The Call Stack can record a history of Stack changes along with the ability to generate Sequences Diagrams from this history.

**Access:** Analyzer | Call Stack

#### Use To:

- View Stack history to understand the execution of a process
- View Threads
- Save a Call Stack for later use
- Record Call Stack changes for Sequence Diagram generation
- Generate a Sequence Diagram from the Call Stack
- View the related code line in Source Code Editor

#### Topics:

Topic	Icon	Detail	See also
Indicators		<ul style="list-style-type: none"> <li>• A green or yellow arrow highlights the current stack frame</li> <li>• A blue arrow indicates a thread that is running</li> <li>• A red arrow indicates a thread for which a stack trace history is being recorded</li> </ul>	
Actions		<p>Toolbar Actions:</p> <ul style="list-style-type: none"> <li>• Save a Call Stack to file</li> <li>• Generate a Sequence diagram from the current Stack</li> <li>• Copy Stack to Recording history - adds the stack details to the Record History for Sequence Diagram generation</li> <li>• Toggle Stack Depth - show either the full Stack View or only frames with source</li> <li>• Double-clicking a thread/frame takes you to the related line of code in the Source Code Editor; local variables are also refreshed for the selected frame</li> </ul> <p>Right-click on an items in the Stack list and select context menu options to:</p> <ul style="list-style-type: none"> <li>• Record Stack changes</li> </ul>	

Topic	Icon	Detail	See also
		<ul style="list-style-type: none"> <li>• Auto-Record</li> <li>• Stop the Recording</li> <li>• Generate a Sequence Diagram of the Stack</li> <li>• Copy Stack to Record History</li> </ul>	
Toolbar		Save Stack to file	
		Generate Sequence diagram from Stack	
		Copy Stack to recording history	
		Toggle Stack View	
		Stop recording	

**Learn More:**

- [Breakpoint and Marker Management](#)<sup>[1444]</sup>

**11.2.6.5.2 View the Local Variables**

Whenever a thread encounters a breakpoint, this window displays all the local variables for the thread at its current stack frame.

The value and the type of any in-scope variables are displayed in a tree. Local variables are displayed with colored box icons with the following meanings:

Color	Meaning
Blue	Object with members
Green	Arrays
Pink	Elemental types
Yellow	Parameters
Red	Workbench Instance

**Learn More:**

- [Breakpoint and Marker Management](#)<sup>[1444]</sup>
- [View the Call Stack](#)<sup>[1450]</sup>

**11.2.6.5.3 View Content Of Long Strings****Topics:**

Topic	Detail	See also
<b>Debugging Actions - View Entire Content Of Long</b>	For efficiency, the Locals window only shows partial strings; the size of any variable value displayed in the window can be up to 256 characters	

Topic	Detail	See also
Strings	To view the entire value of a variable, right-click on it and select the <b>View in Editor</b> context menu option; the String Viewer dialog displays	

#### 11.2.6.5.4 View Elements of Array

**Access:** **Analyzer | Watches**

It is not always possible to evaluate the content of large data structures or arrays using the local variables display. To inspect one or more elements of an array you can use the Watches window. In the toolbar edit box you type the name of the variable followed by the start element and the number of elements to display. The start element is enclosed in square brackets and the count of elements is enclosed in parentheses, as follows:

```
variable[ start_element ]( count_of_elements )
```

m_pStrings[0](10)	Displays ten elements of string array starting at element zero.	char* m_pStrings;
m_Numbers[100]	Displays the 100th element of integer array m_Numbers	int m_Numbers[200]

#### 11.2.6.5.5 View Variables in Other Scopes

**Topics:**

Topic	Detail	See also
<b>Watches</b>	<p>The Watches window is most useful for native code (C, C++, VB) where it can be used to evaluate data items that are not available as Local Variables - data items with module or file scope and static Class member items</p> <p>You can also use the window to evaluate static Class member items in Java and .NET</p> <p>To use the Watches window, type the name of the variable to examine in the field in the window toolbar, and either press ( <b>Enter</b> ) or click on the <b>Add new watched item</b> icon</p> <p>To examine a static Class member variable in C++, Java or Microsoft .NET, enter its fully qualified name; for example:</p> <pre>CMyClass : MyStaticVar</pre> <p>To examine a C++ data symbol with module or file scope, just enter its name</p> <p>Variables are evaluated by looking at the current scope; that is, the module of the current stack frame (you can change the scope at a breakpoint by double-clicking the frame in the call stack)</p> <p>If the global variable exists in a different module, you can examine the variable by prefixing the module name to the variable; for example:</p> <pre>module!variable_name</pre> <p>The names of the items to evaluate persist for the package and user ID, so the next time <i>you</i> debug the same project, the items evaluate automatically whenever a breakpoint occurs; they do not appear if</p>	<p><a href="#">View the Local Variables</a> <sup>[145]</sup></p>

Topic	Detail	See also
	<p>another user debugs the same code</p> <p>If necessary, you can delete items using the <b>Delete all watched items</b> icon in the toolbar, or the right-click context menu option inside the window</p>	

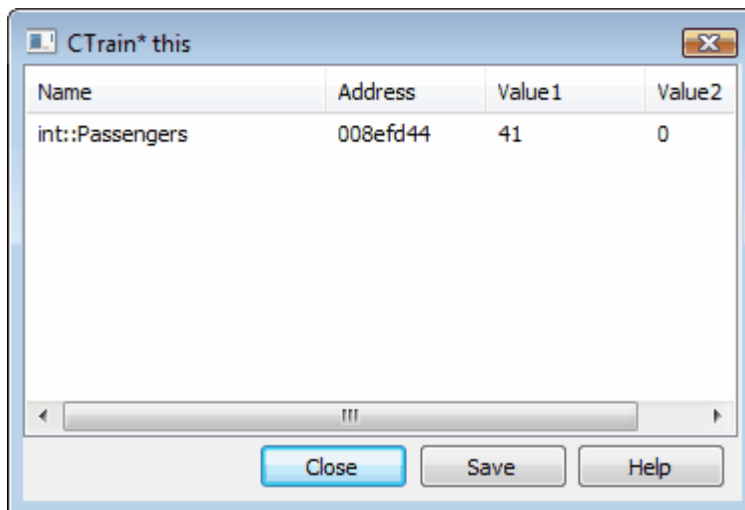

#### 11.2.6.5.6 Variable Snapshots

Snapshots allow you to compare the value of an object at one point in time with its value at a later point in time. You can take a snapshot of a variable when the program is at a breakpoint. The debugger copies the values of not only the selected variable but any of its members and so on until it can find no debug information for a member or no more members can be found.

The procedure for using variable snapshots is typically as follows:

1. Set two breakpoints (called **start** and **end**) The start is usually placed at the start of a function and the end breakpoint at the end of the function.
2. At the **start** breakpoint select a variable in the Locals window and select the **Save Variable Snapshot** context menu option.
3. Run the program.
4. When the **end** breakpoint is reached, select the **Compare Variable Snapshots** context menu option; a dialog displays that details the original value from the first snapshot and the current value from the second snapshot (see the example below).

The following image shows the comparison between values of a variable, captured using this feature. (This is taken from the *EA.Example* model.)

#### 11.2.6.5.7 Inspect Process Memory

**Access:** [Analyzer](#) | [More Analyzer Windows](#) | [Memory Viewer](#)

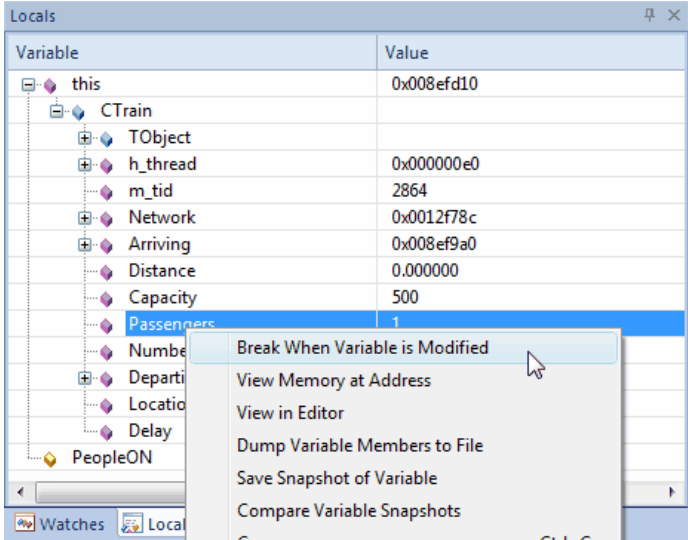

**Topics:**

Topic	Detail	See also
Memory Viewer	<p>You can display the raw values at a memory address or for a variable in a window using the Memory Viewer - select the <b>View Memory at Address</b> context menu option</p> <p>The Memory Viewer displays the raw values at a memory address</p> <p>The Memory Viewer is available for debugging Microsoft Native Code Applications (C, C++, VB) running on Windows or within WINE on Linux</p>	

### 11.2.6.5.8 Break When a Variable Changes Value

You can set a breakpoint on a variable such that when it is modified the debugger halts at the line of code that has just caused the memory to be changed. When such a breakpoint occurs the code editor is displayed and the line highlighted. The log in the Debugger window also prints a statement to the effect.

#### Topics:

Topic	Detail	See also
Usage	<p>An invalid or uninitialised variable can cause the program behaviour to differ from expected. This tool enables you to halt execution whenever a certain variable has its value changed.</p> <p>The example below creates a notification on a variable from the Locals window. The item being watched is the Passengers integer member of the CTrain class.</p>  <p>The screenshot shows the 'Locals' window with a tree view of variables. The 'Passengers' variable under the 'CTrain' class is selected. A context menu is open over it, with 'Break When Variable is Modified' highlighted. Other menu items include 'View Memory at Address', 'View in Editor', 'Dump Variable Members to File', 'Save Snapshot of Variable', and 'Compare Variable Snapshots'.</p>	

#### Notes:

- This feature is not presently supported by the Microsoft .NET platform.

### 11.2.6.5.9 Show Loaded Modules

The debugger **Modules** window lists the modules loaded by the process being debugged.

The columns on this window are described below:

Column	Action
Path	Determine the file path of the loaded module.
Modified Date	Determine the local file date and time the module was modified.
Debug Symbols	Establish the debug symbols type, whether debug information is present in the module and whether line information is present for the module (required for debugging).
Symbol File Match	Check the validity of the symbol file; if the value is false, the symbol file is out of date.
Symbol Path	Determine the file path of the symbol file, which must be present for debugging to work.
Modified Date	Determine the local file date and time the symbol file was created.

### 11.2.6.5.10 Show Output from Debugger

Topics:

Topic	Detail	See also
Usage	<p>During a debug session the <b>Debugger</b> emits messages detailing both startup and termination of session, to its <b>Output</b> tab. Details of exceptions and any errors are also output to this tab. Any trace messages such as those output using <i>Java System.out</i> or <i>.NET System.Diagnostics.Debug</i> are also captured and displayed here.</p> <p>If you double-click on a debug message, either:</p> <ul style="list-style-type: none"> <li>• A pop-up displays with more complete message text, or</li> <li>• If there has been a memory leak, the file is displayed at the point at which the error occurred</li> </ul>	

### 11.2.6.5.11 Debug Tooltips in Code Editors

Topics:

Topic	Detail	See also
Inspecting Member Variables	<p>During debugging, whenever a thread is suspended at a line of execution, you can inspect member variables in the <b>Editor</b> window.</p> <p>To evaluate a member variable, use the mouse to move the cursor over the variable in the <b>Editor</b> window, as shown in the following examples.</p>	

Topic	Detail	See also
	<pre> public void Print() {     int n = 0;     while (names[n].Length &gt; 0)     {         names = {["names[0]=book, names[0]=book, names[1]=novel, names[2]=film}, ...};         Document d = new Document (names[n++]);         d.Print ();     } }  public void Print () {     int n = 0;     while (n &lt;= 0)     {         Document d = new Document (names[n++]);         d.Print ();     } } </pre>	

### 11.2.6.5.12 Start & Stop Debugger

#### Topics:

Topic	Detail	See also
Usage	<p>If <b>Basic Setup</b> has been completed, pressing ( <b>F6</b> ) starts the application using the configured Debugger.</p> <p>If not, debugging is still possible by using the <b>Attach</b> button on either one of the <b>Debugger</b> toolbars.</p> <p>To stop debugging, click on the <b>Stop</b> button  in the <b>Debug</b> window toolbar, or press ( <b>Ctrl+Alt+F6</b> ) .</p>	<a href="#">Setup</a> <sup>[1400]</sup>

#### Notes:

- In most situations, the debugger ends:
  - when it encounters breakpoints (which should be set beforehand)
  - when the debug process terminates
  - when the Java Class thread exits
- However, due to the nature of the Java Virtual Machine, it is necessary at times for Java developers to stop the debugger manually with the **Stop** button

### 11.2.6.5.13 Debug Another Process

#### Topics:

Topic	Detail	See also
Usage	<p>When debugging another process, the <b>Attach To Process</b> dialog is displayed.</p> <p>You can limit the processes displayed using the radio buttons at the top of the dialog. To find a service such as Apache Tomcat or ASP.NET, select the <b>System</b> radio button.</p> <p>You must choose the debugger when you select a process.</p>	

Topic	Detail	See also
	<p>However, if the selected Package has already been configured for debugging then the Debugger listed is the one specified in the Script.</p> <p>Once Enterprise Architect is attached to the process, any breakpoints encountered are detected by the debugger and the information is available in the <b>Debugger</b> windows.</p> <p>To detach from a process, click on the <b>Debug Stop</b> button.</p>	

#### 11.2.6.5.14 Step Over Lines of Code

##### Topics:

Topic	Detail	See also
<b>Stepping Over</b>	<p>You can step over the lines of a function using the <b>Debug</b> toolbar buttons.</p> <p>When you step to the end of the function, you step back to the caller.</p>  <p>Alternatively, press ( <b>Alt+F6</b> ) or select the <b>Analyzer   Debug   Step Over</b> context menu option.</p>	

#### 11.2.6.5.15 Step Into Function Calls

##### Topics:

Topic	Detail	See also
<b>Stepping In</b>	<p>The <i>Step In</i> function is executed by clicking on the <b>Step In</b> button.</p>  <p>Alternatively, press ( <b>Shift+F6</b> ) or select the <b>Analyzer   Debug   Step In</b> context menu option.</p> <p>If no source is available for the function then the debugger continues stepping until it either enters a new function or reaches the next line of the current one.</p>	

#### 11.2.6.5.16 Step Out of Functions

##### Topics:

Topic	Detail	See also
<b>Stepping In</b>	<p>The <i>Step Out</i> function is executed by clicking on the <b>Step Out</b> button.</p> 	

Topic	Detail	See also
	<p>Alternatively, press ( <b>Ctrl+F6</b> ) or select the <b>Analyzer   Debug   Step Out</b> menu option.</p> <p>If no source is available for the function then the debugger continues stepping until it either enters a new function or reaches the next line of the current one.</p>	

### 11.2.6.6 Recording Actions

This section describes how to perform the following debug recording actions:

- [Step through function calls](#) <sup>[1458]</sup>
- [Create a Sequence diagram of the Call Stack](#) <sup>[1458]</sup>
- [Save the Call Stack](#) <sup>[1459]</sup>

#### 11.2.6.6.1 Step Through Function Calls

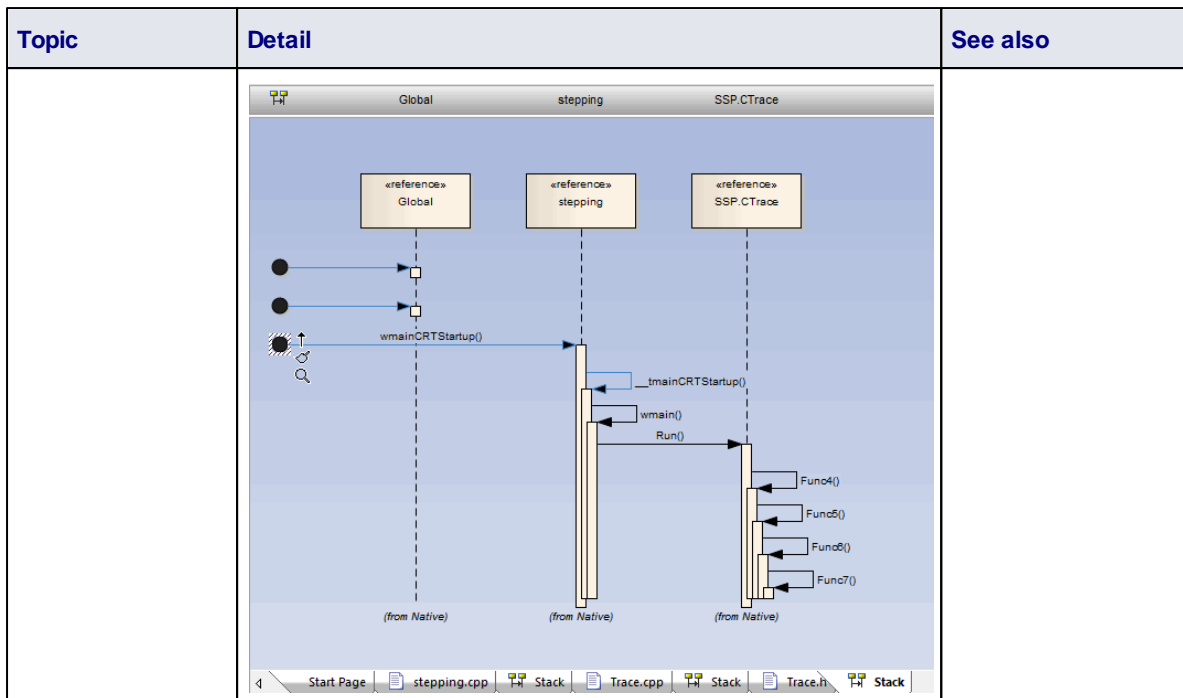

Topics:

Topic	Detail	See also
<b>Stepping Through</b>	<p>The Step Through function can be executed by clicking on the <b>Step Through</b> button on the <b>Record &amp; Analyze</b> window toolbar</p>  <p>Alternatively, press ( <b>Shift+F6</b> ) or select the <b>Analyzer   Debug   Step Into</b> context menu option</p> <p>The <i>Step Through</i> command causes a <i>Step Into</i> command to be executed. If any function is detected, then that function call is recorded in the <b>History</b> window. The debugger then steps out, and the process can be repeated.</p> <p>This button enables you to record a call without having to actually step into a function. The button is only enabled when at a breakpoint and in manual recording mode.</p>	

#### 11.2.6.6.2 Create Sequence Diagram of Call Stack

Topics:

Topic	Detail	See also
<b>Usage</b>	<p>To generate a Sequence diagram from the current Stack, click on the <b>Generate Sequence Diagram of Stack</b> button on the <b>Call Stack</b> window toolbar.</p> <p>This immediately generates a Sequence diagram in the <b>Diagram View</b>.</p>	

### 11.2.6.6.3 Saving the Call Stack

On the **Call Stack** window, you can save the current Stack to file or copy the Stack to the recording history.

**Toolbar:**

Icon	Detail	See also
	Save Stack to file	
	Copy Stack to recording history	

## 11.2.7 Run

This section describes how to create a **command for running** your executable code.

**Learn More:**

- [Add run command](#) 1459

### 11.2.7.1 Add Run Command

This topic explains how you enter a command for running your executable.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	This is the command that is executed when you select the <b>Analyzer   Run</b> menu option; at its simplest, the script would contain the location and name of the file to be run	

Topic	Detail	See also
Example	<p>The following two examples show scripts configured to run a .Net and a Java application in Enterprise Architect.</p> <p><b>.Net:</b></p> <pre>C:\benchmark\cpp\example_net_1 \release\example.exe</pre> <p><b>Java:</b></p> <pre>customer</pre> <p>The command listed in this field is executed as if from the command prompt; as a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes</p>	

**Notes:**

- Enterprise Architect provides the ability to start your application normally OR with debugging from the same script. The **Analyzer** menu has separate options for starting a normal run and a debug run

## 11.2.8 Testing

This section describes how to create a **command for performing unit testing** on your code.

**Learn More:**

- [Add Testing Command](#)<sup>[1460]</sup>
- [Testpoints Output](#)<sup>[1461]</sup>

### 11.2.8.1 Add Testing Command

This topic explains how to configure the Test Page of an Analyzer Script for performing unit testing on your code.

**Topics:**

Topic	Detail	See also
Usage	<p>A sample script would contain a line to execute the testing tool of your choice, with the filename of the executable produced by the <b>Build</b> command as the option</p> <p>To execute this test select the <b>Analyzer   Test   Run Test Script</b> menu option</p> <p>Testing could be integrated with any test tool using the command line provided, but in these examples you can see how to integrate <i>NUnit</i> and <i>JUnit</i> testing with your source code</p> <p>Enterprise Architect provides an inbuilt MDA Transform from source to Test Case, plus the ability to capture <i>xUnit</i> output and use it to go directly to a test failure; <i>xUnit</i> integration with your model is now a powerful means of</p>	

Topic	Detail	See also
	<p>delivering solid and well-tested code as part of the complete model-build-test-execute-deploy life-cycle</p> <p>NUnit and JUnit must be downloaded and installed prior to their use; Enterprise Architect does not include these products in the base installer</p>	
<b>Execute Command As:</b>	<p><b>Process</b></p> <p>Enter the path to a program or batch file to run followed by any parameters</p> <p><b>Batch File</b></p> <p>When using this option you can enter multiple commands, which are then executed as a single script in a command console; you have access to any environment variables available in a standard command console</p>	
<b>Parse Output</b>	<p>Selecting an Output Parser causes output from the command(s) to be captured to the Output window; the <b>Output Parser</b> field specifies the syntax to be expected</p> <p>Double-clicking on a result in the Output window opens the corresponding code segment in Enterprise Architect's code window</p> <p>Selecting the <b>Build First</b> checkbox ensures that the package is recompiled each time you run the test</p> <p>If you include the string %N in your test script it is replaced by the fully namespace-qualified name of the currently selected Class when the script is executed</p>	
<b>Example</b>	<p><b>NUnit</b></p> <pre>" C: \ P r o g r a m F i l e s \ N U n i t \ b i n \ n u n i t - c o n s o l e . e x e " p i n \ d e b u g \ C a l c u l a t o r . e x e "</pre> <p><b>JUnit</b></p> <pre>j a v a j u n i t . t e x t u i . T e s t r u n n e r %N</pre> <p>The command listed in this field is executed as if from the command prompt; as a result, if the executable path or any arguments contain spaces, they must be surrounded in quotes</p>	

### 11.2.8.2 Testpoints Output

The Testpoints page of the Analyzer Script allows you to configure the output of a Testpoint run.

Topic	Detail	See also
<b>Output</b>	<p>You can select from two options:</p> <ul style="list-style-type: none"> <li><b>Screen</b> (Default) - The output is directed to the Testpoints tab of the System Output window</li> <li><b>File</b> - The output is directed to file</li> </ul>	<a href="#">Testpoint Management</a> <sup>[1684]</sup>
<b>Folder</b>	Enter the folder to use for Testpoint log files.	
<b>Filename</b>	Enter the name to use for the Testpoints log files	

Topic	Detail	See also
<b>Overwrite</b>	When this option is selected, the file specified is overwritten each time a Testpoint run is performed	
<b>Auto Number</b>	When this option is selected, the Testpoint output is composed of the filename you specify and the number of the Test run; each time you perform a Test run the number is incremented	
<b>Prefix trace output with function</b>	When this option is selected, any trace statements executed during the Testpoint run are prefixed with the current function call	

## 11.2.9 Deploying

This section describes how to create a **command for deploying** the current package.

### Learn More:

- [Add Deploy Command](#)<sup>[1462]</sup>

### 11.2.9.1 Add Deploy Command

This topic explains how to configure the Deploy Page of an Analyzer Script to deploy your project.

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>This topic enables you to create a command for deploying a package.</p> <p>This script is executed when you select the <b>Analyzer   Deploy</b> or by pressing <b>Ctrl + Shift + Alt + F12</b></p>	
<b>Execute Command as:</b>	<p><b>Process</b></p> <p>If the deployment is handled externally, enter the path to the program or batch file to run followed by any parameters. This program is launched in a separate process.</p> <p>Example:</p> <pre>C:\apache-ant-1.7.1\bin\ant.cmd myproject deploy</pre> <p><b>Batch File</b></p> <p>When using this option, you can enter multiple commands. These commands are then executed as a single script in a command console. You have access to any environment variables available in a standard command console.</p> <p>Example:</p> <pre>@echo on IF NOT EXIST "%1%" GOTO DEPLOY_NOWAR IF "%APACHE_HOME%" == "" GOTO DEPLOY_NOAPACHE xcopy /L "%1%" "%APACHE_HOME%\webapps" GOTO DEPLOY_END rem</pre>	

Topic	Detail	See also
	<pre> rem NO WAR FILE rem :DEPLOY_NOWAR echo "%1% WAR file not found" GOTO DEPLOY_END rem rem NO APACHE ENVIRONMENT VARIABLE rem :DEPLOY_NOAPACHE echo "APACHE_HOME environment variable not f :DEPLOY_END pause </pre>	
<b>Parse Output</b>	<p>Selecting a Parser from the list causes output of the deploy script to be captured. The output is parsed according to the syntax selected from the list.</p> <p>The output window can be displayed by selecting <b>View   System Output</b></p>	

### 11.2.10 Searching Files

This topic describes how to use the File Search facility to search files for data names and structures.

#### Learn More:

- [Find in Files](#)<sup>[1463]</sup>

#### 11.2.10.1 Find in Files

This topic describes the **File Search** control.

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>File Text Searches are provided by the <b>Search</b> Window and from within the Code Editors.</p> <p>The <b>Search</b> window enables you to search for text in code files and scripts. You can select to display the results of the search in one of two formats:</p> <ul style="list-style-type: none"> <li>• <b>List View</b> - each result line consists of the file path and line number, followed by the line text; multiple lines from one file are listed as separate entries</li> <li>• <b>Tree View</b> - each result line consists of the file path that matches the search criteria, and the number of lines matching the search text within that file; you can expand the entry to show the line number and text of each line</li> </ul>	

#### Search Toolbar:

You can use the toolbar options in the **Search** window to control the search operation. The state of all buttons persists over time to always reflect your previous search criteria.

The options, from left to right, are as follows:

**Reference:**

Field	Usage	See also
<b>Search Path</b> list box	<p>Specify the folder to search.</p> <p>You can type the path to search directly into the text box, or click on the folder icon to browse for the path. Any paths you enter are automatically saved in the drop-down list, up to a maximum of ten; paths added after that overwrite the oldest path in the list.</p> <p>A fixed option in the drop-down list is <b>Search in Scripts</b>, which sets the search to operate on all local and user-defined scripts in the <b>Scripts</b> tab of the <b>Scripting</b> window. This option disables the <b>Search File Types</b> list box.</p>	
<b>Search Text</b> list box	<p>Specify the text to look for.</p> <p>You can type the text directly into the text box or click on the drop-down arrow to select from a previous entry in the list. The search text you enter is automatically saved in the list when you click on the <b>Search</b> button.</p> <p>The list box saves up to ten search queries. Search queries added after that overwrite the oldest query in the list.</p>	
<b>Search File Types</b> list box	<p>Limit the search to specific types of files. You can select multiple file types in a string, separated by either a comma or a semi-colon as shown in the image above.</p>	
<b>Search</b> button	<p>Begin the search.</p> <p>During the course of the search all other buttons in the toolbar are disabled. You can cancel the search at any time by clicking on the <b>Search</b> button again.</p> <p>If you switch any of the toggle buttons below, you must run the search again to change the output.</p>	
<b>Case Sensitivity</b> button	<p>Toggle the case sensitivity of the search. The tooltip message identifies the current status of the button.</p>	
<b>Word Match</b> button	<p>Toggle between searching for any match and searching for only those matches that form an entire word. The tooltip message identifies the current status of the button.</p>	
<b>SubFolders</b> button	<p>Toggle between limiting the search to a single path and including all subfolders under that path. The tooltip message identifies the current status of the button.</p>	
<b>Result View</b> button	<p>Select the presentation format of the search results - List View or Tree View format.</p>	
<b>Clear Results</b> button	<p>Clear the results.</p>	
<b>Clear Search Criteria</b> button	<p>Remove all the entries in the <b>Search Path</b>, <b>Search Text</b> and <b>Search File Types</b> list boxes, if required.</p>

### 11.3.1 ActionScript Conventions

Enterprise Architect supports round trip engineering of ActionScript 2 and 3, where the following conventions are used.

#### Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
literal	Operation	A literal method referred to by a variable.
property get	Operation	A read property.
property set	Operation	A write property.

#### Tagged Values

Reference:

Tag	Applies To	Corresponds To
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
dynamic	Class or Interface	The <i>dynamic</i> keyword.
final	ActionScript 3: Operation	The <i>final</i> keyword.
intrinsic	ActionScript 2: Class	The <i>intrinsic</i> keyword
namespace	ActionScript 3: Class, Interface, Attribute, Operation	The namespace of the current element.
override	ActionScript 3: Operation	The <i>override</i> keyword.
prototype	ActionScript 3: Attribute	The <i>prototype</i> keyword.
rest	ActionScript 3: Parameter	The <i>rest</i> parameter ( ... ).

#### Topics:

Topic	Detail	See also
Common Conventions	<ul style="list-style-type: none"> <li>Package qualifiers (ActionScript 2) and Packages (ActionScript 3) are generated when the current package is not a <b>namespace root</b></li> <li>An unspecified type is modeled as <i>var</i> or an empty <b>Type</b> field</li> </ul>	<a href="#">Namespace</a> s <sub>[1504]</sub>
ActionScript 3 Conventions	<ul style="list-style-type: none"> <li>The <i>Is Leaf</i> property of a Class corresponds to the sealed keyword</li> <li>If a <i>namespace</i> tag is specified it overrides the <i>Scope</i> that is specified</li> </ul>

### 11.3.2 Ada 2005

Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect.

Enterprise Architect supports round trip engineering of Ada 2005, where the following conventions are used.

#### Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>adaPackage</b>	Class	A package specification in Ada 2005 without a tagged record.
<b>adaProcedure</b>	Class	A procedure specification in Ada 2005.
<b>delegate</b>	Operation	Access to a subprogram.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>struct</b>	Inner Class	A record definition.
<b>typedef</b>	Inner Class	A type definition, subtype definition, access type definition, renaming.

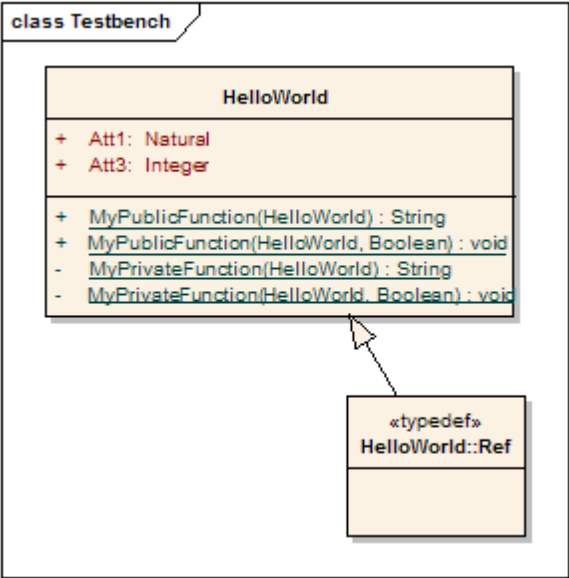

#### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>Discriminant</b>	Inner Class with stereotype <i>typedef</i>	The type's discriminant.
<b>IsAccess</b>	Parameter	Determination of whether the parameter is an access variable.
<b>InstantiatedUnitType</b>	Inner Class with stereotype <i>typedef</i>	The instantiated unit's type ( <i>Package / Procedure / Function</i> ).
<b>PartType</b>	Inner Class with stereotype <i>typedef</i>	The part type ( <i>renames</i> or <i>new</i> ).
<b>Type</b>	Inner Class with stereotype <i>typedef</i>	If Value = <i>Sub Type</i> , set subtype. If Value = <i>Access</i> , set access type.

#### Topics:

Topic	Detail	See also
<b>Other</b>	<ul style="list-style-type: none"> <li>• Appropriate type of source files: Ada specification file, <b>.ads</b>.</li> </ul>	<a href="#">Ada 2005 options</a>

Topic	Detail	See also
Conventions	<ul style="list-style-type: none"> <li>• Ada 2005 imports packages defined as either &lt;&lt;adaPackage&gt;&gt;Class or Class, based on the settings in the <b>Ada 2005 options</b></li> <li>• A package in the Ada specification file is imported as a Class if it contains a Tagged Record, the name of which is governed by the options <b>Use Class Name for Tagged Record</b> and <b>Alternate Tagged Record Name</b>. All attributes defined in that Tagged Record are absorbed as the Class's attributes</li> <li>• A procedure / function in an Ada specification file is considered as the Class's member function if its first parameter satisfies the conditions specified in the options <b>Ref Param Style</b>, <b>Ignore Reference parameter name</b> and <b>Ref parameter name</b></li> <li>• The option <b>Define Reference for Tagged Record</b>, if enabled, creates a reference type for the Class, the name of which is determined by the option <b>Reference Type Name</b></li> </ul> <p>For example: HelloWorld.ads</p> <pre> package HelloWorld is     type HelloWorld is tagged record         Att1: Natural;         Att3: Integer;     end record;      -- Public Functions     function MyPublicFunction (P: HelloWorld) return String;     procedure MyPublicFunction (P1: in out HelloWorld; AFlag: Boolean); private     -- Private Functions     function MyPrivateFunction (P: HelloWorld) return String;     procedure MyPrivateFunction (P1: in out HelloWorld; AFlag: Boolean); end HelloWorld; </pre>  <pre> classDiagram     class HelloWorld {         +Att1: Natural         +Att3: Integer         +MyPublicFunction(HelloWorld): String         +MyPublicFunction(HelloWorld, Boolean): void         -MyPrivateFunction(HelloWorld): String         -MyPrivateFunction(HelloWorld, Boolean): void     }     class HelloWorldRef {         &lt;&lt;typedef&gt;&gt;         HelloWorld::Ref     }     HelloWorldRef --&gt; HelloWorld </pre>	1540

### 11.3.3 C Conventions

Enterprise Architect supports round trip engineering of C, where the following conventions are used:

Stereotype:

Stereotype	Applies To	Corresponds To
enumeration	Inner Class	An <i>enum</i> type
struct	Inner Class	A <i>struct</i> type
	Attribute	A keyword <i>struct</i> in variable definition
typedef	Inner Class	A <i>typedef</i> statement, where the parent is the original type name
union	Inner Class	A <i>union</i> type
	Attribute	A keyword <i>union</i> in variable definition

Tagged Values:

Tag	Applies To	Corresponds To
anonymous	Class also containing the Tagged Value <i>typedef</i>	The name of this class being defined only by the <i>typedef</i> statement
bodyLocation	Operation	The location the method body is generated to; expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b>
typedef	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement

C Code Generation for UML Model:

UML	C Code	Notes
A Class	A pair of C files (.h + .c)	File name is the same as Class name
Operation (public & protected)	Function declaration in .h file and definition in .c file	
Operation (private)	Function definition in .c file only	
Attribute (public & protected)	Variable definition in .h file	
Attribute (private)	Variable definition in .c file	

UML	C Code	Notes
Inner Class (without stereotype)	(N/A)	This inner Class would be ignored

**Topics:**

Topic	Detail	See also
<b>Capture #define value to be generated in C code</b>	For example, <code>#define PI 3.14</code> <ol style="list-style-type: none"> <li>1. Add an attribute to the Class, with <b>Name = PI</b> and <b>Initial Value = 3.14</b></li> <li>2. In the General page of the Attribute Properties dialog, select the <b>Static</b> and <b>Const</b> checkboxes</li> <li>3. On the Tagged Values page of the Attribute Properties dialog, add a tag called <b>define</b> with the value <b>true</b></li> </ol>	<a href="#">Attributes</a> <sup>[697]</sup> <a href="#">Attributes Dialog - General</a> <sup>[698]</sup> <a href="#">Attribute Tagged Values</a> <sup>[701]</sup>

**Notes:**

- Separate conventions apply to **Object Oriented programming in C**

- [Generate Source Code](#)<sup>[1499]</sup>
- [C Options](#)<sup>[1540]</sup>
- [Object Oriented Programming in C](#)<sup>[1471]</sup>

**11.3.3.1 Object Oriented Programming In C**

The following conventions are used for Object-Oriented programming in C.

To configure Enterprise Architect to support Object-Oriented programming using C, you must set the **Object Oriented Support** option to **True** on the C Specifications page of the Options dialog.

**Stereotype**

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type
<b>struct</b>	Class	A <i>struct</i> type
	Attribute	A keyword <i>struct</i> in variable definition
<b>typedef</b>	Class	A <i>typedef</i> statement, where the parent is the original type name
<b>union</b>	Class	A <i>union</i> type
	Attribute	A keyword <i>union</i> in variable definition

**Tagged Values**

Tag	Applies To	Corresponds To
<b>anonymous</b>	Class with stereotype of <i>enumeration, struct</i> or <i>union</i>	The name of this Class being defined only by the <i>typedef</i> statement
<b>bodyLocation</b>	Operation	The location the method body is generated to. Expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b>
<b>define</b>	Attribute	<i>#define</i> statement
<b>typedef</b>	Class with stereotype of <i>enumeration, struct</i> or <i>union</i>	This Class being defined in a <i>typedef</i> statement

**Topics:**

Topic	Detail	See also
<b>Object-Oriented C Code Generation for UML Model</b>	<p>The basic idea of implementing a UML Class in C code is to group the data variable (UML attributes) into a structure type; this structure is defined in a .h file so that it can be shared by other classes and by the client that referred to it</p> <p>An operation in a UML Class is implemented in C code as a function; the name of the function must be a fully qualified name that consists of the operation name, as well as the Class name to indicate that the operation is for that Class</p> <p>A delimiter (specified in the <b>Namespace Delimiter</b> option on the <b>C Specifications</b> page) is used to join the Class name and function (operation) name</p> <p>The function in C code must also have a reference parameter to the Class object - you can modify the <b>Reference as Operation Parameter</b>, <b>Reference Parameter Style</b> and <b>Reference Parameter Name</b> options on the <b>C Specifications</b> page to support this reference parameter</p>	<a href="#">C Specification</a> <small>[1540]</small>
<b>Limitations of Object-Oriented Programming in C</b>	<ul style="list-style-type: none"> <li>No scope mapping for an attribute: an attribute in a UML Class is mapped to a structure variable in C code, and its scope (private, protected or public) is ignored</li> <li>Currently an inner Class is ignored: if a UML Class is the inner Class of another UML Class, it is ignored when generating C code</li> <li>Initial value is ignored: the initial value of an attribute in a UML Class is ignored in generated C code</li> </ul>

**11.3.4 C# Conventions**

Enterprise Architect supports the round trip engineering of C#, where the following conventions are used.

**Stereotypes**

Reference:

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>event</b>	Operation	An event.
<b>extension</b>	Operation	A Class extension method, represented in code by a <i>this</i> parameter in the signature.
<b>indexer</b>	Operation	A property acting as an index for this Class.
<b>partial</b>	Operation	The <i>partial</i> keyword on an operation.
<b>property</b>	Operation	A property possibly containing both read and write code.
<b>struct</b>	Class	A <i>struct</i> type.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>argumentName</b>	Operation with stereotype <i>extension</i>	The name given to the <i>this</i> parameter.
<b>attributeName</b>	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
<b>className</b>	Operation with stereotype <i>extension</i>	The Class that this method is being added to.
<b>const</b>	Attribute	The <i>const</i> keyword.
<b>definition</b>	Operation with stereotype <i>partial</i>	Whether this is the declaration of the method, or the definition.
<b>delegate</b>	Operation	The <i>delegate</i> keyword.
<b>enumType</b>	Operation with stereotype <i>property</i>	The datatype that the property is represented as.
<b>extern</b>	Operation	The <i>extern</i> keyword.
<b>fixed</b>	Attribute	The <i>fixed</i> keyword.
<b>generic</b>	Operation	The generic parameters for this Operation.
<b>genericConstraints</b>	Templated Class or Interface, Operation with tag <i>generic</i>	The constraints on the generic parameters of this type or operation.
<b>Implements</b>	Operation	The name of the method this implements, including the interface name.
<b>ImplementsExplicit</b>	Operation	The presence of the source interface name in this method declaration.
<b>initializer</b>	Operation	A constructor initialization list.

Tag	Applies To	Corresponds To
<b>new</b>	Class, Interface, Operation	The <i>new</i> keyword.
<b>override</b>	Operation	The <i>override</i> keyword.
<b>params</b>	Parameter	A parameter list using the <i>params</i> keyword.
<b>partial</b>	Class, Interface	The <i>partial</i> keyword.
<b>readonly</b>	Operation with stereotype <i>property</i>	This property only defining read code.
<b>sealed</b>	Operation	The <i>sealed</i> keyword.
<b>static</b>	Class	The <i>static</i> keyword.
<b>unsafe</b>	Class, Interface, Operation	The <i>unsafe</i> keyword.
<b>virtual</b>	Operation	The <i>virtual</i> keyword.
<b>writable</b>	Operation with stereotype <i>property</i>	This property only defining write code.

**Topics:**

Topic	Detail	See also
<b>Other Conventions</b>	<ul style="list-style-type: none"> <li>Namespaces are generated for each package below a <b>namespace root</b></li> <li>The <i>Const</i> property of an attribute corresponds to the <i>readonly</i> keyword, while the tag <i>const</i> corresponds to the <i>const</i> keyword</li> <li>The value of <i>inout</i> for the <i>Kind</i> property of a parameter corresponds to the <i>ref</i> keyword</li> <li>The value of <i>out</i> for the <i>Kind</i> property of a parameter corresponds to the <i>out</i> keyword</li> <li>Partial Classes can be modeled as two separate Classes with the <i>partial</i> tag</li> <li>The <i>Is Leaf</i> property of a Class corresponds to the <i>sealed</i> keyword</li> </ul>	<a href="#">Namespaces</a> <sup>[1504]</sup>

**11.3.5 C++ Conventions**

Enterprise Architect supports round trip engineering of C++, including the **Managed C++** and **C++/CLI** extensions, where the following conventions are used.

**Stereotypes**

Reference:

Stereotype	Applies To	Corresponds To
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>friend</b>	Operation	The <i>friend</i> keyword.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.
<b>struct</b>	Class	A <i>struct</i> type.
<b>typedef</b>	Class	A <i>typedef</i> statement, where the parent is the original type name.
<b>union</b>	Class	A <i>union</i> type.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>afx_msg</b>	Operation	The <i>afx_msg</i> keyword.
<b>anonymous</b>	Class also containing the Tagged Value <i>typedef</i>	The name of this class being only defined by the <i>typedef</i> statement.
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>bitfield</b>	Attribute	The size, in bits, allowed for storage of this attribute.
<b>bodyLocation</b>	Operation	The location the method body is generated to; expected values are <b>header</b> , <b>classDec</b> or <b>classBody</b> .
<b>callback</b>	Operation	A reference to the <b>CALLBACK</b> macro.
<b>explicit</b>	Operation	The <i>explicit</i> keyword.
<b>initializer</b>	Operation	A constructor initialization list.
<b>inline</b>	Operation	The <i>inline</i> keyword and inline generation of the method body.
<b>mutable</b>	Attribute	The <i>mutable</i> keyword.
<b>throws</b>	Operation	The exceptions that are thrown by this method.
<b>typedef</b>	Class with stereotype other than <i>typedef</i>	This Class being defined in a <i>typedef</i> statement.
<b>typeSynonyms</b>	Class	The <i>typedef</i> name and/or fields of this type.
<b>volatile</b>	Operation	The <i>volatile</i> keyword.

Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> <li>Namespaces are generated for each package below a <b>namespace root</b></li> <li><i>By Reference</i> attributes correspond to a pointer to the type specified</li> <li>The <i>Transient</i> property of an attribute corresponds to the <i>volatile</i> keyword</li> <li>The <i>Abstract</i> property of an attribute corresponds to the <i>virtual</i> keyword</li> <li>The <i>Const</i> property of an operation corresponds to the <i>const</i> keyword, specifying a constant return type</li> <li>The <i>Is Query</i> property of an operation corresponds to the <i>const</i> keyword, specifying the method doesn't modify any fields</li> <li>The <i>Pure</i> property of an operation corresponds to a pure <i>virtual</i> method using the "= 0" syntax</li> <li>The <i>Fixed</i> property of a parameter corresponds to the <i>const</i> keyword</li> </ul>	<a href="#">Namespaces</a> <sup>[1504]</sup>

**11.3.5.2 C++/CLI Conventions**

The following conventions are used for modeling C++/CLI extensions to C++. In order to set Enterprise Architect to generate managed C++/CLI you must modify the C++ version in the **C++ Options**.

Stereotypes

Reference:

Stereotype	Applies To	Description
event	Operation	Defines an event to provide access to the event handler for this Class.
property	Operation, Attribute	This is a property possibly containing both read and write code.
reference	Class	Corresponds to the <i>ref class</i> or <i>ref struct</i> keyword.
value	Class	Corresponds to the <i>value class</i> or <i>value struct</i> keyword.

Tagged Values

Reference:

Tag	Applies To	Description
attribute_name	Operation with stereotype <i>property</i> or <i>event</i>	The name of the variable behind this property or event.
generic	Operation	Defines the generic parameters for this Operation.
genericConstraints	Templated Class or Interface, Operation with tag <i>generic</i>	Defines the constraints on the generic parameters for this Operation.
initonly	Attribute	Corresponds to the <i>initonly</i> keyword.
literal	Attribute	Corresponds to the <i>literal</i> keyword.

Tag	Applies To	Description
<b>managedType</b>	Class with stereotype <i>reference</i> , <i>value</i> or <i>enumeration</i> ; Interface	Corresponds to either the <i>class</i> or <i>struct</i> keyword.

Topics:

Topic	Detail	See also
<b>Other Conventions</b>	<ul style="list-style-type: none"> <li>The <i>typedef</i> and anonymous tags are not used</li> <li>The <i>property get/property set</i> stereotypes are not used</li> <li>The <i>Pure</i> property of an operation corresponds to the keyword <i>abstract</i></li> </ul>

### 11.3.6 Delphi Conventions

Enterprise Architect supports round trip engineering of Delphi, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>constructor</b>	Operation	A constructor.
<b>destructor</b>	Operation	A destructor.
<b>dispinterface</b>	Class, Interface	A dispatch interface.
<b>enumeration</b>	Class	An enumerated type.
<b>metaclass</b>	Class	A metaclass type.
<b>object</b>	Class	An object type.
<b>operator</b>	Operation	An operator.
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.
<b>struct</b>	Class	A record type.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>overload</b>	Operation	The <i>overload</i> keyword.
<b>override</b>	Operation	The <i>override</i> keyword.
<b>packed</b>	Class	The <i>packed</i> keyword.
<b>property</b>	Class	A property. See <b>Delphi Properties</b> for more information.
<b>reintroduce</b>	Operation	The <i>reintroduce</i> keyword.

**Topics:**

Topic	Detail	See also
<b>Other Conventions</b>	<ul style="list-style-type: none"> <li>The <i>Static</i> property of an attribute or operation corresponds to the <i>class</i> keyword</li> <li>The <i>Fixed</i> property of a parameter corresponds to the <i>const</i> keyword</li> <li>The value of <i>inout</i> for the <i>Kind</i> property of a parameter corresponds to the <i>Var</i> keyword</li> <li>The value of <i>out</i> for the <i>Kind</i> property of a parameter corresponds to the <i>Out</i> keyword</li> </ul>

### 11.3.7 Java Conventions

Enterprise Architect supports round trip engineering of Java - including **AspectJ** extensions - where the following conventions are used.

**Stereotypes**

Reference:

Stereotype	Applies To	Corresponds To
<b>annotation</b>	Interface	An <i>annotation</i> type.
<b>enum</b>	Attributes within a Class stereotyped <i>enumeration</i>	An <i>enumerated</i> option, distinguished from other attributes that have no stereotype.
<b>enumeration</b>	Class	An <i>enum</i> type.
<b>operator</b>	Operation	An operator.
<b>property get</b>	Operation	A read property.

Stereotype	Applies To	Corresponds To
property set	Operation	A write property.
static	Class or Interface	The <i>static</i> keyword.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
annotations	Anything	The annotations on the current code feature.
arguments	Attribute with stereotype <i>enum</i>	The arguments that apply to this enumerated value.
attribute_name	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
dynamic	Class or Interface	The <i>dynamic</i> keyword.
generic	Operation	The generic parameters to this operation.
parameterList	Parameter	A parameter list with the ... syntax.
throws	Operation	The exceptions that are thrown by this method.
transient	Attribute	The transient keyword.

### Topics:

Topic	Detail	See also
Other Conventions	<ul style="list-style-type: none"> <li>Package statements are generated when the current package is not a <b>namespace root</b></li> <li>The <i>Const</i> property of an attribute or operation corresponds to the final keyword</li> <li>The <i>Transient</i> property of an attribute corresponds to the volatile keyword</li> <li>The <i>Fixed</i> property of a parameter corresponds to the final keyword</li> </ul>	<a href="#">Namespaces</a> [1504]

### 11.3.8 PHP Conventions

Enterprise Architect supports the round trip engineering of PHP 4 and 5, where the following conventions are used.

#### Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>property get</b>	Operation	A read property.
<b>property set</b>	Operation	A write property.

#### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>attribute_name</b>	Operation with stereotype <i>property get</i> or <i>property set</i>	The name of the variable behind this property.
<b>final</b>	Operations in PHP 5.	The final keyword.

Topics:

Topic	Detail	See also
<b>Common Conventions</b>	<ul style="list-style-type: none"> <li>An unspecified type is modeled as <i>var</i></li> <li>Methods returning a reference are generated by setting the <i>Return Type</i> to <i>var*</i></li> <li>Reference parameters are generated from parameters with the parameter <i>Kind</i> set to <i>inout</i> or <i>out</i></li> </ul>	
<b>PHP 5 Conventions</b>	<ul style="list-style-type: none"> <li>The <i>final</i> Class modifier corresponds to the <i>Is Leaf</i> property</li> <li>The <i>abstract</i> Class modifier corresponds to the <i>Abstract</i> property</li> <li>Parameter type hinting is supported by setting the <i>Type</i> of a parameter</li> <li>The value of <i>inout</i> or <i>out</i> for the <i>Kind</i> property of a parameter corresponds to a <i>reference</i> parameter</li> </ul>

**11.3.10 System C Conventions**

Enterprise Architect supports round-trip engineering of SystemC, where the following conventions are used.

**Stereotypes**

Reference:

Stereotype	Applies To	Corresponds To
<b>delegate</b>	Method	A delegate.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>friend</b>	Method	A <i>friend</i> method.
<b>property</b>	Method	A property definition.
<b>sc_ctor</b>	Method	A SystemC constructor.
<b>sc_module</b>	Class	A SystemC module.
<b>sc_port</b>	Attribute	A port.
<b>sc_signal</b>	Attribute	A signal
<b>struct</b>	Inner Class	A <i>struct</i> or <i>union</i> .

**Tagged Values**

Reference:

Tag	Applies To	Corresponds To
<b>kind</b>	Attribute (Port)	Port kind ( <i>clocked, fifo, master, slave, resolved, vector</i> ).
<b>mode</b>	Attribute (Port)	Port mode ( <i>in, out, inout</i> ).
<b>overrides</b>	Method	The <i>Inheritance</i> list of a method declaration.
<b>throw</b>	Method	The exception specification of a method.

## 11.3.11 VB.Net Conventions

Enterprise Architect supports round-trip engineering of Visual Basic.Net, where the following conventions are used. Earlier versions of **Visual Basic** are supported as a different language.

### Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>event</b>	Operation	An event declaration.

Stereotype	Applies To	Corresponds To
<b>import</b>	Operation	An operation to be imported from another library.
<b>module</b>	Class	A module.
<b>operator</b>	Operation	An operator overload definition.
<b>partial</b>	Operation	The <i>partial</i> keyword on an operation.
<b>property</b>	Operation	A property possibly containing both read and write code.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>Alias</b>	Operation with stereotype <i>import</i>	The alias for this imported operation.
<b>attribute_name</b>	Operation with stereotype <i>property</i>	The name of the variable behind this property.
<b>Charset</b>	Operation with stereotype <i>import</i>	The <i>character set</i> clause for this import. One of the values <i>Ansi</i> , <i>Unicode</i> or <i>Auto</i> .
<b>delegate</b>	Operation	The <i>Delegate</i> keyword.
<b>enumTag</b>	Operation with stereotype <i>property</i>	The datatype that this property is represented as.
<b>Handles</b>	Operation	The <i>handles</i> clause on this operation.
<b>Implements</b>	Operation	The <i>implements</i> clause on this operation.
<b>Lib</b>	Operation with stereotype <i>import</i>	The library this import comes from.
<b>MustOverride</b>	Operation	The <i>MustOverride</i> keyword.
<b>Narrowing</b>	Operation with stereotype <i>operator</i>	The <i>Narrowing</i> keyword.
<b>NotOverrideable</b>	Operation	The <i>NotOverrideable</i> keyword.
<b>Overloads</b>	Operation	The <i>Overloads</i> keyword.
<b>Overrides</b>	Operation	The <i>Overrides</i> keyword.
<b>parameterArray</b>	Parameter	A parameter list using the <i>ParamArray</i> keyword.
<b>partial</b>	Class, Interface	The <i>Partial</i> keyword.
<b>readonly</b>	Operation with stereotype <i>property</i>	This property only defining read code.
<b>shadows</b>	Class, Interface, Operation	The <i>Shadows</i> keyword.
<b>Shared</b>	Attribute	The <i>Shared</i> keyword.
<b>Widening</b>	Operation with stereotype <i>operator</i>	The <i>Widening</i> keyword.
<b>writeonly</b>	Operation with stereotype <i>property</i>	This property only defining write code.

### 11.3.12 Verilog Conventions

Enterprise Architect supports round-trip engineering of Verilog, where the following conventions are used.

Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>asynchronous</b>	Method	A concurrent process.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>initializer</b>	Method	An initializer process.
<b>module</b>	Class	A module.
<b>part</b>	Attribute	A component instantiation.
<b>port</b>	Attribute	A port.
<b>synchronous</b>	Method	A sequential process.

Tagged Values

Reference:

Tag	Applies To	Corresponds To
kind	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i> ).
mode	Attribute (port)	The port mode ( <i>in</i> , <i>out</i> , <i>inout</i> ).
Portmap	Attribute (part)	The generic / port map of the component instantiated.
sensitivity	Method	The sensitivity list of a sequential process.
type	Attribute	The range or type value of an attribute.

### Verilog Toolbox Pages

To access the **Verilog** pages of the **Toolbox**, select the **More tools | HDL | Verilog Constructs** menu option. Drag these icons onto a diagram to model a Verilog design.

### Reference:

Page	Item	Action
Verilog	Module	Define a Verilog Module. <i>A module-stereotyped Class element.</i>

## 11.3.13 VHDL Conventions

Enterprise Architect supports round-trip engineering of VHDL, where the following conventions are used.

### Stereotypes

Reference:

Stereotype	Applies To	Corresponds To
<b>architecture</b>	Class	An architecture.
<b>asynchronous</b>	Method	An asynchronous process.
<b>configuration</b>	Method	A configuration.
<b>enumeration</b>	Inner Class	An <i>enum</i> type.
<b>entity</b>	Interface	An entity.
<b>part</b>	Attribute	A component instantiation.
<b>port</b>	Attribute	A port.
<b>signal</b>	Attribute	A signal declaration.
<b>struct</b>	Inner Class	A record definition.
<b>synchronous</b>	Method	A synchronous process.
<b>typedef</b>	Inner Class	A <i>type</i> or <i>sub type</i> definition.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
<b>isGeneric</b>	Attribute (port)	The port declaration in a generic interface.
<b>isSubType</b>	Inner Class (typedef)	A subtype definition.
<b>kind</b>	Attribute (signal)	The signal kind (such as <i>register</i> , <i>bus</i> ).
<b>mode</b>	Attribute (port)	The port mode ( <i>in</i> , <i>out</i> , <i>inout</i> , <i>buffer</i> , <i>linkage</i> ).
<b>portmap</b>	Attribute (part)	The generic / port map of the component instantiated.
<b>sensitivity</b>	Method (synchronous)	The sensitivity list of a synchronous process.
<b>type</b>	Inner Class (typedef)	The type indication of a type declaration.
<b>typeNameSpace</b>	Attribute (part)	The type namespace of the instantiated component.

### VHDL Toolbox Pages

To access the VHDL pages of the **Toolbox**, select the **More tools | HDL | VHDL Constructs** menu option. Drag these icons onto a diagram to model a VHDL design.

Reference:

Page	Item	Action
VHDL	Architecture	Define an architecture to be associated with a VHDL entity. <i>An architecture-stereotyped Class element.</i>
	Entity	Define a VHDL entity to contain the Port definitions. <i>An entity-stereotyped interface element.</i>
	Enumeration	Define an Enumerated Type. <i>An enumeration-stereotyped enumeration element.</i>
	Struct	Define a VHDL record. <i>A struct-stereotyped Class element.</i>
	Typedef	Define a VHDL type or subtype <i>A typedef-stereotyped Class element.</i>
VHDL Features	Port	Define a VHDL Port. <i>A port-stereotyped attribute.</i>
	Part	Define a VHDL component instantiation <i>A part-stereotyped attribute.</i>
	Signal	Define a VHDL signal. <i>A signal-stereotyped attribute.</i>

### 11.3.14 Visual Basic Conventions

Enterprise Architect supports the round trip engineering of Visual Basic 5 and 6, where the following conventions are used. **Visual Basic .Net** is supported as a different language.

**Stereotypes**

Reference:

Stereotype	Applies To	Corresponds To
global	Attribute	The <i>Global</i> keyword.
import	Operation	An operation to be imported from another library.

Stereotype	Applies To	Corresponds To
property get	Operation	A property get.
property set	Operation	A property set.
property let	Operation	A property let.
with events	Attribute	The <i>WithEvents</i> keyword.

### Tagged Values

Reference:

Tag	Applies To	Corresponds To
Alias	Operation with stereotype <i>import</i>	The alias for this imported operation.
attribute_name	Operation with stereotype <i>property get</i> , <i>property set</i> or <i>property let</i>	The name of the variable behind this property.
Lib	Operation with stereotype <i>import</i>	The library this import comes from.
New	Attribute	The <i>New</i> keyword.

## 11.4 Code Template Framework

The Code Template Framework (CTF) is used during forward engineering UML models. The CTF enables you to:

- Generate source code from UML models
- Customize the way in which Enterprise Architect generates source code
- Forward engineer languages not specifically supported by Enterprise Architect

### Topics:

Topic	Detail	See also
<b>Default Templates</b>	Default Code Templates which are built into Enterprise Architect for forward engineering supported languages	<a href="#">Code Templates</a> <sup>[1491]</sup>
<b>Code Template Editor</b>	A Code Template Editor for creating and maintaining user-defined Code Templates	<a href="#">Code Template Editor</a> <sup>[1494]</sup>
<b>Synchronize Code</b>	Code Templates to synchronize code.	<a href="#">Synchronize code</a> <sup>[1495]</sup>

### 11.4.1 Code Templates

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Code templates enable you to customize code generation of existing languages. For example:</p> <ul style="list-style-type: none"> <li>• Modify the file headers created when generating new files</li> <li>• Change the style of the generated code (such as indenting or brace position) to match the required coding standards</li> <li>• Handle particular stereotypes to generate things like specialized method bodies and extra methods</li> </ul> <p>They also enable you to add code generation of entirely new languages that Enterprise Architect would otherwise not be able to handle. In this situation it is most useful to combine code templates with an <b>MDG technology file</b> that includes the datatypes, and options for default file extensions.</p> <p>Enterprise Architect's <b>base code templates</b> specify the transformation from UML elements to the various parts of a given programming language. The templates are written as plain text with a syntax that shares some aspects of both</p>	<a href="#">Add Code Modules</a> <sup>[1072]</sup> <a href="#">Base Templates</a> <sup>[1492]</sup>

	<p>mark-up languages and scripting languages. A simple example of a template used by Enterprise Architect is the 'Class template'. It is used to generate source code from a UML Class:</p> <pre>%Cl assNot es% %Cl assDecl ar at i on% %Cl assBody%</pre> <p>The above template simply refers to three other templates, namely <i>ClassNotes</i>, <i>ClassDeclaration</i> and <i>ClassBody</i>. The enclosing percent (%) signs indicate a macro. Code Templates consist of various types of macros, each resulting in a substitution in the generated output. For a language such as C++, the result of processing the above template might be:</p> <pre>/**  * This is an example class note  * generated using code templates  * @author Sparx Systems  */ class ClassA: public ClassB { ... }</pre>	
<b>Execution of Code Templates</b>	<p>A reference to a template (such as the <i>%ClassNotes%</i> macro, from our example above) results in the execution of that template.</p> <p>Each template is designed for use with a particular element. For example the <i>ClassNotes</i> template is to be used with UML Class elements.</p> <p>The element that is currently being generated is said to be <i>in scope</i>. If the element in scope is stereotyped Enterprise Architect looks for a template that has been defined for that stereotype. If a match is found, the specialized template is executed. Otherwise the default implementation of the base template is used.</p> <p>Templates are processed sequentially, line by line, replacing each macro with its underlying text value from the model.</p>	

### 11.4.1.1 Base Templates

The Code Template Framework consists of a number of base templates. Each base template transforms particular aspects of the UML to corresponding parts of object-oriented languages.

The following table lists and briefly describes the base templates used in the CTF.

Template	Description
Attribute	A top-level template to generate member variables from UML attributes
Attribute Declaration	Used by the <i>Attribute</i> template to generate a member variable declaration
Attribute Notes	Used by the <i>Attribute</i> template to generate member variable notes
Class	A top-level template for generating Classes from UML Classes
Class Base	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, where the base Class doesn't exist in the model

Template	Description
Class Body	Used by the <i>Class</i> template to generate the body of a Class
Class Declaration	Used by the <i>Class</i> template to generate the declaration of a Class
Class Interface	Used by the <i>Class</i> template to generate an interface name in the inheritance list of a derived Class, where the interface doesn't exist in the model
Class Notes	Used by the <i>Class</i> template to generate the Class notes
File	A top-level template for generating the source file For languages such as C++, this corresponds to the header file
Import Section	Used in the <i>File</i> template to generate external dependencies
Linked Attribute	A top-level template for generating attributes derived from UML Associations
Linked Attribute Notes	Used by the <i>Linked Attribute</i> template to generate the attribute notes
Linked Attribute Declaration	Used by the <i>Linked Attribute</i> template to generate the attribute declaration
Linked Class Base	Used by the <i>Class</i> template to generate a base Class name in the inheritance list of a derived Class, for a Class element in the model that is a parent of the current Class
Linked Class Interface	Used by the <i>Class</i> template to generate an Interface name in the inheritance list of a derived Class, for an Interface element in the model that is a parent of the current Class
Namespace	A top-level template for generating namespaces from UML packages (although not all languages have namespaces, this template can be used to generate an equivalent construct, such as packages in Java)
Namespace Body	Used by the <i>Namespace</i> template to generate the body of a namespace
Namespace Declaration	Used by the <i>Namespace</i> template to generate the namespace declaration
Operation	A top-level template for generating operations from a UML Class's operations
Operation Body	Used by the <i>Operation</i> template to generate the body of a UML operation
Operation Declaration	Used by the <i>Operation</i> template to generate the operation declaration
Operation Notes	Used by the <i>Operation</i> template to generate documentation for an operation
Parameter	Used by the <i>Operation Declaration</i> template to generate parameters

The second table lists templates used for generating code for languages that have separate interface and implementation sections.

Template	Description
Class Impl	A top-level template for generating the implementation of a Class
Class Body Impl	Used by the <i>Class Impl</i> template to generate the implementation of Class members
File Impl	A top-level template for generating the implementation file

Template	Description
File Notes Impl	Used by the <i>File Impl</i> template to generate notes in the source file
Import Section Impl	Used by the <i>File Impl</i> template to generate external dependencies
Operation Impl	A top-level template for generating operations from a UML Class's operations
Operation Body Impl	Used by the <i>Operation</i> template to generate the body of a UML operation
Operation Declaration Impl	Used by the <i>Operation</i> template to generate the operation declaration
Operation Notes Impl	Used by the <i>Operation</i> template to generate documentation for an operation

**Topics:**

Topic	Detail	See also
<b>Further Information</b>	<p>The base templates form a hierarchy, which varies slightly across different programming languages. A typical template hierarchy relevant to a language like C# or Java (which do not have header files) is shown in the example diagram below. In this diagram the templates are modeled as Classes (in reality they are just plain text). This hierarchy would be slightly more complicated for languages like C++ and Delphi, which have separate implementation templates.</p> <p>Each of the base templates must be specialized to be of use in code engineering; in particular, each template is specialized for the supported languages (or 'products')</p> <p>For example, there is a <i>ClassBody</i> template defined for C++, another for C#, another for Java, and so on; by specializing the templates, you can tailor the code generated for the corresponding UML entity</p> <p>Once the base templates are specialized for a given language, they can be further specialized based on:</p> <ul style="list-style-type: none"> <li>• A Class's stereotype</li> <li>• A feature's stereotype (where the feature can be an operation or attribute)</li> </ul> <p>This type of specialization enables, for example, a C# operation that is stereotyped as «property» to have a different <i>Operation Body</i> template from an ordinary operation; the <i>Operation Body</i> template can then be specialized further, based on the Class stereotype</p>	

**11.4.2 The Code Template Editor**

The Code Template Editor provides the facilities of the *Common Code Editor*, including intellisense for the various macros. For more information on intellisense and the Common Code Editor, see the **Code Editors** topic.

**Access:** [Settings | Code Generation Templates](#)

**Reference:**

Option	Action	See also
Language	Select the programming language	
New Language	Display the Programming Languages Datatypes dialog, which enables you to include programming languages other than those supported for Enterprise Architect, for which to create or edit code templates	<a href="#">Programming Languages Datatypes</a> <sup>[779]</sup>
Template	Display the contents of the active template, and provides the editor for modifying templates	
Templates	List the base code templates; the active template is highlighted  The <b>Modified</b> field indicates whether you have changed the default template for the current language	
Stereotype Overrides	List the stereotyped templates, for the active base template  The <b>Modified</b> field indicates whether you have modified a default stereotyped template	
Add New Custom Template	Invoke a dialog for creating a custom stereotyped template	
Add New Stereotyped Override	Invoke a dialog for adding a stereotyped template, for the currently selected base template	
Get Default Template	Update the editor display with the default version of the active template	
Save	Overwrite the active templates with the contents of the editor	
Delete	If you have overridden the active template, the override is deleted and replaced by the corresponding default code template	

**Notes:**

- User-modified and user-defined Code Templates can be imported and exported as Reference Data (see the Sharing Reference Data topic. The templates defined for each language are indicated in the Export Reference Data dialog by the language name with the suffix `_Code_Templates`. If no templates exist for a language, there is no entry for the language in the dialog

### 11.4.3 Synchronize Code

Enterprise Architect uses code templates during the forward synchronization of the following programming languages:

- ActionScript
- C
- C++
- C#

- Delphi
- Java
- PHP
- Python
- VB
- VB.Net

Only a subset of the code templates are used during synchronization. This subset corresponds to the distinct sections that Enterprise Architect recognizes in the source code. The following table lists the code templates and their corresponding code sections, which can be synchronized.

Code Template	Code Section
Class Notes	Comments preceding Class declaration.
Class Declaration	Up to and including Class parents.
Attribute Notes	Comments preceding Attribute declaration.
Attribute Declaration	Up to and including terminating character.
Operation Notes	Comments preceding operation declaration.
Operation Notes Impl	As for <i>Operation Notes</i> .
Operation Declaration	Up to and including terminating character.
Operation Declaration Impl	Up to and including terminating character.
Operation Body	Everything between and including the braces.
Operation Body Impl	As for <i>Operation Body</i> .

#### Topics:

Topic	Detail	See also
<b>Change Types</b>	<p>Three types of change can occur in the source when it is synchronized with the UML model:</p> <ul style="list-style-type: none"> <li>• <b>Synchronize Existing Sections:</b> for example, changing the return type in an operation declaration</li> <li>• <b>Add New Sections to Existing Features:</b> for example, adding notes to a Class declaration, where there were previously none</li> <li>• <b>Add New Features and Elements:</b> for example, adding a new operation to a Class</li> </ul> <p>Each of these changes must be handled differently by Enterprise Architect; their effect on the CTF is described in the linked topics above.</p>	<p><a href="#">Synchronize Existing Sections</a> <sup>[1496]</sup></p> <p><a href="#">Add New Sections to Existing Features</a> <sup>[1497]</sup></p> <p><a href="#">Add New Features and Elements</a> <sup>[1497]</sup></p>

#### 11.4.3.1 Synchronize Existing Sections

##### Topics:

Topic	Detail	See also
<b>Usage</b>	When an existing section in the source code differs from the	

	<p>result generated by the corresponding template, that section is replaced. Consider for example, the following C++ Class declaration:</p> <pre>( asm ) class A: public B</pre> <p>Now assume you add an inheritance relationship from Class A to Class C; the entire Class declaration would be replaced with something like:</p> <pre>( asm ) class A: public B, public C</pre>	
--	--	--

### 11.4.3.2 Add New Sections

Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The following can be added as new sections, to existing features in the source code:</p> <ul style="list-style-type: none"> <li>• Class Notes</li> <li>• Attribute Notes</li> <li>• Operation Notes</li> <li>• Operation Notes Impl</li> <li>• Operation Body</li> <li>• Operation Body Impl</li> </ul> <p>Assume Class <b>A</b> from the previous example had no note when you originally generated the code. Now assume that you specify a note in the model for Class A. Enterprise Architect attempts to add the new note from the model during synchronization. It does this by executing the <i>Class Notes</i> template.</p> <p>To make room for the new section to be inserted, you can specify how much white space to append to the section via synchronization macros. These macros are described in the <b>Control Macros</b> topic.</p>	<p><a href="#">Control Macros</a> <small>[1139]</small></p>

### 11.4.3.3 Add New Features and Elements

Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The following features and elements can be added to the source code during synchronization:</p> <ul style="list-style-type: none"> <li>• Attributes</li> <li>• Inner Classes</li> <li>• Operations</li> </ul> <p>These are added by executing the relevant templates for each new element or feature in the model. Enterprise Architect attempts to preserve the appropriate indenting of new features in the code, by finding the indents specified in list macros of the Class. For languages that make use of namespaces, the <i>synchNamespaceBodyIndent</i> macro is available. Classes defined within a (non-global) namespace are indented</p>	

	according to the value set for this macro, during synchronization. This value is ignored for Classes defined within a package setup as a root namespace, or if the <b>Generate Namespace</b> option is set to <b>False</b> in the appropriate language page (C#, C++ or VB.Net) on the <b>Options</b> dialog ( <b>To ols   Options   Source Code Engineering   &lt;language&gt;</b> ).	
--	--	--

## 11.5 Generate Source Code

Generating source code (forward engineering) takes the UML Class or Interface model elements and creates a source code equivalent for future elaboration and compilation. By forward engineering code from the model, the mundane work involved with having to key in Classes and attributes and methods is avoided, and symmetry between model and code is ensured.

### Topics:

Topic	Detail	See also
<b>Lanaguages</b>	Enterprise Architect supports code generation in each of the following languages: <ul style="list-style-type: none"> <li>• Action Script</li> <li>• C</li> <li>• C# (for both .NET 1.1 and .NET 2.0)</li> <li>• C++ (standard, plus .NET managed C++ extensions)</li> <li>• Delphi</li> <li>• Java (including Java 1.5, Aspects and Generics)</li> <li>• PHP</li> <li>• Python</li> <li>• Visual Basic</li> <li>• Visual Basic .NET</li> </ul>	
<b>Elements</b>	Code is generated from Class or Interface model elements, so you must create the required Class and Interface elements to generate from  Add attributes (which become variables) and operations (which become methods)	
<b>Settings</b>	Before you generate code, you should ensure the default settings for code generation match your requirements; set up the defaults to match your required language and preferences  Preferences that you can define include default constructors and destructors, methods for interfaces and the Unicode options for created languages  Languages such as Java support 'namespaces' and can be configured to specify a namespace root  In addition to the default settings for generating code, Enterprise Architect facilitates setting specific generation options for each of the supported languages	<a href="#">Source Code Options</a> <sup>[1528]</sup> <a href="#">Namespaces</a> <sup>[1504]</sup> <a href="#">ActionScript Options</a> <sup>[1467]</sup> <a href="#">C Options</a> <sup>[1470]</sup> <a href="#">C# Options</a> <sup>[1472]</sup> <a href="#">C++ Options</a> <sup>[1474]</sup> <a href="#">Delphi Options</a> <sup>[1478]</sup> <a href="#">Java Options</a> <sup>[1479]</sup> <a href="#">PHP Options</a> <sup>[1481]</sup> <a href="#">Python Options</a> <sup>[1482]</sup> <a href="#">Visual Basic Options</a> <sup>[1489]</sup> <a href="#">Visual Basic .NET Options</a> <sup>[1484]</sup>

<b>Code Template Framework</b>	The Code Template Framework (CTF) enables you to customize the way Enterprise Architect generates source code and also enables generation of languages that are not specifically supported by Enterprise Architect	<a href="#">Code Template Framework (CTF)</a> 
<b>Local Paths</b>	Local path names enable you to substitute tags for directory names	<a href="#">Local Paths</a>  <a href="#">Local Paths Dialog</a> 
<b>Behavioral Code</b>	You can also generate code from three UML behavioral modeling paradigms: <ul style="list-style-type: none"> <li>• State Machine diagrams (SW &amp; HW)</li> <li>• Interaction (Sequence) diagrams (SW)</li> <li>• Activity diagrams (SW)</li> </ul>	<a href="#">State Machine diagrams</a>  <a href="#">Interaction (Sequence) diagrams</a>  <a href="#">Activity diagrams</a> 
<b>Live Code Generation</b>	On the <b>Code Engineering</b> submenu, you have the option to update your source code instantly as you make changes to your model	<a href="#">Code Engineering Sub-Menu</a> 
<b>Tasks</b>	When you generate code, you perform one or more of the following tasks: <ul style="list-style-type: none"> <li>• Generate a Single Class</li> <li>• Generate a Group of Classes</li> <li>• Generate a Package</li> <li>• Update Package Contents</li> </ul>	<a href="#">Generate a Single Class</a>  <a href="#">Generate a Group of Classes</a>  <a href="#">Generate a Package</a>  <a href="#">Update Package Contents</a> 

**Notes:**

- The tools provided by Enterprise Architect for code engineering and debugging are available in the Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect
- When security is enabled there are permissions for Generate Source Code and DDL and Reverse Engineer from DDL and Source Code

- [Importing Source Code](#) 
- [Generate From Behavioral Models](#) 

**11.5.1 Generate a Single Class**

To generate code for a single Class, first ensure the design of the model element (Class or Interface) is complete. Also ensure you have added Inheritance connectors to parents and associations to other Classes that are used. Also add Inheritance connectors to Interfaces that your Class implements; Enterprise Architect offers the option to generate function stubs for all interface methods that a Class implements. Once the design is satisfactory, follow the procedure below.

To Generate Code for a Single Class, follow the steps below

**How To:**

Step	Action	See also
1	Open the diagram containing the Class or Interface for which to generate code.	

Step	Action	See also
2	Right-click on the required Class or Interface to display the context menu and select the <b>Generate Code</b> menu option, or press ( <b>F11</b> ). The <b>Generate Code</b> dialog displays, which enables you to control how and where your source code is generated.	
3	On the <b>Path</b> field, click on ( ... ) (Browse) and select a path name for your source code to be generated to.	
4	In the <b>Target Language</b> field, click on the drop-down arrow and select the language to generate; this becomes the permanent option for that Class, so change it back if you are only doing one pass in another language.	
5	Click on the <b>Advanced</b> button. The <b>Object Options</b> dialog displays.	
6	Set any custom options (for this Class alone), then click on the Close button to return to the <b>Generate Code</b> dialog.	
7	In the <b>Import(s) / Header(s)</b> fields, type any import statements, <i>#includes</i> or other header information. (Note that in the case of Visual Basic this information is ignored; in the case of Java the two import text boxes are merged; and in the case of C++ the first import text area is placed in the header file and the second in the body (.cpp) file.)	
8	Click on the <b>Generate</b> button to create the source code.	
9	When complete, click on the <b>View</b> button to see what has been generated. Note that you should set up your default viewer/editor for each language type first. You can also set up the default editor on the <b>Code Editors</b> page of the <b>Options</b> dialog ( <b>Tools   Options   Source Code Engineering   Code Editors</b> ).	<a href="#">The Source Code Viewer</a> <sup>[1417]</sup>

### 11.5.2 Generate a Group of Classes

In addition to being able to generate code for an individual Class, you can also select a group of Classes for batch code generation. When you do this, you accept all the default code generation options for each Class in the set.

#### Steps:

Step	Detail	See also
1	Select a group of Classes and/or interfaces in a diagram	
2	Right-click on an element in the group to display the context menu.	
3	Select the Code <b>Generation   Generate Selected</b> elements menu option. The Save As dialog displays, on which you specify the file path and name for each code file. Enter this information and click on the Save button	
4	The Batch Generation dialog displays, showing the status of the process as it executes (the process might be too fast to see this dialog).	

#### Notes:

- If any of the elements selected are not Classes or interfaces the option to generate code is not available

**Learn More:**

- [Synchronize Model and Code](#)<sup>[1515]</sup>

### 11.5.3 Generate a Package

In addition to generating source code from single Classes and groups of Classes, you can also generate code from a package. This feature provides options to recursively generate child packages and automatically generate directory structures based on the package hierarchy. This enables you to generate a whole branch of your project model in one step.

To generate a package, follow the steps below

**How To:**

Step	Action	See also
1	In the <b>Project Browser</b> , right-click on the package to generate code for. The context menu displays.	
2	Select the <b>Code Engineering   Generate Source Code</b> menu option. The <b>Generate Package Source Code</b> dialog displays.	
3	In the <b>Synchronize</b> field, click on the drop-down arrow and select the appropriate synchronize option: <ul style="list-style-type: none"> <li>• <b>Synchronize model and code:</b> Classes with existing files are forward synchronized with that file; Classes with no existing file are generated to the displayed target file</li> <li>• <b>Overwrite code:</b> All selected target files are overwritten (forward generated)</li> <li>• <b>Do not generate:</b> Only selected Classes that do not have an existing file are generated; all other Classes are ignored</li> </ul>	
4	Highlight the Classes to generate. Leave unselected any to not generate. If you want to display the information in a more readable layout, you can resize the dialog and its columns.	
5	To make Enterprise Architect automatically generate directories and filenames based on the package hierarchy, select the <b>Auto Generate Files</b> checkbox. This then enables the Root Directory field, in which you select a root directory under which the source directories are to be generated. By default, the <b>Auto Generate Files</b> feature <i>ignores</i> any file paths that are already associated with a Class. You can change this behavior by also selecting the <b>Retain Existing File Paths</b> checkbox.	
6	To include all sub-packages in the output, select the <b>Include Child Packages</b> checkbox.	
7	Click on the <b>Generate</b> button to start generating code.	

As code generation proceeds Enterprise Architect displays progress messages. If a Class requires an output filename Enterprise Architect prompts you to enter one at the appropriate time (assuming **Auto Generate Files** is not selected). For example, if the selected Classes include partial Classes, a prompt displays to enter the filename for the second partial Class.

For additional information on the options on the **Generate Package Source Code** dialog, see the following

table:

Option	Action	See also
<b>Root Package</b>	Check the name of the package to be generated.	
<b>Synchronize</b>	Select options that specify how existing files should be generated.	
<b>Auto Generate Files</b>	Specify whether Enterprise Architect should automatically generate file names and directories, based on the package hierarchy.	
<b>Root Directory</b>	If <b>Auto Generate Files</b> is selected, display the path under which the generated directory structures are created.	
<b>Retain Existing File Paths</b>	If <b>Auto Generate Files</b> is selected, specify whether to use existing file paths associated with Classes. If unselected, Enterprise Architect generates Classes to automatically determined paths, regardless of whether source files are already associated with Classes.	
<b>Include all Child Packages</b>	Include all Classes from all sub-packages of the target package in the list. This option facilitates recursive generation of a given package and its sub-packages.	
<b>Select Objects to Generate</b>	List all Classes that are available for generation under the target packages. Only selected (highlighted) Classes are generated. Classes are listed with their target source file.	
<b>Select All</b>	Mark all Classes in the list as selected.	
<b>Select None</b>	Mark all Classes in the list as unselected.	
<b>Generate</b>	Start the generation of all selected Classes.	
<b>Cancel</b>	Exit the <b>Generate Package Source Code</b> dialog. No Classes are generated.	

### 11.5.4 Update Package Contents

To synchronize a directory tree, follow the steps below

#### How To:

Step	Action	See also
1	In the <b>Project Browser</b> , right-click on the root package of the tree to synchronize. The context menu displays.	
2	Select the <b>Code Engineering   Synchronize Package With Code</b> menu option. The <b>Synchronize Package Contents</b> dialog displays.	
3	In the <b>Update Type</b> panel, select the radio button to <b>Forward Engineer</b> or <b>Reverse Engineer</b> the package Classes.	
4	To include child packages in the synchronization, select the <b>Include child packages in generation</b> checkbox.	
5	Click on the <b>OK</b> button to start.	

Enterprise Architect uses the directory names specified when the project source was first imported/generated and updates either the model or the source code depending on the option chosen.

## 11.5.5 Namespaces

### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Languages such as Java support package structures or namespaces. Enterprise Architect lets you specify a package as a namespace root, which denotes where the namespace structure starts; all subordinate packages below this point are generated as namespaces to code.</p> <p>To define a package as a namespace root, right-click on the package in the <b>Project Browser</b> and select the <b>Code Engineering   Set as Namespace Root</b> context menu option. The package icon in the <b>Project Browser</b> changes to include a colored corner (  ).</p> <p>When you have set the namespace root, the menu option changes to <b>Clear Namespace Root</b>; click on this option to take the namespace root status off the package. (Also, see the context menu described below.)</p> <p>Once you have set a namespace root, Java code generated beneath this root automatically adds a package declaration at the head of the generated file indicating the current package location.</p> <p>To view a list of namespaces, select the <b>Settings   Namespace Roots</b> menu option. The <b>Namespaces</b> dialog displays.</p> <p>If you double-click on a namespace in the list, the package is highlighted in the <b>Project Browser</b>. Alternatively, right-click on the namespace to display a context menu, and select the <b>Locate Package in Browser</b> menu option.</p> <p>You can also clear the selected namespace, by selecting the <b>Clear Namespace Attribute</b> option.</p>	

### Notes:

- When performing code generation, any package name that contains whitespace characters is automatically treated as a namespace root

## 11.6 Generate From Behavioral Models

Enterprise Architect's system engineering capability facilitates code generation from each of the following UML behavioral diagrams:

Topic	Link
State Machine diagrams (SW & HW)	<a href="#">State Machine diagrams</a> <sup>[1506]</sup>
Interaction (Sequence) diagrams (SW)	<a href="#">Interaction (Sequence) diagrams</a> <sup>[1512]</sup>
Activity diagrams (SW)	<a href="#">Activity diagrams</a> <sup>[1513]</sup>

You can generate code in various software and **hardware** languages, including C(OO), C++, C#, Java, VB, Net, VHDL, Verilog and SystemC.

To experiment with code generation from these diagrams, using the EAExample project provided with your Enterprise Architect installer, follow the steps below

### How To:

Step	Action	See also
1	Open the <i>EAExample.eap</i> file by selecting the <b>Help   Open Example Model</b> menu option.	
2	<p>From the <b>Project Browser</b>, select any of the following packages:</p> <p><b>Software Language Examples:</b></p> <ul style="list-style-type: none"> <li>Project Models &gt; System Model &gt; Implementation Model (PSM) &gt; Java Model With Behaviors. Generate the Account and Order classes</li> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; C#. Generate the DataProcessor Class</li> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; C++. Generate the IO Class</li> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; Java. Generate the IO Class</li> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Software &gt; VBNet. Generate the IO Class</li> </ul> <p><b>Hardware Language Examples:</b></p> <ul style="list-style-type: none"> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; SystemC. Generate the PlayBack Class</li> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; VHDL. Generate the PlayBack Class</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li>Project Models &gt; Systems Engineering Model &gt; Implementation Model &gt; Hardware &gt; Verilog. Generate the PlayBack Class</li> </ul>	
3	When completed, press ( Ctrl+E ) to open the generated source code. You should see methods generated in the code.	

**Notes:**

- Software code generation from behavioral models is available in the Business and Software Engineering, Systems Engineering and Ultimate editions of Enterprise Architect
- Hardware code generation from State Machine models is available in the Systems Engineering and Ultimate editions of Enterprise Architect
- For C(OO), please ensure that, on the C Specifications page of the Options dialog, you have set the Object Oriented Support option to True
- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

**Learn More:**

- [State Machine modeling for HDLs](#) <sup>[1517]</sup>

**11.6.1 SW Code Generation - State Machine Diagrams**

A State Machine in a *Class* internally generates the following constructs in software languages to enable effective execution of the States' behaviors (**do**, **entry** and **exit**) and also to code the appropriate transition's effect when necessary.

**Topics:**

Topic	Detail	See also
<b>Enumerations</b>	<ul style="list-style-type: none"> <li>• <b>StateType</b> - comprises an enumeration for each of the States contained within the State Machine</li> <li>• <b>TransitionType</b> – comprises an enumeration for each transition that has a valid effect associated with it; for example ProcessOrder_Delivered_to_ProcessOrder_Closed</li> <li>• <b>CommandType</b> – comprises an enumeration for each of the behavior types that a State can contain (Do, Entry, Exit)</li> </ul>	<a href="#">State Machine Diagrams</a> <sup>[817]</sup>  <a href="#">Java Code Generated From State Machine Diagram</a> <sup>[1507]</sup>
<b>Attributes</b>	<ul style="list-style-type: none"> <li>• <b>currState:StateType</b> - a variable to hold the current State's information</li> <li>• <b>nextState:StateType</b> - a variable to hold the next State's information, set by each State's transitions accordingly</li> <li>• <b>currTransition:TransitionType</b> - a variable to hold the current transition information; this is set if the transition has a valid effect associated with it</li> <li>• <b>transcend:Boolean</b> - a flag used to advise if a transition is involved in transcending between different State Machines (or Submachine states)</li> <li>• <b>xx_history:StateType</b> - a history variable for each State</li> </ul>	<a href="#">State Machine Diagrams</a> <sup>[817]</sup>  <a href="#">Java Code Generated From State Machine Diagram</a> <sup>[1507]</sup>

	Machine/Submachine State, to hold information about the last State from which the transition took place	
<b>Operations</b>	<ul style="list-style-type: none"> <li>• <b>StatesProc</b> - a States procedure, containing a map between a State's enumeration and its operation; it de-references the current State's information to invoke the respective State's function</li> <li>• <b>TransitionsProc</b> - a Transitions procedure, containing a map between the Transition's enumeration and its effect; it invokes the respective effect</li> <li>• <b>&lt;&lt;State&gt;&gt;</b> - an operation for each of the States contained within the State Machine; this renders a State's behaviors based on the input CommandType, and also executes its transitions</li> <li>• <b>initializeStateMachine</b> - a function that initializes all the framework-related attributes</li> <li>• <b>runStateMachine</b> - a function that iterates through each State, and executes their behaviors and transitions accordingly</li> </ul>	<a href="#">State Machine Diagrams</a> <sup>[817]</sup> <a href="#">Java Code Generated From State Machine Diagram</a> <sup>[1507]</sup>

**Notes:**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

        }
    }
}
}

```

## 11.6.2 State Machine Modeling For HDLs

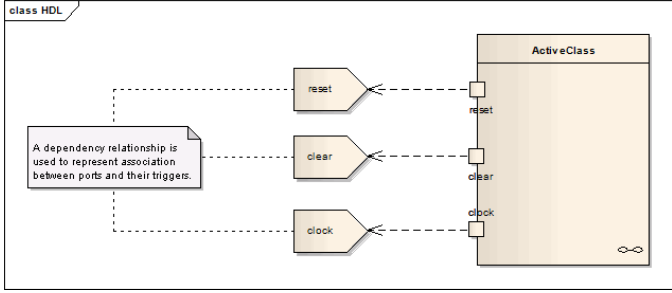

For efficient code generation from State Machine models into Hardware Description Languages (HDL) such as VHDL, Verilog and Systems C, apply the design practices outlined in this topic.

In an HDL State Machine model, the following are expected:

- Designate Driving Triggers
- Establish Port–Trigger Mapping
- Active State Logic

### How To:

Topic	Detail	See also																
<b>Designate Driving Triggers</b>	<ul style="list-style-type: none"> <li>• A "change" trigger is deemed as an asynchronous trigger if the following two conditions are satisfied: <ol style="list-style-type: none"> <li>1. There is a transition from the actual submachine state (which encapsulates the actual logic) triggered by it</li> <li>2. The target state of that transition has a self transition triggered by the same trigger</li> </ol> </li> <li>• Asynchronous triggers should be modeled according to the following pattern: <ol style="list-style-type: none"> <li>1. The trigger should be of type Change (specification: true / false)</li> <li>2. The active state (Submachine State) should have a transition trigger by it.</li> <li>3. The target state of the triggered transition should have a self transition with the same trigger</li> </ol> </li> <li>• A trigger of type <i>time</i>, which triggers the transitions to the active state (Submachine State) is deemed as the <i>Clock</i>. The specification of this trigger should be specific to the target language: <table border="1" data-bbox="509 1303 1190 1585"> <thead> <tr> <th rowspan="2">Trigger Type</th> <th rowspan="2">Language</th> <th colspan="2">Specification</th> </tr> <tr> <th>Positive Edge Triggered</th> <th>Negative Edge Triggered</th> </tr> </thead> <tbody> <tr> <td rowspan="3">Time</td> <td>VHDL</td> <td>rising_edge</td> <td>falling_edge</td> </tr> <tr> <td>Verilog</td> <td>posedge</td> <td>negedge</td> </tr> <tr> <td>SystemC</td> <td>positive</td> <td>negative</td> </tr> </tbody> </table> </li> </ul>	Trigger Type	Language	Specification		Positive Edge Triggered	Negative Edge Triggered	Time	VHDL	rising_edge	falling_edge	Verilog	posedge	negedge	SystemC	positive	negative	<a href="#">State Machine Diagrams</a> <sup>[817]</sup> <a href="#">Trigger</a> <sup>[936]</sup>
Trigger Type	Language			Specification														
		Positive Edge Triggered	Negative Edge Triggered															
Time	VHDL	rising_edge	falling_edge															
	Verilog	posedge	negedge															
	SystemC	positive	negative															
<b>Establish Port-Trigger Mapping</b>	<p>After successfully modeling the different operating modes of the component, and the triggers associated with them, you must associate the triggers with the component's ports. A Dependency relationship from the Port to the associated trigger is used to signify their association.</p>																	

		
<b>Active State Logic</b>	The first two aspects, above, put in place the preliminaries required for efficient interpretation of the hardware components. The actual State Machine logic is now modeled within the Active (Submachine) state.	

**Notes:**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- The current code generation engine supports only one clock trigger for a component

**Learn More:**

- [Transition](#) <sup>[1015]</sup>

**11.6.3 Code Generation - Interaction Diagrams**

During code generation from interaction(sequence) diagrams in a Class, Enterprise Architect applies its system engineering graph optimizer to transform the Class constructs into programmatic paradigms. Messages and Fragments are identified as one of the several action types based on their functionality, and Enterprise Architect uses the *code generation templates* to render their behavior accordingly.

**Topics:**

Topic	Detail	See also
<b>Action Call</b>	A Message that invokes an operation	<a href="#">Message (Sequence Diagram)</a> <sup>[989]</sup> <a href="#">Call</a> <sup>[993]</sup> <a href="#">Message Examples</a> <sup>[994]</sup>
<b>Action Create</b>	A Message with <i>Lifecycle = New</i>	<a href="#">Message (Sequence Diagram)</a> <sup>[989]</sup> <a href="#">Message Properties</a> <sup>[990]</sup>
<b>Action Destroy</b>	A Message with Lifecycle = Delete	<a href="#">Message (Sequence Diagram)</a> <sup>[989]</sup> <a href="#">Message Properties</a> <sup>[990]</sup>
<b>Action Loop</b>	A Combined Fragment with Type = Alt	<a href="#">Combined Fragment</a> <sup>[882]</sup> <a href="#">Interaction Operators</a> <sup>[884]</sup>
<b>Action If</b>	A Combined Fragment with Type = loop	<a href="#">Combined Fragment</a> <sup>[882]</sup>

		<a href="#">Interaction Operators</a> <sup>[884]</sup>
<b>Assign To</b>	A call message with a valid target attribute set using the "Assign To" field is rendered in the code as the target attribute of a call action	<a href="#">Call</a> <sup>[993]</sup> <a href="#">Message Properties</a> <sup>[990]</sup>

**Notes:**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class
- For an Interaction (Sequence) diagram, the behavioral code generation engine expects the Sequence diagram and all its associated messages and interaction fragments to be encapsulated within an interaction element

**Learn More:**

- [EASL Code Generation Macros](#) <sup>[1139]</sup>
- [Interaction](#) <sup>[906]</sup>
- [Interaction Occurrence](#) <sup>[908]</sup>
- [Activity](#) <sup>[875]</sup>

**11.6.4 Code Generation - Activity Diagrams**

Code generation from an Activity Diagrams in a Class requires a validation phase, during which Enterprise Architect uses the system engineering graph optimizer to analyze the diagram and render it into various code-generatable constructs. Enterprise Architect also transforms the constructs into one of the various action types (if appropriate), similar to the Interaction diagram constructs.

**Topics:**

Topic	Detail	See also
<b>Call Actions (Invocation Actions)</b>	<p>Call Actions are used to invoke operations or behaviors in an Activity diagram. The two main variants of Call Actions supported in behavioral code generation are:</p> <ul style="list-style-type: none"> <li>• CallOperationAction - used to invoke operations, which can be within the same Class or in other Classes within the same package. If referencing operations from other Classes within the same package, you must have a target to which the request is passed</li> <li>• CallBehaviorAction - used to invoke another Activity in an activity flow. The referenced activity is expected to be within the same Class</li> </ul> <p><b>Arguments</b></p> <p>Call Actions can specify argument values corresponding to the parameters in the associated behavior or behavioral feature. You can add the arguments manually or create them automatically using the the Synchronize button of the Arguments dialog.</p>	<a href="#">Assign Action Pins</a> <sup>[872]</sup> <a href="#">Behavior Calls</a> <sup>[717]</sup> <a href="#">Synchronize Arguments</a> <sup>[718]</sup>
<b>CreateObjectActi</b>	CreateObjectAction is used to denote an object	<a href="#">Assign Action Pins</a> <sup>[872]</sup>

<b>on</b>	<p>creation in the activity flow. You can set the result Pin of the CreateObjectAction as the object to be created, using the Assign Action Pins dialog.</p> <p>The Classifier of the CreateObjectAction signifies the Classifier for which an instance is to be created.</p>	
<b>DestroyObjectAction</b>	<p>DestroyObjectAction is used to denote an object deletion in the activity flow. You can set the target Pin of the DestroyObjectAction as the object to be destroyed, using the Assign Action Pins dialog.</p>	<a href="#">Assign Action Pins</a> <sup>[872]</sup>
<b>Loops</b>	<p>Enterprise Architect's system engineering graph optimizer is also capable of analyzing and identifying loops. An identified loop is internally rendered as an Action Loop, which is translated by the EASL code generation macros to generate the required code</p>	
<b>Conditional Statements</b>	<p>To model a conditional statement, you use Decision/Merge nodes. Alternatively, you can imply Decisions/Merges internally. The graph optimizer expects an associated Merge node for each Decision node, to facilitate efficient tracking of various branches and analysis of the code constructs within them.</p>	

**Notes:**

- To be able to generate code from behavioral models, all behavioral constructs should be contained within a Class

## 11.7 Synchronize Model and Code

In addition to generating and importing code, Enterprise Architect provides the option to synchronize the model and source code, creating a model that represents the latest changes in the source code and vice versa. You can use either the model as the source, or the code as the source.

For example: you generated some source code, but made subsequent changes to the model. When you generate code again, Enterprise Architect *adds* any new attributes or methods to the existing source code, leaving intact what already exists. This means developers can work on the source code and then generate *additional* methods as required from the model, without having their code overwritten or destroyed.

Similarly, you might have made changes to a source code file, but the model has detailed notes and characteristics you do not want to lose. By synchronizing from the source code into the model, you import additional attributes and methods but do not change other model elements.

Using the two synchronization methods above, it is simple to keep source code and model elements up to date and synchronized.

### Topics:

Topic	Detail	See also
<b>Synchronize Classes on Forward Generation</b>	<p>When there are features present in the code but not in the model you can use the following buttons during forward synchronization:</p> <ul style="list-style-type: none"> <li>• <b>Delete:</b> when you click on this button the selected code features are removed from the code</li> <li>• <b>Reassign:</b> when you click on this button the code elements are reassigned to elements in the model (this is only possible when an appropriate model element is present that is not already defined in the code)</li> <li>• <b>Ignore:</b> when you click on this button the code elements not present in the model are ignored completely</li> <li>• <b>Reset to Default:</b> when you click on this button the settings for synchronizing during forward generation are set to Ignore, meaning that the elements present in the code but not in the model are ignored completely</li> </ul>	<p><a href="#">Generate Source Code</a> <sup>[1499]</sup></p> <p><a href="#">Generate Source Code and DDL</a> <sup>[206]</sup></p>

### Notes:

- Code synchronization does not change method bodies. Behavioral code generation only works when generating the entire file
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have Generate Source Code and DDL permission

to synchronize source code with model elements

- The buttons to influence features generation are only available when the 'On forward synch, prompt to delete code features not in model' checkbox is selected in the Options - Attributes and Operations dialog

**Learn More:**

- [Generate From Behavioral Models](#) <sup>[1505]</sup>

## 11.8 Importing Source Code

### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Reverse Engineering in Enterprise Architect enables you to import existing source code from a variety of code languages into a UML model. Existing source code structures are mapped into their UML representations, for example a Java Class is mapped into a UML Class element with the variables being defined as attributes, methods are modeled as operations and the interactions between the Java Classes being displayed in the UML model Class diagram with the appropriate connectors.</p> <p>Reverse Engineering enables users to examine legacy code and examine the functionality of code libraries for reuse or to bring the UML model up to date with the code that has been developed as part of a process called <i>synchronization</i>. Examining the code in a UML model enables user to identify the critical modules contained the code, enabling a starting point for understanding of the business and system requirements of the pre-existing system and to enable the developers to gain a better overall understanding of the source code.</p> <p>To begin the process of importing existing code into Enterprise Architect, an existing source of code must be <b>imported into Enterprise Architect</b>, which can be a single directory or a <b>directory structure</b>. Several options are available when performing the reverse engineering process. The <b>Source Code Engineering Options</b> topic contains several options that affect the reverse engineering process. These include:</p> <ul style="list-style-type: none"> <li>• If comments are reverse engineered into notes fields, and how they are formatted if they are</li> <li>• How property methods are recognized</li> <li>• If dependencies should be created for operation return and parameter types</li> </ul> <p>It is important to note that when a legacy system is not well designed, simply importing the source into Enterprise Architect does not create an easily understandable UML model. When working with a legacy system that is poorly designed it is useful to break down the code into manageable components by examining the code elements individually. This can be achieved by importing a specific Class of interest into a diagram and then <b>inserting the related elements</b> at one level to determine immediate relationship to other Classes. From this point it is possible to create Use Cases that identify the interaction between the legacy Classes, enabling an overview of the legacy system's operation.</p>	<p><a href="#">Imported Source Code</a> <sup>[1519]</sup></p> <p><a href="#">Import a Directory Structure</a> <sup>[1522]</sup></p> <p><a href="#">Source Code Options</a> <sup>[1526]</sup></p> <p><a href="#">Insert Related Elements</a> <sup>[654]</sup></p>
<b>Copyright</b>	<p>Copyright ownership is an important issue to take into account</p>	

<b>Ownership</b>	<p>when undertaking the process of reverse engineering. In some cases, software might have specific limitations that prohibit the process of reverse engineering. It is important that a user address the issue of copyright before beginning the process of reverse engineering code. Situations that typically lend themselves to reverse engineering source code include source code that:</p> <ul style="list-style-type: none"> <li>• You have already developed</li> <li>• Is part of a third-party library that you have obtained permission to use</li> <li>• Is part of a framework that your organization uses</li> <li>• Is being developed on a daily basis by your developers</li> </ul>	
------------------	---	--

Enterprise Architect currently supports reverse engineering in the following programming languages:

**Reference:**

Topic	Link
Action Script	<a href="#">ActionScript</a> <sup>[1467]</sup>

### 11.8.1 Import Source Code

To import source code (reverse engineer) follow the steps below

#### How To:

Step	Action	See also
1	In the <b>Project Browser</b> , select (or add) a diagram into which to import the Classes.	
2	Right-click on the diagram background to open the context menu and either: <ul style="list-style-type: none"> <li>Select the language to import from the <b>Import from source file(s)</b> submenu</li> <li>Click on the <b>Import Language</b> drop-down arrow in the <b>Code Generation</b> toolbar and select the <b>Import   Import xxx files</b> menu option, where xxx represents the language to import</li> </ul>	
3	From the file browser that appears, select one or more <b>source code</b> files to import.	<a href="#">Notes on Source Code Import</a> <sup>[1519]</sup>
4	Click on the <b>Open</b> button to start the import process.	

As the import proceeds, Enterprise Architect provides progress information. When all files are imported, Enterprise Architect makes a second pass to resolve associations and inheritance relationships between the imported Classes.

### 11.8.2 Notes on Source Code Import

Enterprise Architect enables you to **import code** into your project, in the following programming languages:

Topic	Link
Action Script	<a href="#">ActionScript</a> <sup>[1467]</sup>
C	<a href="#">C</a> <sup>[1470]</sup>
C#	<a href="#">C#</a> <sup>[1472]</sup>

Python	<a href="#">Python</a> <sup>[1482]</sup>
Visual Basic	<a href="#">Visual Basic</a> <sup>[1483]</sup>
Visual Basic .NET	<a href="#">Visual Basic .NET</a> <sup>[1484]</sup>

**Topics:**

Topic	Detail	See also
<b>Introduction</b>	<p>Enterprise Architect supports most constructs and keywords for each coding language.</p> <p>If there is a particular feature you require support for that you feel is missing, please contact <b>Sparx Systems</b>.</p> <p>You must select the appropriate type of source file for the language, as the source code to import.</p>	<a href="#">Sparx Systems</a> (Online resource)
<b>ActionScript</b>	Appropriate type of source file: <b>.as</b> .	
<b>C</b>	<p>Appropriate type of source file: <b>.h</b> header files and/or <b>.c</b> files.</p> <p>When you select a header file Enterprise Architect automatically searches for the corresponding <b>.c</b> implementation file to import based on the options for extension and search path specified in the <b>C options</b>.</p> <p>Enterprise Architect does not expand macros that have been used, these must be added into the internal list of <b>Language Macros</b>.</p>	<a href="#">C options</a> <sup>[1540]</sup> <a href="#">Language Macros</a> <sup>[1534]</sup>
<b>C++</b>	<p>Appropriate type of source file: <b>.h</b> header file.</p> <p>Enterprise Architect automatically searches for the <b>.cpp</b> implementation file based on the extension and search path set in the <b>C++ options</b>. When it finds the implementation file it can use it to resolve parameter names and method notes as necessary.</p> <p>When importing C++ source code, Enterprise Architect ignores function pointer declarations. To import them into your model you could create a typedef to define a function pointer type, then declare function pointers using that type. Function pointers declared in this way are imported as attributes of the function pointer type.</p> <p>Enterprise Architect does not expand macros that have been used; these must be added into the internal list of <b>Language Macros</b>.</p>	<a href="#">C++ options</a> <sup>[1542]</sup> <a href="#">Language Macros</a> <sup>[1534]</sup>
<b>C#</b>	Appropriate type of source file: <b>.cs</b> .	
<b>Delphi</b>	Appropriate type of source file: <b>.pas</b> .	
<b>Java</b>	<p>Appropriate type of source file: <b>.java</b>.</p> <p>Enterprise Architect supports the <b>AspectJ</b> language extensions.</p>	

	 <pre> classDiagram     class ThingObserving {         &lt;&lt;aspect&gt;&gt;         - observers: Vector = new Vector()         + addObserver(Thing, Thing) : void         + removeObserver(Thing, ThingObserver) : void         ~ updateObserver(Thing, ThingObserver) : void         &lt;&lt;advice&gt;&gt;         + after(Thing) : void           changes(t)         &lt;&lt;pointcut&gt;&gt;         ~ changes(Thing) : void           target(t) &amp;&amp; call(Void Thing.set*(int))     </pre> <p>Aspects are modeled using Classes with the stereotype aspect. These aspects can then contain attributes and methods as for a normal Class. If an <i>intertype</i> attribute or operation is required, you can add a tag <i>className</i> with the value being the name of the Class it belongs to.</p> <p><i>Pointcuts</i> are defined as operations with the stereotype of <i>pointcut</i>. These can occur in any Java Class, Interface or aspect. The details of the <i>pointcut</i> are included in the behavior field of the method.</p> <p>Advice is defined as an operation with the stereotype advice. The <i>pointcut</i> this advice operates on is in the <b>behavior</b> field and acts as part of the method's unique signature. After advice can also have one of the Tagged Values <i>returning</i> or <i>throwing</i>.</p>	
PHP	Appropriate type of source file: <b>.php, .php4, or .inc.</b> Nested if condition syntax is enabled.	
Python	Appropriate type of source file: <b>.py.</b>	
Visual Basic	Appropriate type of source file: <b>.cls</b> Class file.	
Visual Basic .NET	Appropriate type of source file: <b>.vb</b> Class file.	

**Notes:**

- When reverse engineering attributes with parameter substitutions (templated attributes):
  - If a Class with proper **template parameter definitions** is found, an Association connector is created and its parameter substitutions are configured
  - An Association connector is also created if a matching entry is defined as a **Collection Class** or in the Additional Collection Classes option (for **C#, C++** and **Java**). For an example, see **Example Use of Collection Classes**

**Learn More:**

- [C++ Options](#) <sup>[1542]</sup>
- [Java Options](#) <sup>[1544]</sup>
- [Example Use of Collection Classes](#) <sup>[1537]</sup>

### 11.8.3 Import a Directory Structure

You can import from all source files in a complete directory structure. This process enables you to import or synchronize multiple files in a directory tree in one pass. Enterprise Architect creates the necessary packages and diagrams during the import process.

To import a directory structure, follow the steps below

#### How To:

Step	Action	See also
1	In the <b>Project Browser</b> , right-click on the target package for the import.	
2	From the context menu, select the <b>Code Engineering   Import Source Directory</b> menu option. The <b>Import Source Directory</b> dialog displays.	
3	Select the options you require. You can configure: <ul style="list-style-type: none"> <li>• The source directory</li> <li>• The source type</li> <li>• The file extensions to look at</li> <li>• Whether to recurse sub directories</li> <li>• Whether to create a diagram for each package</li> <li>• Whether to import additional files as described in the <b>Import Component Types</b> dialog</li> <li>• Whether to exclude private members from libraries being imported from the model</li> <li>• Whether to create a package for every directory, namespace or file; this might be restricted depending on the source type selected</li> <li>• Whether to Synchronize or Overwrite existing Classes when found (if a model Class is found matching the one in code, Synchronize updates the model Class to include the details from the one in code, which preserves information not represented in code such as the location of Classes in diagrams; <b>Overwrite</b> <i>deletes</i> the model Class and generates a new one from code, which deletes and does not replace the additional information)</li> <li>• How to handle Classes not found during the import (Prompt for action enables you to <b>review Classes individually</b>)</li> <li>• What is shown on diagrams created by the import</li> </ul>	<a href="#">Classes not found during Import</a> <sup>[1524]</sup>
4	Click on the <b>OK</b> button to start.	

### 11.8.4 Import Binary Module

Enterprise Architect enables you to reverse-engineer certain types of binary modules.

**Access:** Right-click on a package within the Project Browser | Code Engineering | Import Binary Module

#### Topics:

Topic	Detail	See also

<p><b>Usage</b></p>	<p>Currently the permitted types are as follows:</p> <ul style="list-style-type: none"> <li>• Java Archive (.jar)</li> <li>• .Net PE file (.exe, .dll); native Windows DLL and EXE files are not supported, only PE files containing .NET assembly data</li> <li>• Intermediate Language file (.il)</li> </ul> <p>Enterprise Architect creates the necessary packages and diagrams during the import process. Selecting the <b>Do not import private members</b> checkbox excludes private members from libraries from being imported into the model.</p> <p>When importing .Net files, you can import via reflection or via disassembly, or let Enterprise Architect decide the best method - this might result in both types being used. The reflection-based importer relies on a .Net program, and requires the .Net runtime environment to be installed. The disassembler-based importer relies on a native Windows program called <i>lldasm.exe</i>, which is a tool provided with the MS .Net SDK. The SDK can be downloaded from the Microsoft website.</p> <p>A choice of import methods is available because some files are not compatible with reflection (such as <i>mscorlib.dll</i>) and can only be opened using the disassembler. However, the reflection-based importer is generally much faster.</p> <p>You can also configure:</p> <ul style="list-style-type: none"> <li>• Whether to <b>Synchronize</b> or <b>Overwrite</b> existing Classes when found (if a model Class is found matching the one in the file, <b>Synchronize</b> updates the model Class to include the details from the one in the file, which preserves information not represented in the file such as the location of Classes in diagrams; <b>Overwrite</b> deletes the model Class and generates a new one from the file, which deletes and does not replace the additional information)</li> <li>• Whether to create a diagram for each package</li> <li>• What is shown on diagrams created by the import</li> </ul>	
---------------------	---	--

### 11.8.5 MDG Integration and Code Engineering

#### Topics:

Topic	Detail	See also
<p><b>Abstract/Usage</b></p>	<p>MDG Integration for Eclipse and MDG Integration for Visual Studio are standalone products that provide an enhanced code engineering functionality between Enterprise Architect and the development environments.</p> <p>The MDG Integration programs provide a lightweight bridge between Enterprise Architect and the</p>	<p><a href="http://www.sparxsystems.com/products/mdg/int/eclipse/index.html">www.sparxsystems.com/products/mdg/int/eclipse/index.html</a> (Online Resource)</p> <p><a href="http://www.sparxsystems.com/products/mdg/int/vs/index.html">www.sparxsystems.com/products/mdg/int/vs/index.html</a> (Online Resource)</p>

	<p>development environment, offering enhanced code generation, reverse engineering and synchronization between code and the UML model. Merging changes can be achieved with minimal effort, and navigation between model and source code is significantly enhanced.</p> <p>A trial version of MDG Integration for Eclipse can be downloaded from <a href="http://www.sparxsystems.com/products/mdg/int/eclipse/index.html">www.sparxsystems.com/products/mdg/int/eclipse/index.html</a> and MDG Integration for Visual Studio can be downloaded from <a href="http://www.sparxsystems.com/products/mdg/int/vs/index.html">www.sparxsystems.com/products/mdg/int/vs/index.html</a>.</p>	
--	--	--

### 11.8.6 Classes Not Found During Import

#### Topics:

Topic	Detail	See also
Usage	<p>When reverse synchronizing from your code, there are times when some Classes might be deliberately removed from your source code. Enterprise Architect's import source directory functionality keeps track of the Classes it expects to synchronize with and, on the <b>Import Directory Structure</b> dialog, provides options for how to handle the Classes that weren't found. You can select the appropriate action so that, at the end of the import, Enterprise Architect either ignores the missing Classes, automatically deletes them or prompts you to handle them.</p> <p>If you select the <b>Prompt For Action</b> radio button on the <b>Import Directory Structure</b> dialog, to manually review missing Classes a dialog is displayed allowing you to specify the handling for each class that was missing in the <b>imported</b> code. By default, all Classes are marked for deletion. To keep one or more Classes, select them and click on the Ignore button.</p>	<a href="#">Import a Directory Structure</a> <sup>[1522]</sup>

## 11.9 Other Settings

You can set the default code options such as the editors for each of the programming languages available for Enterprise Architect and special options for how source code is generated or reverse engineered.

### Learn More:

Topic	Details	Link
<b>General Options</b>	Describes the general options that apply to all languages when generating code from Enterprise Architect	<a href="#">General Options</a> <small>[1525]</small>
<b>Local Paths</b>	Describes how to define local paths for each Enterprise Architect user, using the Local Paths settings	<a href="#">Local Paths</a> <small>[1532]</small>
<b>Local Path Dialog</b>	Enables you to set up local paths for a single user on a particular machine	<a href="#">Local Path Dialog</a> <small>[1533]</small>
<b>Language Macros</b>	Describes how to define macros, which is helpful for reverse engineering	<a href="#">Language Macros</a> <small>[1534]</small>
<b>Set Collection Classes</b>	Describes how to define Collection Classes	<a href="#">Set Collection Classes</a> <small>[1535]</small>

### 11.9.1 Source Code Engineering

The following topics describe general options that apply to all languages when generating code from Enterprise Architect. These options are all available under the Source Code Engineering section of the Options dialog

#### Access: **Tools | Options | Source Code Engineering**

Topic	Detail	Link
<b>Source Code Options</b>	You can set certain defined options for a particular language while generating the code	<a href="#">Source Code Options</a> <small>[1526]</small>
<b>Options - Code Editors</b>	Describes how to access and configure the source code editor	<a href="#">Options - Code Editors</a> <small>[1528]</small>
<b>Options - Object Lifetimes</b>	Describes configuring various options concerning Object Lifetimes	<a href="#">Options - Object Lifetimes</a> <small>[1530]</small>
<b>Options - Attributes/Operations</b>	Describes configuring Attributes/Operations	<a href="#">Options - Attribute/Operations</a> <small>[1531]</small>
<b>Synchronize Model and Code</b>	Describes synchronizing the model and source code	<a href="#">Synchronize Model and Code</a> <small>[1515]</small>

Topic	Detail	Link
<b>Code Page for Source Editing</b>	Provides an option to define the Unicode character set for code generation	<a href="#">Code Page for Source Editing</a> <sup>[1532]</sup>

### 11.9.1.1 Source Code Options

When you generate code for a particular language, you can set certain options. These include:

- Create a default constructor
- Create a destructor
- Generate copy constructor
- Select default language
- Generate methods for implemented interfaces
- Set the Unicode options for code generation

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#)

**Use to:**

- Configure code generation options

**Reference:**

Field	Usage	See also
<b>Always synchronize with existing file (recommended)</b>	Indicates that imported code synchronizes with an existing file	
<b>Replace (overwrite) existing source file</b>	Indicates that imported code overwrites an existing source file	
<b>Component Types</b>	Allows for the importation of component types, this opens the Import component types dialog	<a href="#">Import Component Types</a> <sup>[1527]</sup>
<b>Default Language for Code Generation:</b>	Indicates the default coding language used in code generation	
<b>Wrap long comment lines at:</b>	Specifies the line length to wrap comments within	
<b>Auto Layout Diagram on Import:</b>	Specifies if and when a diagram is automatically generated on code import	
<b>Output file use both CR &amp; LF</b>	Indicates if carriage return and line feed is a used; ensure that this option is set according to what operating system is currently in use as code might not render correctly	
<b>Prompt when synchronizing (reversing)</b>	Ensures that a prompt displays when synchronization occurs	
<b>Remove hard breaks from comments on import</b>	Indicates that hard breaks are removed from commented sections on importation	

<b>Auto generate role names when creating code</b>	Indicates that role names are generated when creating code	
<b>Do not generate role names when creating code</b>	Indicates that role names are not generated when creating code	
<b>Do not generate members where association direction is "Unspecified"</b>	If association direction is "unspecified", members are not generated	
<b>Create dependencies for operation returns and parameter types</b>	Creates dependencies for operation returns and parameter types	
<b>Comments: Generate</b>	Indicates that comments are generated	
<b>Comments: Reverse</b>	Indicates that reverse comments are generated	
<b>Remove prefixes when generating Get/Set properties</b>	Enables specification of prefixes used in your variable naming conventions, if those prefixes should be removed in the variables' corresponding get/set functions	
<b>Treat as suffixes</b>	Treats the prefixes defined within <b>Remove prefixes when generating Get/Set properties</b> as suffixes	
<b>Capitalized Attribute Name for properties</b>	Capitalizes Attribute names for properties	
<b>Use "Is" for Boolean property Get()</b>	Indicates that the /s keyword is used for the Boolean property <b>Get()</b>	
<b>Code page for source editing</b>	Specifies the character embedding format	

**Notes:**

- It is worthwhile to configure these settings, as they serve as the defaults for all Classes in the model; you can override these on a per-Class basis using the custom settings (from the Code Generation dialog)

**11.9.1.1.1 Import Component Types**

The Import Component Types dialog enables you to configure what elements you would like to be created for files of any extension found while importing a source code directory.

**Access:** **Tools | Options | Source Code Engineering : Component Types**

**Use to:**

- Configure what elements are to be created for files of any extension found while importing a source code directory

**Reference:**

Field	Usage	See also
<b>Extension</b>	Indicates the extension name for a component type	
<b>Type</b>	Indicates the type for a component	
<b>Stereotype</b>	Indicates the stereotype name given to a component	
<b>Component List</b>	The defined list of component types	
<b>Save</b>	Saves a component definition and adds it to the component list	
<b>New</b>	Allows a new component type to be defined	
<b>Delete</b>	Deletes a highlighted component from the component list	

**Notes:**

- You can transport these import component types between models, using the Export Reference Data and Import Reference Data options

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

**11.9.1.2 Options - Code Editors**

You access the source code editor options via the Code Editors page of the Options dialog. They enable you to configure options for Enterprise Architect's internal editor, as well as the default editor for DDL scripts. You can configure external editors for code languages on each language options page.

**Access:** [Tools | Options | Source Code Engineering > Code Editors](#)

**Use to:**

- Configure options for Enterprise Architect's internal editor
- Configure the default editor for DDL Scripts
- Configure DDL Name Templates

**Reference:**

Field	Usage	See also
<b>DDL Editor</b>	Specifies what DDL Editor is currently in use; the (...) button opens a dialog that enables you to choose a default DDL editor	
<b>Default Database</b>	Indicates the default database used	
<b>MySQL Storage Engine</b>	Indicates the storage engine used	
<b>DDL Name Templates</b>	Specifies the Foreign Key, Primary Key and Unique Constraint Name templates; the (...) button enables you to specify template names	

Field	Usage	See also
<b>Use inbuilt editor if no external editor set</b>	Specifies the editor for code in a language if no external editor is defined for that language	
<b>Show Line Numbers</b>	Shows line numbers in the editor	
<b>Show Structure Tree</b>	Shows a tree with the results of parsing the open file (requires that the file is parsed successfully)	
<b>Don't parse files larger than</b>	Specifies an upper limit on file size for parsing Use this to prevent performance decrease due to parsing very large files	
<b>Syntax Highlighting Options</b>	Specifies both global and language-specific editor language properties	<a href="#">Editor language properties</a> <sup>[1529]</sup>
<b>Automatically Reverse Engineer on File Save</b>	When this is checked, pressing <b>(Ctrl) + (S)</b> to save in the source code editor automatically reverse engineers the code in the same way as the <b>Save Source and Re-Synchronize Class</b> button does	

### 11.9.1.2.1 Editor Language Properties

Enterprise Architect enables you to specify syntax highlighting properties for all the programming languages that Enterprise Architect supports at installation.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Code Editors](#) : [Syntax Highlighting Options \(...\)](#)

#### Use to:

- Configure Syntax highlighting for various coding languages

#### Reference:

Topic	Detail	See also
<b>General Features</b>	<p>The <b>Syntax Highlighting Options</b> button displays the Editor Language properties dialog</p> <p>The panel on the left of the dialog lists the languages for which you can set properties</p> <p>The <i>(Global)</i> item at the top of the list enables you to set properties that apply to all programming languages; however, you can reset a global property to a different value for a specific language, on the page for that language</p> <p>Resetting a global property for one language does not affect that property's value for the other languages</p> <p>Click on the required language in the list, to display the properties for that language:</p> <ul style="list-style-type: none"> <li>• Properties shown in bold indicate that this is the highest level at which this property can be defined (for most language options other than <i>Global</i>, this is effectively the only point at which the property is defined)</li> <li>• Properties shown in normal font are generally the global</li> </ul>	

Topic	Detail	See also
	<p>properties that you can reset just for the current language</p> <p>Scroll through the property categories and individual properties for the language; you can collapse and expand categories as necessary, using the expansion box next to the category name (☐)</p> <p>When you click on a property name, an explanation of that property displays in the panel at the bottom right of the dialog</p>	
<b>Define Properties</b>	<p>To define a property, click on the value field following the property name; depending on the type of property, either the field is enabled for direct editing or a drop-down arrow or <b>Browse</b> button displays (as described for the Tagged Values window) to enable you to select the values to define the property</p> <p>Select or type in the required values</p> <p>The Toolbar icons enable you to:</p> <ul style="list-style-type: none"> <li>• Save your changes to the properties</li> <li>• Reset ALL properties fields to the default settings shipped with Enterprise Architect</li> <li>• Reset the current style field to the default setting (not enabled for non-style fields)</li> </ul>	<a href="#">Tagged Values</a> <sup>[768]</sup>
<b>Assign Keys to Macros</b>	<p>The Macros category enables you to assign (<b>Ctrl+Alt+n</b>) keystroke combinations to coding macros that you have created yourself in the Source Code Viewer</p> <p>When you click on the <b>Browse</b> button in a selected <b>Macro</b> field, the Open Macro dialog displays; this dialog lists the existing macros and, if a key combination has been assigned to a macro, what that key combination is</p> <p>Click on the name of the macro and on the <b>Open</b> button to assign the selected keys to the macro</p>	<a href="#">Source Code Viewer</a> <sup>[1418]</sup>

**Notes:**

- You cannot currently set properties for any additional languages you include through an MDG Technology
- You can resize this dialog, if required

**Learn More:**

- [Syntax Highlighting](#)<sup>[1404]</sup>
- [MDG Technology](#)<sup>[1072]</sup>

**11.9.1.3 Options - Object Lifetimes**

This set of options enables you to configure various options concerning Object Lifetimes.

**Access:** **Tools | Options | Source Code Engineering > Object Lifetimes**

**Use to:**

- Define constructor details when generating code
- Specify whether to create a copy constructor
- Destructor details

**Reference:**

Field	Usage	See also
<b>Constructor</b>	This set of options specify if a constructor is generated, if a constructor is in-line and the visibility of the default constructor	
<b>Copy Constructor</b>	This set of options specify if a copy constructor is generated, if a copy constructor is in-line and the visibility of the default copy constructor	
<b>Destructor</b>	This set of options specify if a destructor is generated, if a destructor is in-line, if a destructor is defined as <i>virtual</i> and the visibility of the default constructor	

**Notes:**

- Some options are related to C++ only

#### 11.9.1.4 Options - Attribute/Operations

The Options - Attributes/Operations section enables you to configure Attribute and Operations specifications.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Attribute/Operations](#)

**Use to:**

- Configure the default name generated from imported attributes
- Generate methods for implemented interfaces
- Delete model attributes not included in the code during reverse synchronization
- Delete model methods not included in the code during reverse synchronization
- Delete code from features contained in the model during forward synchronization
- Delete model associations and aggregations that correspond to attributes not included in the code during reverse synchronization
- Define whether or not the bodies of methods are included and saved in the Enterprise Architect model when reverse engineering
- Create attributes in quick succession, clearing the dialog when you click on **Save** so that you can enter another attribute name

**Reference:**

Field	Usage	See also
<b>Attribute Specifications: Default name for associated</b>	Specifies the default name generated from imported attributes	
<b>Attribute Specifications: On reverse synch, delete model attributes not in code</b>	Indicates that on reverse synchronization, model attributes not included within code are removed	

Field	Usage	See also
<b>Attribute Specifications: On reverse synch, delete model associations not in code</b>	Indicates that on reverse synchronization, model associations not included within code are removed	
<b>Operation Specifications: Generate methods for implemented interface</b>	Indicates that methods are generated for an implemented interface	
<b>Operation Specifications: On reverse synch, delete model methods not in code</b>	Indicates that on reverse synchronization, model methods not included within code are removed	
<b>Operation Specifications: Include method bodies in model when reverse engineering</b>	Indicates that on reverse engineering code, method bodies are included within your model	
<b>Options: After Save, re-select edited item</b>	Indicates that after saving, the dialog clears allowing for another attribute name to be specified	
<b>On forward synch, prompt to delete code features not in mode</b>	Indicates that a prompt displays to remove features not in the mode during forward synchronization	

### 11.9.1.5 Code Page for Source Editing

Enterprise Architect enables you to define the Unicode character set for code generation.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#)

#### How To:

To set the Unicode character set, follow the steps below:

Step	Action	See also
1	Select the <b>Source Code Engineering</b> option The Source Code Engineering page of the Options dialog displays	
2	In the <b>Code page for source editing</b> field, click on the drop-down arrow and select the appropriate Unicode character set	
3	Click on the <b>Close</b> button	

### 11.9.2 Local Paths

**Access:** [Settings](#) | [Local Directories and Paths](#)

#### Topics:

Topic	Detail	See also
<b>General</b>	Sometimes a team of developers could be working on the same	<a href="#">Local Paths</a>

Topic	Detail	See also
<b>Features</b>	<p>Enterprise Architect model; each developer might store their version of the source code in their local file system, but not always at the same location as their fellow developers</p> <p>To handle this scenario, Enterprise Architect enables you to define local paths for each Enterprise Architect user, using the Local Paths dialog (select the <b>Local Directories and Paths</b> menu option)</p> <p>You can use local paths in generating code and reverse engineering, and in version control, developing XML schemas and generating RTF and HTML reports</p> <p>Local paths take a bit of setting up, but if you want to work collaboratively on source and model concurrently, the effort is well worth while</p> <p>For example:</p> <ul style="list-style-type: none"> <li>• Developer A stores her .java files in a <code>C:\Java\Source</code> directory, while developer B stores his in <code>D:\Source</code></li> <li>• Both developers want to generate and reverse engineer into the same Enterprise Architect model located on a shared (or replicated) network drive</li> </ul> <p>Developer A might define a local path of:</p> <pre>JAVA_SOURCE = " C: \ J a v a \ S o u r c e "</pre> <p>All Classes generated and stored in the Enterprise Architect project are stored as:</p> <pre>%J A V A _ S O U R C E % \ &lt; x x x . j a v a &gt;</pre> <p>Developer B defines a local path as:</p> <pre>J A V A _ S O U R C E = " D : \ S o u r c e "</pre> <p>Now, Enterprise Architect stores all java files in these directories as:</p> <pre>%J A V A _ S O U R C E % \ &lt; f i l e n a m e &gt;</pre> <p>On each developer's machine, the filename is expanded to the correct local version</p>	<a href="#">Dialog</a> <sup>[1533]</sup>

### 11.9.3 Local Paths Dialog

The Local Paths dialog enables you to set up local paths for a single user on a particular machine. For a description of what Local Paths are used for, see the *Local Paths* topic.

**Access:** [Settings | Local Directories and Paths](#)

#### Topics:

Topic	Detail	See also
<b>General Usage</b>	<p>The Local Paths dialog enables you to define:</p> <ul style="list-style-type: none"> <li>• <b>Path</b> - the local directory in the file system (for example, <code>d:\java\source</code>)</li> <li>• <b>ID</b> - the shared ID that is substituted for the Local Path (for example, <code>JAVA_SRC</code>)</li> <li>• <b>Type</b> - the language type (for example, <code>Java</code>)</li> </ul>	

Topic	Detail	See also
	<p>And also:</p> <ul style="list-style-type: none"> <li>• <b>Apply Path</b> - select a path and click on this button to update any existing paths in the model (with full path names) to the shared relative path name (for example:   <pre>d: \j ava\ sour ce\ mai n. j ava</pre> might become % <pre>JAVA_SRC% \ mai n. j ava</pre>)</li> <li>• <b>Expand Path</b> - the opposite of <b>Apply Path</b>; this enables you to remove a relative path and substitute the full path name</li> </ul> <p>Using the two options you can update and change existing paths</p>	

**Notes:**

- You can also set up a hyperlink on a diagram to access the Local Paths dialog, to switch, update or expand your current Local Path

**Learn More:**

- [Local Paths](#)<sup>[1532]</sup>
- [Hyperlink](#)<sup>[1295]</sup>

## 11.9.4 Language Macros

When reverse engineering a language such as C++, you might find preprocessor directives scattered throughout the code. This can make code management easier, but can hamper parsing of the underlying C++ language.

To help remedy this, you can include any number of *macro* definitions, which are ignored during the parsing phase of the reverse engineering. It is still preferable, if you have the facility, to preprocess the code using the appropriate compiler first; this way, complex macro definitions and defines are expanded out and can be readily parsed. If you don't have this facility, then this option provides a convenient substitute.

**Access:** [Settings | Preprocessor Macros](#)

**How To:**

To define a macro, follow the steps below:

Step	Action	See also
1	Select the <b>Preprocessor Macros</b> menu option The Language Macros dialog displays	
2	Click on the <b>Add New</b> button	
3	Enter details for your macro	
4	Click on the <b>OK</b> button	

**Topics:**

Topic	Detail	See also
<b>Macros Embedded Within Declarations</b>	<p>Macros are sometimes used within the declaration of Classes and operations, as in the following examples:</p> <pre>class __declspec Foo {     int __declspec Bar(int p); };</pre> <p>If <i>declspec</i> is defined as a C++ macro, as outlined above, the imported Class and operation contain a Tagged Value called <i>DeclMacro1</i> with value <i>__declspec</i> (subsequent macros would be defined as <i>DeclMacro2</i>, <i>DeclMacro3</i> and so on)</p> <p>During forward engineering, these Tagged Values are used to regenerate the macros in code</p>	
<b>Define Complex Macros</b>	<p>It is sometimes useful to define rules for complex macros that can span multiple lines;Enterprise Architect ignores the entire code section defined by the rule</p> <p>Such macros can be defined in Enterprise Architect as in the following two examples; both types can be combined in one definition</p> <p><b>Block Macros</b></p> <pre>BEGIN_INTERFACE_PART ^ END_INTERFACE_PART</pre> <p>where the ^ symbol represents the body of the macro - this enables skipping from one macro to another; the spaces surrounding the ^ symbol are required</p> <p><b>Function Macros</b></p> <pre>RTTI_EMULATION()</pre> <p>where Enterprise Architect skips over the token including everything inside the parentheses</p>	

**Notes:**

- You can transport these language macro (or preprocessor macro) definitions between models, using the **Export Reference Data** and **Import Reference Data** options; the macros are exported as a Macro List

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 11.9.5 Set Collection Classes

Enterprise Architect enables you to define *Collection Classes* for generating code from Association connectors where the target role has a multiplicity setting greater than 1.

Topic	Detail	See Also
<b>Defining Collection Classes</b>	On the Source Code Engineering section of the Options dialog (select the <b>Tools   Options   Source Code Engineering</b> option), on each language page	<a href="#">Source Code Options</a> <sup>[1528]</sup>

Topic	Detail	See Also
	<p>click on the <b>Collection Classes</b> button</p> <p>The Collection Classes for Association Roles dialog displays</p> <p>On this dialog, you can define:</p> <ul style="list-style-type: none"> <li>• The default Collection Class for 1..* roles</li> <li>• The ordered Collection Class to use for 1..* roles</li> <li>• The qualified Collection Class to use for 1..* roles</li> </ul>	
<b>Defining Collection Classes for a specific Class</b>	Class-specific Collection classes can be defined by clicking the <b>Collection Classes</b> button in the Class Properties dialog of the element	<a href="#">Element Details</a> <sup>[665]</sup>
<b>Code Generation Precedence</b>	<p>When Enterprise Architect generates code for a connector that has a multiplicity role &gt;1:</p> <ol style="list-style-type: none"> <li>1. If the Qualifier is set use the qualified collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language qualified collection</li> </ul> </li> <li>2. If the Order option is set use the ordered collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language ordered collection</li> </ul> </li> <li>3. Else use the default collection: <ul style="list-style-type: none"> <li>• for the Class if set</li> <li>• else use the code language default collection</li> </ul> </li> </ol>	
<b>Using Markers</b>	<p>You can include the marker <b>#TYPE#</b> in the collection name; Enterprise Architect replaces this with the name of the Class being collected at source generation time (for example, <i>Vector&lt;#TYPE#&gt;</i> would become <i>Vector&lt;foo&gt;</i>)</p> <p>Conversely, when reverse engineering, an Association connector is also created if a matching entry (e.g. <i>foo</i> if <i>foo</i> is found in the model) is defined as a Collection Class</p>	
<b>Additional Collection Classes</b>	Additional Collection Classes can be defined in the language options page (C#, C++, Java)	<a href="#">Example Use of Collection Classes</a> <sup>[1537]</sup> <a href="#">C# Options</a> <sup>[1541]</sup> <a href="#">C++ Options</a> <sup>[1542]</sup> <a href="#">Java Options</a> <sup>[1544]</sup>
<b>Member Type</b>	<p>On both the Source Role and Target Role tabs of the Association Property dialog (accessible from the right-click context menu of any Association) there is a <b>Member Type</b> field</p> <p>If you set this, the value you enter overrides all the above options</p>	<a href="#">Source Role</a> <sup>[760]</sup> <a href="#">Target Role</a> <sup>[762]</sup>

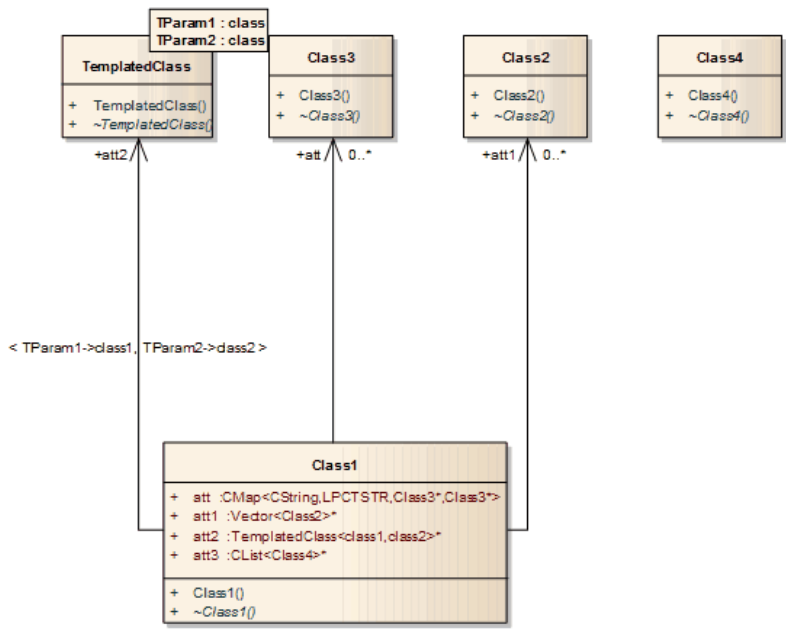

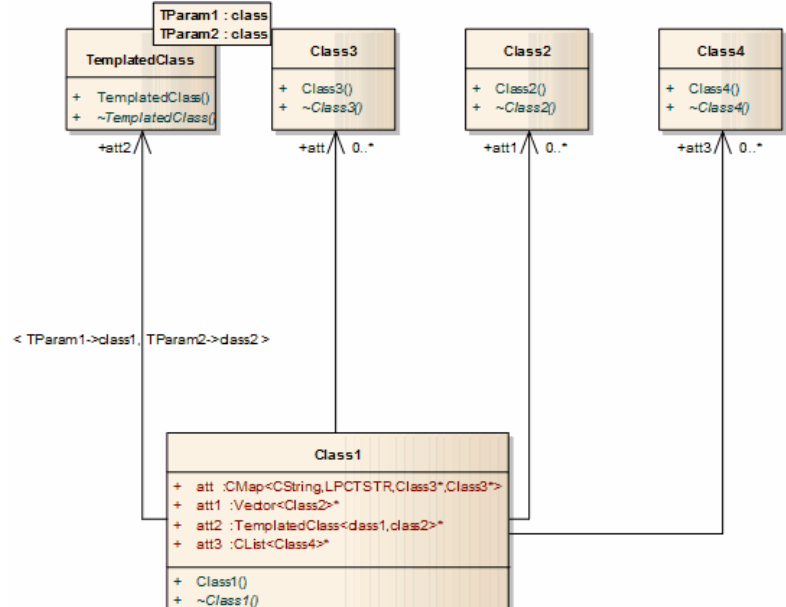

**Learn More:**

- [Generate Source Code](#) <sup>[1499]</sup>
- [Importing Source Code](#) <sup>[1517]</sup>
- [Source Code Options](#) <sup>[1526]</sup>

**11.9.5.1 Example Use of Collection Classes**

**Topics:**

Topic	Detail	See also
<p><b>Example Code</b></p>	<p>Consider the following source code:</p> <pre> class Class1 { public:     Class1();     virtual ~Class1();     CMap&lt;CString, LPCTSTR, Class3*, Class3*&gt; att;      Vector&lt;Class2&gt; *att1;     TemplatedClass&lt;class1, class2&gt; *att2;     CList&lt;Class4&gt; *att3; };  class Class2 { public:     Class2();     virtual ~Class2(); };  class Class3 { public:     Class3();     virtual ~Class3(); };  class Class4 { public:     Class4();     virtual ~Class4(); };  template&lt;class TParam1, class TParam2&gt; class TemplatedClass { public:     TemplatedClass() {     }     virtual ~TemplatedClass() {     } };                     </pre>	
<p><b>Generated Diagram</b></p>	<p>If this code above is imported into Enterprise Architect with default import options, the following diagram is generated:</p>	<p><a href="#">C# Options</a> <sup>[1541]</sup>  <a href="#">Java</a></p>

Topic	Detail	See also
	 <p data-bbox="478 996 1268 1097">If, however, you enter the value <b>CList&lt;#Type#&gt;</b> in the <b>Additional Collection Classes</b> field in the language options page (<b>C#, Java, C++</b>), an Association connector is also created to Class 4:</p> 	<a href="#">Options</a> <sup>1544</sup> <a href="#">C++ Options</a> <sup>1542</sup>

### 11.9.6 Language Options

You can set up various options for how Enterprise Architect handles a particular language when generating code. These options are accessible on the Options dialog (select the **Tools | Options** menu option).

Under the **Source Code Engineering** option, select the required language. The following topics outline the options available for each language.

Topic	Link
Action Script	<a href="#">ActionScript</a> <sup>[1539]</sup>
Ada 2005 (in the Systems Engineering and Ultimate editions of Enterprise Architect)	<a href="#">Ada 2005</a> <sup>[1540]</sup>
ANSI C	<a href="#">ANSI C</a> <sup>[1540]</sup>
C#	<a href="#">C#</a> <sup>[1541]</sup>
C++	<a href="#">C++</a> <sup>[1542]</sup>
Delphi	<a href="#">Delphi</a> <sup>[1542]</sup>
Delphi Properties	<a href="#">Delphi Properties</a> <sup>[1543]</sup>
Java	<a href="#">Java</a> <sup>[1544]</sup>
PHP	<a href="#">PHP</a> <sup>[1545]</sup>
Python	<a href="#">Python</a> <sup>[1545]</sup>
SystemC	<a href="#">SystemC</a> <sup>[1546]</sup>
Verilog (Systems Engineering and Ultimate editions)	<a href="#">Verilog</a> <sup>[1547]</sup>
VHDL (Systems Engineering and Ultimate editions)	<a href="#">VHDL</a> <sup>[1547]</sup>
Visual Basic	<a href="#">Visual Basic</a> <sup>[1548]</sup>
Visual Basic .NET	<a href="#">Visual Basic .NET</a> <sup>[1546]</sup>
MDG Technology Languages	<a href="#">MDG Technology Languages</a> <sup>[1549]</sup>
Reset Options	<a href="#">Reset Options</a> <sup>[1549]</sup>

### 11.9.6.1 ActionScript Options

Configure options for ActionScript code generation using the ActionScript Specifications page of the Options dialog.

**Access:** **Tools | Options | Source Code Engineering > ActionScript**

#### **Use to:**

- Specify default ActionScript version to generate (AS2.0 or AS3.0)
- Specify default file extensions (header and source)
- Specify default source directory
- Specify the editor for ActionScript code

#### **Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that the ActionScript is to be disabled	

<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> [1535]

### 11.9.6.2 Ada 2005 Options

Configure options for Ada 2005 code generation using the Ada page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Ada](#)

**Use to:**

- Inform the reverse engineering process whether the name of the Tagged Record is the same as the package name
- Advise the engine of the alternate Tagged Record name to locate
- Specify whether the engine should create a reference type for the Tagged Record (if one is not defined)
- Supply the name of the reference type to be created (default is Ref)
- To specify the reference parameter of a Reference / Access type
- Tell the engine to ignore the name of the reference parameter
- Indicate the name of the reference parameter to locate

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that Ada is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> [1535]

**Notes:**

- Ada 2005 support is available in the System Engineering and Ultimate editions of Enterprise Architect

### 11.9.6.3 C Options

Configure options for C code generation using the C Specifications page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [C](#)

**Use to:**

- Support Object Oriented coding
- Indicate default file extensions (header and source)
- Indicate default source directory
- Indicate an editor for C code
- Specify a path that Enterprise Architect uses to search for the implementation file; the first path in the list is the default path when generating

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that C is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> [1535]

**11.9.6.4 C# Options**

Configure options for C# code generation using the C# Specifications page of the Options dialog.

**Access:** **Tools | Options | Source Code Engineering > C#**

**Use to:**

- Indicate the default File extension
- Indicate additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as *CArray<#TYPE#>*) or a mix of other strings and substitutions (such as *Cmap<CString,LPCWSTR,#TYPE#\*,#TYPE#\*>*); the following collection classes are defined by default:
  - *List<#TYPE#>*; *Stack<#TYPE#>*; *Queue<#TYPE#>*;
- Specify a 'Get' prefix
- Specify a 'Set' prefix
- Specify a directory for opening and saving C# source code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that C# is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	

<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>1535</small>

### 11.9.6.5 C++ Options

Configure options for C++ code generation using the C++ Specifications page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [C++](#)

**Use to:**

- Indicate the version of C++ to generate; this controls the set of templates used and how properties are created
- Specify the default reference type used when a type is specified by reference
- Specify the default file extensions
- Specify default Get/Set prefixes
- Define additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as `CArray<#TYPE#>`) or a mix of other strings and substitutions (such as `Cmap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`); the following collection classes are defined by default:
  - `CArray<#TYPE#>`; `CMap<CString,LPCTSTR,#TYPE#*,#TYPE#*>`;
- Specify a default source directory
- Specify the path that Enterprise Architect uses to search for the implementation file; the first path in the list is the default path when generating new implementation files and parsing existing files - if you add further directories, Enterprise Architect also searches these when parsing existing files

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that C++ is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>1535</small>

### 11.9.6.6 Delphi Options

Configure options for Delphi code generation using the Delphi Specifications page of the Options dialog

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Delphi](#)

**Use to:**

- Indicate a default file extension
- Indicate a default source directory
- Set a default directory for opening and saving Delphi source code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that Delphi is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <sup>[1535]</sup>

**Learn More:**

- [Delphi Properties](#) <sup>[1543]</sup>

#### 11.9.6.6.1 Delphi Properties

Enterprise Architect has comprehensive support for Delphi properties. These are implemented as Tagged Values, with a specialized property editor to help create and modify Class properties. By using the **Feature Visibility** element context menu option, you can display the 'tags' compartment that contains the properties. Imported Delphi Classes with properties have this feature automatically made visible for your convenience.

**Use to:**

- Configure additional properties for Delphi based elements

**Reference:**

Topic	Description	See also
<b>To manually activate the property editor</b>	<ul style="list-style-type: none"> <li>• Ensure the Class you have selected has the code generation language set to Delphi</li> <li>• Right-click on the Class and select the <b>Delphi Properties</b> context menu option to open the editor</li> </ul> <p>The Delphi Properties editor enables you to build properties in a simple and straightforward manner; from here you can:</p> <ul style="list-style-type: none"> <li>• Change the name and scope (only <b>Public</b> and <b>Published</b> are currently supported)</li> <li>• Change the property type (the drop-down list includes all defined Classes in the project)</li> <li>• Set the Read and Write information (the drop-down lists have all the attributes and operations from the current</li> </ul>	

	Class; you can also enter free text) <ul style="list-style-type: none"> <li>• Set <b>Stored</b> to <b>True</b> or <b>False</b></li> <li>• Set the Implements information</li> <li>• Set the default value, if one exists</li> </ul>	
--	---	--

**Notes:**

- When you use the Create Property dialog from the Attribute screen, Enterprise Architect generates a pair of Get and Set functions, together with the required property definition as Tagged Values; you can manually edit these Tagged Values if required
- Public properties are displayed with a '+' symbol prefix and published with a '^'
- When creating a property in the Create Property Implementation dialog (accessed through the Attributes dialog), you can set the scope to Published if the property type is Delphi
- Only **Public** and **Published** are supported
- If you change the name of a property and forward engineer, a new property is added, but the old one must be manually deleted from the source file

**11.9.6.7 Java Options**

Configure options for Java code generation using the Java Specifications page of the Options dialog.

**Access:** **Tools | Options | Source Code Engineering > Java**

**Use to:**

- Set a default directory for opening and saving Java source code
- Indicate a default file extension
- Specify a default 'Get' prefix
- Specify a default 'Set' prefix
- Define additional Collection Classes - to define custom collection classes, which can be simple substitutions (such as *CArray<#TYPE#>*) or a mix of other strings and substitutions (such as *Cmap<CString,LPCWSTR,#TYPE#\*,#TYPE#\*>*); the following collection classes are defined by default:
  - *HashSet<#TYPE#>;Map<String,#TYPE#>;*

### 11.9.6.8 PHP Options

Configure options for PHP code generation using the PHP Specifications page of the Options dialog.

**Access:** [Tools | Options | Source Code Engineering > PHP](#)

**Use to:**

- Specify the extension to be used when creating files for PHP source
- Define a semi-colon separated list of extensions to look at when doing a directory code import for PHP
- Set a default directory for opening and saving PHP source code
- Specify the version of PHP to generate

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that PHP is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	

**Learn More:**

- [Import a Directory Structure](#)<sup>[1522]</sup>

### 11.9.6.9 Python Options

Configure options for Python code generation using the Python Specifications page of the Options dialog.

**Access:** [Tools | Options | Source Code Engineering > Python](#)

**Use to:**

- Indicate the default file extension(s)
- Specify the default source directory to be used
- Specify the editor used to write code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that Python is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	

<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
-------------------------------------	--	--

### 11.9.6.10 SystemC Options

Configure options for SystemC code generation using the SystemC page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [SystemC](#)

**Use to:**

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that SystemC is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>[1535]</small>

### 11.9.6.11 VB.NET Options

Configure options for VB.NET code generation using the VB.NET Specifications page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [VB.NET](#)

**Use to:**

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that VB.NET is to be disabled	
<b>Options for the</b>	Specifies the options used in the current model	

<b>current model</b>	These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>[1535]</small>

### 11.9.6.12 Verilog Options

Configure options for Verilog code generation using the Verilog page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Verilog](#)

**Use to:**

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that Verilog is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>[1535]</small>

### 11.9.6.13 VHDL Options

Configure options for VHDL code generation using the VHDL page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [VHDL](#)

**Use to:**

- Indicate default file extension(s)
- Specify a default source directory
- Specify an editor for changing code

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that VHDL is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current user; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>[1535]</small>

### 11.9.6.14 Visual Basic Options

Configure options for Visual Basic code generation using the VB Specifications page of the Options dialog.

**Access:** [Tools](#) | [Options](#) | [Source Code Engineering](#) > [Visual Basic](#)

**Use to:**

- Indicate the default file extension when reading/writing
- Specify the default Visual Basic version
- Indicate the MTS transaction mode for MTS objects
- Specify if a Class uses Multi use (**true** or **false**)
- Specify if a Class uses the **Persistable** property
- Indicate data binding behaviours
- Set the global namespace
- Set the *Exposed* attribute
- Indicate if the *Creatable* attribute is **true** or **false**

**Reference:**

Field	Usage	See also
<b>Disable Language</b>	Indicates that Visual Basic is to be disabled	
<b>Options for the current model</b>	Specifies the options used in the current model These options affect all users of the current model; however, they do not apply to other models	
<b>Options for the current user</b>	Specifies the options used for the current use; these options apply to all models that are accessed by the user	
<b>Collection Classes</b>	Opens the Collection Classes for Association Roles dialog, which allows the specification of collection class definitions	<a href="#">Collection Classes</a> <small>[1535]</small>

### 11.9.6.15 MDG Technology Language Options

If you have loaded an MDG Technology that specifies a code module into your *Sparx Systems > EA > MDG Technologies* folder, the language is included in the Source Code Engineering list on the Options dialog. The language is only listed on the Options dialog if an MDG Technology file actually uses it in your model.

**Access:** [Tools | Options | Source Code Engineering > MDG](#)

**Reference:**

Field	Usage	See also
<b>Default Extension</b>	Default extension for generated source files; shown if the option is in the technology This is saved per project	
<b>Import File Extensions</b>	Default folder to import source files from; shown if the technology supports namespaces This is saved once for all projects	
<b>Generate Namespaces</b>	Indicates if namespaces are generated or not	
<b>Default Source Directory</b>	The default directory to save generated source files This is always shown	
<b>Editor</b>	Indicates the editor that is used to edit source files	
<b>Att Type</b>	Indicates the default attribute type	

**Notes:**

- These options are set in the technology inside the `<CodeOptions>` tag of a code module, as follows:

```
<CodeOption name="DefaultExtension">.rb</CodeOption>
```

**Learn More:**

- [MDG Technology](#)<sup>[1066]</sup>
- [Adding Code Modules in MDG Technologies](#)<sup>[1072]</sup>

### 11.9.6.16 Reset Options

Enterprise Architect stores some of the options for a Class when it is first created. Some are global; for example, `$LinkClass` is stored when you first create the Class, so it won't automatically pick up the global change in the Options dialog in existing Classes. You must modify the options for the existing Class.

**How To:**

To modify options for a single Class, follow the steps below:

Step	Action	See also
1	Right-click on the Class to change, and select the <b>Generate Code</b> context menu option The Generate Code dialog displays	
2	Click on the <b>Advanced</b> button The Object Options dialog displays	
3	Click on the <b>Attributes/Operations</b> button	
4	Change the options, and click on the <b>Close</b> button to apply the changes	

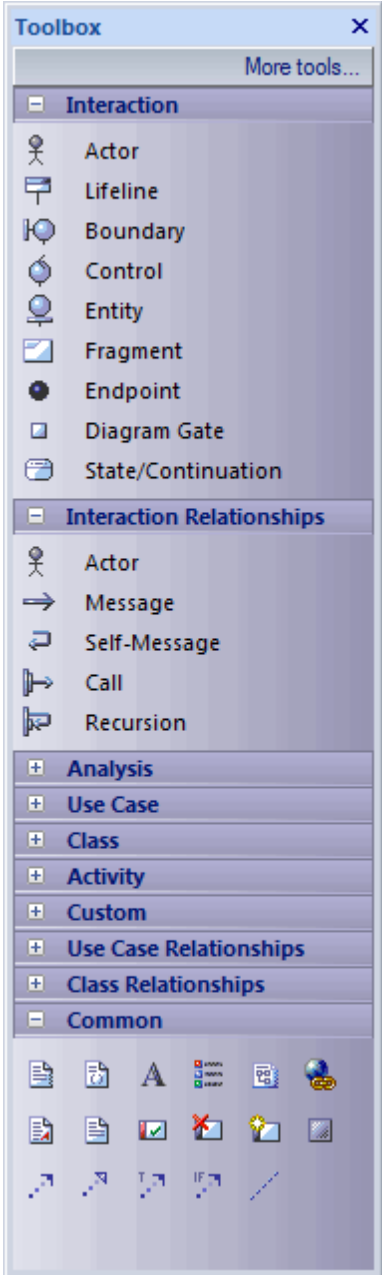

To modify options for all Classes within a package, follow the steps below:

Step	Action	See also
1	Right-click on the package in the Project Browser The context menu displays	
2	Select the <b>Code Engineering   Reset Options for this Package</b> menu option The Manage Code Generation dialog displays	
3	Reset the required defaults for each existing Class	
4	Click on the <b>OK</b> button to apply the changes	

## 11.10 ICONIX

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>The following text is derived from the <b>ICONIX</b> entry in the online Wikipedia:</p> <p><i>The ICONIX Process is a minimalist, streamlined approach to Use Case driven UML modeling that uses a core subset of UML diagrams and techniques to provide thorough coverage of object-oriented analysis and design. Its main activity is robustness analysis, a method for bridging the gap between analysis and design. Robustness analysis reduces the ambiguity in use case descriptions, by ensuring that they are written in the context of an accompanying domain model. This process makes the use cases much easier to design, test and estimate.</i></p> <p>The ICONIX Process was developed by Doug Rosenberg; for more information on ICONIX, refer to ICONIX Software Engineering Inc.</p>	<a href="#">ICONIX</a> (Online Resource)
<b>ICONIX in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop models under ICONIX quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer</p> <p>The ICONIX facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• A set of ICONIX pages in the Toolbox</li> <li>• ICONIX element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> </ul> <p>To further help you develop and manage a project under ICONIX, Enterprise Architect also provides a white paper on the <b>ICONIX Roadmap</b></p> <p>In addition, Enterprise Architect has an alternative <b>visual layout</b> specific to ICONIX</p>	<a href="#">Toolbox Shortcut Menu</a> <sup>[553]</sup> <a href="#">Quick Linker</a> <sup>[624]</sup> <a href="#">ICONIX Roadmap</a> (Online Resource)
<b>ICONIX Toolbox Pages</b>	<p>Within the Toolbox, Enterprise Architect provides ICONIX versions of the pages for UML <b>Analysis</b>, <b>Use Case</b>, <b>Class</b>, <b>Interaction (Sequence)</b>, <b>Activity</b> and <b>Custom</b> diagrams (which often form the basis for <i>Robustness diagrams</i>)</p> <p>Compared to the standard Toolbox pages, these have slightly different element and relationship sets; you can access them by either:</p> <ul style="list-style-type: none"> <li>• Selecting the <b>More tools   ICONIX   &lt;Diagram Type&gt;</b> menu option for a specific Toolbox page</li> <li>• Selecting the <b>ICONIX</b> option in the drop-down field of the Default Tools toolbar, which adds all six pages to the Toolbox; the first page and the Common page are expanded, and the others are closed up</li> </ul>	<a href="#">Analysis Diagram</a> <sup>[1190]</sup> <a href="#">Use Case Diagram</a> <sup>[815]</sup> <a href="#">Class Diagram</a> <sup>[800]</sup> <a href="#">Sequence Diagram</a> <sup>[851]</sup> <a href="#">Activity Diagram</a> <sup>[813]</sup> <a href="#">Custom Diagram</a> <sup>[1186]</sup>

Topic	Detail	See also
		
<b>ICONIX Layout</b>	<p>The ICONIX layout re-organizes the Enterprise Architect work area, opening the:</p> <ul style="list-style-type: none"> <li>• Toolbox on the right hand side of the screen (follow the instructions above to display the ICONIX pages)</li> <li>• The Learning Center window auto-hidden in the top right of the screen</li> <li>• Project Browser window in the top left of the screen, and</li> <li>• Notes, Properties and Tagged Values windows nested on the bottom left of the screen</li> </ul> <p>To apply this layout, select the <b>View   Workspace Layouts</b> menu option and select the <b>Basic Layout (Alternate)</b> option</p>	<a href="#">Workspace Layout</a> <small>116</small>
<b>Disable ICONIX</b>	<p>If you prefer not to use ICONIX in Enterprise Architect, you can</p>	<a href="#">MDG Technologies</a>

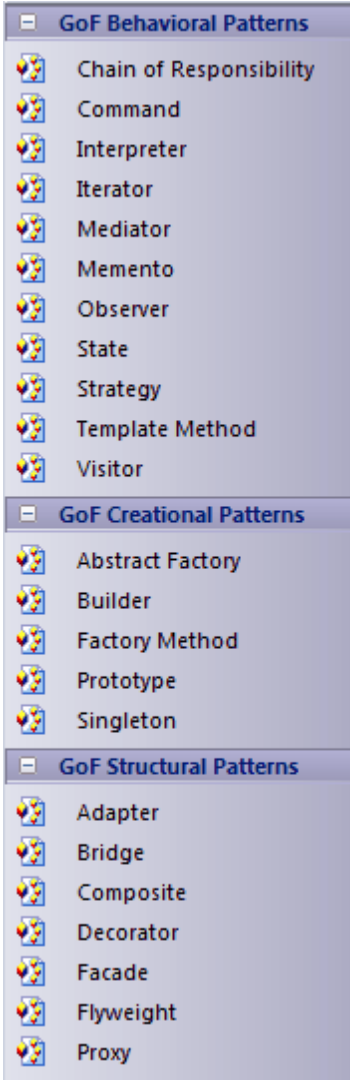

Topic	Detail	See also
	<p>disable it (and subsequently re-enable it) using the MDG Technologies dialog (<b>Settings   MDG Technologies</b>)</p> <p>This does not affect the ICONIX layout, which you can switch back to your own layout or the Enterprise Architect default layout using the <b>View   Workspace Layouts</b> menu option</p>	 1035

## 11.11 GoF Patterns

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>The following text is derived from the <b>Design Patterns</b> entry in the online Wikipedia.</p> <p><i>Gang of Four (GoF) Patterns are 23 classic software design patterns providing recurring solutions to common problems in software design. They were developed by Erich Gamma, Richard Helm, Ralph Johnson and John Vlissides, often referred to as the Gang of Four. The patterns are defined in the book Design Patterns: Elements of Reusable Object-Oriented Software (Gamma et al., ISBN 0-201-63361-2).</i></p> <p>For further information on the concepts of GoF Patterns, refer to the <b>Wikipedia</b> item and its linked sources.</p>	<a href="#">Design Patterns</a> (Online Resource)
<b>GoF Patterns in Enterprise Architect</b>	<p>Enterprise Architect enables you to develop diagrams from GoF patterns quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The GoF Patterns are provided in the form of:</p> <ul style="list-style-type: none"> <li>• <b>GoF Behavioral Patterns, GoF Creational Patterns and GoF Structural Patterns</b> pages in the <b>Toolbox</b></li> <li>• Gang of Four pattern entries in the <b>Toolbox Shortcut Menu</b>.</li> </ul> <p><u><a href="#">GoF Toolbox Pages</a></u></p> <p>You can access the GoF Pattern pages of the Toolbox through the <b>More tools   GoF Patterns</b> menu option. The following icons are available:</p>	<a href="#">Toolbox Shortcut Menu</a> <sup>[553]</sup> <a href="#">Use A Pattern</a> <sup>[1028]</sup>

Topic	Detail	See also
	 <p>When you drag one of the pattern elements onto a new diagram, the <b>Add Pattern GoF &lt;pattern group&gt;&lt;pattern type&gt;</b> dialog displays. If necessary, modify the action and/or default for the component elements, then click on the <b>OK</b> button to create a diagram based on the pattern.</p> <p>The GoF patterns are drawn from the <b>Resources</b> window. If you delete a pattern in the <b>Resources</b> window the equivalent <b>Toolbox</b> item cannot work. Therefore, if you cannot drop a pattern element from the <b>Toolbox</b>, check that it is still available in the <b>Resources</b> window.</p>	
<p><b>Disable GoF Patterns</b></p>	<p>If you prefer not to use the GoF Patterns technology in Enterprise Architect, you can disable it (and subsequently re-enable it) using the <b>MDG Technologies</b> dialog (<b>Settings   MDG Technologies</b>).</p>	<p><a href="#">MDG Technologies</a> <small>110351</small></p>

## 12 Systems Engineering

### Topics:

Topic	Detail	See also
Usage	<p>To model Systems using <b>SysML</b> in Enterprise Architect, you work through the following steps:</p> <ul style="list-style-type: none"> <li>• <b>Create a Systems Engineering model</b> to develop your system</li> <li>• <b>Create a Requirements model</b> to define the systems requirements and expectations</li> <li>• Create an Operational Domain model, which describes the environment that the system operates within, and the entities it interacts with</li> <li>• <b>Create Constraint models</b> to describe the systems operating characteristics using parametric models</li> <li>• <b>Simulate the parametric models</b> to verify their correctness and obtain the desired characteristic</li> <li>• <b>Design the system's composition</b> using SysML Blocks and Parts</li> <li>• <b>Implement the embedded software</b> using UML Classes and behavioral models</li> <li>• <b>Create a Library of reusable SysML blocks</b>, representing subsystems that can be reused on other projects, and other common Type definitions</li> </ul>	<p><a href="#">SysML</a><sup>[1561]</sup></p> <p><a href="#">Create a Systems Engineering model</a><sup>[1558]</sup></p> <p><a href="#">Create a Requirements model</a><sup>[1581]</sup></p> <p><a href="#">Create an Operational Domain model</a><sup>[1582]</sup></p> <p><a href="#">SysML Parametric Models</a><sup>[1577]</sup></p> <p><a href="#">Simulating a SysML Model</a><sup>[1579]</sup></p> <p><a href="#">Compose System Design</a><sup>[1584]</sup></p> <p><a href="#">Generate from Behaviour Models</a><sup>[1505]</sup></p> <p><a href="#">Create Re-usable Subsystems</a><sup>[1586]</sup></p>

### Example:

These steps are represented graphically in the following flow:

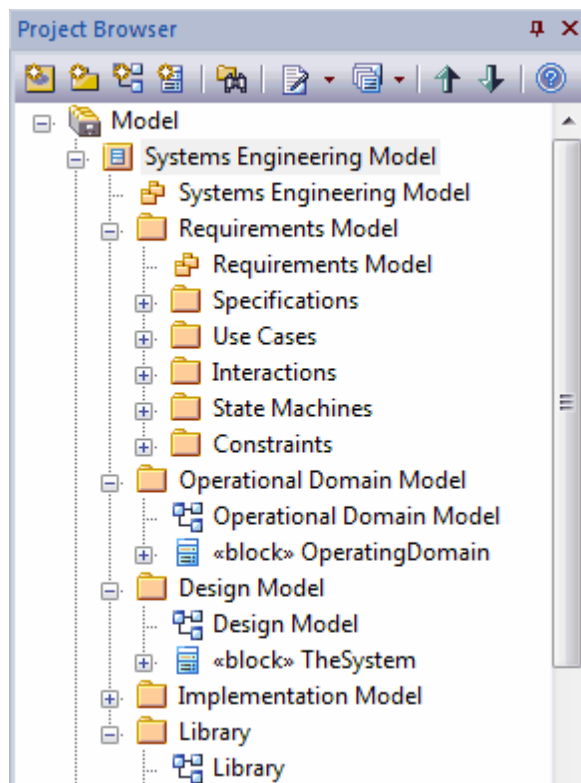

To create a Systems Engineering Model from a template provided with Enterprise Architect, follow the steps below

**How To:**

Step	Action	See Also
1.	In the <b>Project Browser</b> , either: <ul style="list-style-type: none"> <li>Click on the <b>New Model From Pattern</b> icon in the toolbar</li> <li>Right-click on a model root node and select the <b>Add a New Model using Wizard</b> context menu option, or</li> <li>Right-click on a package and select the <b>Add   Add a New Model using Wizard</b> context menu option.</li> </ul> The <b>Select Model(s)</b> dialog displays.	
2.	In the <b>Select From</b> field, click on the drop-down arrow and select <b>Systems Engineering Model</b> . Alternatively, if it is listed in the <b>Technology</b> panel, select the <b>Systems Engineering Model</b> item.	
3.	In the <b>Name</b> panel, select the checkbox next to the <b>Systems Engineering Model</b> icon.	
4.	Click on the <b>OK</b> button.	

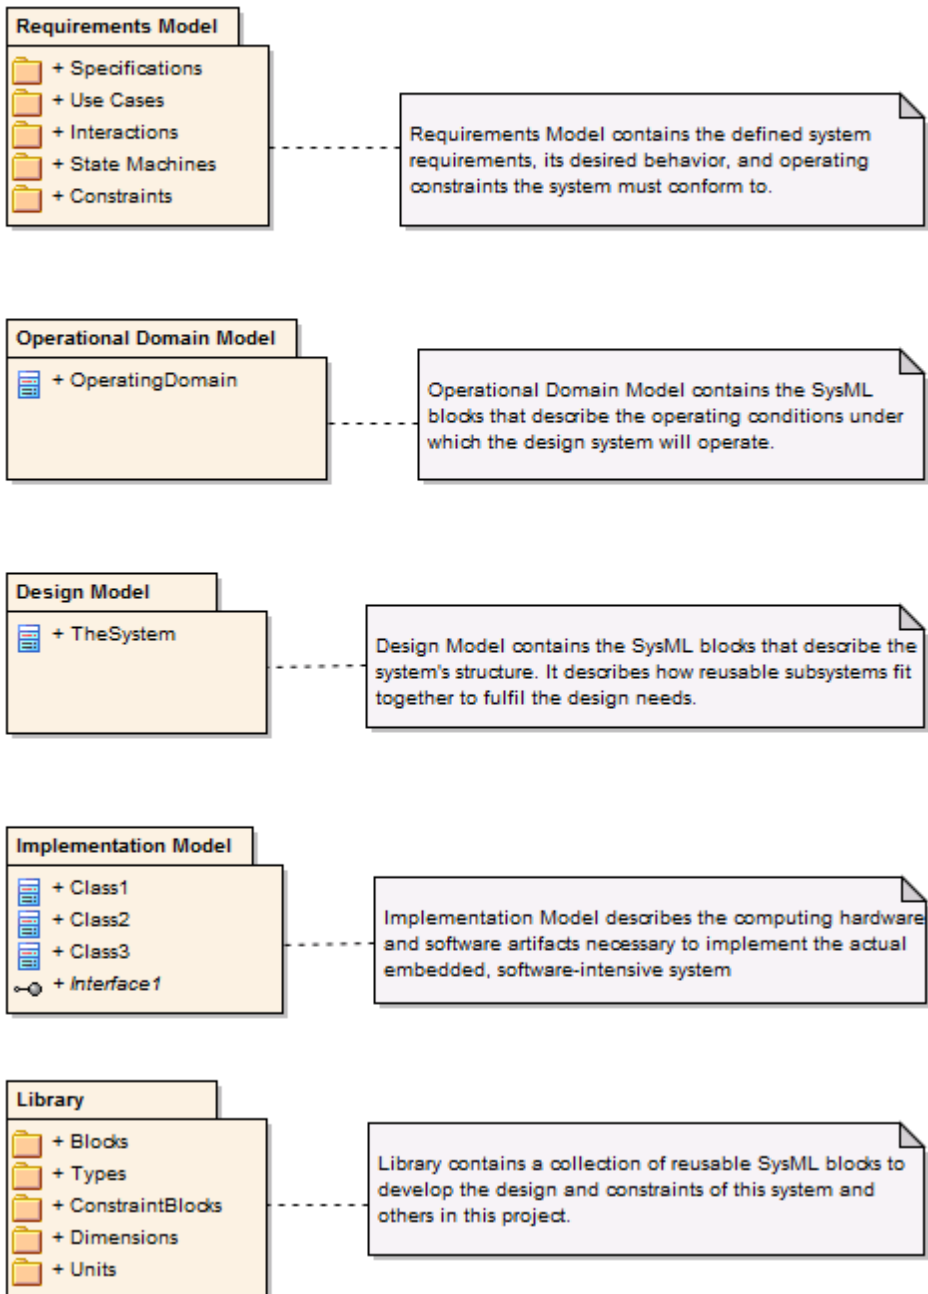

**Example:**

The following model structure is created in the **Project Browser**:

The *Systems Engineering Model* diagram, shown below, encapsulates the key components of the Systems Engineering model.

Systems Engineering Model captures the requirements, operating conditions and performance constraints of a complex system. It captures the design of the system in terms of distinct, configurable, reusable subsystem components.

**Notes:**

- Systems Modeling Language (SysML) is available in the Systems Engineering edition and Ultimate edition of Enterprise Architect

## 12.1 SysML

### Topics:

Topic	Detail	See also
<b>Introduction</b>	<p>The following text is derived from the official OMG SysML site of the Object Management Group</p> <p><i>The OMG Systems Modeling Language (OMG SysML™) is a general-purpose graphical modeling language for specifying, analyzing, designing, and verifying complex systems that may include hardware, software, information, personnel, procedures, and facilities.</i></p> <p><i>The language provides graphical representations with a semantic foundation for modeling system requirements, behavior, structure, and parametrics, which is used to integrate with other engineering analysis models.</i></p> <p><i>SysML was developed in response to requirements developed jointly by the OMG and the International Council on Systems Engineering (INCOSE) by the diverse group of tool vendors, end users, academia, and government representatives.</i></p>	<a href="#">OMG SysML</a>
<b>SysML In Enterprise Architect</b>	<p>Enterprise Architect enables you to develop SysML models quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer</p> <p>The SysML technology provides:</p> <ul style="list-style-type: none"> <li>• Each of the nine SysML diagram types, accessed through the New Diagram dialog</li> <li>• A collection of SysML pages in the Toolbox that contain each of the supported SysML elements and relationships</li> <li>• SysML element and relationship entries in the Toolbox Shortcut Menu and Quick Linker</li> <li>• <b>Simulation of SysML Parametric diagrams</b>, which supports engineering analysis of critical system parameters including the evaluation of key metrics such as performance, reliability and other physical characteristics</li> </ul>	<a href="#">Add New Diagram</a> <sup>[570]</sup> <a href="#">Toolbox Shortcut Menu</a> <sup>[553]</sup> <a href="#">Quick Linker</a> <sup>[624]</sup> <a href="#">Simulate a SysML Model</a> <sup>[1579]</sup>
<b>SysML Toolboxes</b>	<p>You can access the SysML pages of the Toolbox through the <b>More tools   SysML 1.1</b> and <b>SysML 1.2</b> menu options</p> <p>You can also enable SysML as the active technology to access the Toolbox pages directly</p> <p>The following sets of Toolbox pages are available:</p> <ul style="list-style-type: none"> <li>• <b>Model Elements</b> contains the constructs required to build SysML models, package structures and views</li> <li>• <b>Block Definition</b> contains the constructs required to design SysML blocks, constraint blocks, data and value types</li> <li>• <b>Internal Block</b> contains the constructs required</li> </ul>	<a href="#">Model Elements</a> <sup>[1570]</sup> <a href="#">Block Definition</a> <sup>[1565]</sup> <a href="#">Internal Block</a> <sup>[1568]</sup> <a href="#">Parametrics</a> <sup>[1572]</sup> <a href="#">Activity</a> <sup>[1562]</sup> <a href="#">Interaction</a> <sup>[1567]</sup> <a href="#">State Machine</a> <sup>[1574]</sup> <a href="#">Use Case</a> <sup>[1576]</sup> <a href="#">Requirements</a> <sup>[1573]</sup> <a href="#">Default Tools Toolbar</a> <sup>[108]</sup>

Topic	Detail	See also
	<p>to design SysML block compositions within Internal Block Diagrams</p> <ul style="list-style-type: none"> <li>• <b>Parametrics</b> contains the constructs required to construct SysML Parametric Diagrams using constraint blocks</li> <li>• <b>Activity</b> contains the constructs required to construct SysML Activity models</li> <li>• <b>Interaction</b> contains the constructs required to construct SysML interactions and Sequence diagrams</li> <li>• <b>State Machine</b> contains the constructs required to build SysML State Machines</li> <li>• <b>Use Case</b> contains the constructs required to build SysML Use Case models</li> <li>• <b>Requirements</b> contains the constructs required to build SysML Requirements models</li> </ul> <p>With the Model Elements pages there is a set of SysML Common elements and relationships; these are also provided with the other SysML Toolbox pages if the active technology is set to <b>SysML 1.1</b> or <b>SysML 1.2</b> on the Default Tools toolbar</p>	
<b>Convert SysML 1.1 Models to SysML 1.2</b>	Enterprise Architect enables you to migrate a SysML 1.1 model (or part of a model) to SysML 1.2, using the Automation Interface	<a href="#">Migrate SysML 1.1 Model to SysML 1.2</a> <sup>[1587]</sup>
<b>Disable SysML</b>	If you prefer not to use SysML in Enterprise Architect, you can disable it (and subsequently re-enable it) using the MDG Technologies dialog ( <b>Settings   MDG Technologies</b> )	<a href="#">MDG Technologies</a> <sup>[1035]</sup>

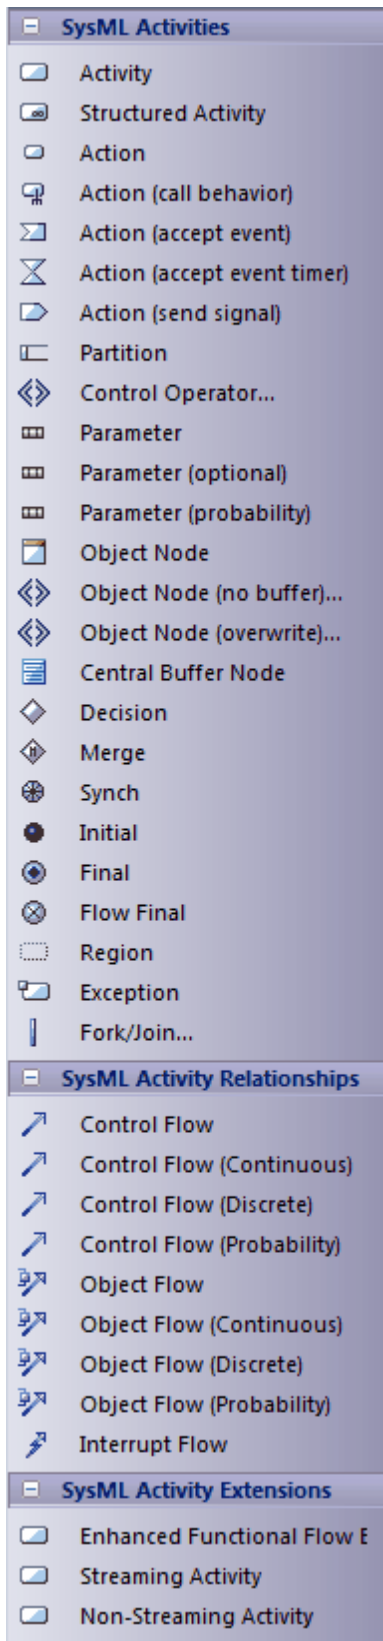

**Notes:**

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

**12.1.1 SysML Activity**

These pages provide the SysML elements to construct SysML Activity models.

**Access:** [View | Diagram Toolbox: More Tools | SysML 1.2 | SysML 1.2 Activity](#)

Page	Item	Action
SysML Activities	Activity	Define a SysML Block of executable behavior as a UML Activity

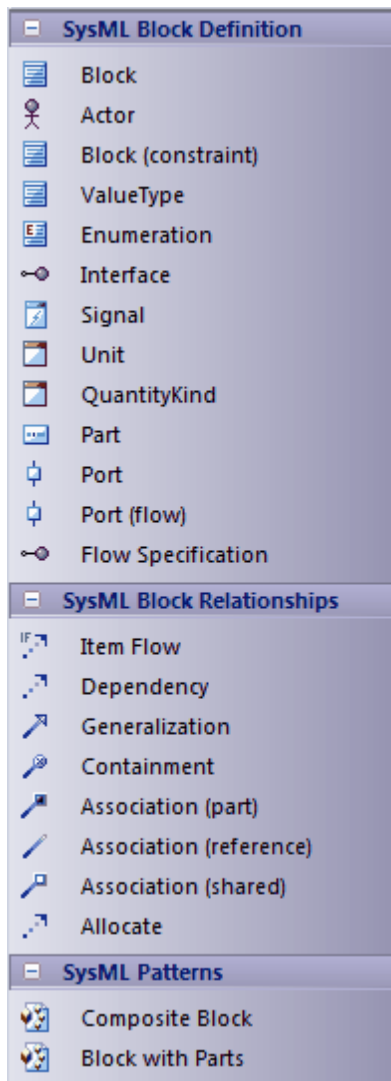

Page	Item	Action
	<b>Structured Activity</b>	Define a SysML Block of executable behavior as a UML Structured Activity
	<b>Action</b>	Declare a unit of execution in an Activity as a UML Action.
	<b>Action (call behavior)</b>	Declare a unit of execution that calls another behavior
	<b>Action (accept event)</b>	Declare a unit of execution that accepts an event raised by the system
	<b>Action (accept event timer)</b>	Declare a unit of execution that accepts an event raised by a time epoch
	<b>Action (send signal)</b>	Declare a unit of execution that sends a signal as an event
	<b>Partition</b>	Create an Activity Partition to group execution elements together by the node responsible for their execution
	<b>Control Operator</b>	Control the execution of an Activity
	<b>Parameter</b>	Provide access to input and output objects within the Activity
	<b>Parameter (optional)</b>	Define a parameter whose contents are optional in the Activity's execution
	<b>Parameter (probability)</b>	Tag a parameter with probability of the likelihood of the parameter's use in the Activity
	<b>Object Node</b>	Declare a variable in the Activity, typed by a ValueType, DataType or Block
	<b>Object Node (no buffer)</b>	Declare an ObjectNode in an Activity which discards unconsumed tokens
	<b>Object Node (overwrite)</b>	Declare an ObjectNode in an Activity which overwrites tokens
	<b>Central Buffer Node</b>	Declare an ObjectNode that stores tokens for consumption throughout the Activity
	<b>Decision</b>	Create a branch of control in an Activity based on a decision
	<b>Merge</b>	Merge two or more Activity control branches together
	<b>Synch</b>	Establish a rendezvous point for two or more Activity flows, in order to synchronize their execution in the Activity
	<b>Initial</b>	Declare the start of Activity's execution
	<b>Final</b>	Declare the end of an Activity's execution, and the termination of the Activity
	<b>Flow Final</b>	Declare the end of an Activity's execution path without terminating the Activity
	<b>Region</b>	Group a subset of an Activity into a common execution context
	<b>Exception</b>	Declare a node of execution that happens outside the normal flow of execution of an Activity
	<b>Fork/Join</b>	Simultaneously branch / join a set of Control or Object Flows

Page	Item	Action
SysML Activity Relationships	<b>Control Flow</b>	Establish a flow of logic between two Activity nodes
	<b>Control Flow (Continuous)</b>	Declare a continuous control flow
	<b>Control Flow (Discrete)</b>	Declare a discrete control flow
	<b>Control Flow (Probability)</b>	Tag a control flow with a probability of the likelihood of the flow's traversal
	<b>Object Flow</b>	Establish a flow of objects (data) between two Activity nodes
	<b>Object Flow (Continuous)</b>	Declare a continuous object flow
	<b>Object Flow (Discrete)</b>	Declare a discrete object flow
	<b>Object Flow (Probability)</b>	Tag an object flow with a probability of the likelihood of the flow's traversal
	<b>Interrupt Flow</b>	Declare a control flow that interrupts flow within a Region
SysML Activity Extensions	<b>Enhanced Functional Flow Block Diagrams</b>	Declare an Activity used to contain an Enhanced Functional Flow Block Diagram (EFFBD)
	<b>Streaming Activity</b>	Declare an Activity where the flow of tokens passes through its parameters continuously throughout the Activity's execution
	<b>Non-Streaming Activity</b>	Declare an Activity where the flow of tokens passes through its parameters at the start of the Activity's execution

### 12.1.2 SysML Block Definition

These pages provide the SysML elements to design SysML blocks, constraint blocks, data and value types.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Block Definition](#)

Page	Item	Action
SysML Block Definition	<b>Block</b>	Define a composite system entity in SysML
	<b>Actor</b>	Represent a user that interacts with one or more SysML systems
	<b>Block (constraint)</b>	Define a composite constraint as a system of parametric equations
	<b>ValueType</b>	Define a SysML quantity, expressed as a measurable dimension with specific units
	<b>Enumeration</b>	Define a data type as a set of symbols or values
	<b>Interface</b>	Define an element that describes a specification of an interaction point with properties and methods
	<b>Signal</b>	Define a SysML message, containing attributes, exchanged between system blocks in an interaction
	<b>Unit</b>	Represent a standard unit of measure in SysML

Page	Item	Action
	<b>QuantityKind</b>	Identify a measurable quantity in SysML
	<b>Part</b>	Describe the decomposition of a SysML Block subsystem in the context of its whole using instances of reusable SysML Blocks
	<b>Port</b>	Describe a structural interaction point of a SysML Block which, in turn, connects between interacting parts of a block
	<b>Port (flow)</b>	Describe what flows in and out of interacting SysML Blocks
	<b>Flow Specification</b>	Define a set of flow properties that correspond to individual pieces of a common interaction point
<b>SysML Block Relationships</b>	<b>Item Flow</b>	Specify the items that flow across a connector in an interaction point
	<b>Dependency</b>	Establish a traceable relationship describing how one element is dependant upon another
	<b>Generalization</b>	Describe an element as a specialized descendant of another element, containing additional properties and behavior
	<b>Containment</b>	Graphically display ownership of one element within a parent element
	<b>Association (part)</b>	Describe the characteristics of a connection between a SysML Block and its internal parts, such as the multiplicity and type
	<b>Association (reference)</b>	Describe the characteristics of a connection between separate SysML Blocks, such as the multiplicity and type
	<b>Association (shared)</b>	Describe the characteristics of a common connection between SysML Blocks, such as the multiplicity and type
	<b>Allocate</b>	Relate model elements together to formalize a refinement of behavior, structure, constraints or design expectations
<b>SysML Patterns</b>	<b>Composite Block</b>	A pattern that creates a Composite Block made up of Blocks related by Aggregation relationships
	<b>Block with Parts</b>	A pattern that creates a Composite Block made up of nested parts

### 12.1.3 SysML Interaction

These pages provide the SysML elements to construct SysML interactions and Sequence diagrams.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML1.2 Interaction](#)

Page	Item	Action
SysML Interactions	<b>Interaction</b>	Define a SysML Block of executable behavior as a UML Interaction
	<b>Sequence</b>	Reference an instance of a SysML Block as a Lifeline in the Interaction
	<b>Fragment</b>	Declare a portion of an interaction as a group with specific behavior semantics
	<b>Endpoint</b>	Create an exit point for the Interaction
	<b>Diagram Gate</b>	Create an endpoint for the interaction, which bridges between nested interactions
	<b>State/Continuation</b>	Constrain the Interaction with assertions of the state that the lifeline is expected to be in
SysML Interactions Relationships	<b>Message</b>	Describe a message exchange between two lifelines in an Interaction
	<b>Self-Message</b>	Describe a message exchange between a lifeline and itself in an Interaction
	<b>Recursion</b>	Describe a recursive message exchange between a lifeline and itself in an Interaction
	<b>Call from Recursion</b>	Describe a message exchange between two lifelines within a recursive exchange

### 12.1.4 SysML Internal Block

These pages provide the SysML elements to design SysML block compositions within Internal Block Diagrams.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Internal Block](#)

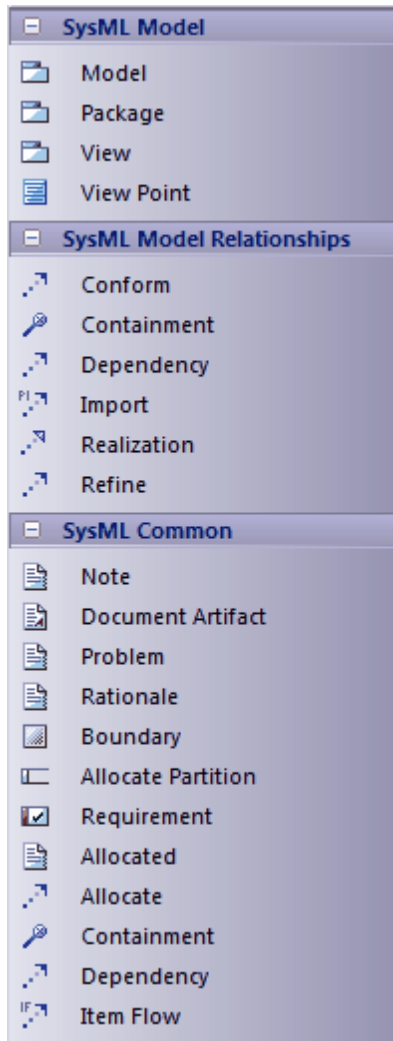

Page	Item	Action
<b>SysML Block Internal</b>	<b>Part</b>	Describe the decomposition of a SysML Block subsystem in the context of its whole, using instances of reusable SysML Blocks
	<b>Connector Part</b>	Create a SysML connector part
	<b>Distributed Part</b>	Create a SysML distributed part
	<b>Flow Part</b>	Create a SysML flow part
	<b>Participant Part</b>	Create a SysML participant part
	<b>Signal</b>	Define a SysML message, containing attributes, exchanged between system blocks in an interaction
	<b>Port</b>	Describe a structural interaction point of a SysML Block which, in turn, connects between interacting parts of a block
	<b>Port (flow)</b>	Describe what flows in and out of interacting SysML Blocks
	<b>Flow Specification</b>	Define a set of flow properties that correspond to individual pieces of a common interaction point
<b>SysML Block Internal Relationships</b>	<b>Dependency</b>	Establish a traceable relationship describing how one element is dependant upon another
	<b>Item Flow</b>	Specify the items that flow across a connector in an interaction point
	<b>Binding Connector</b>	Establish a connection between two parts in a system decomposition

### 12.1.5 SysML Model Elements

These pages provide the SysML elements to build SysML models, package structures and views.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Model Elements](#)

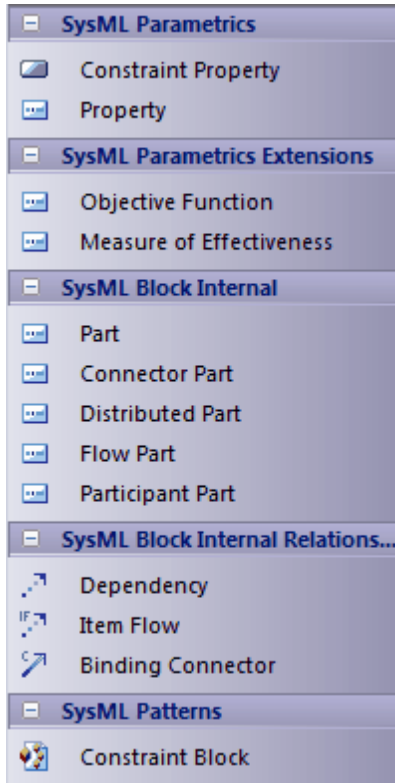

Page	Item	Action
SysML Model	Model	Create a Package containing a SysML Model
	Package	Group model constructs together in a single unit of containment
	View	Create a stereotyped Package that defines a SysML View of a system, from the perspective of a SysML View Point
	View Point	Create a stereotyped Class that defines a SysML View Point, which specifies the rules and conventions for the construction and use of Views
SysML Model Relationships	Conform	Establish a conformance dependency of a View to the defining View Point

Page	Item	Action
	<b>Containment</b>	Graphically display ownership of one element within a parent one
	<b>Dependency</b>	Establish a traceable relationship describing how one element is dependant upon another
	<b>Import</b>	Represent a reuse of elements from one model package in another
	<b>Realization</b>	Identify a design fulfillment of a specification between elements
	<b>Refine</b>	Represent a refinement of one element by another
<b>SysML Common</b>	<b>Note</b>	Create a textual annotation that can be attached to a set of elements of any other type  The attachment is created separately, using a Notelink connector
	<b>Document Artifact</b>	Attach a linked document to the diagram by associating this element with an RTF document
	<b>Problem</b>	Document the failure of model elements to satisfy a requirement
	<b>Rationale</b>	Document the justification for decisions
	<b>Boundary</b>	Define a conceptual boundary, to visually group logically related elements
	<b>Allocate Partition</b>	Contains elements deemed to be allocated to the classifier of the partition
	<b>Requirement</b>	Specify the capabilities of the system, or the conditions that it should satisfy
	<b>Allocated</b>	The source element being allocated to the target element in an Allocate relationship
	<b>Allocate</b>	Relate model elements to formalize a refinement of behavior, structure, constraints or design expectations  The Allocate relationship points from the element being allocated to the element that is the target of the allocation
	<b>Containment</b>	Graphically display ownership of one element within a parent one
	<b>Dependency</b>	Establish a traceable relationship describing how one element is dependant upon another
	<b>Item Flow</b>	Specify the items that flow across a connector in an interaction point.

### 12.1.6 SysML Parametrics

These pages provide the SysML elements to construct SysML Parametric Diagrams using constraint blocks.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Parametrics](#)

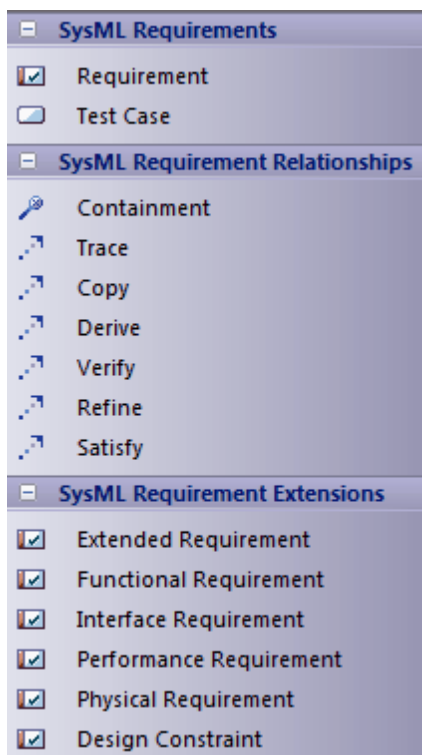

Page	Item	Action
SysML Parametrics	Constraint Property	Instantiate a Constraint Block for use in a Parametric diagram
	Property	Define a SysML property typed by a DataType, ValueType or Block
SysML Parametrics Extensions	Objective Function	Define a SysML Constraint Block for use as an objective function to evaluate Measures of Effectiveness (MOEs)
	Measure of Effectiveness	Define a SysML property for use as a Measure of Effectiveness (MOE)
SysML Block Internal	Part	Describe the decomposition of a SysML Block subsystem in the context of its whole, using instances of reusable SysML Blocks
	Connector Part	Create a SysML connector Part
	Distributed Part	Create a SysML distributed Part
	Flow Part	Create a SysML flow Part
	Participant Part	Create a SysML participant Part

Page	Item	Action
SysML Block Internal Relationships	Dependency	Establish a traceable relationship describing how one element is dependant upon another
	Item Flow	Specify the items that flow across a connector in an interaction point
	Binding Connector	Establish a connection between two Parts in a system decomposition
SysML Patterns	Constraint Block	A pattern that creates a typical Constraint property that owns two Parts

### 12.1.7 SysML Requirements

These pages provide the SysML elements to build SysML Requirements models.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.1 Requirements](#)

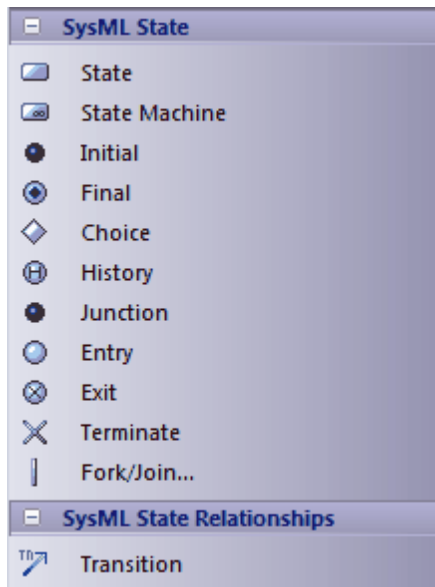

Page	Item	Action
SysML Requirements	Requirement	Specify the capabilities of the system, or the conditions that it should satisfy
	Test Case	Describe the verification of a Requirement through methods of inspection, analysis, demonstration or testing
SysML Requirement	Containment	Graphically display ownership of one element within a parent element

Page	Item	Action
	<b>Trace</b>	Declare a trace relationship between a SysML Requirement and another SysML element
	<b>Copy</b>	Declare a copy of one SysML Requirement by another
	<b>Derive</b>	Derive a SysML Requirement from another
	<b>Verify</b>	Declare a verification of a SysML Requirement by another SysML element
	<b>Refine</b>	Declare a refinement of a SysML Requirement by another SysML element
	<b>Satisfy</b>	Declare that the SysML Requirement is satisfied by another SysML element
<b>SysML Requirement Extensions</b>	<b>Extended Requirement</b>	Extend a SysML Requirement with additional Tag properties
	<b>Functional Requirement</b>	Declare a SysML Requirement that describes the operation, or behavior, that the system must perform
	<b>Interface Requirement</b>	Declare a SysML Requirement that describes how the system connects, or interfaces with, other systems
	<b>Performance Requirement</b>	Declare a SysML Requirement that describes how the system performs against defined capabilities or conditions
	<b>Physical Requirement</b>	Declare a SysML Requirement that describes the physical characteristics, or physical constraints, of the system
	<b>Design Requirement</b>	Declare a SysML Requirement that specifies a constraint on the implementation of the system

### 12.1.8 SysML State Machine

These pages provide the SysML elements to build SysML State Machines.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 State Machine](#)

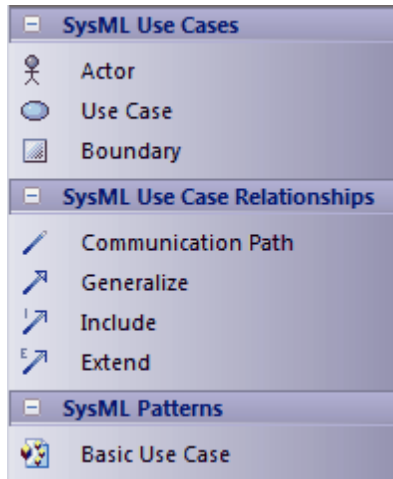

Page	Item	Action
SysML State	<b>State</b>	Declare a significant condition in the life of a SysML Block within its State Machine
	<b>State Machine</b>	Describe the life-cycle behavior of a SysML Block in terms of its states and transitions
	<b>Initial</b>	Declare the starting state of the State Machine
	<b>Final</b>	Declare the ending state of the State Machine, and its completion
	<b>Choice</b>	Declare a Junction with a mandatory 'else' transition
	<b>History</b>	Represent the last active State of the State Machine prior to its interruption
	<b>Junction</b>	Declare a decision point at which a Transition branches out into multiple guarded, alternative paths
	<b>Entry</b>	Declare an Entry point between State Machines, Substate Machines and Regions
	<b>Exit</b>	Declare an Exit point between State Machines, Substate Machines and Regions
	<b>Terminate</b>	Declare a termination State in which the State Machine no longer operates
	<b>Fork/Join</b>	Simultaneously branch / join a set of Transitions
SysML State Relationships	<b>Transition</b>	Establish a life-cycle path between one State and another, based on its operational conditions

### 12.1.9 SysML Use Case

These pages provide the SysML elements to build SysML Use Case models.

**Access:** [View](#) | [Diagram Toolbox: More Tools](#) | [SysML 1.2](#) | [SysML 1.2 Use Cases](#)

Page	Item	Action
SysML Use Cases	Actor	Represent a user that interacts with one or more SysML systems
	Use Case	Describe the expected functionality of a system as a UML Use Case
	Boundary	Graphically bound elements in a diagram with a border
SysML Use Case Relationships	Communication Path	Declare which Actors perform in the Use Case
	Generalize	Describe an element as a specialized descendant of another element, containing additional properties and behavior
	Include	Describe one Use Case as a subset of another
	Extend	Describe one Use Case as an extension of another
SysML Patterns	Basic Use Case	A pattern that creates a typical simple Use Case diagram of Actor, Use Case and System Boundary

## 12.2 SysML Parametric Models

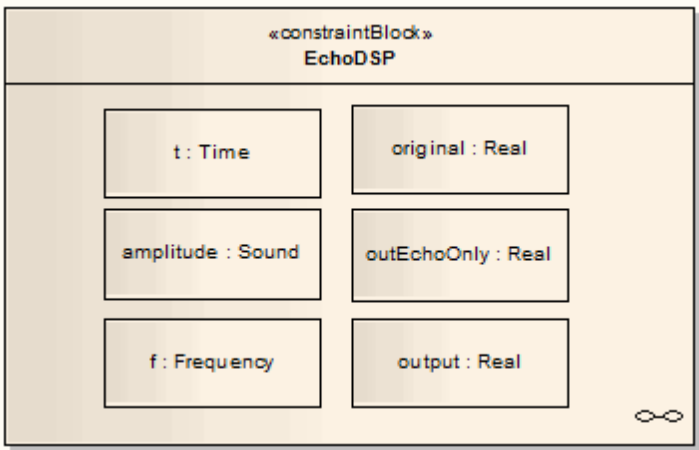

SysML Parametric models support the engineering analysis of critical system parameters, including the evaluation of key metrics such as performance, reliability and other physical characteristics.

**Topics:**

Topic	Detail	See also
<b>SysML Parametric Models - Concept</b>	<p>SysML Parametric Models unite requirements models with system design models by capturing executable constraints based on complex mathematical relationships</p> <p>The following text is derived from the SysML entry in the online Wikipedia</p> <p><i>The advantages of SysML over UML for systems engineering become obvious if you consider a concrete example, such as modeling an automotive system. With SysML you can use Parametric diagrams to precisely define performance and mechanical constraints such as maximum acceleration, curb weight, air conditioning capacity, and interior cabin noise management.</i></p> <p>For further information on the concepts of SysML Parametric models, refer to the official OMG SysML website and its linked sources</p> <p>Enterprise Architect enables you to develop SysML Parametric models quickly and simply; these models can also be simulated</p>	<p><a href="#">SysML</a> (Online Resource)</p> <p><a href="#">OMG SysML</a> (Online Resource)</p>

**How To:**

To create a Parametric model, follow the steps below:

Step	Action	See Also
1	<p>Create a collection of <i>SysML Constraint Blocks</i> that formally describe the function of a constraint in a simulation model</p> <p>Each Constraint Block contains properties that describe its input and output parameters, as well as <i>Element Script</i> that describes the constraint's executable component</p>  <p>The diagram shows a SysML Constraint Block named «constraintBlock» EchoDSP. It contains six properties arranged in two columns: t: Time, original: Real, amplitude: Sound, outEchoOnly: Real, f: Frequency, and output: Real. An infinity symbol is located in the bottom right corner of the block.</p>	
2	<p>Right-click on each of the <i>constraintBlocks</i> and select the <b>SysML   Add Element Script</b></p>	

Step	Action	See Also
	<p>context menu option to add script to the constraint block</p> <p>This is where you express the relationship / behavior of the constraint block as an executable script</p>	
<p>3</p>	<p>Create a SysML Constraint Block to contain the Parametric model to simulate; the Parametric model contains properties and occurrences of constraint blocks as Constraint Property elements, connected in a Parametric Diagram</p>	
<p>4</p>	<p>Right-click within a Parametric Diagram and select the <b>SysML   Simulate Diagram...</b> context menu option</p>	
<p>5</p>	<p>Depending on your <b>configuration selections</b>, the simulation's results are either written to a comma-separated CSV file or graphed in a 2-dimensional plot</p>	

**Notes:**

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

**Learn More:**

- [SysML](#)<sup>[1561]</sup>
- [Simulating a SysML Model](#)<sup>[1579]</sup>

**12.2.1 Simulate a SysML Model**

You simulate a SysML model from a Parametric diagram, using the Simulation Configuration dialog.

**Access:** Parametric Diagram Context Menu | SysML | Simulate Diagram..

**How To:**

To simulate a SysML model, follow the steps below:

Step	Action	See Also
1	<p>The Parameters panel lists all of the parameters that can be assigned input</p> <p>Select each of the required parameters and click on the right <b>Arrow</b> button to assign them as input</p> <p>Parameters designated as input parameters are listed in the Inputs panel on the right.</p>	

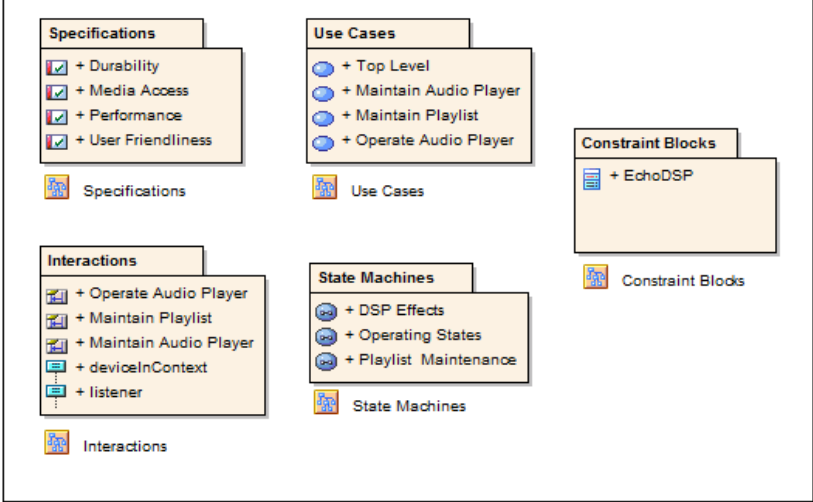

Step	Action	See Also
	There must be at least one input parameter assigned for the simulation to execute	
2	Assign a set of values for each of the designated input parameters For each input parameter, in the Input Values panel select one of the two possible value kinds: <ul style="list-style-type: none"> <li>• <b>Discrete</b> - To enter a constant or a comma-separated range of discrete values</li> <li>• <b>Range</b> - To enter a range of values beginning at the From value and ending at the To value; the input values are incremented by the <b>Step</b> value</li> </ul>	
3	Specify the classes of output value: <ul style="list-style-type: none"> <li>• <b>Parameters</b> - To output the parameters' data, select the checkbox</li> <li>• <b>Variables</b> - To output the data generated within each internal variable, select the checkbox; internal variables are automatically generated by the simulator</li> </ul>	
4	Specify how the simulation results are to be reported The <b>Output Format</b> panel enables you to choose how the simulation outputs the simulation data: <ul style="list-style-type: none"> <li>• <b>Plot To Graph</b>: To plot the results on a 2-dimensional graph, select the checkbox; if you select this option, you must specify an input parameter for the plot's <b>X Axis</b></li> <li>• <b>Title</b> - To enter a title for the graph, type in the title text</li> <li>• <b>Output to File</b> - To output the results to a CSV text file, select the checkbox and type or browse ( ... ) for the file name</li> </ul>	
5	Click on the <b>OK</b> button to execute the simulation	

**Notes:**

- Systems Modeling Language (SysML) is supported in the Systems Engineering and Ultimate editions of Enterprise Architect

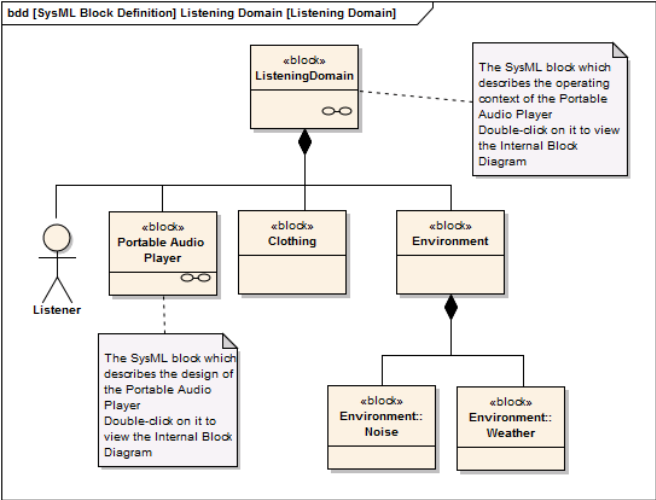

## 12.3 Create a Requirements Model

### Topics:

Topic	Detail	See also
<p><b>Example</b></p>	<p>The SysML <i>Requirements Model</i> provides the system requirements, the expected abstract behavior and the operating constraints that the designed system must conform to</p> <p>The following diagram shows an example requirements model for a <i>Portable Audio Player</i></p>  <p>In the example Requirements Model, each of the child packages contains child models that capture the following aspects of the system's requirements:</p> <ul style="list-style-type: none"> <li>• The <i>Specifications</i> package contains SysML Requirements describing the overall expectations of the designed system</li> <li>• The <i>Use Cases</i> package contains SysML Use Cases that describe the general interaction between the system and its users</li> <li>• The <i>Interactions</i> package contains SysML Interactions that describe a detailed sequence of interactions between the system and its users</li> <li>• The <i>State Machines</i> package contains SysML State Machines that describe each of the operational states the designed system has</li> <li>• The <i>Constraint Blocks</i> package contains SysML ConstraintBlocks that describe the expected performance and operating boundaries of the system</li> </ul>	

## 12.4 Create an Operational Domain Model

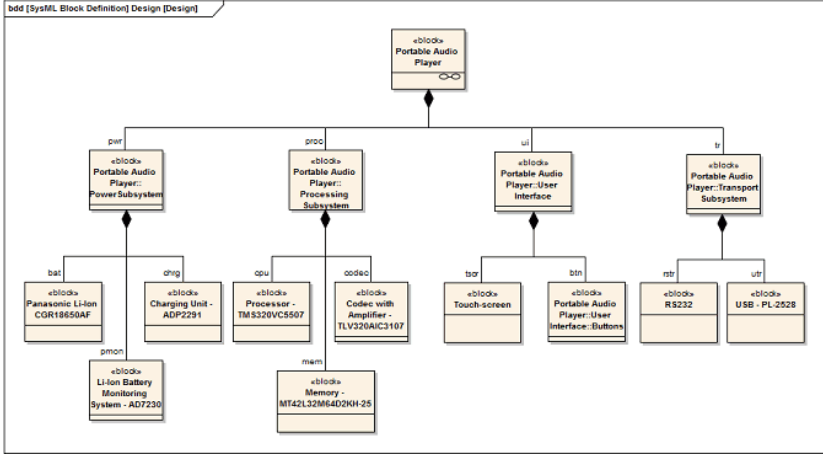

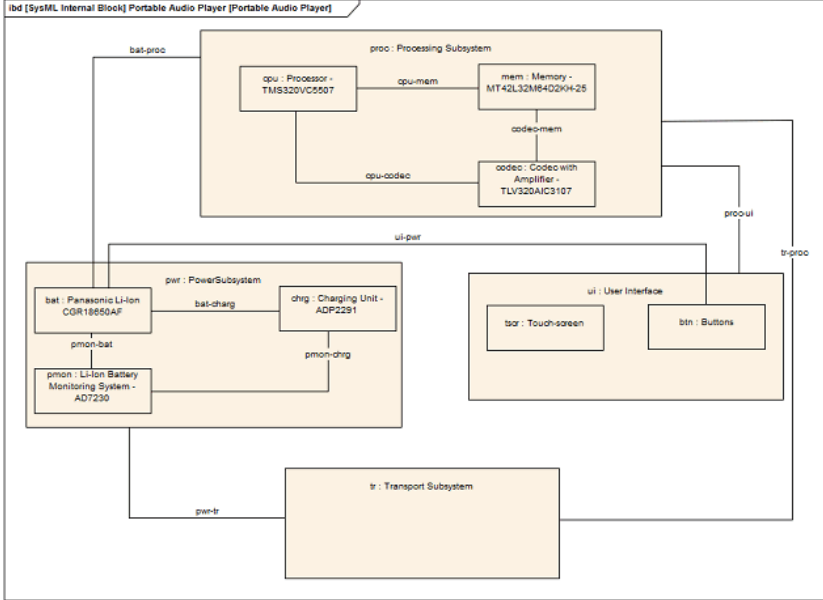

### Topics:

Topic	Detail	See also
<p><b>Abstract</b></p>	<p>The SysML <i>Operational Domain Model</i> defines the system's operating environment, which describes the operating conditions that the system is intended to operate within</p> <p>The following diagram shows an example Operational Domain model for a <i>Portable Audio Player</i>; the SysML Block Definition Diagram describes the Operational Domain (in this example - the <i>ListeningDomain</i>) as a system composition</p>  <p>The diagram is a SysML Block Definition Diagram (bdd) titled "Listening Domain [Listening Domain]". It shows a composition of blocks. At the top is the «block» ListeningDomain, which contains three sub-blocks: «block» Portable Audio Player, «block» Clothing, and «block» Environment. The «block» Environment is further composed of two sub-blocks: «block» Environment: Noise and «block» Environment: Weather. A stick figure labeled "Listener" is connected to the «block» Portable Audio Player. Two callout boxes provide additional information: one points to the «block» ListeningDomain and the other points to the «block» Portable Audio Player. Both callouts state: "The SysML block which describes the operating context of the Portable Audio Player. Double-click on it to view the Internal Block Diagram".</p> <p>In this example, the <i>ListeningDomain</i> is defined as a system containing other subsystems within it; the domain contains subsystems that define the Listener (i.e. User), the Portable Audio Player, Clothing (which the user wears), and the External Environment</p> <p>Details of the <i>ListeningDomain</i> system are further detailed in the <i>ListeningDomain</i>'s Internal Block Diagram:</p>	

Topic	Detail	See also
	<div data-bbox="507 315 1161 976" data-label="Diagram"> <p>ibd [SysML Internal Block] ListeningDomain [ListeningDomain]</p> <p>:Listener</p> <p>portableAudioPlayer</p> <p>listenerClothing</p> <p>externalNoise</p> <p>weather</p> <p>listeningConditions</p> </div> <p data-bbox="497 994 1168 1171">In this example, the <i>ListeningDomain's</i> system's detailed composition shows how the Portable Audio Player and other sub-systems fit together to form the Listening Domain; it also describes the binding relationships between the parts, which describe how the parts are functionally bound to one another</p>	

## 12.5 Compose System Design

### Topics:

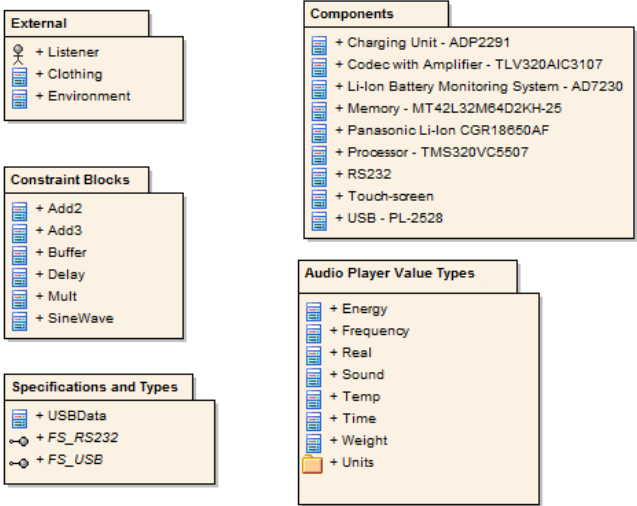

Topic	Detail	See also
<p><b>SysML Design Model</b></p>	<p>The <i>SysML Design Model</i> contains the blocks that define the system's composition; it describes the manner in which reusable subsystems fit together to fulfill the design requirements</p> <p>The following diagram shows an example Design Model for a <i>Portable Audio Player</i>; the <i>SysML Block Definition Diagram</i> describes the <i>Portable Audio Player</i> as a composition of various reusable off-the-shelf subsystems and in-house designed ones</p>  <p>The diagram is a SysML Block Definition Diagram (bdd) titled "[SysML Block Definition] Design [Design]". It shows a hierarchical composition of blocks. At the top is the "Portable Audio Player" block. Below it are four main subsystems: "Power Subsystem", "Processing Subsystem", "User Interface", and "Transport Subsystem". Each subsystem is further decomposed into specific components like "Processor", "Memory", "Codec", "Battery", "Charging Unit", "Touch-screen", and "Buttons".</p> <p>In the example above, the <i>Portable Audio Player</i> is defined as a SysML system containing subsystems that perform specific tasks; the design contains subsystems for supplying power, performing playback and audio processing, interfacing with other devices and the user interface</p> <p>Details of the <i>Portable Audio Player's</i> composition are further described in detail within the <i>Portable Audio Player's Internal Block Diagram</i>:</p>  <p>The diagram is a SysML Internal Block Diagram (ibd) titled "[SysML Internal Block] Portable Audio Player [Portable Audio Player]". It shows the internal composition of the Portable Audio Player. The main block is "Processing Subsystem", which contains "Processor", "Memory", "Codec", and "Codec with Amplifier". It is connected to "Power Subsystem" (containing "Battery", "Charging Unit", and "Battery Monitoring System") and "User Interface" (containing "Touch-screen" and "Buttons"). The "Transport Subsystem" is also shown at the bottom.</p>	

Topic	Detail	See also
	<p>In this example, the <i>Portable Audio Player's</i> composition is described, detailing how each of the sub-systems is structured</p> <p>It also describes the binding relationships between the parts, which describe how they are functionally bound to one another; for example, the CPU, Memory and Codec are interfaced together in the Processing Subsystem</p>	

## 12.6 Create Reusable Subsystems

### Topics:

Topic	Detail	See also
<b>SysML Design Model</b>	<p>Model Based Systems Engineering provides the flexibility and expressiveness to define complex systems quickly and effectively, by reusing common entities across design projects</p> <p>A <i>Library</i> is a package containing many reusable subsystems, parametric constraints, common data types and common value types, dimensions and units</p> <p>The following diagram shows an example library model:</p>  <p>In the example Library, each of the child packages contains child models that capture the following reusable entities:</p> <ul style="list-style-type: none"> <li>• <i>Blocks</i> defining systems such as those listed in the <i>Components</i> package, or those defined in the <i>External</i> package</li> <li>• <i>ConstraintBlocks</i> defining parametric constraints for use in parametric models.</li> <li>• <i>Value Types</i> describing quantities, expressed as measurable dimensions in specific units</li> <li>• <i>Data Types</i> and <i>Flow Specifications</i> describing data structures and <i>Flows</i></li> </ul>	

## 12.7 Migrate SysML 1.1 Model to SysML 1.2

Enterprise Architect enables you to migrate a SysML 1.1 model (or part of a model) to SysML 1.2, using the Automation Interface function *Migrate()*. This function updates the Tagged Values and, if required, stereotypes to SysML1.2 for all elements, attributes, connectors and diagrams under the selected package or element.

### Example:

The following VB script calls the *Migrate()* function to migrate the package or element to SysML 1.2:

```
Sub MigrateElement (sGUID, lngPackageID)
    Dim proj as EA.Project
    set proj = Repository.GetProjectInterface
    proj.Migrate sGUID, "SysML1.1", "SysML1.2"

    'refresh the model
    If lngPackageID <> 0 Then
        Repository.RefreshModelView (lngPackageID)
    End If
End Sub

Sub MigrateSelectedItem
    Dim selType
    Dim selElement as EA.Element
    Dim selPackage as EA.Package
    selType = GetTreeSelectedItemType
    If selType = 4 Then 'means Element
        set selElement = GetTreeSelectedObject
        MigrateElement selElement.ElementGUID, selElement.PackageID
        MsgBox "Element Migration Completed", 0, "SysML Migration"
    ElseIf selType = 5 Then 'means Package
        set selPackage = GetTreeSelectedObject
        MigrateElement selPackage.PackageGUID, selPackage.PackageID
        MsgBox "Package Migration Completed", 0, "SysML Migration"
    Else
        MsgBox "Select a Package or Element in the Project Browser to
        initiate migration", 0, "SysML Migration"
    End If
End Sub

Sub Main
    MigrateSelectedItem
End Sub

Main
```

### Notes:

- The stereotype *dimension* is changed to *quantitykind* when migrating from SysML1.1 to SysML1.2
- The stereotype *dataType* is removed from SysML1.2
- The Tagged Value *dimension* is migrated to *quantitykind*; this applies to stereotypes *unit* and *valueType*
- The Tagged Value *isConjugated* of stereotype *flowport* is migrated to custom properties

### Learn More:

- [Migrate\(\)](#)<sup>[1957]</sup>

**Part**

## 13 SOA and XML

This section explains how to import and generate:

- XSD
- WSDL

It also describes how to generate and export *Meta-Object* Facility (**MOF**) models, along with describing **SoaML** and **SOME**.

### Learn More:

- [XML Schema](#)<sup>[1590]</sup>
- [Web Services - WSDL](#)<sup>[1620]</sup>
- [SoaML](#)<sup>[1633]</sup>
- [SOME](#)<sup>[1637]</sup>
- [Generating MOF](#)<sup>[1639]</sup>

## 13.1 XML Schema - XSD

**XML Schema Definition** ( XSD ), also known as **XML Schema**, is a **W3C** XML technology that is used to specify the rules to which an XML document must adhere.

Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of XML Schema. XSD support is critical for the development of a complete *Service Oriented Architecture* (SOA), and the coupling of UML 2.3 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization.

### Learn More:

- [W3C XML Schema](#) (Online Resource)
- [Model XSD using Toolbox](#)<sup>[1590]</sup>
- [Abstract XSD Models](#)<sup>[1604]</sup>
- [Generate XSD](#)<sup>[1607]</sup>
- [Import XSD](#)<sup>[1609]</sup>
- [UML Profile for XSD](#)<sup>[1611]</sup>

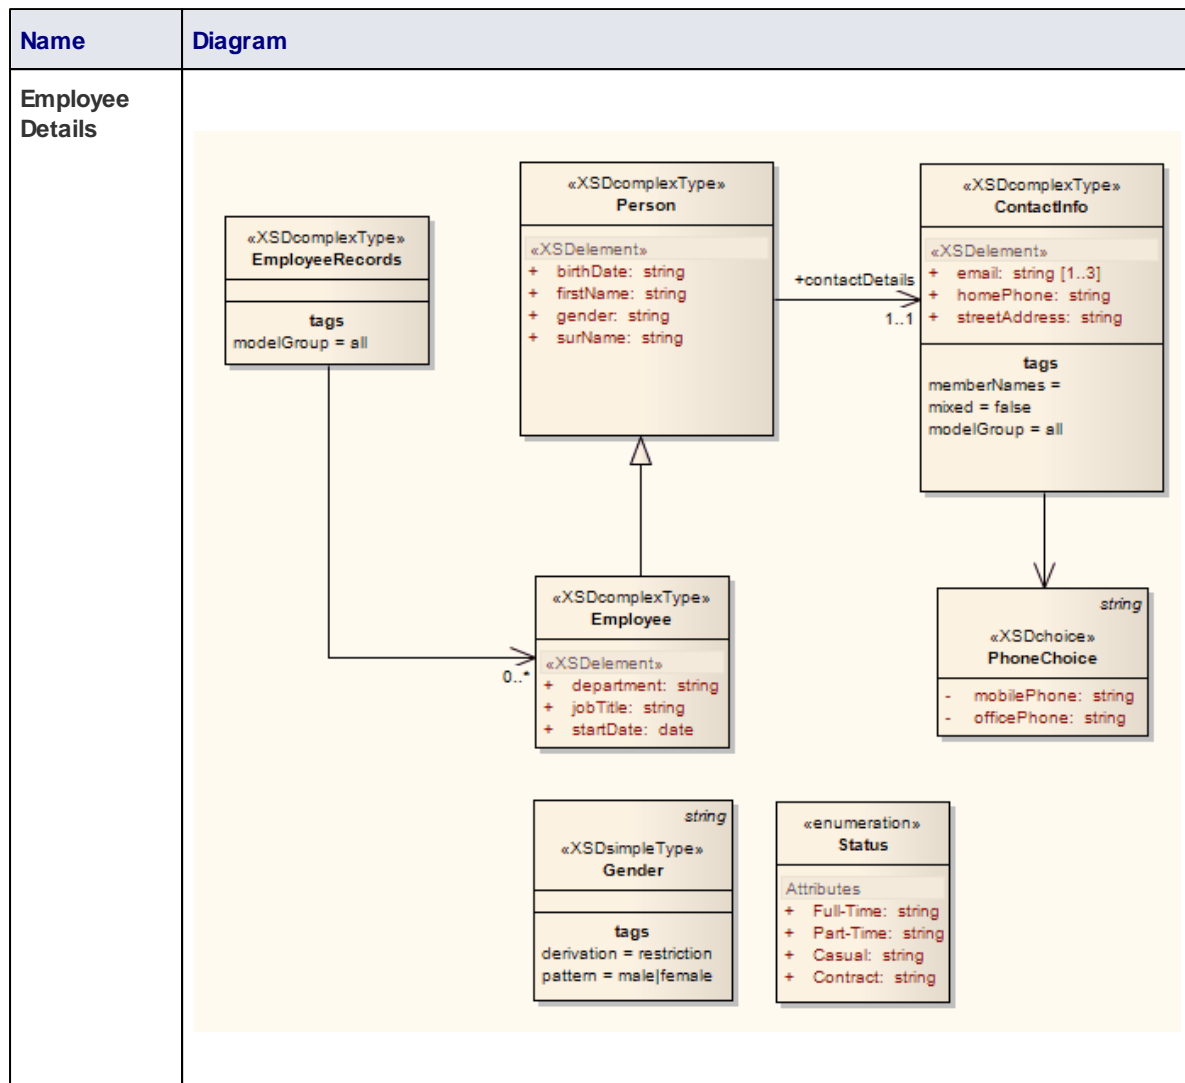

### 13.1.1 Model XSD

XML schemas are modeled using UML **Class** diagrams. The **XML Schema** page of the **Toolbox** provides built-in support for the **UML profile for XSD**. This enables an abstract UML Class model to be automatically generated as a **W3C XML Schema** (XSD) file.

**Access:** [View | Toolbox > More tools | XML Schema](#)

### How To:

Step	Action	See Also
1	Create a package in the <b>Project Browser</b>	
2	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>	<a href="#">Project Browser Toolbar</a> <sup>[454]</sup>
3	Select <b>UML Structural</b> in the <b>Select From</b> field and <b>Class</b> in the <b>Diagram Types</b> field	
4	Click on the <b>More tools</b> option in the Toolbox and select <b>XML Schema</b> from the list of Toolboxes	<a href="#">Diagram Toolbox</a> <sup>[548]</sup>
5	Click on the <b>Schema</b> icon from the Toolbox and drag it into the created <b>Class</b> diagram  When the <b>New Diagram</b> dialog is displayed, Select <b>UML Structural</b> in the <b>Select From</b> field and <b>Class</b> in the <b>Diagram Types</b> field to create a Class diagram.	<a href="#">Schema Icon</a> <sup>[1592]</sup>
6	Enterprise Architect creates a new <i>XSDschema</i> stereotyped package with a Class diagram under it.  Open this Class diagram and use the constructs from the <b>XML Schema</b> Toolbox to model the XML Schema  <b>Alternative:</b>  XML Schemas can also be modeled using the <b>UML Profile for XSD</b> .	<a href="#">XML Schema Group</a> <sup>[568]</sup> <a href="#">UML profile for XSD</a> <sup>[1611]</sup>

**Example:****Notes:**

- The UML attributes of the Classes map directly to XML elements or attributes
- Classes have no methods since there is no meaningful correspondence between Class methods and XSD constructs

**Modeling Restrictions:**

The following XML Schema constructs cannot be modeled in Enterprise Architect:

- *appinfo*
- *field*
- *key*
- *keyref*
- *notation*
- *redefine*
- *selector*
- *substitutionGroup*

- *unique*

### 13.1.1.1 Schema Package

The **Schema** icon in the **XML Schema** Toolbox creates an *XSDschema* stereotyped package that acts as a container for the XSD constructs, from which XML Schema can be generated.

#### XSD Properties:

Double-click on the *XSDschema* stereotyped package in the diagram or the **Project Browser**

### 13.1.1.2 Global Element

The **Element** icon from the **XML Schema** Toolbox creates an *XSDtopLevelElement* stereotyped Class, which acts as a XSD global element, when dropped directly on a diagram.

#### XSD Properties:

Double-click on the *XSDtopLevelElement* stereotyped Class in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also						
<b>Name</b>	Specify the name for this global element							
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or <i>complexType</i> or <i>simpleType</i>							
<b>Value</b>	If <b>Type</b> is an XSD <i>built-in type</i> then optionally specify its value <table border="1" data-bbox="507 994 1262 1173"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Default</b></td> <td>Specifies <b>Value</b> as default value</td> </tr> <tr> <td><b>Fixed</b></td> <td>Specifies <b>Value</b> as fixed</td> </tr> </tbody> </table>	Option	Usage	<b>Default</b>	Specifies <b>Value</b> as default value	<b>Fixed</b>	Specifies <b>Value</b> as fixed	
Option	Usage							
<b>Default</b>	Specifies <b>Value</b> as default value							
<b>Fixed</b>	Specifies <b>Value</b> as fixed							
<b>Nested complexType</b>	Check this option to create an <i>XSDcomplexType</i> as a child of this global element	<a href="#">Complex Type</a> 						
<b>Nested simpleType</b>	Check this option to create an <i>XSDsimpleType</i> as a child of this global element	<a href="#">Simple Type</a> 						
<b>Annotation</b>	Specify the notes for this element ( <i>Optional</i> )							
<b>OK</b>	Save the values entered and close the dialog							
<b>Cancel</b>	Discard the values entered and close the dialog							
<b>Help</b>	Display this Help topic							
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the global element	<a href="#">Properties</a> 						

#### Notes:

- The fields **Nested complexType** and **Nested simpleType** are available in the dialog only when creating a new global element (and not when editing the global element)
- The fields **Type**, **Nested complexType** and **Nested simpleType** are mutually exclusive - selecting one disables the others
- Global elements cannot contain any UML Attributes
- Global elements cannot be the source of Association connector
- Global elements cannot be the target of a Generalization connector
- Global elements can be the target of Association connector from Complex Type or Group Class

- Global elements can have at most one Generalization connector to a Complex Type or Simple Type Class

### 13.1.1.3 Local Element

The **Element** icon from the **XML Schema** Toolbox creates an *XSDelement* stereotyped UML Attribute, which acts as a local XSD element, when dropped on a *XSDcomplexType* and *XSDgroup* stereotyped classes.

#### XSD Properties:

Double-click on the *XSDelement* stereotyped UML Attribute in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also						
<b>Name</b>	Specify the name for this local element							
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or <i>complexType</i> or <i>simpleType</i>	<a href="#">Complex Type</a> <small>[1597]</small> <a href="#">Simple Type</a> <small>[1600]</small>						
<b>Reference</b>	Specify whether to use <i>ref</i> attribute ( instead of <i>type</i> attribute ) to refer to the <i>complexType</i> or <i>simpleType</i> selected in the <b>Type</b> field in the generated XSD ( <i>Optional</i> )							
<b>Value</b>	If <b>Type</b> is an XSD <i>built-in type</i> then optionally specify its value ( <i>Optional</i> ) <table border="1" data-bbox="501 1144 1235 1323"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Default</b></td> <td>Specifies <b>Value</b> as default value</td> </tr> <tr> <td><b>Fixed</b></td> <td>Specifies <b>Value</b> as fixed</td> </tr> </tbody> </table>	Option	Usage	<b>Default</b>	Specifies <b>Value</b> as default value	<b>Fixed</b>	Specifies <b>Value</b> as fixed	
Option	Usage							
<b>Default</b>	Specifies <b>Value</b> as default value							
<b>Fixed</b>	Specifies <b>Value</b> as fixed							
<b>MinOccurs</b>	Specify the minimum number of times this element occurs in the Class ( <i>Optional</i> )							
<b>MaxOccurs</b>	Specify the maximum number of times this element occurs in the Class ( <i>Optional</i> )							
<b>Form</b>	Specify whether to qualify the element ( <i>Optional</i> ) <table border="1" data-bbox="501 1559 1235 1760"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>qualified</b></td> <td>Use the <b>Prefix</b> supplied on the Schema package to this element</td> </tr> <tr> <td><b>unqualified</b></td> <td>Do not qualify this element</td> </tr> </tbody> </table>	Option	Usage	<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this element	<b>unqualified</b>	Do not qualify this element	<a href="#">Schema Package</a> <small>[1592]</small>
Option	Usage							
<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this element							
<b>unqualified</b>	Do not qualify this element							
<b>Annotation</b>	Specify the notes for this local element ( <i>Optional</i> )							
<b>OK</b>	Save the values entered and close the dialog							
<b>Cancel</b>	Discard the values entered and close the dialog							
<b>Help</b>	Display this Help topic							
<b>UML</b>	Open the UML <b>Properties</b> dialog	<a href="#">Properties</a> <small>[698]</small>						

	This button is available when editing the local element	
--	---	--

**Notes:**

- Only Complex Types, Groups and Model Groups can have this UML Attribute

**13.1.1.4 Global Attribute**

The **Attribute** icon from the **XML Schema** Toolbox creates an *XSDtopLevelAttribute* class, which acts as an XSD global attribute, when dropped directly on a diagram.

**XSD Properties:**

Double-click on the *XSDtopLevelAttribute* stereotyped Class in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also						
<b>Name</b>	Specify the name for this global attribute							
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or <i>simpleType</i>							
<b>Value</b>	If <b>Type</b> is an XSD <i>built-in type</i> then optionally specify its value <table border="1"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Default</b></td> <td>Specifies <b>Value</b> as default value</td> </tr> <tr> <td><b>Fixed</b></td> <td>Specifies <b>Value</b> as fixed</td> </tr> </tbody> </table>	Option	Usage	<b>Default</b>	Specifies <b>Value</b> as default value	<b>Fixed</b>	Specifies <b>Value</b> as fixed	
Option	Usage							
<b>Default</b>	Specifies <b>Value</b> as default value							
<b>Fixed</b>	Specifies <b>Value</b> as fixed							
<b>Nested simpleType</b>	Check this option to create an <i>XSDsimpleType</i> as a child of this global attribute	<a href="#">Simple Type</a> <sup>[1600]</sup>						
<b>Form</b>	Specify whether to qualify the attribute ( <i>Optional</i> ) <table border="1"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>qualified</b></td> <td>Use the <b>Prefix</b> supplied on the Schema package to this attribute</td> </tr> <tr> <td><b>unqualified</b></td> <td>Do not qualify this attribute</td> </tr> </tbody> </table>	Option	Usage	<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this attribute	<b>unqualified</b>	Do not qualify this attribute	<a href="#">Schema Package</a> <sup>[1592]</sup>
Option	Usage							
<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this attribute							
<b>unqualified</b>	Do not qualify this attribute							
<b>Annotation</b>	Specify the notes for this attribute ( <i>Optional</i> )							
<b>OK</b>	Save the values entered and close the dialog							
<b>Cancel</b>	Discard the values entered and close the dialog							
<b>Help</b>	Display this Help topic							
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the global attribute	<a href="#">Properties</a> <sup>[662]</sup>						

**Notes:**

- The field **Nested simpleType** is available in the dialog only when creating a new global attribute (and not when editing the global attribute )
- The fields **Type** and **Nested simpleType** are mutually exclusive - selecting one disables the other
- Global attributes cannot contain any UML Attributes
- Global attributes cannot be the source of Association connector
- Global attributes cannot be the target of a Generalization connector
- Global attributes can be the target of Association connector from Complex Type Classes
- Global attributes can have at most one Generalization connector to a Simple Type Class

**13.1.1.5 Local Attribute**

The **Attribute** icon from the **XML Schema** Toolbox creates an *XSDattribute* stereotyped UML Attribute, which acts as a local XSD attribute, when dropped on a *XSDcomplexType* and *XSDattributeGroup* stereotyped classes.

**XSD Properties:**

Double-click on the *XSDattribute* stereotyped UML Attribute in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also						
<b>Name</b>	Specify the name for this local attribute							
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or <i>simpleType</i>	<a href="#">Simple Type</a> <sup>[1600]</sup>						
<b>Reference</b>	Specify whether to use <i>ref</i> attribute ( instead of <i>type</i> attribute ) to refer to the <i>simpleType</i> selected in the <b>Type</b> field in the generated XSD ( <i>Optional</i> )							
<b>Value</b>	If <b>Type</b> is an XSD <i>built-in type</i> then optionally specify its value ( <i>Optional</i> ) <table border="1" data-bbox="497 1406 1219 1585"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Default</b></td> <td>Specifies <b>Value</b> as default value</td> </tr> <tr> <td><b>Fixed</b></td> <td>Specifies <b>Value</b> as fixed</td> </tr> </tbody> </table>	Option	Usage	<b>Default</b>	Specifies <b>Value</b> as default value	<b>Fixed</b>	Specifies <b>Value</b> as fixed	
Option	Usage							
<b>Default</b>	Specifies <b>Value</b> as default value							
<b>Fixed</b>	Specifies <b>Value</b> as fixed							
<b>Form</b>	Specify whether to qualify the attribute ( <i>Optional</i> ) <table border="1" data-bbox="497 1653 1219 1854"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>qualified</b></td> <td>Use the <b>Prefix</b> supplied on the Schema package to this attribute</td> </tr> <tr> <td><b>unqualified</b></td> <td>Do not qualify this attribute</td> </tr> </tbody> </table>	Option	Usage	<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this attribute	<b>unqualified</b>	Do not qualify this attribute	<a href="#">Schema Package</a> <sup>[1592]</sup>
Option	Usage							
<b>qualified</b>	Use the <b>Prefix</b> supplied on the Schema package to this attribute							
<b>unqualified</b>	Do not qualify this attribute							
<b>Annotation</b>	Specify the notes for this local attribute ( <i>Optional</i> )							
<b>OK</b>	Save the values entered and close the dialog							
<b>Cancel</b>	Discard the values entered and close the dialog							

<b>Help</b>	Display this Help topic	
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the local attribute.	<a href="#">Properties</a> <small>[698]</small>

**Notes:**

- Only Complex Types and Attribute Groups can have this UML Attribute

**13.1.1.6 Attribute Group**

The **Attribute Group** icon from the **XML Schema** Toolbox creates an *XSDattributeGroup* class when dropped on a diagram. This Class is used to group a set of *XSDattribute* stereotyped UML Attributes and **Simple Type** classes that can be referenced from an *XSDcomplexType* Class.

**XSD Properties:**

Double-click on the *XSDattributeGroup* stereotyped Class in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for this attribute group	
<b>Annotation</b>	Specify the notes for this attribute ( Optional )	
<b>OK</b>	Save the values entered and close the dialog	
<b>Cancel</b>	Discard the values entered and close the dialog	
<b>Help</b>	Display this Help topic	
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the attribute group	<a href="#">Properties</a> <small>[662]</small>

**Notes:**

- Attribute Group cannot be the child of any other XSD class
- Attribute Group can contain only *XSDattribute* stereotyped UML Attributes and Simple Type classes
- Attribute Group can be the source of Association connector to another Attribute Group
- Attribute Group can be the target of Association connector from Complex Type classes
- Attribute Group cannot be the source or target of a Generalization connector

**13.1.1.7 Complex Type**

The **Complex Type** icon from the **XML Schema** Toolbox creates an *XSDcomplexType* stereotyped Class when dropped on a diagram.

**XSD Properties:**

Double-click on the *XSDcomplexType* stereotyped Class in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also								
<b>Name</b>	Specify the name for this complexType									
<b>Model Group</b>	Specify how the child elements of this complexType should occur in the Schema <table border="1" data-bbox="507 539 1276 801"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>sequence</b></td> <td>Specifies that the child elements must occur in the specified order</td> </tr> <tr> <td><b>choice</b></td> <td>Specifies that only one of the child elements must occur</td> </tr> <tr> <td><b>all</b></td> <td>Specifies that the child elements can occur in any order</td> </tr> </tbody> </table>	Option	Usage	<b>sequence</b>	Specifies that the child elements must occur in the specified order	<b>choice</b>	Specifies that only one of the child elements must occur	<b>all</b>	Specifies that the child elements can occur in any order	
Option	Usage									
<b>sequence</b>	Specifies that the child elements must occur in the specified order									
<b>choice</b>	Specifies that only one of the child elements must occur									
<b>all</b>	Specifies that the child elements can occur in any order									
<b>MinOccurs</b>	Specify the minimum number of times this element occurs in the Class ( <i>Optional</i> )									
<b>MaxOccurs</b>	Specify the maximum number of times this element occurs in the Class ( <i>Optional</i> )									
<b>Annotation</b>	Specify the notes for this element ( <i>Optional</i> )									
<b>Abstract</b>	Specify whether this complexType can be used in the instance XML file ( <i>Optional</i> ) <b>Default:</b> False									
<b>Mixed</b>	Specify whether character data can appear among the child elements ( <i>Optional</i> ) <b>Default:</b> False									
<b>OK</b>	Save the values entered and close the dialog									
<b>Cancel</b>	Discard the values entered and close the dialog									
<b>Help</b>	Display this Help topic									
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the complexType	<a href="#">Properties</a> 662								

**Notes:**

- Complex Types can contain both *XSDelement* and *XSDattribute* stereotyped UML Attributes
- Complex Types can contain other Complex Types as child elements
- Complex Types can be children of Global Elements
- Complex Types can have Association connectors to other Complex Type, Simple Type, Attribute Group, Group and Model Group
- Complex Types can have at most one Generalization connector to either another Complex Type or a Simple Type Class

### 13.1.1.8 Model Group

The **Model Group** icon from the **XML Schema** Toolbox creates an *XSDsequence*, *XSDchoice* or *XSDall* stereotyped Class when dropped on a diagram.

#### XSD Properties:

Double-click on the **Model Group** in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also								
<b>Name</b>	Specify the name for this Model Group									
<b>Model Group</b>	Specify how the child elements should occur. <table border="1"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>sequence</b></td> <td>This option creates an <i>XSDsequence</i> stereotyped Class. It specifies that the child elements must occur in the specified order.</td> </tr> <tr> <td><b>choice</b></td> <td>This option creates an <i>XSDchoice</i> stereotyped Class. It specifies that only one of the child elements must occur.</td> </tr> <tr> <td><b>all</b></td> <td>This option creates an <i>XSDall</i> stereotyped Class. It specifies that the child elements can occur in any order.</td> </tr> </tbody> </table>	Option	Usage	<b>sequence</b>	This option creates an <i>XSDsequence</i> stereotyped Class. It specifies that the child elements must occur in the specified order.	<b>choice</b>	This option creates an <i>XSDchoice</i> stereotyped Class. It specifies that only one of the child elements must occur.	<b>all</b>	This option creates an <i>XSDall</i> stereotyped Class. It specifies that the child elements can occur in any order.	
Option	Usage									
<b>sequence</b>	This option creates an <i>XSDsequence</i> stereotyped Class. It specifies that the child elements must occur in the specified order.									
<b>choice</b>	This option creates an <i>XSDchoice</i> stereotyped Class. It specifies that only one of the child elements must occur.									
<b>all</b>	This option creates an <i>XSDall</i> stereotyped Class. It specifies that the child elements can occur in any order.									
<b>MinOccurs</b>	Specify the minimum number of times this Model Group occurs in the Class ( <i>Optional</i> )									
<b>MaxOccurs</b>	Specify the maximum number of times this Model Group occurs in the Class ( <i>Optional</i> )									
<b>Annotation</b>	Specify the notes for this Model Group ( <i>Optional</i> )									
<b>OK</b>	Save the values entered and close the dialog									
<b>Cancel</b>	Discard the values entered and close the dialog									
<b>Help</b>	Display this Help topic									
<b>UML</b>	Open the <b>UML Properties</b> dialog This button is available when editing the <b>Model Group</b>	<a href="#">Properties</a> [662]								

#### Notes:

- Model Groups can contain only XSDelement stereotyped UML Attributes
- Model Groups can contain other Complex Types and Simple Types as child elements
- Model Groups can have Association connector to other Complex Type, Simple Type, Group and Model Group
- Model Groups must have at least one incoming Association connector from a Complex Type
- Model Groups cannot be the source or target of Generalization connectors

### 13.1.1.9 Group

The **Group** icon from the **XML Schema** Toolbox creates an *XSDgroup* stereotyped Class when dropped on a diagram. This Class is used to group a set of *XSDelement* stereotyped UML Attributes, **Complex Type** and **Simple Type** classes that can be referenced from an *XSDcomplexType* Class.

#### XSD Properties:

Double-click on the *XSDgroup* stereotyped Class in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also	
<b>Name</b>	Specify the name for this group		
<b>Model Group</b>	Specify how the child elements of this group should occur in the Complex Type	<a href="#">Complex Type</a> <sup>[159]</sup>	
	<b>Option</b>		<b>Usage</b>
	<b>sequence</b>		Specifies that the child elements must occur in the specified order
	<b>choice</b>		Specifies that only one of the child elements must occur
	<b>all</b>	Specifies that the child elements can occur in any order	
<b>Annotation</b>	Specify the notes for this group ( <i>Optional</i> )		
<b>OK</b>	Save the values entered and close the dialog		
<b>Cancel</b>	Discard the values entered and close the dialog		
<b>Help</b>	Display this Help topic		
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the group.	<a href="#">Properties</a> <sup>[662]</sup>	

#### Notes:

- Group can contain only *XSDelement* stereotyped UML Attributes
- Group can contain Complex Types and Simple Types as child elements
- Group can have Association connector to other Complex Types, Simple Types and Groups
- Group can be the target of Association connector from Complex Types
- Group cannot be the source or target of a Generalization connector

### 13.1.1.10 Simple Type

The **Simple Type** icon from the **XML Schema** Toolbox creates an *XSDsimpleType* class when dropped on a diagram.

#### XSD Properties:

Double-click on the *XSDsimpleType* stereotyped Class in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also						
<b>Name</b>	Specify the name for this simpleType							
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or simpleType <table border="1"> <thead> <tr> <th>Field</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Restriction</b></td> <td>Restricts the value of this simpleType to the selected Type The various restrictions ( facets ) on the simpleType are a tagged-values on this Class.</td> </tr> <tr> <td><b>List</b></td> <td>Specifies this simpleType as a list of values of the selected</td> </tr> </tbody> </table>	Field	Usage	<b>Restriction</b>	Restricts the value of this simpleType to the selected Type The various restrictions ( facets ) on the simpleType are a tagged-values on this Class.	<b>List</b>	Specifies this simpleType as a list of values of the selected	
Field	Usage							
<b>Restriction</b>	Restricts the value of this simpleType to the selected Type The various restrictions ( facets ) on the simpleType are a tagged-values on this Class.							
<b>List</b>	Specifies this simpleType as a list of values of the selected							
<b>Annotation</b>	Specify the notes for this simpleType ( <i>Optional</i> )							
<b>OK</b>	Save the values entered and close the dialog							
<b>Cancel</b>	Discard the values entered and close the dialog							
<b>Help</b>	Display this Help topic							
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the simpleType	<a href="#">Properties</a> [662]						

**Notes:**

- Simple Types cannot contain any XSDelement or XSDattribute stereotyped UML Attributes
- Simple Types cannot contain any child classes
- Simple Types cannot be the source of an Association connector
- Simple Types can be the target of a Generalization connector
- Simple Types can have at most one Generalization connector to another Simple Type Class

**13.1.1.11 Union**

The **Union** icon from the **XML Schema** Toolbox creates an *XSDunion* class when dropped directly on a diagram. This Class, which is a Simple Type, defines a collection of Simple Types.

**XSD Properties:**

Double-click on the *XSDunion* stereotyped Class in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for this Union	
<b>Member Types</b>	Specify the collection of XSD <i>built-in dataTypes</i> and simpleTypes	<a href="#">Simple Type</a> [1600]
<b>Annotation</b>	Specify the notes for this Union ( <i>Optional</i> )	

<b>OK</b>	Save the values entered and close the dialog	
<b>Cancel</b>	Discard the values entered and close the dialog	
<b>Help</b>	Display this Help topic	
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the Union	<a href="#">Properties</a> 662

**Notes:**

- Unions cannot contain any child Classes
- Unions cannot contain any XSDelement or XSDattribute stereotyped UML Attributes
- Unions cannot be the source of an Association connector
- Unions can be the target of Association connector from Complex Types
- Unions can be the target of a Generalization connector from Simple Types

**13.1.1.12 Enumeration**

The **Enum** icon from the **XML Schema** Toolbox creates an *enumeration* stereotyped Class when dropped on a diagram. This Class, which is a Simple Type, defines a list of acceptable values for this Class.

**XSD Properties:**

Double-click on the *enumeration* stereotyped Class under a Schema package in the diagram or the **Project Browser**

**Reference:**

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for this Enumeration	
<b>Type</b>	Specify either an XSD <i>built-in dataType</i> or simpleType	<a href="#">Simple Type</a> 1600
<b>Values</b>	Specify the list of acceptable values for the specified <b>Type</b>	
<b>Annotation</b>	Specify the notes for this Enumeration ( <i>Optional</i> )	
<b>OK</b>	Save the values entered and close the dialog	
<b>Cancel</b>	Discard the values entered and close the dialog	
<b>Help</b>	Display this Help topic	
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the Enumeration	<a href="#">Properties</a> 662

**Notes:**

- Enumeration cannot contain any XSDelement or XSDattribute stereotyped UML Attributes
- Enumeration cannot contain any child Classes
- Enumeration cannot be the source of an Association connector
- Enumeration can be the target of a Generalization connector

- Enumeration can have at most one Generalization connector to another Simple Type Class

### 13.1.1.13 Any

The **Any** icon from the **XML Schema** Toolbox creates an *XSDany* stereotyped Class when dropped on a diagram. This Class allows a Complex Type to contain elements that are not specified in the Schema package.

#### XSD Properties:

Double-click on the *XSDany* stereotyped Class in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also								
<b>Name</b>	Specify the name for this Class									
<b>Namespace</b>	Specifies the namespace that contains the elements that can be used in the Complex Type ( <i>Optional</i> )	<a href="#">Complex Type</a> <small>[1597]</small>								
<b>ProcessContents</b>	Specifies how the XML Parser should validate these elements ( <i>Optional</i> ) <table border="1" data-bbox="497 1003 1225 1256"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>lax</b></td> <td>Tries to validate the elements against their Schema is flagged when the Schema cannot be obtained</td> </tr> <tr> <td><b>skip</b></td> <td>Skips validating the elements</td> </tr> <tr> <td><b>strict</b></td> <td>Validates the elements against their Schema</td> </tr> </tbody> </table>	Option	Usage	<b>lax</b>	Tries to validate the elements against their Schema is flagged when the Schema cannot be obtained	<b>skip</b>	Skips validating the elements	<b>strict</b>	Validates the elements against their Schema	
Option	Usage									
<b>lax</b>	Tries to validate the elements against their Schema is flagged when the Schema cannot be obtained									
<b>skip</b>	Skips validating the elements									
<b>strict</b>	Validates the elements against their Schema									
<b>Annotation</b>	Specify the notes for this Class ( <i>Optional</i> )									
<b>OK</b>	Save the values entered and close the dialog									
<b>Cancel</b>	Discard the values entered and close the dialog									
<b>Help</b>	Display this Help topic									
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing this Class	<a href="#">Properties</a> <small>[662]</small>								

#### Notes:

- Any Class cannot contain any UML Attributes or child XSD Classes
- Any Class cannot be the child of any XSD Class
- Any Class cannot be the target of Generalization connectors
- Any Class cannot be the source of Association and Generalization connectors
- Any Class can be the target of Association connectors from Complex Types, Groups and Model Groups
- Any Class must have at least one incoming Association connector

### 13.1.1.14 Any Attribute

The **Any Attribute** icon from the **XML Schema** Toolbox creates an *XSDany* stereotyped UML Attribute when dropped on Complex Type or an Attribute Group. This Class allows a Complex Type or an Attribute Group to contain elements that are not specified in the Schema package.

#### XSD Properties:

Double-click on the *XSDany* stereotyped UML Attribute in a Class or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also								
<b>Name</b>	Specify the name for this UML Attribute									
<b>Namespace</b>	Specifies the namespace that contains the attributes that can be used in the Complex Type or Attribute Group ( <i>Optional</i> )	<a href="#">Complex Type</a> [1597] <a href="#">Attribute Group</a> [1597]								
<b>ProcessContents</b>	Specifies how the XML Parser should validate these attributes ( <i>Optional</i> ) <table border="1" data-bbox="496 1016 1227 1279"> <thead> <tr> <th>Option</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>lax</b></td> <td>Tries to validate the attribute against their Schema; if it is flagged when the Schema cannot be obtained</td> </tr> <tr> <td><b>skip</b></td> <td>Skips validating the attributes</td> </tr> <tr> <td><b>strict</b></td> <td>Validates the attributes against their Schema</td> </tr> </tbody> </table>	Option	Usage	<b>lax</b>	Tries to validate the attribute against their Schema; if it is flagged when the Schema cannot be obtained	<b>skip</b>	Skips validating the attributes	<b>strict</b>	Validates the attributes against their Schema	
Option	Usage									
<b>lax</b>	Tries to validate the attribute against their Schema; if it is flagged when the Schema cannot be obtained									
<b>skip</b>	Skips validating the attributes									
<b>strict</b>	Validates the attributes against their Schema									
<b>Annotation</b>	Specify the notes for this UML Attribute ( <i>Optional</i> )									
<b>OK</b>	Save the values entered and close the dialog									
<b>Cancel</b>	Discard the values entered and close the dialog									
<b>Help</b>	Display this Help topic									
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing this UML Attribute	<a href="#">Properties</a> [698]								

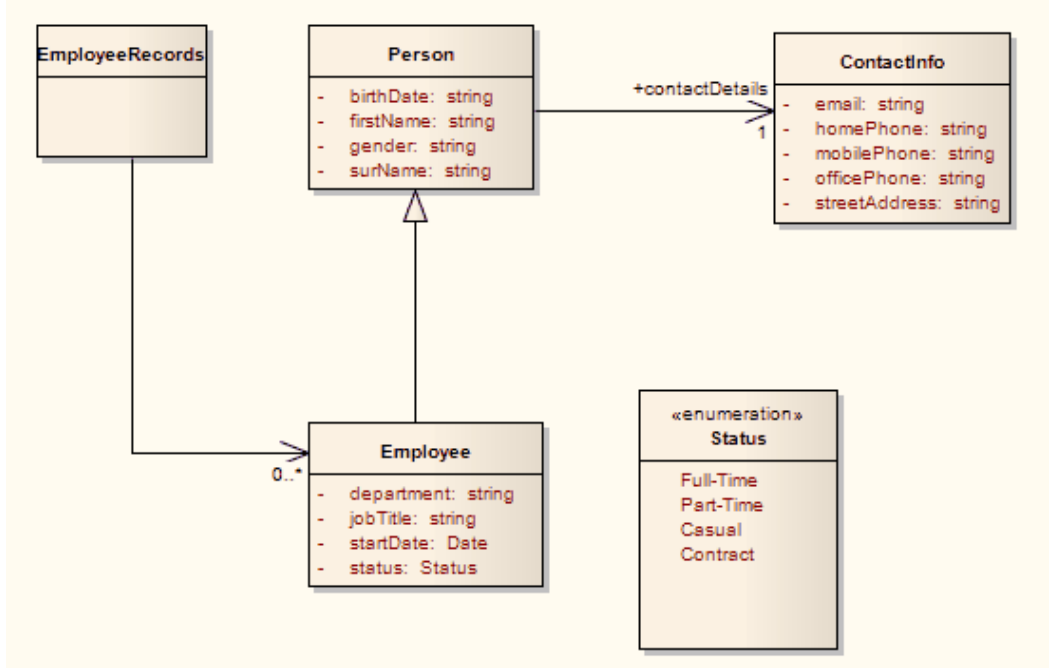

#### Notes:

- Only Complex Types and Attribute Groups can have this UML Attribute

### 13.1.2 Abstract XSD models

XML schemas can also be modeled using simple, abstract Class models. This can be useful in enabling an architect to start working at a higher level of abstraction, without concern for the implementation details of a Schema. Such an abstract model can be refined further using the **XML Schema** pages of the **Toolbox**, or it can be generated directly by Enterprise Architect's **Schema Generator**. In this case, a set of **default mappings** is assumed by the schema generator to convert the abstract model to an XSD file.

**Example:**

Topic	Detail
<b>Diagram</b>	<p>The following is a simplified version of the <i>Employee Details</i> example model, which does not use XSD-specific stereotypes or Tagged Values:</p>  <pre> classDiagram     class EmployeeRecords     class Person {         - birthDate: string         - firstName: string         - gender: string         - surName: string     }     class Employee {         - department: string         - jobTitle: string         - startDate: Date         - status: Status     }     class ContactInfo {         - email: string         - homePhone: string         - mobilePhone: string         - officePhone: string         - streetAddress: string     }     class Status {         &lt;&lt;enumeration&gt;&gt;         Full-Time         Part-Time         Casual         Contract     }     EmployeeRecords --&gt; Employee : 0..*     Employee &lt; -- Person     Person --&gt; ContactInfo : +contactDetails, 1     </pre>
<b>Schema</b>	<p>The following schema fragment would be generated by Enterprise Architect, given the above model:</p> <pre> &lt;?xml version="1.0"?&gt; &lt;xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"&gt;   &lt;xs:simpleType name="Status"&gt;     &lt;xs:restriction base="xs:string"&gt;       &lt;xs:enumeration value="Full-Time"/&gt;       &lt;xs:enumeration value="Part-Time"/&gt;       &lt;xs:enumeration value="Casual"/&gt;       &lt;xs:enumeration value="Contract"/&gt;     &lt;/xs:restriction&gt;   &lt;/xs:simpleType&gt;   &lt;xs:element name="Person" type="Person"/&gt;   &lt;xs:complexType name="Person"&gt;     &lt;xs:sequence&gt;       &lt;xs:element name="firstName" type="xs:string"/&gt;       &lt;xs:element name="surName" type="xs:string"/&gt;       &lt;xs:element name="birthDate" type="xs:string"/&gt;       &lt;xs:element name="gender" type="xs:string"/&gt;       &lt;xs:element name="contactDetails" type="ContactInfo"/&gt;     &lt;/xs:sequence&gt;   &lt;/xs:complexType&gt;   &lt;xs:element name="Employee" type="Employee"/&gt;   &lt;xs:complexType name="Employee"&gt;     &lt;xs:complexContent&gt;       &lt;xs:extension base="Person"&gt;         &lt;xs:sequence&gt;           &lt;xs:element name="status" type="Status"/&gt;           &lt;xs:element name="jobTitle" </pre>

Topic	Detail
	<pre> type="xs:string" /&gt;                                 &lt;xs:element name="startDate" type="xs:date" /&gt;                                 &lt;xs:element name="department" type="xs:string" /&gt;                                 &lt;/xs:sequence&gt;                                 &lt;/xs:extension&gt;                                 &lt;/xs:complexContent&gt;                                 &lt;/xs:complexType&gt;                                 &lt;xs:element name="EmployeeRecords" type="EmployeeRecords" /&gt;                                 &lt;xs:complexType name="EmployeeRecords"&gt;                                 &lt;xs:sequence&gt;                                 &lt;xs:element name="Employee" type="Employee" minOccurs="0" maxOccurs="unbounded" /&gt;                                 &lt;/xs:sequence&gt;                                 &lt;/xs:complexType&gt;                                 &lt;xs:element name="ContactInfo" type="ContactInfo" /&gt;                                 &lt;xs:complexType name="ContactInfo"&gt;                                 &lt;xs:sequence&gt;                                 &lt;xs:element name="homePhone" type="xs:string" /&gt;                                 &lt;xs:element name="mobilePhone" type="xs:string" / &gt;                                 &lt;xs:element name="officePhone" type="xs:string" / &gt;                                 &lt;xs:element name="email" type="xs:string" /&gt;                                 &lt;xs:element name="streetAddress" type="xs: string" /&gt;                                 &lt;/xs:sequence&gt;                                 &lt;/xs:complexType&gt;                                 &lt;/xs:schema&gt; </pre>

- [Default UML to XML Mappings](#) <sup>1606</sup>
- [Generate XSD](#) <sup>1607</sup>

### 13.1.2.1 Default UML to XSD Mappings

The following table describes the default mapping of UML to XSD constructs. This set of mappings is useful when defining simple schemas from abstract Class models. The defaults are also assumed by the schema generator when generating unsteretyped elements in an abstract model. The **XML Schema** pages of the **Toolbox** (and UML Profile for XSD) override these default mappings through the use of stereotypes and Tagged Values.

UML Construct	Default XSD Production Rules
<b>Package</b>	<p>A schema element is generated for the target package. If the target package includes Classes from another package, which has the Tagged Values <i>targetNamespace</i> and <i>targetNamespacePrefix</i> set, these are included as attributes of the schema element.</p> <p>In addition, an <i>import</i> or <i>include</i> element is created for each referenced package. (An <i>include</i> element is used if the external package shares the same <i>targetNamespace</i> Tagged Value as the target package. An <i>import</i> element is used where the <i>targetNamespaces</i> differ).</p>
<b>Class</b>	<p>A root-level element declaration and <i>complexType</i> definition are generated. The element name and type are the same as the Class name. An XSD sequence model group is generated to contain UML attributes generated as elements.</p>
<b>Attribute</b>	<p>An element is declared for each Class attribute. The element name is set to that of the UML attribute name. This is prefixed with the Class name to make the element</p>

UML Construct	Default XSD Production Rules
	unique. The <i>minOccurs</i> and <i>maxOccurs</i> attributes are set to reflect the attribute cardinality.  If the attribute refers to another Class, the element declaration is followed a <i>complexType</i> definition, which contains a reference to the appropriate <i>complexType</i> .
<b>Association</b>	An element is declared for each association owned by a Class. The element name is set to that of the association role. The <i>minOccurs</i> and <i>maxOccurs</i> reflect the cardinality of the association.
<b>Generalization (Inheritance)</b>	For single inheritances, an extension element is generated with the base attribute set to the base Classname. The UML attributes of the child Class are then appended to an all model group within the extension element.
<b>«enumeration» (stereotype)</b>	A <i>simpleType</i> element is declared for the enumeration Class with the name attribute set to the Classname. A restriction element is generated with base set to string. Each of the Class attributes is appended to the restriction element as XSD enumeration elements with value set to the UML attribute name. Any type specification for the UML attributes is ignored by the schema generator.

**Notes:**

- If left unspecified, *minOccurs* and *maxOccurs* default to 1
- If the direction of the association is unspecified, the owner is assumed to be the source

### 13.1.3 Generate XSD

The **Generate XML Schema** feature forward-engineers a UML Class model to a W3C XML Schema (XSD) file. An XML schema corresponds to a UML package in Enterprise Architect, therefore XML schema generation is a package-level operation.

**Access:**

- **Tools | XML Schema | Generate XML Schema**
- Right-click on a package in the **Project Browser** and select the following context menu : **Code Engineering | Generate XML Schema**

**Reference:**

### 13.1.3.1 Generate Global Element

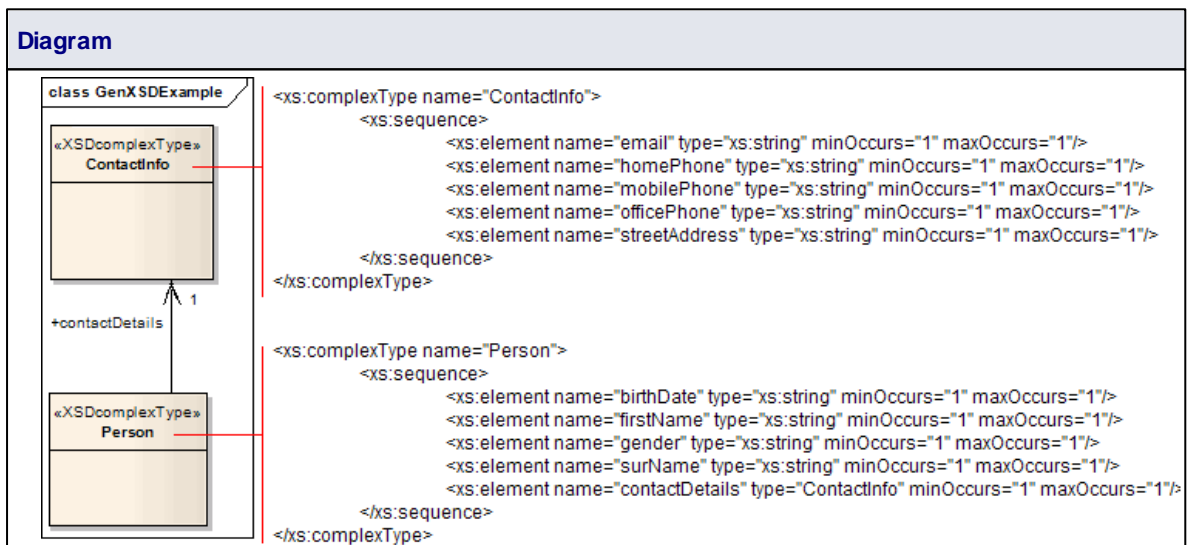

Enterprise Architect, by default, generates XML Schema in the **Garden of Eden** style. For every global *XSDcomplexType* stereotyped Class, Enterprise Architect generates a global element.

Example:

You can change the above specified default behaviour by de-selecting the **Generate global element for all global ComplexTypes** checkbox on the **Generate XML Schema** dialog. Then, the generated XSD no longer contains the global element.

#### Learn More:

- [Generate XML Schema](#)<sup>1607</sup>

### 13.1.4 Import XSD

The **XML Schema Import** facility is used to reverse engineer a W3C XML Schema (XSD) file as a UML Class model. An XSD file is imported into Enterprise Architect as a UML package.

#### Access:

- **Tools | XML Schema | Import XML Schema**
- Right-click on a package in the **Project Browser** and select the following context menu : **Code Engineering | Import XML Schema**

**Reference:**

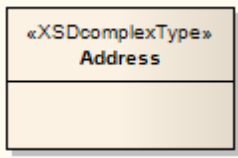

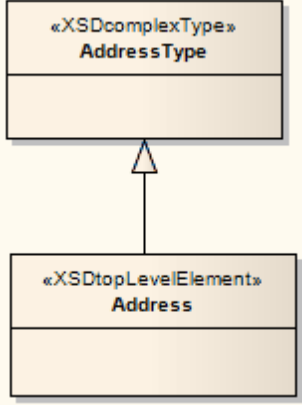

Field/Option/Button	Usage	See also										
<b>Root Package</b>	Indicates the name of the package selected.											
<b>Directory</b>	Specifies the directory where the XSD file(s) is located.											
<b>Selected File(s)</b>	Lists the XML Schema(s) currently selected for import. To select several individual files <b>CTRL + left click</b> on each file. To select a range of files, press <b>SHIFT</b> and select the first and last file in the range.											
<b>Import Options</b>	<table border="1"> <thead> <tr> <th>Field</th> <th>Usage</th> </tr> </thead> <tbody> <tr> <td><b>Import global elements with "Type" postfix</b></td> <td>Treat the global elements as <i>ComplexType</i> if it is referenced by separate entities.</td> </tr> <tr> <td><b>Import referenced XML Schema(s)</b></td> <td>Import any XML Schema referenced by any of the files in the <b>Selected File(s)</b> field.</td> </tr> <tr> <td><b>Create Diagram for XML Schema(s)</b></td> <td>Creates a <b>Class</b> diagram for the imported <i>XSDschema</i>.</td> </tr> <tr> <td><b>Import XSD Elements/Attributes as</b></td> <td>Indicate how the inline <i>XSDattributes</i> are imported.</td> </tr> </tbody> </table>	Field	Usage	<b>Import global elements with "Type" postfix</b>	Treat the global elements as <i>ComplexType</i> if it is referenced by separate entities.	<b>Import referenced XML Schema(s)</b>	Import any XML Schema referenced by any of the files in the <b>Selected File(s)</b> field.	<b>Create Diagram for XML Schema(s)</b>	Creates a <b>Class</b> diagram for the imported <i>XSDschema</i> .	<b>Import XSD Elements/Attributes as</b>	Indicate how the inline <i>XSDattributes</i> are imported.	<a href="#">Global Element and ComplexType</a>
	Field	Usage										
	<b>Import global elements with "Type" postfix</b>	Treat the global elements as <i>ComplexType</i> if it is referenced by separate entities.										
	<b>Import referenced XML Schema(s)</b>	Import any XML Schema referenced by any of the files in the <b>Selected File(s)</b> field.										
	<b>Create Diagram for XML Schema(s)</b>	Creates a <b>Class</b> diagram for the imported <i>XSDschema</i> .										
<b>Import XSD Elements/Attributes as</b>	Indicate how the inline <i>XSDattributes</i> are imported.											
<b>Import</b>	Initiate XSD Import.											
<b>Close</b>	Close this dialog.											
<b>Help</b>	Display this Help topic											
<b>Progress</b>	Lists the progress of Schema Import.											

**Notes:**

- If an XML Schema file being imported already exists in the model, Enterprise Architect skips importing the file
- References to XSD *Primitive Types* are always imported as UML Attributes
- References to XSD constructs in external Schema files are always imported as UML Attributes
- Enterprise Architect uses the *schemaLocation* attribute in the *XSD Import* and *XSD Include* elements of an XML Schema to determine the dependencies between the files. Ensure that this attribute is set to a valid file path (and not a URL) for the dependent XML Schema(s) to be imported correctly

**13.1.4.1 Global Element and ComplexType**

Topic	Detail
<b>ComplexType element naming convention</b>	Some XML Schemas have <b>ComplexType</b> elements with the same name as the referring global elements, but with the suffix <i>Type</i> as shown below: <pre>&lt;xs:element name="Address" type="AddressType" /&gt; &lt;xs:complexType name="AddressType" /&gt;</pre>

Topic	Detail
	<pre data-bbox="531 309 866 365">&lt;xs: sequence / &gt; &lt;/ xs: compl exType &gt;</pre> <p data-bbox="483 369 1409 454">On XSD import, Enterprise Architect treats this global element and its bounding <b>ComplexType</b> as a single entity and creates a single <b>XSDcomplexType</b> stereotyped Class with the same name as the global element as shown below:</p> 
<p data-bbox="260 689 451 745"><b>Changing the default behavior</b></p>	<p data-bbox="483 689 1409 902">You can change the above specified default behaviour by selecting the <b>Import global elements with "Type" postfix</b> checkbox. When you select this option, Enterprise Architect treats the global element and the ComplexType it is referring to as two separate entities. So, for the above example, Enterprise Architect creates an <i>XSDtopLevelElement</i> stereotyped Class for the global element and an <i>XSDcomplexType</i> stereotyped Class for the ComplexType, and connects them as follows:</p> 

**Notes:**

- Enterprise Architect treats the following as two separate entities irrespective of whether the **Import global elements with "Type" postfix** checkbox is selected or unselected:

```
<xs: element name=" HomeAddress" type=" AddressType" / >
<xs: complexType name=" AddressType" >
  <xs: sequence / >
</ xs: compl exType >
```

**Learn More:**

- [Import XML Schema](#)<sup>[1609]</sup>

### 13.1.5 UML Profile for XSD

The **UML Profile for XSD** specifies a set of stereotypes, tagged values and constraints that can be applied to the UML model in order to change particular aspects of the resulting schema. For example, you might have to convert certain UML Class attributes to XSD attributes, or use a model group other than the default *Sequence*.

Enterprise Architect provides native support for the UML Profile for XSD via the **XML schema** page of the Diagram Toolbox. Alternatively, you can use the profile via Enterprise Architect's generic profile mechanism by downloading the UML Profile for XSD. The XSD profile used by Enterprise Architect is an adaptation of the profile defined in *Modeling XML Applications with UML* (David Carlson).

#### Learn More:

- [Profile for XML Schema](#)<sup>[1612]</sup>
- [XSD Datatypes Package](#)<sup>[1619]</sup>

### 13.1.5.1 Profile for XML Schema

The **UML Profile for XSD** specifies stereotypes that provide an explicit mapping from XSD to UML constructs. The Tagged Values further define aspects of the mapping, such as whether the elements should be qualified. The constraints define any conditions that must be satisfied for the stereotype to apply.

The UML Profile for XSD specifies the following stereotypes:

- [XSDschema](#)<sup>[1612]</sup>
- [XSDcomplexType](#)<sup>[1613]</sup>
- [XSDsimpleType](#)<sup>[1614]</sup>
- [XSDsequence](#)<sup>[1614]</sup>
- [XSDchoice](#)<sup>[1615]</sup>
- [XSDelement](#)<sup>[1615]</sup>
- [XSDattribute](#)<sup>[1616]</sup>
- [XSDany](#)<sup>[1616]</sup>
- [XSDrestriction](#)<sup>[1617]</sup>
- [XSDgroup](#)<sup>[1617]</sup>
- [XSDtopLevelElement](#)<sup>[1617]</sup>
- [XSDtopLevelAttribute](#)<sup>[1618]</sup>
- [XSDunion](#)<sup>[1618]</sup>
- [XSDattributeGroup](#)<sup>[1618]</sup>

The following tables list the features of the UML Profile for XSD.

- Tagged Value names are shown in bold followed by the allowed values.
- If a default value is used by Enterprise Architect's schema generator, it is underlined.

#### «XSDschema»:

<b>UML Construct</b>		Package
<b>Description</b>		All Classes in a package are defined within one schema. This stereotype can be used to specify schema-wide settings.
<b>Toolbox Icon</b>		 Schema
<b>Tagged Values</b>	<b>anonymousRole</b> (true   <u>false</u> )	Specifies if the role name is included in the element declaration for the UML attribute.
	<b>anonymousType</b> (true   <u>false</u> )	Specifies whether the Class type is anonymous for attributes.

	<b>attributeFormDefault</b> (qualified   <u>unqualified</u> )	Determines whether attribute instances must be qualified.
	<b>defaultNamespace</b>	The default namespace used in this schema. This value is used to specify the default namespace attribute ( <i>xmlns=</i> ), in the schema element.
	<b>elementDerivation</b> ( <u>true</u>   false)	Determines whether inheritances are generated using XSD extension or copy-down inheritance.
	<b>elementFormDefault</b> (qualified   <u>unqualified</u> )	Determines whether element instances must be qualified.
	<b>memberNames</b> ( <u>qualified</u>   unqualified)	Determines whether elements generated from Class attributes have their name qualified by the corresponding Class name.
	<b>modelGroup</b> (all   <u>sequence</u>   choice)	Specifies the default XSD model group used to generate <i>complexType</i> definitions.
	<b>schemaLocation</b>	The URI that identifies the location of the schema. This value is used in the import and include elements.
	<b>targetNamespace</b>	The URI that uniquely identifies this schema's namespace.
	<b>targetNamespacePrefix</b>	The prefix that abbreviates the <i>targetNamespace</i> .
	<b>version</b>	The version of this schema.
	<b>xmlns</b>	The comma separated list of all the namespaces ( and their prefixes ).
<b>Constraints</b>		None.

«XSDcomplexType»:

<b>UML Construct</b>		Class
<b>Description</b>		<i>complexType</i> definitions are created for generic UML Classes. This stereotypes helps tailor the generation of a <i>complexType</i> definition.
<b>Toolbox Icon</b>		
<b>Tagged Values</b>	<b>memberNames</b> (qualified   unqualified)	Determines whether elements generated from the UML Class attributes and associations have their name qualified by the corresponding Class name for this <i>complexType</i> definition.
	<b>mixed</b> (true   <u>false</u> )	Determines whether this element can contain mixed element and character content. See the W3CXML Schema recommendation.
	<b>modelGroup</b> (all   sequence   choice)	Overrides the default XSD model for generating this <i>complexType</i> definition.
	<b>minOccurs</b>	Specifies the minimum number of times the model group in the element can occur.
	<b>maxOccurs</b>	Specifies the maximum number of times the model group in the element can occur.

	<b>nillable</b> (true   false)	Specifies whether a null value can be assigned to the top-level element generated for this <i>complexType</i> element.
<b>Constraints</b>		None.

«XSDsimpleType»

<b>UML Construct</b>		Class
<b>Description</b>		An XSD <i>simpleType</i> is generated for Classes with this stereotype.
<b>Toolbox Icon</b>		 Simple Type
<b>Tagged Values</b>	<b>derivation:</b> (restriction   list)	Specifies the derivation of the <i>simpleType</i> . See the W3C XML Schema recommendation.
	<b>length:</b>	See the W3C XML Schema recommendation.
	<b>minLength:</b>	
	<b>maxLength:</b>	
	<b>minInclusive:</b>	
	<b>minExclusive:</b>	
	<b>maxInclusive:</b>	
	<b>maxExclusive:</b>	
	<b>totalDigits:</b>	
	<b>fractionDigits:</b>	
	<b>whiteSpace:</b>	
	<b>pattern:</b>	
<b>Constraints</b>		This Class can only participate in an inheritance relation with another <i>simpleType</i> . It cannot have any attributes or own any associations; they are ignored if present.

«XSDsequence»

<b>UML Construct</b>		Class
<b>Description</b>		The schema generator creates a sequence model group as the container for the attributes and associations owned by this Class. The model group is in turn added to the model groups of this Class respective owners.  Tagged values specified by owners of this Class persist through to the child elements of this model group. Thus if

		<i>memberNames</i> are unqualified for a <i>complexType</i> , so are the children of this model group when added to that <i>complexType</i> .
<b>Toolbox Icon</b>		
<b>Tagged Values</b>		None.
<b>Constraints</b>		This Class must be the destination of unidirectional associations. If it is not, this Class and its connectors are ignored, possibly invalidating other model group Classes. Inheritance relations are ignored for this Class.

## «XSDchoice»

<b>UML Construct</b>		Class
<b>Description</b>		Creates an XSD choice element. See <i>XSDsequence</i> for more details.
<b>Toolbox Icon</b>		
<b>Tagged Values</b>		None.
<b>Constraints</b>		As for <i>XSDsequence</i> .

## «XSDElement»

<b>UML Construct</b>		UML Attribute, Association <i>End</i>
<b>Description</b>		By applying this stereotype to a UML Class or Association <i>End</i> , the corresponding UML entity is generated as an element within the parent <i>complexType</i> and not as an XSD attribute.
<b>Toolbox Icon</b>		
<b>Tagged Values</b>	<b>form:</b> (qualified   unqualified)	Overrides the schema's <i>elementFormDefault</i> value.
	<b>position:</b>	Causes the elements to be ordered within a sequence model group of the containing <i>complexType</i> . Duplicated and invalid position Tagged Values are ignored and result in undefined ordering of the UML attributes. Missing position values cause the defined positions to be allocated as specified, with the remaining elements filling the missing positions in an undefined order.
	<b>anonymousRole:</b> (true   false)	Specifies if the role name is included in the element declaration for the UML attribute.
	<b>anonymousType:</b> (true   false)	Specifies whether the Class type is anonymous for attributes.

	<b>nillable</b> (true   false)	Specifies whether a null value can be assigned to this element.
	<b>default</b>	See the W3C XML Schema recommendation.
	<b>fixed</b>	
<b>Constraints</b>		None.

«XSDattribute»

<b>UML Construct</b>		UML Attribute, Association <i>End</i>
<b>Description</b>		By applying this stereotype to a UML Class attribute or Association <i>End</i> , the corresponding UML entity is generated as an XSD attribute within the parent <i>complexType</i> and not as an XSD element.
<b>Toolbox Icon</b>		 Attribute
<b>Tagged Values</b>	<b>form:</b> (qualified   unqualified)	Overrides the schema's <i>attributeFormDefault</i> value.
	<b>use:</b> (prohibited   optional   required)	See the W3C XML Schema recommendation.
	<b>default</b>	
	<b>fixed</b>	
<b>Constraints</b>		The attribute <i>datatype</i> should not see a Class specification, otherwise it is ignored.

«XSDany»

<b>UML Construct</b>		UML Attribute
<b>Description</b>		If applied to a UML attribute, an XSD <i>anyAttribute</i> element is generated. If applied to a UML Class, an XSD <i>any</i> element is generated.
<b>Toolbox Icon</b>		 Any Attribute
<b>Tagged Values</b>	<b>namespace:</b>	See the W3C XML Schema recommendation.
	<b>processContents:</b> (skip   lax   strict)	
<b>Constraints</b>		None.

«XSDrestriction»

<b>UML Construct</b>		Generalization
<b>Description</b>		Overrides the default use of XSD extension for inheritance and generates the child as a <i>complexType</i> with a restriction element instead.
<b>Tagged Values</b>		None.
<b>Constraints</b>		Applies only to UML Class parent-child relations.

«XSDgroup»

<b>UML Construct</b>		Class
<b>Description</b>		An <i>XSDgroup</i> is generated for Classes with this stereotype.
<b>Toolbox Icon</b>		
<b>Tagged Values</b>	<b>modelGroup:</b> ( <u>sequence</u>   choice   all)	Overrides the default XSD model for generating this group definition.
<b>Constraints</b>		A group Class can only associate itself to other group Classes. A group Class can be associated by another group Class or a <i>complexType</i> Class. The association should be via an Association connector. A group Class cannot be inherited/aggregated.

«XSDtopLevelElement»

<b>UML Construct</b>		Class
<b>Description</b>		Creates an <code>&lt;xs:element&gt;</code> construct which acts as a container for <i>XSDcomplexType</i> and <i>XSDsimpleType</i> Class.
<b>Toolbox Icon</b>		
<b>Tagged Values</b>	<b>default</b>	See the W3C XML Schema recommendation.
	<b>fixed</b>	
<b>Constraints</b>		An <i>XSDtopLevelElement</i> Class can contain either an <i>XSDsimpleType</i> or an <i>XSDcomplexType</i> as its child Class. When such a Class is present as its child, all its inheritance is ignored. This Class cannot be inherited.

## «XSDtopLevelAttribute»

<b>UML Construct</b>		Class
<b>Description</b>		Creates an <code>&lt;xs:attribute&gt;</code> construct which acts as a container for <i>XSDsimpleType</i> Class.
<b>Toolbox Icon</b>		 Attribute
<b>Tagged Values</b>	<b>use:</b> ( <i>optional</i>   required   prohibited)	See the W3C XML Schema recommendation.
	<b>default</b>	
	<b>fixed</b>	
<b>Constraints</b>		An <i>XSDtopLevelAttribute</i> Class can contain only an <i>XSDsimpleType</i> Class as its child Class. When such a Class is present as its child, all its inheritance is ignored.  This Class can inherit from only one <i>XSDsimpleType</i> Class.

## «XSDunion»

<b>UML Construct</b>		Class
<b>Description</b>		Creates an <code>&lt;xs:union&gt;</code> construct which can act as a container for <i>XSDsimpleType</i> Class.
<b>Toolbox Icon</b>		 Union
<b>Tagged Values</b>		None
<b>Constraints</b>		An <i>XSDunion</i> Class can contain only <i>XSDsimpleType</i> as its child Class and can generalize from other <i>XSDsimpleType</i> Classes only.  All the Classes that this Class generalizes become the members of the attribute <i>memberTypes</i> .  This Class cannot have any attributes or associations.

## «XSDattributeGroup»

<b>UML Construct</b>		Class
<b>Description</b>		Creates an <code>&lt;XSDattributeGroup&gt;</code> construct which can act as a container for a set of elements for stereotype <i>XSDattribute</i> .
<b>Toolbox Icon</b>		 Attribute Group

<b>Tagged Values</b>		None
<b>Constraints</b>		<p>An <i>XSDattributeGroup</i> Class can contain only elements of stereotype <i>XSDattribute</i> and can be associated only with other <i>XSDattributeGroup</i> Classes.</p> <p>Only <i>XSDcomplexType</i> Classes can associate with this Class.</p> <p>This Class cannot be inherited.</p>

**13.1.5.2 XSD Datatypes Package**

When modeling XSD constructs, it is often useful to have the XSD primitive types represented as UML elements. In this way user-defined types, for example, can reference the datatype elements as part of inheritance or association relationships.

Sparx Systems provides the set of primitive XSD data types as a UML package in the form of an XML file. Each of the XSD primitive types is represented by a UML Class in a package named *XSDDatatypes*.

**How To:**

Step	Action	See Also
1.	Download the <i>XSDDatatypes</i> package using the link to the right. The file <i>XSDDatatypes.xml</i> is an XML file.	<a href="#">XSDDatatypes Package</a> (XML file)
2.	Use Enterprise Architect's <b>XMI import</b> facility, which is available via the <b>Project   Model Import/Export   Import Package</b> from XMI menu option.	<a href="#">XMI import</a> <sup>[324]</sup>
3.	When the XMI import is complete, you have the UML package named <i>XSDDatatypes</i> in your model, from which you can drag and drop the relevant types as required.	

**Notes:**

- Import and use the XSD Datatypes into Enterprise Architect only if you are modeling the XSD model using the UML Profile for XSD ( instead of using the XML Schema Toolbox )

## 13.2 Web Services - WSDL

Enterprise Architect enables rapid modeling, forward engineering and reverse engineering of **Web Service Definition Language 1.1** (WSDL), a key W3C XML technology.

WSDL support is critical for the development of a complete *Service Oriented Architecture* (SOA), and the coupling of UML 2.3 and XML provides the natural mechanism for specifying, constructing and deploying XML-based SOA artifacts within an organization. This section explains how to use Enterprise Architect to model WSDL files.

### Learn More:

- [W3C WSDL Specification](#) (Online Resource)
- [WSDL Model Structure](#)<sup>[1620]</sup>
- [Model WSDL](#)<sup>[1621]</sup>
- [WSDL Model Transformation](#)<sup>[1331]</sup>
- [Generate WSDL 1.1](#)<sup>[1630]</sup>
- [Import WSDL 1.1](#)<sup>[1631]</sup>

### 13.2.1 Create WSDL 1.1 Model Structure

Enterprise Architect provides the **WSDL** page in the **Toolbox** to conveniently model WSDL documents. WSDLs, represented as Components marked with the stereotype *WSDL*, are contained in a *WSDLnamespace* stereotyped Package whose hierarchy represents the target WSDL namespace and its constituent *XSD Types*, *Messages*, *PortTypes*, *Bindings* and *Services*. A sample WSDL Package structure can be created in the **Project Browser**, using the **Namespace** icon from the **WSDL** of the **Toolbox**. You can use this package structure as a template for developing your WSDL.

**Access:** [View](#) | [Toolbox > More tools](#) | [WSDL](#)

### Use to:

- Create a new **WSDL** Package structure that can be used as a starting point for developing your WSDL model.

### How To:

Step	Action	See Also
1	Create a package in the <b>Project Browser</b>	
2	Click on the <b>New Diagram</b> icon in the <b>Project Browser</b>	<a href="#">Project Browser Toolbar</a> <sup>[454]</sup>
3	Select <b>UML Structural</b> in the <b>Select From</b> field and <b>Class</b> in the <b>Diagram Types</b> field	
4	Click on the <b>More tools</b> option in the Toolbox and select <b>WSDL</b> from the list of Toolboxes	<a href="#">Diagram Toolbox</a> <sup>[548]</sup>
5	Click on the <b>Namespace</b> icon from the Toolbox and drag it into the created <b>Class</b> diagram	<a href="#">WSDL Group</a> <sup>[567]</sup>
6	Specify the WSDL Package <b>Name</b> and <b>Namespace</b> and press <b>OK</b> button to create the sample WSDL Package structure.	<a href="#">Namespace Icon</a> <sup>[1621]</sup>

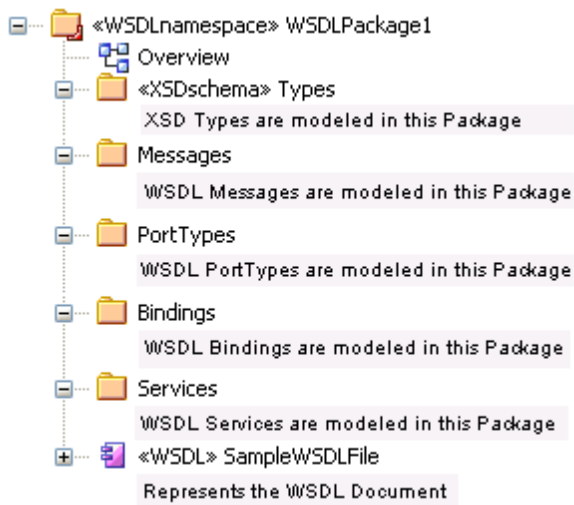

**Alternative:**

A WSDL Package structure can also be created from an UML Interface using the **WSDL Model Transformation**.

[WSDL Model Transformation](#)<sup>[1331]</sup>

**Example WSDL Package Structure:**

The *WSDLnamespace* Package acts as a container for the WSDL Structure in Enterprise Architect. The various WSDL constructs like *Messages*, *PortTypes*, *Bindings* and *Services* should be modeled in the **Messages**, **PortTypes**, **Bindings** and **Services** Packages respectively.

**Notes:**

- A *WSDLnamespace* package can contain one or more *WSDL* stereotyped Component
- A *WSDL* stereotyped Component can be generated as a WSDL file

**Learn More:**

- [WSDL Toolbox](#)<sup>[567]</sup>
- [Model WSDL](#)<sup>[1621]</sup>
- [Generate WSDL 1.1](#)<sup>[1630]</sup>
- [Import WSDL 1.1](#)<sup>[1631]</sup>

**13.2.2 Model WSDL**

The **Namespace** icon in the **WSDL** Toolbox creates a *WSDLnamespace* stereotyped Package which represents the top-level container for the WSDL constructs in Enterprise Architect.

**WSDL Properties:** Double-click on the *WSDLnamespace* stereotyped package in the diagram or the Project Browser

**Reference:**

Field/Button	Usage	See Also

	<b>Button</b>	<b>Usage</b>	
	<b>New</b>	Add a new Fault	
	<b>Delete</b>	Delete an existing Fault in the list	
<b>OK</b>	Save the values entered and close the dialog		
<b>Cancel</b>	Discard the values entered and close the dialog		
<b>Help</b>	Display this Help topic		
<b>UML</b>	Open the UML <b>Properties</b> dialog This button is available when editing the WSDL PortType Operation.		<a href="#">Properties</a> <sup>[710]</sup>

**Notes:**

- WSDL PortType Operations can only be contained by WSDL PortTypes
- The value specified in the **Name** field of the **Input**, **Output** and **Fault** section above must be unique among all the Inputs, Outputs and Faults of the WSDL PortType respectively

**Learn More:**

- [WSDL Port Type](#)<sup>[1623]</sup>

### 13.2.2.3 WSDL Binding

The **Binding** icon in the **WSDL** Toolbox creates a *WSDLbinding* stereotyped Class, representing the WSDL Binding. Each *WSDLbinding* Class implements the operations specified by a particular *WSDLportType* Interface and describes the message format and protocol details for the operations and messages defined by this WSDL PortType. WSDL Bindings should be defined under the *Bindings* package in the WSDL Package structure.

**WSDL Properties:** Double-click on the *WSDLbinding* stereotyped Class in the diagram or the **Project Browser**

#### Reference:

Field/Button	Usage	See Also
<b>Name</b>	Specify the name for the WSDL PortType	
<b>PortType</b>	Select the WSDL PortType to be implemented by this WSDL Binding.	<a href="#">Port Type</a> <sup>[1623]</sup>
<b>Protocol</b>	Specify the protocol for the transmission of the selected WSDL PortType's Operations.  The supported protocols are: <ul style="list-style-type: none"> <li>• SOAP</li> <li>• HTTP</li> </ul>	
<b>Transport</b>	Defines the SOAP protocol.  This field is disabled for HTTP protocol.  <b>Default:</b> <i>http://schemas.xmlsoap.org/soap/http</i>	
<b>Style</b>	Specify the style of SOAP protocol.  This field is disabled for HTTP protocol.	
<b>Verb</b>	Specify the HTTP verb.  The supported verbs are: <ul style="list-style-type: none"> <li>• GET</li> <li>• POST</li> </ul> This field is disabled for SOAP protocol.	
<b>Documentation</b>	Specify the notes for this element ( <i>Optional</i> )	
<b>OK</b>	Save the values entered and close the dialog	
<b>Cancel</b>	Discard the values entered and close the dialog	
<b>Help</b>	Display this Help topic	
<b>UML</b>	Open the UML <b>Properties</b> dialog  This button is available when editing the WSDL Binding.	<a href="#">Properties</a> <sup>[662]</sup>

#### Notes:

- A WSDL Binding must implement a WSDL PortType. Therefore, WSDL PortTypes should be defined before creating WSDL Bindings
- WSDL Bindings can only be created under the *Bindings* package in the WSDL Package structure.

- The name of the WSDL Binding should be unique among all the WSDL Bindings within the WSDL.

**Learn More:**

- [WSDL Binding Operation](#)<sup>[1627]</sup>
- [WSDL Package Structure](#)<sup>[1628]</sup>

### 13.2.2.3.1 WSDL Binding Operation

When a *WSDLbinding* stereotyped Class is created using the WSDL Binding dialog, Enterprise Architect draws a Realization connector from the WSDL Binding to the WSDL Porttype and automatically populates the WSDL Binding with all the UML Operations in the WSDL PortType.

**WSDL Properties:** Double-click on the UML Operation in the WSDLbinding stereotyped Class in the diagram or the Project Browser

**Reference:**

Field/Button	Usage	See Also
<b>Operation Name</b>	Name of the Operation. This value in this field cannot be edited.

### 13.2.4 Import WSDL

Enterprise Architect provides a **WSDL Import** facility to reverse engineer WSDL 1.1 files into UML Class models.

#### Access:

- **Tools | Web Service | Import WSDL**
- Right-click on a Package in the **Project Browser** and select the following context menu : **Code Engineering | Import WSDL**

#### Reference:

Field/Button	Usage
<b>Filename</b>	Specify the WSDL file to import
<b>Root Package</b>	Specifies the Package under which the WSDL file is to be imported
<b>Target Package</b>	Specifies the name of the Package that represents the imported WSDL file <b>Default:</b> Name of the WSDL file
<b>Import</b>	Initiate the WSDL Import
<b>Close</b>	Close this dialog

Field/Button	Usage
Help	Display this Help topic
Progress	Lists the progress of WSDL Import

**Notes:**

Enterprise Architect cannot import a WSDL file that references WSDL constructs existing outside this WSDL file	
<b>Importable Example</b>	<a href="http://www.w3.org/TR/wsd1.html#_wsdl">http://www.w3.org/TR/wsd1.html#_wsdl</a>
<b>Non-importable Example</b>	<a href="http://www.w3.org/TR/wsd1.html#_style">http://www.w3.org/TR/wsd1.html#_style</a> Attempting to import the second WSDL file would result in the following error: <b>Cannot Import Split Files</b>
<b>Workaround</b>	Combine the split WSDL files into a single file and then import it into Enterprise Architect

## 13.3 SoaML

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>The following text is derived from Service oriented architecture Modeling Language (SoaML) - Specification for the UML Profile and metamodel for Services (UPMS) (OMG document ad/2008-11-01); pp. 25-26:</p> <p><i>A service is an offer of value to another through a well-defined interface and available to a community (which may be the general public). A service results in work provided to one by another.</i></p> <p><i>Service Oriented Architecture (SOA) is a way of organizing and understanding ( representations of ) organizations, communities and systems to maximize agility, scale and interoperability. The SOA approach is simple - people, organizations and systems provide services to each other. These services allow us to get something done without doing it ourselves or even without knowing how to do it - enabling us to be more efficient and agile. Services also enable us to offer our capabilities to others in exchange for some value - thus establishing a community, process or marketplace. The SOA paradigm works equally well for integrating existing capabilities as for creating and integrating new capabilities.</i></p> <p><i>SOA ... is an architectural paradigm for defining how people, organizations and systems provide and use services to achieve results. SoaML ... provides a standard way to architect and model SOA solutions using the Unified Modeling Language (UML). The profile uses the built-in extension mechanisms of UML to define SOA concepts in terms of existing UML concepts.</i></p> <p><i>... the highest leverage of employing SOA comes from understanding a community, process or enterprise as a set of interrelated services and ... supporting that service oriented enterprise with service-enabled systems. SoaML enables business oriented and systems oriented services architectures to mutually and collaboratively support the enterprise mission. ... SoaML depends on Model Driven Architecture® (MDA®) to help map business and systems architectures, the design of the enterprise, to the technologies that support SOA, like web services and CORBA®.</i></p> <p>For further information on the concepts of SoaML, see the specification document on the OMG website <b>SOAML document page</b>.</p>	<p><a href="#">SOAML document page</a> (Online Resource)</p>
<b>SoaML in Enterprise Architect</b>	<p>Enterprise Architect enables you to model services architectures quickly and simply, through use of an MDG Technology integrated with the Enterprise Architect installer. The SoaML facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• Two SoaML diagram types - <i>SoaML Component Diagram</i> and <i>SoaML Sequence Diagram</i> - accessed through the <b>New Diagram</b> dialog</li> <li>• SoaML pages in the <b>Toolbox</b></li> <li>• SoaML element and relationship entries in the <b>Toolbox Shortcut Menu</b> and <b>Quick Linker</b></li> </ul>	<p><a href="#">New Diagram</a> [570]</p> <p><a href="#">Toolbox Shortcut Menu</a> [553]</p> <p><a href="#">Quick Linker</a> [624]</p>

<p><b>Example SoaML Diagram</b></p>	<p>The diagram illustrates a SoaML service architecture. At the top level, a dashed oval represents the «servicesArchitecture» <b>DealerNetworkArchitecture</b>. Inside this architecture, a central «collaboration» <b>ps :PurchasingService</b> is shown. This collaboration has two roles: <b>buyer</b> and <b>seller</b>. The <b>buyer</b> role is associated with a participant «participant» <b>dealer</b>, and the <b>seller</b> role is associated with a participant «participant» <b>mfg</b>. Below these participants are detailed boxes for «participant» <b>Dealer</b> and «participant» <b>Manufacturer</b>. The <b>Dealer</b> participant has a «servicePoint» <b>Buyer</b>, and the <b>Manufacturer</b> participant has a «servicePoint» <b>ServicePoint</b>. Dashed arrows labeled <b>type</b> connect the participants to their respective service points. A «Comments» box in the center states: "The purpose of the dealer network architecture is to establish the financially related services between dealers and manufacturers such that any dealer can do business with any manufacturer."</p>	
<p><b>Disable SoaML</b></p>	<p>If you prefer not to use SoaML in Enterprise Architect, you can disable it (and subsequently re-enable it) using the <b>MDG Technologies</b> dialog (<b>Settings   MDG Technologies</b>).</p>	<p><a href="#">Manage MDG Technologies</a> 1035</p>

**Notes:**

- Service Oriented Architecture Modeling Language (SoaML) is supported in the Corporate, Systems Engineering, Business and Software Engineering and Ultimate editions of Enterprise Architect

## 13.4 SOMF

### Topics:

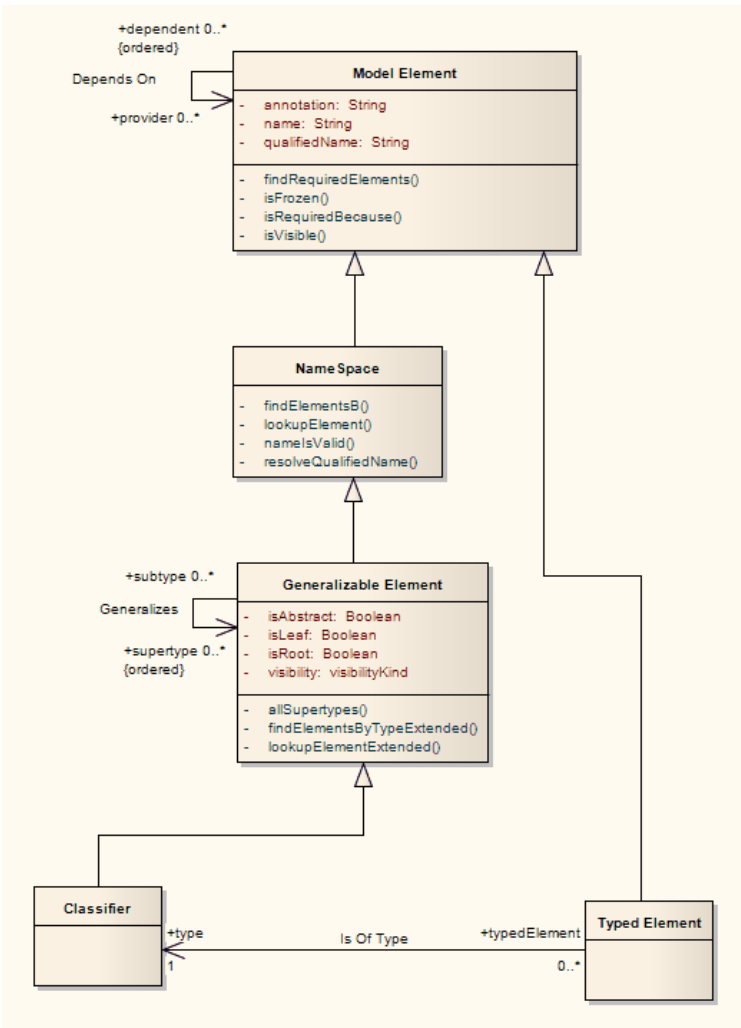

Topic	Detail	See also
<b>Abstract</b>	<p>The following text is derived from the extensive Wikipedia entry on Service Oriented Modeling:</p> <p><i>The Service-Oriented Modeling Framework (SOMF) has been proposed by author Michael Bell as a holistic and anthropomorphic modeling language for software development that employs disciplines and a universal language to provide tactical and strategic solutions to enterprise problems. The term "holistic language" pertains to a modeling language that can be employed to design any application, business and technological environment, either local or distributed. This universality may include design of application-level and enterprise-level solutions, including SOA landscapes or Cloud Computing environments. The term "anthropomorphic", on the other hand, affiliates the SOMF language with intuitiveness of implementation and simplicity of usage.</i></p> <p><i>The service-oriented modeling framework (SOMF) is a service-oriented development life cycle methodology. It offers a number of modeling practices and disciplines that contribute to a successful service-oriented life cycle management and modeling. ... It illustrates the major elements that identify the "what to do" aspects of a service development scheme. These are the modeling pillars that will enable practitioners to craft an effective project plan and to identify the milestones of a service-oriented initiative- either a small or large-scale business or a technological venture.</i></p> <p>For further information on the concepts of SOMF, see the Wikipedia Service Oriented Modeling pages.</p>	<p><a href="#">Michael Bell</a> (Online Resource)</p> <p><a href="#">Service Oriented Modeling</a> (Online Resource)</p>
<b>SOMF in Enterprise Architect</b>	<p>In Enterprise Architect, SOMF is implemented as a profile within an MDG Technology that is integrated with the Enterprise Architect installer. For further information on this MDG Technology, see the <i>Service-Oriented Modeling Framework™ in Enterprise Architect</i> page on the Sparx Systems website.</p> <p>The SOMF facilities are provided in the form of:</p> <ul style="list-style-type: none"> <li>• Eight SOMF diagram types accessed through the New Diagram dialog; these are SOMF: <ul style="list-style-type: none"> <li><i>Analysis</i></li> <li><i>Business Integration</i></li> <li><i>Logical Design Relationship</i></li> <li><i>Logical Design Composition</i></li> <li><i>Transaction</i></li> <li><i>Conceptual Architecture</i></li> <li><i>Asset Utilization</i></li> <li><i>Transaction Directory</i></li> </ul> </li> <li>• SOMF pages in the Toolbox</li> <li>• SOMF element and relationship entries in the <b>Toolbox Shortcut</b> menu and Quick Linker</li> </ul>	<p><a href="#">Sparx Systems</a> (online resource)</p> <p><a href="#">New Diagram</a><sup>[570]</sup></p> <p><a href="#">Toolbox Shortcut Menu</a><sup>[553]</sup></p> <p><a href="#">Quick Linker</a><sup>[624]</sup></p>

## 13.5 Generate MOF

Enterprise Architect offers support for exporting packages to XML under the *Meta-Object Facility (MOF)* 1.3 and 1.4 standards. MOF models are created by assigning the stereotype *metamodel* to the package. MOF models can be exported to MOF 1.3 or MOF 1.4 XML file specification.

### Topics:

Topic	Detail	See also
<p><b>Background Knowledge</b></p>	<p>MOF is an Object Management Group (OMG) standard that originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture, as illustrated in the following diagram.</p>  <pre> classDiagram     class ModelElement {         +annotation: String         +name: String         +qualifiedName: String         -findRequiredElements()         -isFrozen()         -isRequiredBecause()         -isVisible()     }     class Namespace {         -findElementsB()         -lookupElement()         -nameIsValid()         -resolveQualifiedName()     }     class GeneralizableElement {         -isAbstract: Boolean         -isLeaf: Boolean         -isRoot: Boolean         -visibility: visibilityKind         -allSupertypes()         -findElementsByTypeExtended()         -lookupElementExtended()     }     class Classifier     class TypedElement     ModelElement &lt; -- Namespace     ModelElement &lt; -- GeneralizableElement     GeneralizableElement &lt; -- Classifier     GeneralizableElement &lt; -- TypedElement     TypedElement --&gt; Classifier : +type 1     TypedElement --&gt; ModelElement : +typedElement 0..*     ModelElement --&gt; ModelElement : +dependent 0..* {ordered}     ModelElement --&gt; ModelElement : +provider 0..*     GeneralizableElement --&gt; GeneralizableElement : +subtype 0..*     GeneralizableElement --&gt; GeneralizableElement : +supertype 0..* {ordered}     </pre> <p>Because of the similarities between the MOF-model and UML structure models, MOF meta-models are usually modeled as UML Class diagrams. You can also use the Metamodel page of the Toolbox to create MOF model elements and connectors. A supporting standard of MOF is XML, which defines an XML-based exchange format.</p> <p>MOF is a closed, strict meta-modeling architecture; every model element on every layer is strictly an instance of a model element of the layer above. MOF only provides a means to define the structure</p>	<p><a href="#">Class Diagrams</a> <sup>[80]</sup></p> <p><a href="#">Metamodel Group</a> <sup>[563]</sup></p>

Topic	Detail	See also
	<p>or abstract syntax of a languages or of data.</p> <p>Simplified, MOF uses the notion of Classes, as known from object orientation, to define concepts (model elements) on a meta-layer. These Classes (concepts) can then be instantiated through objects (instances) of the model layer below. Because an element on the M2 layer is an object (instance of an M3 model element) as well as a Class (an M2 layer concept) the notion of a <i>clabject</i> is used. <i>Clabject</i> is a merge of the words Class and Object.</p> <p>Another related standard is OCL, which describes a formal language that can be used to define model constraints by means of predicate logic.</p>	

**Learn More:**

- [Getting Started](#)<sup>[1640]</sup>
- [Export MOF to XML](#)<sup>[1641]</sup>

### 13.5.1 Getting Started

MOF diagrams are **Class** diagrams that are contained in packages with a metamodel stereotype.

To create a MOF diagram, follow the steps below

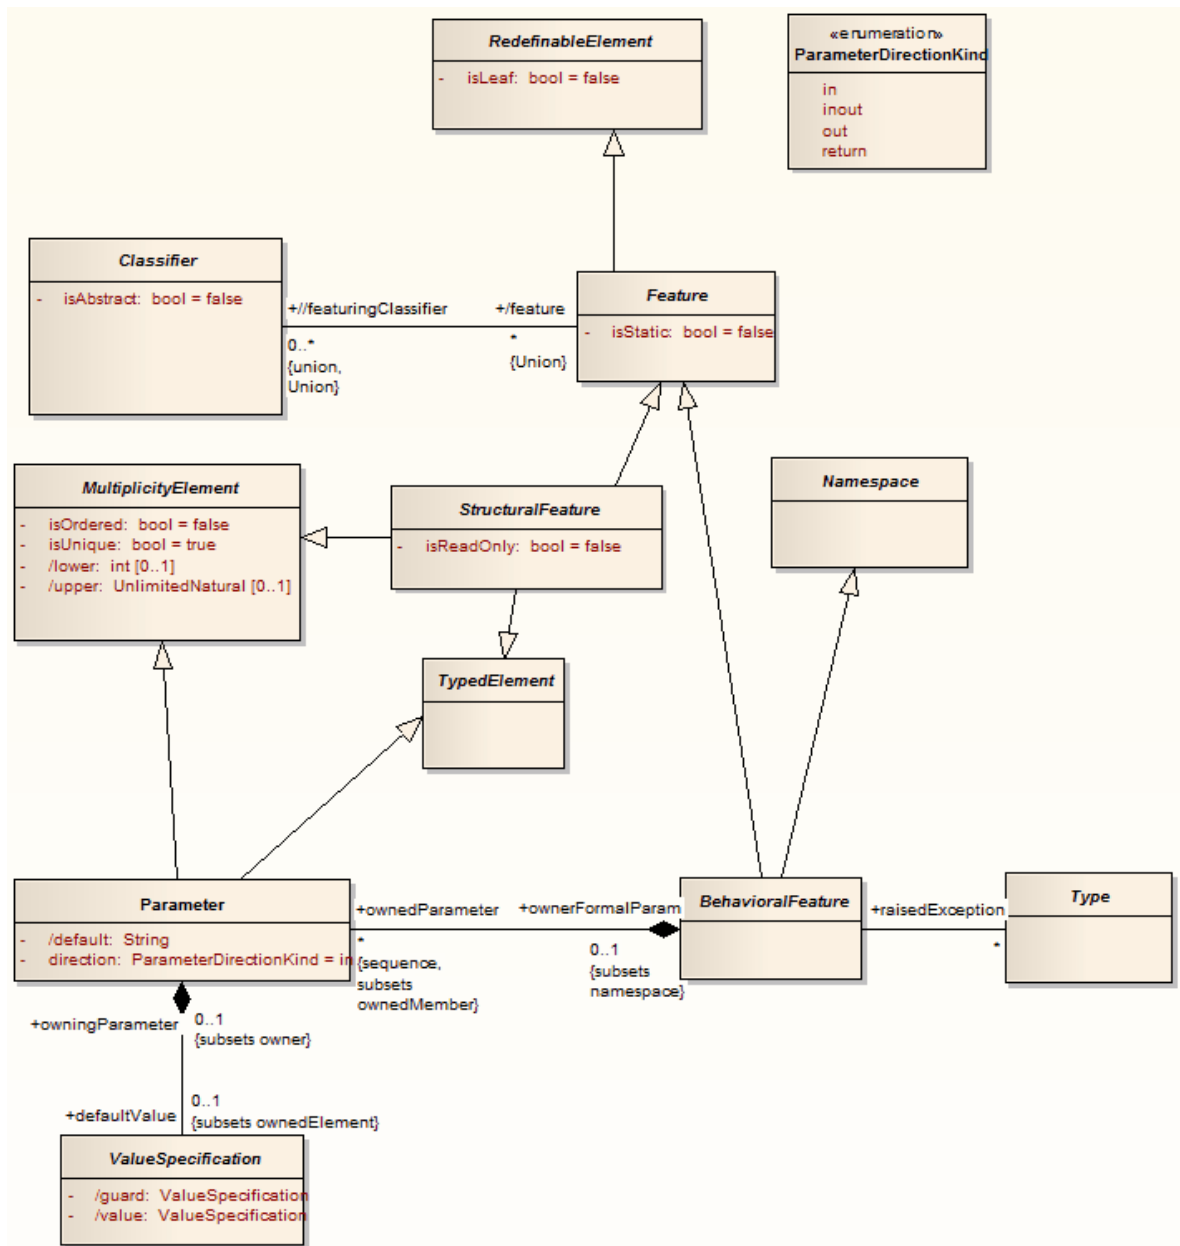

**How To:**

Step	Action	See Also
1.	Create a package to contain your MOF elements.	
2.	Double-click on the package name to display the <b>Properties</b> dialog.	
3.	In the <b>Stereotype</b> field type the value <b>metamodel</b> .	
4.	Click on the <b>OK</b> button.	
5.	Right-click on the package in the <b>Project Browser</b> and select the <b>Add   Add Diagram</b> context menu option. Create a Class diagram (the default diagram).	
6.	Give your MOF Class diagram an appropriate name.	
7.	In the <b>Toolbox</b> , select the <b>More tools   Metamodel</b> menu option and add the required <b>Metamodel</b> elements to the diagram.	<a href="#">Metamodel Group</a> <sup>[563]</sup>

**Example:**

The following is an example of a MOF diagram. A MOF diagram can typically contain Package, Class, Enumeration and Primitive elements, and Generalization, Association, Compose and Aggregate relationships.

**Learn More:**

- [Class Diagram](#) <sup>[800]</sup>

**13.5.2 Export MOF to XMI**

To export a MOF diagram to XMI, specifying the MOF 1.3 or MOF 1.4 standard, follow the steps below

**How To:**

Step	Action	See Also
1.	Right-click on the package in the <b>Project Browser</b> . The context menu displays.	

Step	Action	See Also
2.	Select the <b>Import/Export   Export Package to XMI file</b> menu option. The <b>Export Package to XMI</b> dialog displays:	
3.	In the <b>Filename</b> field, type a name for the XMI file.	
4.	De-select the <b>Enable full EA Roundtrip</b> checkbox.	
5.	In the <b>XMI Type</b> field, click on the drop-down arrow and select <b>MOF 1.3</b> or <b>MOF 1.4</b> .	
6.	Click on the <b>Export</b> button and wait until the <b>Progress</b> bar reads <b>100%</b> .	
7.	Once your file has been created, you can view it by clicking on the <b>View XMI</b> button.	<a href="#">Metamodel Group</a> [563]

**Notes:**

- MOF diagrams exported to XMI can be imported using the regular import XMI features of Enterprise Architect. See **Import from XMI**

**Learn More:**

- [Import from XMI](#) [324]

**Part**

## 14 Visual Execution Analyzer

This section describes the recording and visual analysis of executing applications in Enterprise Architect.

The Visual Execution Analyzer builds on and processes the structures and operations of the Model Driven Development Environment (MDDE). The MDDE provides tools to design, build and debug an application, forming part of the Debugger facilities of Enterprise Architect.

One of the primary objectives of the Visual Execution Analysis feature is to enable you to work with the stack traces you captured in debugging your application, to generate Sequence diagrams. This is a great way to document and understand what your program is doing during its execution phase.

**Access:** **Analyzer**  
**Project Manager package context menu | Execution Analyzer**

### Use To:

- Optimize existing system resources and understand resource allocation
- Ensure that the system is following the rules as designed
- Produce high quality documentation that more accurately reflects system behavior
- Understand how and why systems work
- Train new employees in the structure and function of a system
- Provide a comprehensive understanding of how existing code works
- Identify costly or unnecessary function calls
- Illustrate interactions, data structures and important relationships within a system
- Trace problems to a specific line of code, system interaction or event
- Visualize why a sequence of events is important
- Establish the sequence of events that occur immediately prior to system failure
- Simulate the execution of behavior models including State Machines, Activities and Interactions

### Topics:

Topic	See
Create a sample model for your language compiler, on which to examine the facilities of the Visual Execution Analyzer	<a href="#">Generate Example Model</a> [1648]
Record executing programs and represent the behavior as a UML Sequence diagram; recording is supported for: <ul style="list-style-type: none"> <li>• Microsoft Windows Native C</li> <li>• Microsoft Windows Native C++</li> <li>• Microsoft Windows Visual Basic</li> <li>• Microsoft .NET Family (C#, J#, VB)</li> <li>• Sun Microsystems Java</li> <li>• PHP</li> </ul>	<a href="#">Recording Sequence Diagrams</a> [1648]

Topic	See
Simulate UML behavior models to verify their logical and design correctness, for: <ul style="list-style-type: none"><li>• Activities</li><li>• Interactions and Sequences</li><li>• State Machines</li></ul>	<a href="#">Model Simulation</a> <small>[1693]</small>
Run xUnit tests	<a href="#">Unit Testing</a> <small>[1680]</small>
Record native Windows applications and profile their behavior	<a href="#">Profiling Native Applications</a> <small>[1669]</small>
Create and work with objects created within the Enterprise Architect modeling environment using a dynamic Object Workbench	<a href="#">Object Workbench</a> <small>[1674]</small>
Testpoint Management - provides the facility to pass or fail application tasks, viewing test results in real time as the program executes and results are saved	<a href="#">TestPoint Management</a> <small>[1684]</small>

**Learn more:**

- [Code, Build & Debug](#) [1398] (for the Enterprise Architect MDDE and Debugger)

## 14.1 Visual Execution Analyzer Samples

Enterprise Architect enables you to easily import complete sample models (packages), including all necessary model information, code and build scripts. These sample patterns make it simple to explore and try out the Visual Execution Analyzer. You can generate an example model for:

- Java
- Microsoft.NET
- Microsoft C++
- PHP Apache

**Access:** **Project | New Model (Ctrl+Shift+M) > VEA Examples**  
**Project Browser | Package context menu | Add | New Model > VEA Examples**

### Reference:

Field	Usage	See also
<b>Technology</b>	Select the appropriate technology	
<b>Name</b>	Displays the samples available for the selected technology; select the required sample to import	
description field	Displays a description of the selected sample	
<b>Destination folder</b>	Browse for and select the directory in which to load the source code for the sample	
<b>Use Local Path</b>	Enable the selection of an existing local path to place the source code under; changes the <b>Destination folder</b> field to a drop-down selection	
<b>Compiler command</b>	Displays the default compiler command path for the selected technology; you must either: <ul style="list-style-type: none"> <li>• Confirm that the compiler can be found at this path, or</li> <li>• Edit the path to the compiler location</li> </ul>	<a href="#">Local Paths</a> [1532] <a href="#">Local Paths Dialog</a> [1533]
<b>Edit Local Paths</b>	Many VEA examples specify their compiler using a local path  The first time you use any sample you must click on this button to ensure the local path points to the correct location  The Local Paths dialog displays	<a href="#">Local Paths</a> [1532] <a href="#">Local Paths Dialog</a> [1533]

### Notes:

- If required, you can define custom samples by adding files to the *AppSamples* directory where Enterprise Architect is installed; top-level directories are listed as Technologies and can contain an icon file to customize the icon displayed for the technology

Directories below this are defined as groups in the patterns list; the patterns are defined by the presence of four files with a matching name: a zip file (.zip), XML file (.xml), config file (.cfg) and optional icon (.ico)

- The *config* file supports the following fields:
  - [provider], [language], [platform], [url], [description], [version] - all displayed in the description field
  - [xmireootpaths] - the root path of the source code in the exported xmi; this is replaced with the selected destination folder when the user applies the application pattern

**Learn More:**

- [Model Wizard](#)<sup>[520]</sup>

## 14.2 Recording Sequence Diagrams

This section explains how to use the Visual Execution Analyzer to record execution data in the form of a Sequence Diagram.

A Sequence diagram provides easy to understand visual information including:

- A representation of how information is passed through a system
- The sequence of various functions and their corresponding parameters
- A clear view of how different Classes interact to create behavior
- A visual overview of how data structures are used to produce results

A Sequence diagram extends traditional analysis to help identify errors in logic, explain unexpected system behavior and identify data flow inconsistencies; the Visual Execution Analyzer extends analysis through the use of a comprehensive array of reports that detail everything from state transitions through to the contents of the stack at a given time.

**Access:** [Analyzer](#) | [Record](#) | [Recorder](#)

### Use To:

- Set up and control the recording of code execution
- Interpret the results of recording
- Generate Sequence diagrams from the recording, and moderate the contents of the diagram

### Topics:

Review the following topics in sequence:

Topic	Link
An overview of how the Visual Execution Analyzer creates a visual representation of the execution of an application, outlining the functions that are being called, the types of messages being sent, the key data structures used and the relationships between different Classes  The diagram makes it much simpler to understand how information is moved throughout the system and what values are being passed by various functions	<a href="#">How It works</a>  <sup>[1649]</sup>
Preparing to record execution of the application	<a href="#">Setup for Recording</a>  <sup>[1650]</sup>
Deploying recording markers, breakpoints and marker sets	<a href="#">Place Recording Markers</a>  <sup>[1653]</sup>
Controlling the recording session, using the Record & Analyze window	<a href="#">Control the Recording Session</a>  <sup>[1659]</sup>
Interpreting the results of a recording, saving and retrieving these results, generating a Sequence diagram from the recording, and reviewing the diagram	<a href="#">Generating Sequence Diagrams</a>  <sup>[1662]</sup>
A description of how you can generate Sequence diagrams that show transitions in state as a program executes	<a href="#">Add State Transitions</a>  <sup>[1664]</sup>

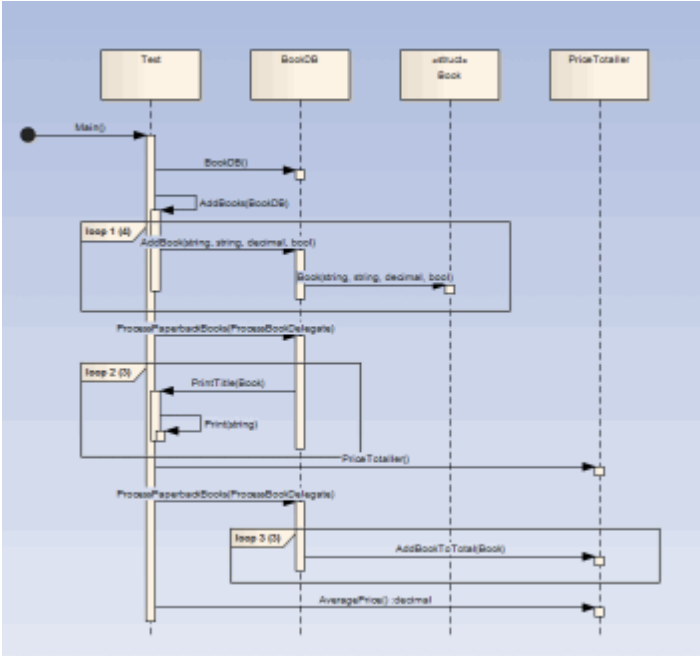

**Notes:**

- Recording is available to users of all editions of Enterprise Architect except the Desktop edition

**14.2.1 How it Works**

This topic explains how the Visual Execution Analyzer generates Sequence diagrams.

## 14.2.2 Setup for Recording

This section explains how you prepare to record execution of the application.

Topic	Link
Satisfying the prerequisites for recording execution of the application	<a href="#">Prerequisites</a> <sup>[1650]</sup>
Controlling the detail of a recording by adjusting the stack depth and applying filters	<a href="#">Configuring Recording Detail</a> <sup>[1650]</sup>

### 14.2.2.1 Pre-Requisites

This topic discusses the prerequisites for recording execution of the application

To set up the environment for recording Sequence diagrams you must

- Have completed the Basic setup for Build & Debug
- Be able to successfully debug the application

**Learn More:**

- [Build and Debug Prerequisites](#)<sup>[1399]</sup>
- [Build and Debug Setup](#)<sup>[1400]</sup>
- [Debugging](#)<sup>[1425]</sup>
- 

### 14.2.2.2 Configure Recording Detail

To avoid generating an overly complex sequence diagram, you need to control the scope of what is being recorded.

To narrow the scope of the recording, you can configure two Analyzer properties:

- Filtering - using the Analyzer Script you can exclude specific modules, Classes and functions from the recording
- Stack Depth - this can be used to speed up recording and present a clearer diagram (see Notes below)

**Access:** **Analyzer | Execution Analyzer (Shift + F12) Double-click on required Analyzer Script > Recording**

Topics:

Topic	Detail	See also
<p><b>Filtering</b></p>	<p>If the <b>Enable Filter</b> checkbox is selected on the Recording page of the Execution Analyzer Script Editor, the debugger excludes calls to matching methods from the generated Sequence history and diagram; the comparison is case-sensitive</p> <p>To add a value, click on the <b>New (Insert)</b> icon in the right corner of the Exclusion Filters box, and type in the comparison string; each filter string takes the form:</p> <pre>class_name_token::method_name_token</pre> <p>The <i>class_name_token</i> excludes calls to all methods of a Class or Classes that have a name matching the token; the string can contain the wildcard character * (asterisk)</p> <p>The <i>method_name_token</i> excludes calls to methods having a name that matches the token; again, the string can contain the wildcard character *</p> <p>Both tokens are optional; if no Class token is present, the filter is applied only to global or public functions (that is, methods not belonging to any Class)</p>	<p><a href="#">Managing Analyzer Scripts</a> <sup>[1400]</sup></p> <p><a href="#">Analyzer Script Editor</a> <sup>[1402]</sup></p>
<p><b>Example</b></p>	<p>In the Java example below, the debugger would exclude:</p> <ul style="list-style-type: none"> <li>• Calls to the <i>OnDraw</i> method for the Class <i>Example.common.draw.DrawPane</i></li> <li>• Calls to any method of any Class having a name beginning with <i>Example.source.Collection</i></li> <li>• Calls to any constructor for any Class (such as <i>&lt;clint&gt;</i> and <i>&lt;init&gt;</i>)</li> </ul> <div data-bbox="427 1323 874 1473" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p>Filters</p> <p>Example.common.draw.DrawPane::OnDraw</p> <p>Example.source.Collection*</p> <p>*:init*</p> </div> <p>In the Native Code example below, the debugger would exclude:</p> <ul style="list-style-type: none"> <li>• Calls made to Standard Template Library namespace</li> <li>• Calls to any Class beginning with <i>TOb</i></li> <li>• Calls to any method of Class <i>CLock</i></li> <li>• Calls to any Global or Public Function with a name beginning with <i>Get</i></li> <li>• Calls to the method <i>GetLocation</i> for Class <i>Ctrain</i></li> </ul> <div data-bbox="427 1771 874 1989" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;"> <p>Filters</p> <p>std*</p> <p>TOb*</p> <p>CLock</p> <p>CTrain::GetLocation</p> <p>::Get*</p> </div>	

**Reference:**

To Filter	Use Filter Entry
All public functions having a name beginning with <b>Get</b> from the recording session (for example, <i>GetClientRect</i> in Windows API)	:: Get *
All methods beginning with <b>Get</b> for every Class member method	* :: Get *
All methods beginning with <b>Get</b> from the Class <i>CClass</i>	CClass :: Get *
All methods for Class <i>CClass</i>	CClass :: *
All methods for Classes belonging to Standard Template and Active Template Libraries	ATL* std*
The specific method <i>GetName</i> for Class <i>CClass</i>	CClass :: GetName

**Notes:**

By default, the Analyzer stack depth is restricted to four frames. This is relative to the depth at which the recording marker is encountered.

You can control stack depth on the toolbar of either

- The Breakpoint and Markers window or
- The Record & Analyze window

**Learn More:**

- [Control Stack Depth](#)<sup>[1652]</sup>
- [Marker Types](#)<sup>[1653]</sup>
- [Recorder Toolbar](#)<sup>[1655]</sup>

**14.2.2.3 Control Stack Depth**

When recording particularly high-level points in an application, the stack frame count can result in a lot of information being collected; to achieve a quicker and clearer picture, it is better to limit the stack depth by setting the stack frame threshold.

**Access:** Analyzer | Record | Recorder

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Set the Control Stack depth in the numerical field on the toolbar of <b>Breakpoints and Markers</b> window or the <b>Record &amp; Analyze</b> window</p>  <p>The depth is relative to the stack depth where the Debugger first encountered the recording marker; so, when recording begins, if the stack depth is 6 and the limit depth is set to 3, the Debugger will record to a stack depth of 9</p> <p>For situations where the stack is very large, it is recommended that you first use a low stack frame threshold of 2 or 3 and gradually increase it if necessary to expand the picture.</p>	<p><a href="#">Breakpoint &amp; Markers</a> <sup>[1657]</sup></p> <p><a href="#">Control the Recording Session</a> <sup>[1658]</sup></p>

### 14.2.3 Place Recording Markers

This section explains how to deploy recording markers:

**Access:** **Analyzer | Break Points and Markers**

#### **Use To:**

Trace marking enables you to silently record code execution between two points. This can be used for generating a Sequence diagram. As this records the execution of multiple threads, it can be particularly useful in capturing event driven sequences (such as mouse and timer events).

Topic	Link
Explaining the types and effects of the various kinds of recording markers, which are similar to breakpoints but determine the action the debugger takes when it comes to one	<p><a href="#">Marker Types</a> <sup>[1653]</sup></p> <p><a href="#">Recording Activity for a Class</a> <sup>[1657]</sup></p> <p><a href="#">Recording Activity for a Single Method</a> <sup>[1658]</sup></p>
How to manage breakpoints in the Breakpoint & Markers window	<a href="#">The Breakpoint &amp; Markers Window</a> <sup>[1657]</sup>
How to activate and deactivate markers	<a href="#">Activate and Disable Markers</a> <sup>[1658]</sup>
Working with Marker Sets	<a href="#">Working with Marker Sets</a> <sup>[1659]</sup>

#### 14.2.3.1 Marker Types

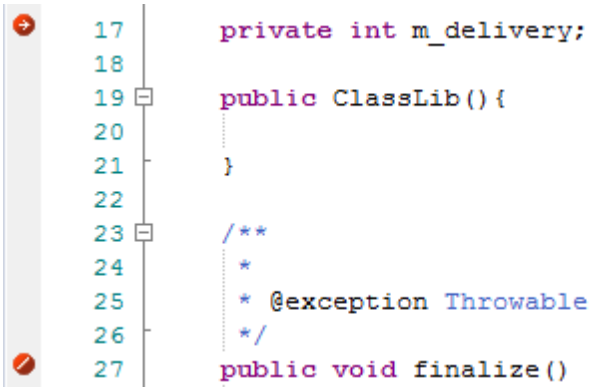

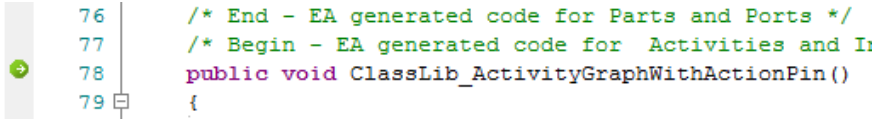

The recording markers are similar to breakpoints; however, instead of breaking execution as it does at a breakpoint, the debugger takes the action defined by the type of marker. If the marker is denoted as a recording *start point*, the debugger immediately begins to trace all executed calls from that point for the breaking thread. Recording is stopped again when either the thread that is being captured terminates or the thread encounters a recording *end point*.

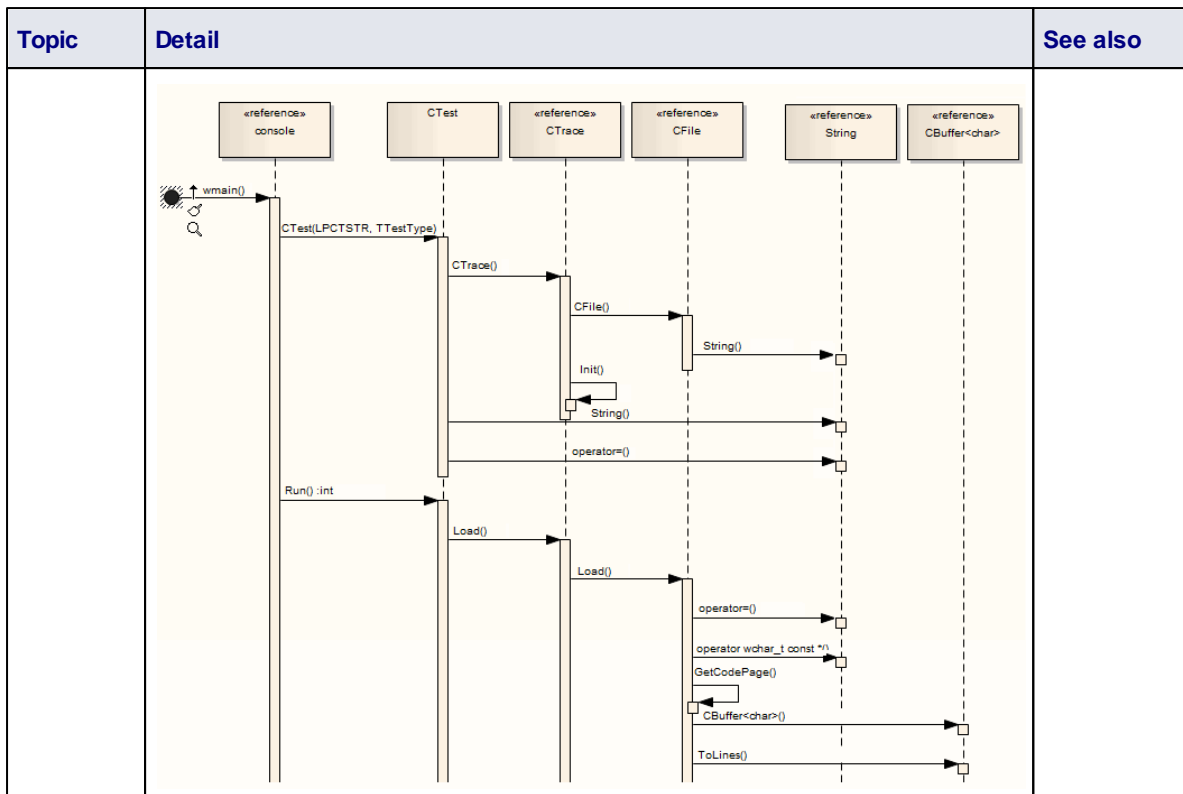

Recording markers are set in the source code editor. If you right-click on the breakpoint margin at the point to begin recording, a context menu displays that enables you to select the type of a marker.

**Use To:**

- Set Breakpoints and End points for recording
- Set Markers for a Single Method
- Set Stack Trace Markers

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Select the <b>Add Start Recording Marker</b> option, then right-click on the breakpoint margin at the point to stop recording and select the <b>Add End Recording Marker</b> context menu option; the markers are shown below:</p>  <pre> 17     private int m_delivery; 18 19     public ClassLib () { 20         ..... 21     } 22 23     /** 24     * 25     * @exception Throwable 26     */ 27     public void finalize () </pre> <p>When the debugger is executed it continues to run the thread, recording a stack history until either the <b>End Recording</b> marker is encountered or the thread terminates, unlike normal breakpoints where the debugger halts and displays the line of code</p> <p>In order to limit the amount of information being collected, you can control the stack depth being recorded.</p>	<p><a href="#">Breakpoints and Markers</a> <small>[1657]</small></p> <p><a href="#">Analyzer Script Editor</a> <small>[1402]</small></p> <p><a href="#">Control Stack Depth</a> <small>[1652]</small></p>
<b>Stack Auto-Capture Marker</b>	 <pre> 76     /* End - EA generated code for Parts and Ports */ 77     /* Begin - EA generated code for Activities and I 78     public void ClassLib_ActivityGraphWithActionPin () 79     { </pre> <p>(Native Code only) Stack markers enable you to capture any unique stack traces that occur at a point in an application; they provide a quick and useful picture of where a point in an application is being called from</p> <p>To insert a marker at the required point in code, right-click on the line and select the <b>Add Stack Auto Capture Marker</b> context menu option</p> <p>Each time the debugger encounters the marker it performs a stack trace; if the stack trace is not in the recording history, it is copied, and the application continues running</p>	

**Learn More:**

- [Recording Activity for a Single Method](#) <sup>1656</sup>
- [Recording Activity for a Class](#) <sup>1657</sup>

**14.2.3.1.1 Set Record Markers**

Markers are set in the code editor. Like breakpoints, they are placed on a line of code; when that line of code executes, the Execution Analyzer starts or stops recording code execution.

Step	Action	See also
1	Open the source code to debug in the integrated source code editor	<a href="#">Code Editors</a> <sup>1403</sup>
2	Find the appropriate code line and right click in the left margin to bring up the Analyzer context menu. Select one of the following: <ul style="list-style-type: none"> <li>• Add Start Recording Marker</li> <li>• Add End Recording Marker</li> <li>• Add Stack Auto Capture Recording Marker</li> </ul>	

Step	Action	See also
	<ul style="list-style-type: none"> <li> Add Breakpoint</li> <li> Add Start Recording Marker</li> <li> Add End Recording Marker</li> <li> Add Stack Auto Capture Marker</li> <li> Add Method Auto Record Marker</li> <li> Add Tracepoint Marker</li> <li>-----</li> <li> Help</li> </ul>	
3	Where a Start Recording Marker has been set, you must add an End Recording Marker	

### 14.2.3.2 Recording Activity for a Single Method

A **Method Auto Record** marker enables you to record activity for a particular function during a debug session. The debugger records any function calls executed after the marker point, and always stops recording when this function exits. The function marker combines a **Start Recording** marker and an **End Recording** marker in one.

#### Example:

```

185 ////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////////
186 // CRecurrenceDlg message handlers
187
188 BOOL CRecurrenceDlg::OnInitDialog()
189 {
190     CBCGPDIALOG::OnInitDialog();
191
192     UINT nMask =
193         CBCGPDateTimeCtrl::DTM_SPIN      |
194         CBCGPDateTimeCtrl::DTM_DATE     |
195         CBCGPDateTimeCtrl::DTM_TIME     |
196         CBCGPDateTimeCtrl::DTM_CHECKBOX |
197         CBCGPDateTimeCtrl::DTM_DROPCALENDAR |
198         CBCGPDateTimeCtrl::DTM_CHECKED;
199
200     UINT nFlags = CBCGPDateTimeCtrl::DTM_CHECKED | CBCGPDateTimeCtrl::DI
201     //-----
202     // Setup date fields:

```

Related Topics:

[Breakpoint and Marker Management](#) <sup>[1444]</sup>

#### 14.2.3.4.1 Activate and Disable Markers

This topic describes how to delete, enable and disable breakpoints and markers.

Topics:

Topic	Detail	See also
<b>Delete a breakpoint or marker</b>	To delete a specific breakpoint: <ul style="list-style-type: none"> <li>• If the breakpoint is enabled, click on the red breakpoint circle in the left margin of the Source Code Editor, or</li> <li>• Right-click on the breakpoint or marker in the Source Code Editor, the <i>Breakpoints</i> folder or the Breakpoints &amp; Markers window and select the <b>Delete</b> context menu option, or</li> <li>• Select the breakpoint in the Breakpoints &amp; Markers tab and press ( <b>Delete</b> )</li> </ul>	<a href="#">Setting Code Breakpoints</a> <sup>[1446]</sup> <a href="#">Breakpoint and Marker Management</a> <sup>[1444]</sup>
<b>Delete all breakpoints</b>	Click on the <b>Delete all breakpoints</b> button on the Breakpoints & Markers window toolbar (  )	
<b>Convert breakpoint to Start Recording marker or End Recording marker</b>	In the <i>Breakpoints</i> folder or the Breakpoints & Markers window, right-click on the breakpoint and select the context menu option to convert it to either a <b>Start Recording</b> marker or an <b>End Recording</b> marker	
<b>Disable a breakpoint</b>	Deselect the checkbox against the breakpoint or marker, on the Breakpoints & Markers window  The breakpoint is then shown as an empty grey circle	
<b>Enable a breakpoint or marker</b>	Select the checkbox against the breakpoint or marker, on the Breakpoints & Markers window	
<b>Disable all breakpoints</b>	Click on the <b>Disable all breakpoints</b> button in the Breakpoints & Markers window toolbar (  )	
<b>Enable all breakpoints</b>	Click on the <b>Enable all breakpoints</b> button in the Breakpoints & Markers window toolbar (  )	

Learn More:

- [Marker Types](#) <sup>[1653]</sup>

#### 14.2.3.4.2 Working with Marker Sets

Marker sets enable you to group markers into collections.

##### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>A marker set can be used to record a specific Use Case, which might involve the operations of various Classes</p> <p>Once a set is created it is saved with the model; any user using the model has access to that set</p> <p>Sets are normally loaded prior to the point at which an action is to be captured; for example, to record a sequence involving a particular dialog, you might set markers for the areas to record, saving the markers as a set</p> <p>When you begin debugging, prior to invoking the dialog you would load the set; once you bring up the dialog in the application, the operations you have marked are recorded</p> <p>Review the recording history and create a Sequence diagram</p>	

### 14.2.4 Control the Recording Session

The Record & Analyze window enables you to control a recording session. The control has a toolbar and history window that displays the recording history as it is captured. Each entry in this window represents a call sequence made up of one or more function calls.

**Access:** **Analyzer | Record | Recorder**

You must also open the Execution Analyzer window (**Analyzer | Execution Analyzer**), which lists all the scripts in the model; make sure the active script is appropriate for the recording to make.

##### Learn More:

- [Recorder Toolbar](#)<sup>[1659]</sup>
- [Start Recording](#)<sup>[1661]</sup>
- [State Transition Recorder](#)<sup>[1661]</sup>

#### 14.2.4.1 Recorder Toolbar

The Record & Analyzer Toolbar is described below.

##### Reference:

Icon	Description	See also
	<p>The <b>Recording</b> icon is enabled when the active Analyzer Script is configured for debugging</p> <p>Use this icon to launch and record the application described in the script</p>	<a href="#">Start Recording</a> <sup>[1661]</sup>

Icon	Description	See also
	You can optionally select a record marker set and / or a State machine to use during the recording	<a href="#">Recording Activity for a Class</a> <sup>[1657]</sup>
	<p>The <b>Recording</b> (attach to process) icon is enabled even if no Analyzer Script exists</p> <p>When you use this icon, a prompt displays to select a process to record and a debugging platform to use</p> <p>You can also optionally select a record marker set and / or a State machine to use during the recording</p>	<a href="#">Start Recording</a> <sup>[1657]</sup>  <a href="#">Recording Activity for a Class</a> <sup>[1657]</sup>
	<p>Use the <b>Manual Record</b> icon to perform ad-hoc recording of the current thread during a debug session</p> <p>Used in conjunction with the 'step' buttons of the debugger; each function that is called due to a step command is logged to the history window</p> <p>This icon is only enabled if no recording is taking place and you are currently at a breakpoint (that is, debugging)</p>	
	<p>Use the <b>Auto Record Selected Thread</b> icon to perform ad-hoc auto-recording during a debug session</p> <p>When you select this icon, the Analyzer begins recording and does not stop until either the program ends, you stop the debugger or you click on the <b>Stop</b> icon</p> <p>This icon is only enabled if no recording is taking place and you are currently at a breakpoint (that is, debugging)</p>	
	<p>Use the <b>Step Through</b> icon to step into a function, record the function call in the History window, and step back out</p> <p>Enabled for manual recording only</p>	<a href="#">Step Through Function Calls</a> <sup>[1458]</sup>
	Use the <b>Stop Recording</b> icon to stop recording the execution trace	
	Use this field to define the marker set's recording stack depth - the number of frames from the point recording began	<a href="#">Marker Types</a> <sup>[1653]</sup>
	<p>Select the <b>Show/Hide lines during recording</b> icon to show live line-by-line execution in the code editors as the program runs</p> <p>This icon is disabled if marker sets are in use</p>	
	Use this icon to select an XML file from which to load a previously-saved recording history	
	Use the <b>Save Recording History to file</b> icon to save the recording history to an XML file	<a href="#">Saving Recording</a> <sup>[1664]</sup>
	Use the <b>Generate Sequence Diagram from recording</b> icon to generate a Sequence/State diagram from the Execution Analyzer trace	<a href="#">Generate a Diagram</a> <sup>[1663]</sup>
	Use the <b>Testpoints</b> icon to generate a TestPoints diagram from the Execution Analyzer trace, including Classes, Test Cuts and a Test Set that can be used with the Testpoint facility	<a href="#">Testpoint Management</a> <sup>[1684]</sup> <a href="#">Generate a Diagram</a> <sup>[1663]</sup>

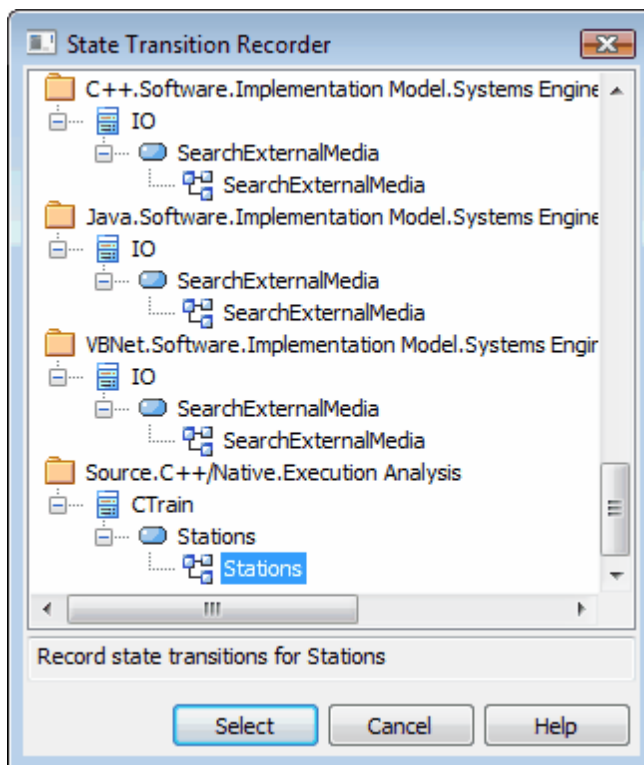

#### 14.2.4.1.1 Start Recording

When you begin recording the Record dialog displays, on which you can optionally select a marker set to use and choose State Transitions to record during the session. The Execution Analyzer captures instances of the Class that the State Machine refers to and calculates the State whenever a function in the recorded stack exits.

Button	Detail
Using record set	Recording markers determine what is recorded If you have a recording set to use you can select it here
Using Statechart / Diagram	The recording can also capture changes in State transitions If you have a State Machine to use you can select it by clicking on this button

#### 14.2.4.2 State Transition Recorder

The State Transition dialog presents a list of State Machines for the entire model. The Execution Analyzer can capture State Transitions designed on the Statechart while it is recording. When the Sequence Diagram is generated the diagram depicts not only the sequence but changes in State at the various points in the sequence. Each Class instance participating in the detection process is displayed with its own lifeline.

## 14.2.5 Generating Sequence Diagrams

### Topics:

Topic	Detail	See also
Usage	<p>Once you have captured activity and are about to generate the diagram:</p> <ul style="list-style-type: none"> <li>Select a package in the Project Browser where the Sequence diagram is to be stored</li> <li>Use the <b>Generate Sequence Diagram from recording</b> button on the Record &amp; Analyze window toolbar to generate the diagram</li> </ul>	<a href="#">Recorder Toolbar</a> <small>1659</small>

### 14.2.5.1 The Recording History

All information recorded as a result of the application encountering recording markers set by the user is held in the Record & Analyze window.

### Topics:

Topic	Detail	See also
Columns	<p>The columns in this Record &amp; Analyze window are as follows:</p> <ul style="list-style-type: none"> <li><b>Sequence</b> - The unique sequence number</li> <li><b>Threads</b> - The operating system thread ID</li> <li><b>Delta</b> - The elapsed thread CPU time since the start of the sequence</li> <li><b>Method</b> - There are two <b>Method</b> columns: the first shows the caller for a call or for a current frame if a return; the second shows the function called or function returning</li> <li><b>Direction</b> - <i>Stack Frame Movement</i>, can be <i>Call</i>, <i>Return</i>, <i>State</i>, <i>Breakpoint</i> or <i>Escape</i> (<i>Escape</i> is used internally when producing a Sequence diagram, to mark the end of an iteration)</li> <li><b>Depth</b> - The stack depth at the time of a call; used in the generation of Sequence diagrams</li> <li><b>State</b> - The state between sequences</li> <li><b>Source</b> - There are two Source columns: the first shows the source filename and line number of the caller for a call, or for a current frame if a return; the second shows the source filename and line number of the function called or function returning</li> <li><b>Instance</b> - There are two Instance columns; these columns only have values when the Sequence diagram produced contains State transitions. The values consist of two items separated by a comma - the first item is a unique number for the instance of the Class that was captured, and the second is the actual instance of the Class</li> </ul> <p>For example: supposing a Class <i>CName</i> has an internal value of 4567 and the program created two instances of that Class; the values might be:</p> <ul style="list-style-type: none"> <li>4567,1</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>4567,2</li> </ul> <p>The first entry shows the first instance of the Class and the second entry shows the second instance</p>	
<b>Toolbar</b>	The Record & Analyze window toolbar provides a range of facilities for controlling the recording of the execution of an Analyzer script	<a href="#">Recorder Toolbar</a> <sup>[1659]</sup>

**Notes:**

- The checkbox against each number is used to control whether or not this call should be used to create a Sequence diagram from this history
- In addition to enabling or disabling the call using the checkbox, you can use context menu options to enable or disable an entire call, all calls to a given method, or all calls to a given Class

**14.2.5.2 Generate a Diagram****Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>To generate a Sequence diagram for:</p> <ul style="list-style-type: none"> <li>All history, click on the toolbar <b>Create Sequence Diagram</b> icon (  )</li> <li>A single sequence, select it and then click the toolbar <b>Create Sequence Diagram</b> icon (  )</li> </ul>	<a href="#">The Recording History</a> <sup>[1662]</sup>

**14.2.5.3 Diagram Features**

When you generate a Sequence diagram, it includes the following features:

Feature	Detail	See also
<b>References</b>	<p>When the Visual Execution Analyzer cannot match a function call to an operation within the model, it still creates the sequence but also creates a reference for any Class that it cannot locate</p> <p>It does this for all languages</p>	
<b>Fragments</b>	<p>Fragments displayed in the Sequence diagram represent loops or iterations of a section(s) of code</p> <p>The Visual Execution Analyzer attempts to match function scope with method calls to as accurately as possible represent the execution visually</p>	
<b>States</b>	<p>If a State Machine has been used during the recording process, any transitions in State are presented after the method call that caused the transition to occur</p> <p>States are calculated on the return of every method to its caller</p>	

### 14.2.5.4 Saving Recording

This topic explains how to save a recorded sequence to an XML file, and retrieve it.

Action	Detail	See also
<b>To Save</b>	To save a recorded sequence to an XML file, click on the sequence and on the toolbar <b>Save</b> icon (  )	<a href="#">Recorder Toolbar</a> <sup>[1659]</sup>
<b>To Access</b>	To access an existing sequence XML file, either: <ul style="list-style-type: none"> <li>• Click on the toolbar <b>Open</b> icon (  ), or</li> <li>• Right-click on a blank area of the screen and click on the <b>Load Sequence From File</b> context menu option</li> </ul> The Windows Open dialog displays, from which you select the file to open	<a href="#">Recorder Toolbar</a> <sup>[1659]</sup>

### 14.2.6 Add State Transitions

This section describes how you can generate Sequence diagrams that show transitions in state as a program executes.

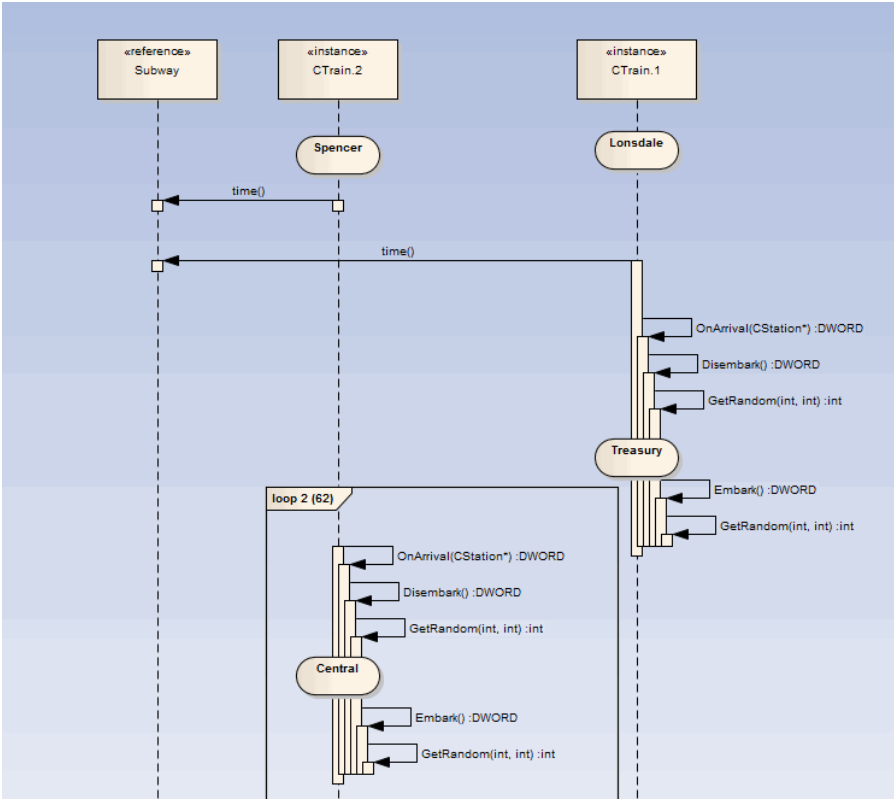

Topic	Link
Setup for capturing changes	<a href="#">Setup for Capturing State Changes</a> <sup>[1664]</sup>
State change during the execution of an application	<a href="#">The State Machine</a> <sup>[1666]</sup>
Recording and Mapping state changes	<a href="#">Recording and Mapping State Changes.</a> <sup>[1668]</sup>

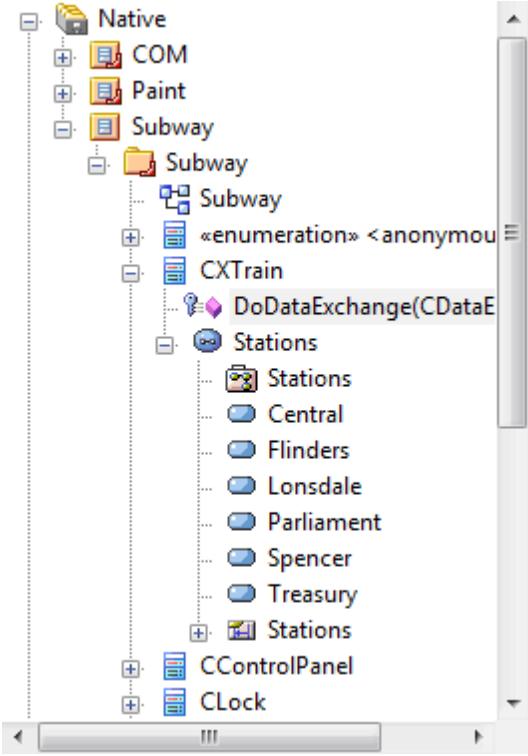

#### 14.2.6.1 Setup for Capturing State Changes

You can generate Sequence diagrams that show transitions in state as a program executes. The illustration below shows a project that has, in its State Machine, a number of States that correspond to stations in the Melbourne underground railway system.

#### Topics:

Topic	Detail	See also
<p><b>State Transitions</b></p>	 <p>Showing State transitions on your debug-generated Sequence diagrams is optional; you set an option in the package script associated with the Class for which you intend to record States</p> <p>You then create a State Machine under the Class, and on the State Machine you create the State elements that correspond to any states to be captured for your Class</p> <p>The debugger evaluates your States by checking constraints on the States you create; the States on this diagram are then used by the debugger and State transitions are incorporated into the diagram</p>	
<p><b>Example</b></p>		

Topic	Detail	See also
	 <p>This figure shows the Class <i>CXTrain</i> with a State Machine called <i>Stations</i>; it has a child diagram also called <i>Stations</i>, on which the States {<i>Central, Flinders, Lonsdale...</i>} are placed</p>	

**Notes:**

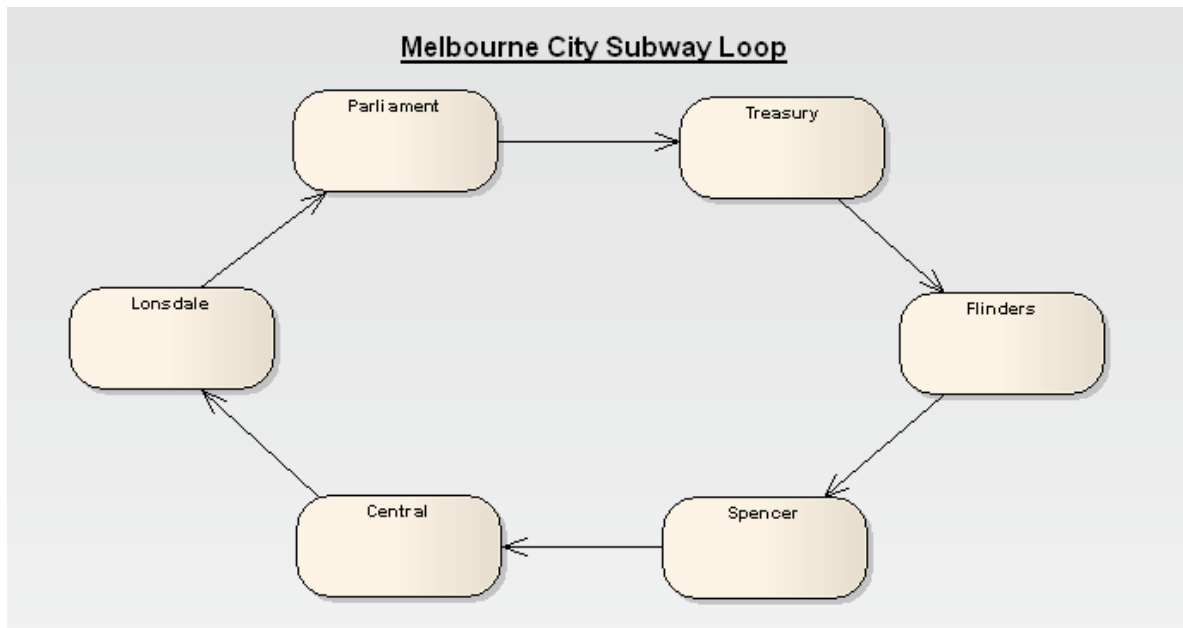

- If you do not have a package script for the Class or package you must create one; Sequence diagrams can only be generated for a package that has been configured for debug

**14.2.6.2 The State Machine**

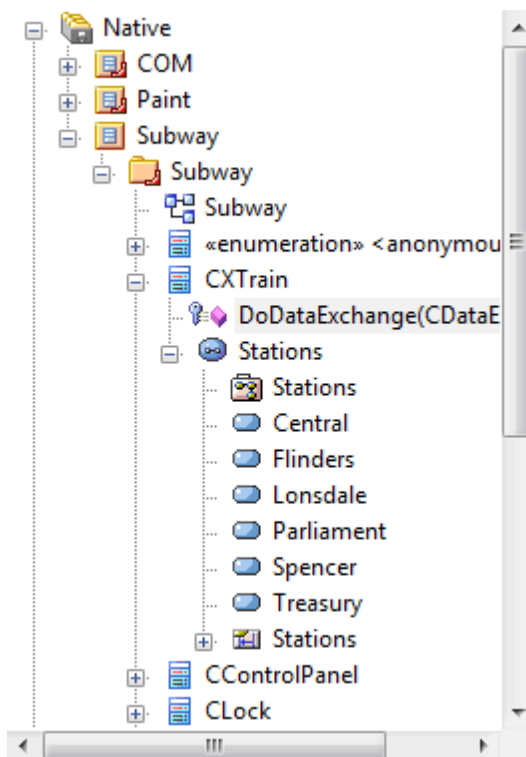

A State Transition diagram can be used to illustrate how States change during the execution of an application. The Visual Execution Analyzer can build a State Machine to model all the valid system states and explicitly describe the transitions between each state.

The diagram below is a State Machine that shows the different States within the Melbourne Underground Loop subway system. A train traveling on the subway network can be stopped at any of the stations represented on the State Machine.

**Example:**

This State Machine diagram is a child of the *CXTrain* Class.

### 14.2.6.3 Recording and Mapping State Changes

#### Topics:

Topic	Detail	See also									
<p><b>Example</b></p>	<p>The State Properties dialog shown below is for the State called <i>Parliament</i>; the Constraints tab is open to show how the State is linked to the Class <i>CXTrain</i></p> <p>A State can be defined by a single constraint or by many; in the example below the State <i>Parliament</i> has two constraints:</p> <div data-bbox="483 683 1289 862" style="border: 1px solid gray; padding: 5px;"> <p>Defined Constraints   <span style="float: right;">New Save Delete</span></p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="width: 70%;">Constraint</th> <th style="width: 15%;">Type</th> <th style="width: 15%;">Status</th> </tr> </thead> <tbody> <tr> <td>Location=0</td> <td>Invariant</td> <td>Approved</td> </tr> <tr> <td>Departing.Name=Parliament</td> <td>Invariant</td> <td>Approved</td> </tr> </tbody> </table> </div> <p>The values of constraints can only be compared for <i>elemental</i>, <i>enum</i> and <i>string</i> types</p> <p>The <i>CXTrain</i> Class has a member called <i>Location</i> of type <i>int</i>, and a member called <i>Departing.Name</i> of type <i>CString</i>; what this constraint means is that this State is evaluated to <b>true</b> when:</p> <ul style="list-style-type: none"> <li>• an instance of the <i>CXTrain</i> Class exists and</li> <li>• its member variable <i>Location</i> has the value <b>0</b> and</li> <li>• the member variable <i>Departing.Name</i> has the value <b>Parliament</b></li> </ul>	Constraint	Type	Status	Location=0	Invariant	Approved	Departing.Name=Parliament	Invariant	Approved	
Constraint	Type	Status									
Location=0	Invariant	Approved									
Departing.Name=Parliament	Invariant	Approved									
<p><b>Operators in Constraints</b></p>	<p>There are two types of operators you can use on constraints to define a State:</p> <ul style="list-style-type: none"> <li>• Logical operators AND and OR can be used to combine constraints</li> <li>• Equivalence operators {= and !=} can be used to define the conditions of a constraint</li> </ul> <p>All the constraints for a State are subject to an AND operation unless otherwise specified; you can use the OR operation on them instead, so you could rewrite the constraints in the above example as:</p> <pre>Location=0 OR Location=1 AND Departing.Name!=Central</pre> <p>Below are some examples of using the equivalence operators:</p> <pre>Departing.Name!=Central AND Location!=1</pre>										

#### Notes:

- Quotes around strings are optional; the comparison for strings is always case-sensitive in determining the truth of a constraint

## 14.3 Profiling Native Applications

**Notes:**

- The Profiler, or sampler, is available in the Enterprise Architect Professional, Corporate, Business and Software Engineering, System Engineering and Ultimate editions

**Learn More:**

- [Profiler System Requirements](#) <sup>[1669]</sup>
- [Profiler Operation](#) <sup>[1672]</sup>

### 14.3.1 System Requirements

**Topics:**

Topic	Detail	See also
<b>Prerequisites</b>	Options on the Profiler window toolbar enable you to attach to an existing process, or to launch a new application if a Package Script been specified	<a href="#">Profiling Native Applications</a> <sup>[1669]</sup>

Topic	Detail	See also
		<a href="#">Getting Started</a> [1670]
<b>Supported Platforms</b>	<p>Enterprise Architect supports profiling on native Windows applications (C, C++ and Visual Basic) compiled with the Microsoft™ native compiler, where an associated PDB file is available; select <b>Microsoft Native</b> from the list of debugging platforms in your package script</p> <p>The Profiler can sample both Debug and Release configurations of an application, providing the PDB for each executable exists and is up to date</p>	

### 14.3.2 Getting Started

**Access:** [Analyzer](#) | [Profile](#)

**Topics:**

Topic	Detail	See also
<b>Abstract</b>	<p>The Profiler operates by taking samples of a process at intervals of up to 250 milliseconds</p> <p>At these intervals the Profiler interrupts the process and collects stack information for all threads running at that time; this information is sent back to Enterprise Architect where it is collected sorted and stored</p> <p>You can pause and resume profiling at any time during the session, or clear any sample data collected and begin again</p> <p>If you stop the Profiler and the process is still running, you can quickly attach to it again</p>	

**Toolbar Options:**

Icon	Action	See Also
	(When an application is configured for the package) create the Profiler process, which launches the configured application	<a href="#">Managing Scripts</a> [1400]
	Profile an application that is already running	
	When the application is running, pause and resume sample capture Pausing sampling enables the <b>Report</b> and <b>Erase</b> buttons	
	Stop the Profiler process; if any samples have been collected, the <b>Report</b> button is enabled	
	Generate a report on the current number of samples collected	<a href="#">Profiling Native Application</a> [1669]

Icon	Action	See Also
	Set the interval, in milliseconds, at which samples are taken of the target process; the range of possible values is <b>1 - 250</b>	<a href="#">Setting Options</a> <small>[1672]</small>
	Set Profiler options, using a drop-down menu; the options are: <ul style="list-style-type: none"> <li>• <b>Load Report from Disk</b> - load and display a previously-generated report from an XML disk file</li> <li>• <b>Analyzer Scripts ( Shift+F12 )</b> - display the Execution Analyzer window to enable creation or editing of scripts and debug configuration</li> <li>• <b>Start Sampling Immediately</b> - begin sample collection immediately upon either process start (main thread entry point executed) or attachment of process by Profiler</li> <li>• <b>Capture Debug output</b> - capture any appropriate debug output and redirect it to the Enterprise Architect Output window</li> <li>• <b>Stop Process on Exit</b> - select to terminate the target process when the Profiler is stopped</li> </ul>	<a href="#">Build</a> <small>[1423]</small>
	Erase the collected data	
	Display the Help topic for this window	

### 14.3.3 Start & Stop the Profiler

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>For most debugging operations it is necessary to have first configured a Package Script that typically defines the application to build, test and debug, and any sequence recording options</p> <p>It is possible to use the Profiler without doing any of this by using the <b>Attach to Process</b> button</p> <p>If the application to profile is the one defined in the current package, use the <b>Launch</b> button</p> 	
<b>Buttons</b>	(When an application is configured for the package) create the Profiler process, which launches the configured application	<a href="#">Managing Scripts</a> <small>[1406]</small>
	Profile an application that is already running	
	Stop the Profiler process	

### 14.3.4 Profiler Operation

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Enterprise Architect creates a Profiler process whenever you click on the <b>Launch</b> or <b>Attach to Process</b> button on the Profiler window toolbar; this process operates by collecting samples from the stacks of every thread in the target process</p> <div data-bbox="349 633 1195 817" data-label="Diagram"> <pre> classDiagram     class EA     class Profiler     class TargetApplication     EA ..&gt; Profiler : «flow»     Profiler ..&gt; TargetApplication : «flow»   </pre> </div> <p>The sampler process exits if you click on the <b>Stop</b> button, if the target application terminates, or if you close the current model</p> <p>You can turn sample collection on and off at any time during a session</p> <p>When sampling is turned on or resumed, the Profiler process becomes active and samples are collected from the target; resuming sampling collects completely new samples</p> <p>The Profiler process idles if sampling is turned off or paused during a session. The <b>Report</b> and <b>Erase</b> buttons then become enabled</p> <p>Click on the <b>Report</b> button to produce a call graph summary similar to that in the <i>Profile Native Applications</i> topic; this report can be saved to file</p> <p>Click on the <b>Erase</b> button to discard any samples currently collected for the target</p>	<a href="#">Profile Native Applications</a> 

### 14.3.5 Setting Options

#### Topics:

Topic	Icon	Detail	See also
<b>Interval</b>		Set the interval, in milliseconds, at which samples are taken of the target process; the range of possible values is <b>1 - 250</b>	
<b>Profile Options</b>		<p>Set Profiler options, using a drop-down menu; the options are:</p> <ul style="list-style-type: none"> <li>• <b>Start Sampling Immediately</b> - begin sample collection immediately upon either process start (main thread entry point executed) or attachment of process by Profiler</li> <li>• <b>Capture Debug output</b> - capture any appropriate debug output and redirect it to the Enterprise Architect Output window</li> <li>• <b>Stop Process on Exit</b> - select to terminate the target process when the Profiler is stopped</li> </ul>	

### 14.3.6 Save and Load Reports

#### Topics:

Topic	Detail	See also																																
<b>Usage</b>	<p>The Profiler Reports can be saved in either binary format or xml format.; save the report using the toolbar above the report (Stack) view</p> <table border="1"> <thead> <tr> <th>Stack</th> <th>Inclusive Hits</th> <th>Hits</th> <th>Inclusive Hi...</th> </tr> </thead> <tbody> <tr> <td>[-] CBCGPVisualManager2010::OnUpdateSystemColors</td> <td>200</td> <td></td> <td>72%</td> </tr> <tr> <td>[-] CBCGPAdapterManager::ExcludeTag</td> <td>85</td> <td></td> <td>31%</td> </tr> <tr> <td>[-] mfc90ud</td> <td>84</td> <td></td> <td>30%</td> </tr> <tr> <td>[-] BCGCBPRO1100ud90</td> <td>1</td> <td>1</td> <td>0%</td> </tr> <tr> <td>[-] CBCGPControlRenderer::Create</td> <td>32</td> <td></td> <td>12%</td> </tr> <tr> <td>[-] CBCGPAdapterManager::ReadControlRenderer</td> <td>62</td> <td></td> <td>22%</td> </tr> <tr> <td>[-] CBCGPAdapterManager::ParseControlRenderer</td> <td>56</td> <td></td> <td>20%</td> </tr> </tbody> </table> <p>To load a report, use the Profiler Toolbar <b>Options</b> button  and select the <b>Load Report From Disk</b> option</p>	Stack	Inclusive Hits	Hits	Inclusive Hi... ### 14.3.7 Save Report in Team Review

You can save any current report as a resource for a Category, Topic or Post in the Team Review. The report can then be shared and reviewed at any time as it is saved with the model.

**Access:** [Team Review Context Menu](#) | [Share Resource](#) | [Add Active Profiler Report](#)

#### Use to:

- Preserve a profiler report to compare against future runs
- Allow other people to investigate the profile

#### Learn More:

- [\(Team Review\) Context Menu](#)<sup>[219]</sup>

## 14.4 Object Workbench

This section describes the Object Workbench, a tool in Enterprise Architect Debugging that enables you to create your own variables and invoke methods on them.

Topic	Link
Setup requirements for the workbench	<a href="#">Workbench Setup</a> <small>[1674]</small>
Overview - your methods can be invoked to record Stack trace and produce Sequence diagrams	<a href="#">How it works</a> <small>[1675]</small>
Description of workbench variables	<a href="#">Workbench Variables</a> <small>[1676]</small>
How to create workbench variables	<a href="#">Create Workbench Variables</a> <small>[1676]</small>
How to invoke methods	<a href="#">Invoke Methods</a> <small>[1677]</small>

### 14.4.1 Workbench Setup

This topic describes the requirements for setting up the Object Workbench on Java and Microsoft .NET.

#### **Java Workbench:**

To use the Object Workbench you must have created an Analyzer Script for the package and configured the Debugger.

The Java workbench uses the Virtual Machine settings configured in the Analyzer Script Debug page to create the JVM.

#### **Microsoft .NET Workbench:**

You must have created an Analyzer Script for the package and configured the Debugger.

The .NET workbench requires an assembly, which is used to create the workbench items. You specify the path to the assembly on the Workbench page of the Analyzer Script.

Debug Platform: Microsoft Native

Microsoft .NET

The specified assembly is used to create the Workbench Objects.

Java

The workbench uses the same runtime options defined in the debugging section.

Native

Not supported.

The Workbench Page of the Analyzer Script

## 14.4.2 How it Works

The Workbench is a tool in Enterprise Architect Debugging, enabling you to create your own variables and invoke methods on them. Stack trace can be recorded and Sequence diagrams produced from the invocation of such methods. It provides a quick and simple way to debug your code.

### Topics:

Topic	Detail	See also
<b>Platforms Supported</b>	<p>The Workbench supports the following workbench platforms:</p> <ul style="list-style-type: none"> <li>• Microsoft .NET (version 2.0 or later)</li> <li>• Java (JDK 1.4 or later)</li> </ul> <p>The Workbench does not currently support the creation of Class instances written in native C++, C or VB</p>	
<b>Mode</b>	<p>The Workbench operates in two modes:</p> <ul style="list-style-type: none"> <li>• Idle mode - When the Workbench is in idle mode, instances can be created and viewed and their members inspected</li> <li>• Active mode - When methods are invoked on an instance, the Workbench enters Active mode and the displayed variables change if the debugger encounters any breakpoints; if no breakpoints are set, then the variables do not change and the Workbench immediately returns to Idle mode</li> </ul>	
<b>Logging</b>	<p>The results of creating variables and the results of calls on their methods are displayed in the Debug Output window</p>	<p><a href="#">Show Output From Debugger</a> [1455]</p>

### Learn More:

- [Create Workbench Variables](#) [1676]
- [Invoke Methods](#) [1677]

### 14.4.3 Workbench Variables

You can create (and delete) workbench variables from any Class in your model. When you do so, you are asked to name the variable. It then displays in the Workbench window, showing the variable in a hierarchy and displaying its type and value and those of any members.

#### Topics:

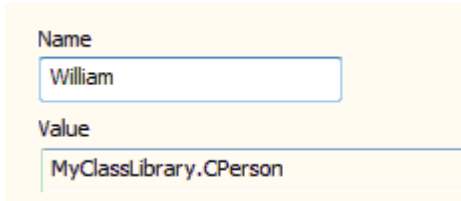

Topic	Detail	See also
<b>Workbench Requirements</b>	<ul style="list-style-type: none"> <li>.NET framework version 2 is required to workbench any .NET model</li> <li>The package from which the variable is created must have a debugger configured</li> </ul>	<a href="#">Setup For Debugging</a> <sup>[1426]</sup>
<b>Constraints (.NET)</b>	<ul style="list-style-type: none"> <li>Members defined as <i>struct</i> in managed code are not supported</li> <li>Classes defined as <i>internal</i> are not supported</li> </ul>	
<b>Delete Workbench Variables</b>	<p>You can delete variables using the <b>Delete</b> shortcut menu on any instance on the Workbench</p> <p>If all instances are deleted, the debugger is shut down and the Workbench window is closed</p>	

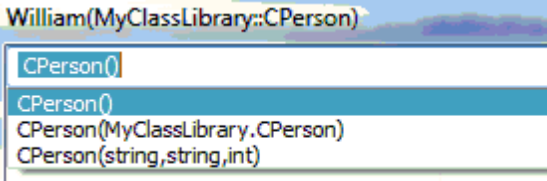

### 14.4.4 Create Workbench Variables

This topic explains how to create a workbench instance for a Class element.

**Access:** **Project Browser Class context menu | Execution Analyzer | Create Workbench Instance of Class (Ctrl+Shift+J)**

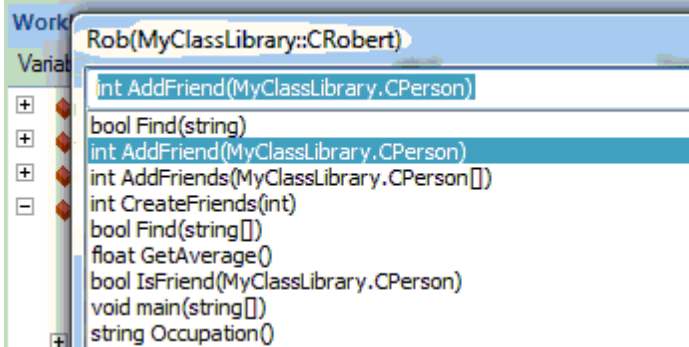

#### Topics:

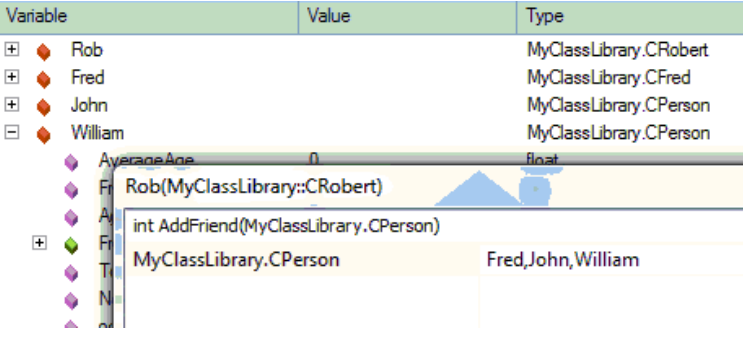

Topic	Detail	See also
<b>Naming the Workbench</b>	<p>Select the <b>Create Workbench Instance of Class</b> option</p> <p>The Workbench dialog displays</p>  <p>Type in a name for the variable; each instance name must be unique for the workbench</p>	
<b>Choosing a Constructor</b>	<p>After naming the variable, select the constructor to use</p> <p>If you do not define a constructor, or define a single constructor taking no arguments, the default constructor or the defined constructor is automatically invoked</p> <p>Otherwise the following dialog displays; select the constructor from the drop-</p>	

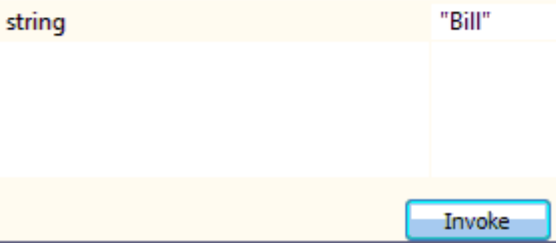

Topic	Detail	See also
	<p>down list and fill in any parameters required</p> 	

### 14.4.5 Invoke Methods

#### Topics:

Topic	Detail	See also
<b>Access</b>	On the Workbench window, right-click on the instance on which to execute a method, and select the <b>Invoke</b> context menu option	
<b>Choose Method</b>	<p>A list of methods for the type are presented in a dialog; select a method from the list and click on the <b>Invoke</b> button</p> <p>Note that all methods listed are public; private methods are not available</p> 	
<b>Supply Arguments</b>	<p>In the example, the instance or variable <i>Rob</i> has been created, of type <i>MyClassLibrary.CRobert</i>, and the method <i>AddFriends</i> invoked that takes an array of <i>CPerson</i> objects as its only argument</p> <p>You now supply to it three other Workbench instances: <i>Fred</i>, <i>John</i> and <i>William</i></p>	

Topic	Detail	See also						
								
<b>Arguments</b>	<p>In the dialog above, type any parameters required by the constructor:</p> <ul style="list-style-type: none"> <li>• <b>Literals as arguments</b> <ul style="list-style-type: none"> <li>• Text: abc or "abc" or "a b c"</li> <li>• Numbers: 1 or 1.5</li> </ul> </li> <li>• <b>Objects as arguments</b> <p>If an argument is not a literal then you can supply it in the list only if you have already created an instance of that type in the workbench; you do this by typing the name of the instance as the argument</p> <p>The debugger checks any name entered in an argument against its list of workbench instances, and substitutes that instance in the actual call to the method</p> </li> <li>• <b>Strings as arguments</b> <p>Surrounding strings with quotes is unnecessary as anything you type for a string argument becomes the value of the string; for example, the only time you should surround strings with quotes is in supplying elements of a string array, or where the string is equal to the name of an existing workbench instance</p> <pre> "A b c" "a b \$ % 6 4" A b c d As 5 7 ) 2 === 4 </pre> </li> <li>• <b>Arrays as arguments</b> <p>Enter the elements that compose the array, separated by commas</p> <table border="0" data-bbox="555 1805 1174 1899"> <tr> <td>Type</td> <td>Arguments</td> </tr> <tr> <td>String( )</td> <td>one,two,three,"a book","a bigger book"</td> </tr> <tr> <td>CPerson( )</td> <td>Tom,Dick,Harry</td> </tr> </table> <p>If you enter text that matches the name of an existing instance, surround it in quotes to avoid the debugger passing the instance rather than a string</p> </li> </ul>	Type	Arguments	String( )	one,two,three,"a book","a bigger book"	CPerson( )	Tom,Dick,Harry	
Type	Arguments							
String( )	one,two,three,"a book","a bigger book"							
CPerson( )	Tom,Dick,Harry							

Topic	Detail	See also

<b>Invoke</b>	<p data-bbox="467 651 1225 712">Having chosen the constructor and supplied any arguments, click on the <b>Invoke</b> button to create the variable</p> <p data-bbox="467 725 1107 754">Output confirming this action is displayed in the Output tab</p>	<p data-bbox="1241 651 1425 712"><a href="#">Show Output From Debugger</a></p> <p data-bbox="1241 712 1289 741">1455</p>

## 14.5 Unit Testing

Enterprise Architect supports integration with unit testing tools in order to make it easier to develop good quality software.

In sequence:

- You download and install the NUnit and JUnit applications (JUnit - <http://www.junit.org/> NUnit - <http://www.nunit.org/index.php?p=home>) - Enterprise Architect does not include these applications in the installer
- Enterprise Architect helps you to create test Classes with the **JUnit** and **NUnit** transformations
- You set up and run a **test script** against any package
- All test results are automatically recorded inside Enterprise Architect

Learn More:

- [JUnit Transformation](#)<sup>[1327]</sup>
- [NUnit Transformation](#)<sup>[1329]</sup>
- [Set Up Unit Testing](#)<sup>[1680]</sup>
- [Add Testing Command](#)<sup>[1680]</sup>
- [Run Unit Tests](#)<sup>[1681]</sup>
- [Record Test Results](#)<sup>[1682]</sup>

### 14.5.1 Set Up Unit Testing

This topic explains the actions you should take in setting up Unit Testing, after having downloaded and installed the JUnit and/or NUnit applications.

Topics:

Topic	Detail	See also
<b>Create Unit Test Stubs</b>	<p>By using the <b>JUnit</b> or <b>NUnit</b> transformations and code generation you can create test method stubs for all of the public methods in each of your Classes</p> <pre>( Test Fixture ) public class CalculatorTest {     ( Test )     public void testAdd(){     }      ( Test )     public void testDivide(){     }      ( Test )     public void testMultiply(){     }      ( Test )     public void testSubtract(){     } }</pre>	<p><a href="#">Unit Testing</a><sup>[1680]</sup></p> <p><a href="#">JUnit Transformation</a><sup>[1327]</sup></p> <p><a href="#">NUnit Transformation</a><sup>[1329]</sup></p> <p><a href="#">Generate Source Code</a><sup>[1499]</sup></p>

Topic	Detail	See also
<b>Define Test Cases</b>	<p>Write your unit test in the generated code stubs (either in Enterprise Architect or your preferred IDE)</p> <p>The following is an <i>NUnit</i> example in C#, although it could also be any other .NET language, or Java and JUnit</p> <pre>( Test Fixture ) public class CalculatorTest {     ( Test )     public void testAdd() {         Assert.AreEqual ( 1+1, 2 );     }      ( Test )     public void testDivide() {         Assert.AreEqual ( 2/2, 1 );     }      ( Test )     public void testMultiply() {         Assert.AreEqual ( 1*1, 1 );     }      ( Test )     public void testSubtract() {         Assert.AreEqual ( 1-1, 1 );     } }</pre> <p>Alternatively, if you have not performed an xUnit transformation, you can reverse engineer the above code into Enterprise Architect so that Enterprise Architect can record all test results against this Class</p>	
<b>Compile Your Code</b>	Ensure the source code being tested is compiled without errors, so that the test scripts can be run against it	
<b>Set up the Test Scripts</b>	Set up the Test scripts against the required package, and then run the tests	<a href="#">Add Testing Command</a> <sup>[1460]</sup> <a href="#">Run Unit Tests</a> <sup>[1681]</sup>

### 14.5.2 Run Unit Tests

On running a test script you generate test results that are stored as Test Cases against the Classes being tested.

**Access:** Analyzer | Test | Run Test Script

**Topics:**

Topic	Detail	See also
<b>Run Tests</b>	<p>Select the appropriate package in the Project Browser</p> <p>Select the <b>Run Test Script</b> option to run the test script you previously</p>	<a href="#">Set Up Unit Testing</a> <sup>[1680]</sup>

The image shows a Testpoint run in progress. The example was produced using the Example Model that ships with Enterprise Architect

### Topics:

Topic	Detail	See also
<b>Overview</b>	<p>You define tests as Class invariants, and as pre/post conditions on operations</p> <p>Testpoint design and management is performed on a Test Domain diagram, on which you define constraints and group them into sets, which in turn can form suites</p> <p>The Testpoint interface is contextual, and when an object (Class, Test Cut, Test Set, Test Suite) is selected, the constraints for that object are displayed</p> <p>In the Testpoint system, the rules that define task behaviors are defined within the model and do not form part of any code base, which has a number of advantages - changing a test condition in other systems can require that the application be re-built; in Enterprise Architect you could stop the run, change a constraint and start the run again without re-building the project</p>	
<b>Test Domain Diagram</b>	<p>A Test Domain diagram is a particular diagram designed for use with the Testpoint facility</p> <p>A Test Domain diagram provides specific elements that can aid in the logical composition of the Tests into Test Sets and Suites</p> <p>You can perform a Testpoint run on an entire Suite, a single Set or</p>	<p><a href="#">Test Domain Group</a><sup>[569]</sup></p> <p><a href="#">Test Cut</a><sup>[1303]</sup></p> <p><a href="#">Test Set</a><sup>[1304]</sup></p>

Topic	Detail	See also
	an individual Class	<a href="#">Test Suite</a> <sup>[1304]</sup> <a href="#">Combine Testpoints</a> <sup>[1697]</sup>
<b>Testpoint Class</b>	<p>Test conditions are always defined on a Class; invariants are created for the Class itself, and pre- and post-conditions are defined on its operations</p> <p>These conditions can be aggregated later into sets, but the Classes are the building blocks upon which any sets you create are built</p>	
<b>Constraints</b>	<p>The Testpoint facility is based on a programming-by-contract model</p> <p>The Execution Analyzer uses constraints that you define for a Class and its methods:</p> <ul style="list-style-type: none"> <li>• A Class invariant is evaluated by the Analyzer whenever a method called on an object of the Class completes</li> <li>• Pre-conditions defined for a method are evaluated when the method is first called; similarly, Post-conditions are evaluated (at the same time as any Class invariant) when the method completes</li> </ul> <p>In the Testpoint facility, constraints are composed using member and local variables in expressions separated by operands; precedence can be achieved through the use of parentheses, which also permits the construction of complex expressions - you can specify any variable that would be in scope at the time</p> <p>Elements and members of elements can also form part of the constraint; almost all equivalence operands are supported for primitive types and strings</p>	<a href="#">Testpoint Editor</a> <sup>[1690]</sup>
<b>Testpoint Constraints</b>	<p>An <i>invariant</i> defines the rules or constraints of a Class; it is expected that no objects of the Class nor its methods can break this constraint, thus preserving the state of the object</p> <p>In the Testpoint facility, constraints are composed in much the same way as conditions are written in code; they rely on and are tied ultimately to the named attributes of the Class</p> <p>The Execution Analyzer can take a single invariant defined for a Class and test it against every invocation of any method on any instance of that Class; the results can be seen during real time in the Testpoints window</p>	<a href="#">The Testpoints Window</a> <sup>[1686]</sup> <a href="#">Class Invariant Dialog</a> <sup>[1688]</sup>
<b>Trace Statements</b>	<p>Trace statements are used to output messages during the execution of a program; the Execution Analyzer provides this facility in:</p> <ul style="list-style-type: none"> <li>• Debugging through the use of Tracepoints and</li> <li>• Testing through the use of Testpoints</li> </ul> <p>In Testpoints, a trace statement can be associated with a pre- or post- condition; whenever the condition is evaluated, the trace statement is output</p> <p>You can also group trace statements by level; when you perform a Testpoint run, you can choose the level of trace to be output</p> <p>Output can be directed to the Testpoints tab of the Output window or to a file, as configured in the Analyzer script for the parent package</p> <p>In debugging, trace statements are associated with code breakpoints</p>	<a href="#">The Output Window</a> <sup>[128]</sup> <a href="#">Managing Scripts</a> <sup>[140]</sup>

Topic	Detail	See also
	<p>You can include the values of variables in trace statements, by prefixing the variable name with a special token that lets the debugger know it is not a part of the text; the available tokens are:</p> <ul style="list-style-type: none"> <li>• \$ - when the variable is to be interpreted or printed as a string</li> <li>• @ - when the variable is a primitive type (int, double, char)</li> </ul> <p>Variables can be qualified - that is, the members of a variable can be printed</p> <p>You separate member names with a period character ('.'); for example:</p> <p><i>The value of the station name = \$station.name</i>  <i>Departing passenger count = @passenger.count</i></p>	

### 14.6.1 The Testpoints Window

The Testpoints window lists the test and trace items for the testpoint object currently selected on a diagram or in the Project Browser.

You can execute, stop and filter the test runs using the window toolbar.

**Access:** [Analyzer](#) | [Test](#) | [Testpoint Manager](#)

**Use to:**

- Review tests and traces for testpoint objects

**Reference:**

- [Testpoint Management](#)<sup>[1684]</sup>

**14.6.1.2 Class Invariant Dialog**

You use the Class Invariant dialog to define or edit the invariant constraint on a Class that is subject to Testpoint tests. A Class invariant is evaluated by the Analyzer whenever a method called on an object of the Class completes.

**Access:** Double-click on the Class item in the Testpoints window

**Reference:**

Field	Usage	See also
<b>Name</b>	Defaults to <b>Invariant</b> Leave this value or, if required, overtype it with your preferred name	
<b>Constraints</b>	Click on the ( ... ) button  The Testpoint Editor dialog displays, listing the conditions currently set on the operation; you can create, delete and re-sequence the conditions on this dialog	<a href="#">Testpoint Editor</a> <sup>[1690]</sup>

Field	Usage	See also
<b>Action on Fail</b>	Click on the drop-down arrow and select from the three options: <ul style="list-style-type: none"> <li>• <b>Continue</b> - ignore the failure</li> <li>• <b>Break execution</b> - halt the run and display the Stack trace</li> <li>• <b>Disable on fail</b> - do not execute the test again</li> </ul>	
<b>OK</b>	Click on this button to apply your changes	

**Learn More:**

- [The Testpoints Window](#)<sup>[1686]</sup>

### 14.6.1.3 Operation Constraints Dialog

You use the Operation Constraints dialog to define or edit the pre-conditions and/or post-conditions on an operation in a Testpoint Class that is subject to Testpoint tests.

Pre-conditions defined for a method are evaluated when the method is first called; post-conditions are evaluated (at the same time as any Class Invariant) when the method completes.

**Access:** Double-click on the operation item in the Testpoints window

**Reference:**

The dialog contains two sets of the following fields; one set for pre-conditions and one set for post-conditions:

Field	Usage	See also
<b>Constraint</b>	Click on the ( ... ) button  The Testpoint Editor dialog displays, listing the conditions currently set on the operation; you can create, delete and re-sequence the conditions on this dialog	<a href="#">Testpoint Editor</a> <sup>[1690]</sup>
<b>Action on Fail</b>	Click on the drop-down arrow and select from the three options: <ul style="list-style-type: none"> <li>• <b>Continue</b> - ignore the failure</li> <li>• <b>Break execution</b> - halt the run and display the Stack trace</li> <li>• <b>Disable on fail</b> - do not execute the test again</li> </ul>	

**Testpoint Trace:**

The dialog also contains fields for Testpoint Trace statements. Testpoints differ from constraints, being statements that can return the values of variables (similar to a *Debug.Print* or *Session.output* statement). They are not set in the code, but stored in the model.

Field	Usage	See also
<b>Trace</b>	(Disabled if the <b>Level</b> field is set to <b>Disabled</b> )  View the current traces and/or, if necessary, type in a new trace statement  If there are several trace statements, you can list the statements in a vertical	<a href="#">Testpoint Management</a> <sup>[1685]</sup>

Field	Usage	See also
	list rather than a comma-separated string - click on the <b>Browse</b> button	
<b>Level</b>	Select the required level of trace statement to be output <ul style="list-style-type: none"> <li>• <b>Disabled</b> - no statement output</li> <li>• <b>Level 1</b> - Only Level 1 statements output</li> <li>• <b>Level 2</b> - Both Level 1 and Level 2 statements output</li> <li>• <b>Level 3</b> - Levels 1, 2, and 3 statements output</li> </ul>	

**Learn More:**

- [The Testpoints Window](#)<sup>[1686]</sup>

#### 14.6.1.4 Testpoint Editor

You identify the Testpoint constraints to use on the Class Invariant dialog and the Operation Constraints dialog, but both dialogs call the Testpoint Editor dialog to enable you to:

- List the existing conditions in a vertical list rather than a comma-separated string (**Browse** button)
- Delete a condition applied to the invariant (**Delete** icon)
- Create a new condition (**New** icon, then type the condition in)
- Change the order in which the conditions are applied (**Move Item Up**, **Move Item Down** icons)

**Constraint Composition:**

Constraints are composed using member and local variables in expressions separated by operands such as:

- /
- \*
- %
- +
- -
- >
- >=
- <
- <=
- OR
- AND
- (
- )

The following is an example Conditional expression that returns a Boolean True/False:

```
( ( x%2) > 1) AND ( y >= 10) )
```

Variables can be scoped by either '.' or '->'; for example:

```
c. Name : c. Names[ 0] of an array as c. Names[ 0]. Sur name= " S m i t h"
```

There are two types of operators you can use on constraints:

- Logical operators AND and OR can be used to combine constraints
- Equivalence operators '=' and '!=' can be used to define the conditions of a constraint

All constraints are subject to an AND operation unless otherwise specified; you can use the OR operation on them instead, for example:

```

Locat ion=0 OR
Locat ion=1 AND
Depart ing. Name! =Cent ral

( a AND b)
( a. b AND ( b. a OR c. a ) )
    
```

Below are some examples of using the equivalence operators:

```

m_val ue! =" t r u e"
m_val ue <> 0

m_val ue[ 10] =" j o h n"
m_val ue[ 0] [ 1] =2
    
```

**Notes:**

- Quotes around strings are optional; the comparison for strings is always case-sensitive in determining the truth of a constraint

**Learn more:**

- [Testpoint Management](#)<sup>[1685]</sup>

### 14.6.1.5 Combine Testpoints

Under Construction

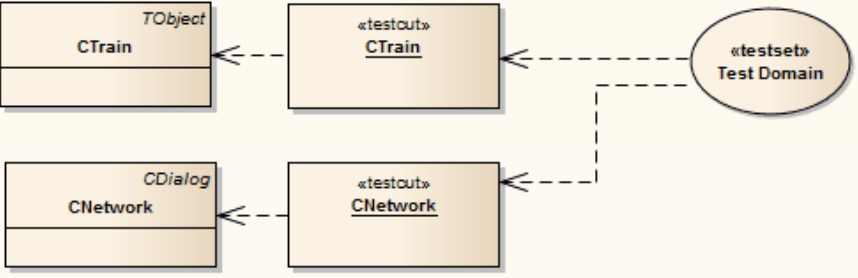

Testpoints are applied to a Class. Where functionality requires tests across multiple Classes, you can group the tests together to allow a single test run across the group of Classes.

You group the tests on a Test Domain diagram, either:

- Manually using the Test Domain Toolbox pages and Project Browser, or
- Automatically from the results of using the debugger and Record and Analyze window

**Topics:**

Topic	Detail	See also
<b>Create Test diagram manually</b>	<p>Create a new Test Domain diagram under the required package, and drag a Test Cut element from the Test Domain Toolbox page onto the diagram; give the element an appropriate name, such as the name of the Class it acts on</p> <p>Drag the Class containing the tests from the Project Browser onto the diagram, and select the 'paste as simple link' option on the Paste Element dialog; create a Dependency connector between the Test Cut element and the Class</p> <p>(When you select the Test Cut element on the Testpoints window, the operations of the Class are listed in the window, each followed by a checkbox; you then select the checkbox against each Class operation to include in the Test Cut)</p> <p>Drag and connect further Test Cut and Class element pairs on the diagram as appropriate</p> <p>Drag a Test Set element from the Toolbox onto the diagram, and create a Dependency relationship between this element and each of the Test Cut elements; the resulting diagram should resemble the following:</p>	<p><a href="#">Test Domain Group</a><sup>[569]</sup></p> <p><a href="#">Test Cut</a><sup>[1303]</sup></p> <p><a href="#">Test Set</a><sup>[1304]</sup></p>

## 14.7 Model Simulation

This section explains how to use the Visual Execution Analyzer to simulate the execution of behavior models. It covers the following topics:

Topic	Link
Overview of the Model Simulator	<a href="#">How It Works</a> <sup>[1693]</sup>
How to set up simulation	<a href="#">Set Up Simulation</a> <sup>[1693]</sup>
How to activate a simulation script	<a href="#">Activate a Simulation</a> <sup>[1694]</sup>
How to run the model simulation	<a href="#">Run Model Simulation</a> <sup>[1695]</sup>
How to set up and use breakpoints	<a href="#">Using Simulation Breakpoints</a> <sup>[1696]</sup>

### 14.7.1 How It Works

The Model Simulator is a tool in Enterprise Architect's Visual Execution Analyzer, enabling you to simulate the execution of conceptual model designs containing behavior. It provides a quick and simple way to verify your design's behavior for logical correctness.

#### Topics:

Topic	Detail	See also
<b>Platforms Supported</b>	<p>The Model Simulator supports the following simulation platform:</p> <ul style="list-style-type: none"> <li>UML Basic</li> </ul> <p>The Model Simulator currently supports the execution of Activity, Interaction and State Machine models</p>	<a href="#">Set Up Simulation</a> <sup>[1693]</sup>

#### Learn More:

- [Set Up Model Simulation](#) <sup>[1693]</sup>
- [Run Model Simulation](#) <sup>[1695]</sup>

### 14.7.2 Set Up Simulation

Setting up a model for simulation is a simple process. An Execution Analyzer script is configured for the package containing the required simulation model.

To configure a simulation execution script, you must select the package on the Project Browser, Package Browser, Diagram List or Model Search.

**Access:** [Project Browser Package Context Menu | Execution Analyzer | Analyzer Scripts...](#)

#### How To:

To set up a model for simulation, follow the steps below:

Step	Action	See Also
1	In the Execution Analyzer window, click on the <b>New</b> toolbar icon (second from the left)	
2	Select the required package in the Browse Project dialog and click on the <b>OK</b> button	
3	In the Execution Analyzer dialog, select the Simulation page	
4	In the <b>Entry Point</b> field, click on the ( ... ) button and select the required entry point for the simulation, and the required Activity, Interaction or State Machine to simulate	
5	In the <b>Platform</b> field, click on the drop-down arrow and select <b>UML Basic</b>	
6	If required, select the <b>Record Execution</b> checkbox to record the simulation session	<a href="#">Control the Recording Session</a> <small>[1659]</small>
7	Click on the <b>OK</b> button to save changes	

**Notes:**

- If you do not specify an entry point, the simulator attempts to simulate the entire package
- All simulation elements and relationships must reside within the package configured for simulation

**Learn More:**

- [How Simulation Works](#) [1693]
- [Activate Simulation Script](#) [1694]
- [Run Model Simulation](#) [1695]
- [Using Simulation Breakpoints](#) [1696]

**14.7.3 Activate Simulation Script**

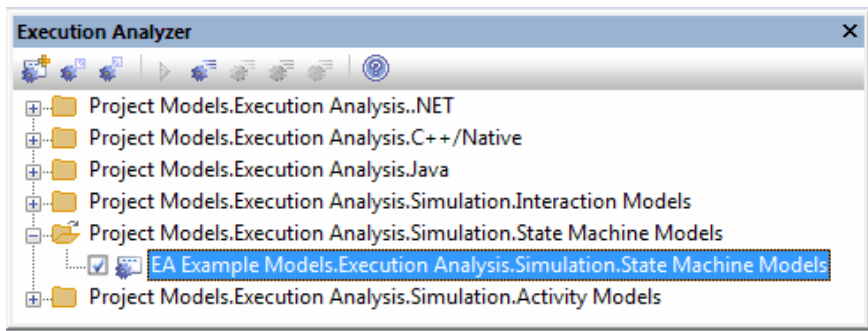

An Execution Script is configured for a model package defining the simulation parameters. To run the simulation you must first activate the execution script on the Execution Analyzer window.

**Access:** [Project Browser Package Context Menu | Execution Analyzer | Analyzer Scripts...](#)

**How to:**

To activate a simulation script for execution, follow the steps below:

Step	Action	See Also
1	In the Execution Analyzer window, select the required execution script	

Step	Action	See Also
		
2	Click on the checkbox to the left of the script to activate it	
3	Execute the simulation using the <b>Analyzer   Simulation</b> menu option	<a href="#">Run Model Simulation</a> <sup>1695</sup>

**Notes:**

- The simulation tool only becomes active when a valid simulation execution script is activated

**Learn More:**

- [Set Up Simulation](#) <sup>1693</sup>

**14.7.4 Run Model Simulation**

You run a model simulation through the Simulation window, by executing the activated simulation script configured for the model package.

**Access:** **Analyzer | Simulation > Output**

**Topics:**

Topic	Detail	See also
<b>Abstract</b>	<p>The simulation executes the model step-by-step, enabling you to validate the logic of your behavior model; the simulation automatically highlights the execution step in the model's diagram</p> <p>If a branch is encountered in the execution, the simulator prompts you to choose the appropriate path to take in your execution</p> <p>The Simulation window toolbar icons are explained in the table below</p>	<a href="#">Activate Simulation Script</a> <sup>1694</sup>

Icon	Action	See Also
	Start the simulator using the activated simulation script	<a href="#">Activate Simulation Script</a> <sup>1694</sup>
	Pause the simulation	

Icon	Action	See Also
	When the simulation is paused, step over, step in and step out to control the simulator's execution at the required step in the model simulation	
	Stop the simulation	

**Notes:**

- The Simulation tool only becomes active when a valid simulation Execution Script is activated

**Learn More:**

- [Set Up Simulation](#) <sup>[1693]</sup>
- [Using Simulation Breakpoints](#) <sup>[1696]</sup>

### 14.7.5 Using Simulation Breakpoints

The Simulation Breakpoints window enables you to apply control to the Model Simulation process.

**Access:** **Analyzer | Simulation > Breakpoints**

**Topics:**

Topic	Detail	See also
<b>Abstract</b>	<p>The simulation executes the model step-by-step, enabling you to validate the logic of your behavior model; the simulation halts when it reaches an element defined as a breakpoint</p> <p>The UML elements that can be defined as breakpoints include: <i>Actions</i>, <i>Activities</i>, and <i>States</i></p> <p>The UML relationships that can be defined as breakpoints include: <i>Interaction Messages</i></p> <p>The breakpoints are stored as Breakpoint Sets for a given Enterprise Architect project</p>	<a href="#">Run Model Simulation</a> <sup>[1695]</sup>

Icon	Action	See Also
	Enables all breakpoints defined in the current Breakpoint Set for the simulation session	
	Deletes all breakpoints defined in the current Breakpoint Set for the simulation session	
	Disables all breakpoints defined in the current Breakpoint Set for the simulation session	
	Adds a breakpoint for the selected element or Sequence message to the current Breakpoint Set	
	Changes the selected Breakpoint Set for use in the simulation session	

Icon	Action	See Also
	Performs Breakpoint Set commands: <ul style="list-style-type: none"><li>• <b>New Set:</b> Create a new Breakpoint Set</li><li>• <b>Save As Set:</b> Saves the current Breakpoint Set under a new name</li><li>• <b>Delete Selected Set:</b> Deletes the current Breakpoint Set</li><li>• <b>Delete All Sets:</b> Deletes all Breakpoint Sets saved for the project</li></ul>

## 15 Testing

This section discusses quality control in your project with Enterprise Architect, describing:

Topic	Link
<b>Model Validation Checks</b> - Used to check UML elements, diagrams or packages against known UML rules (identified in configuring validation) and constraints defined within the model, using the Object Constraint Language (OCL)	<a href="#">Model Validation Checks</a> <sup>[1706]</sup>
<b>Testing</b> - Enterprise Architect enables you to create and manage test scripts for model elements, covering unit, integration, scenario, system and acceptance tests	<a href="#">Testing</a> <sup>[1706]</sup>
<b>Testpoint Management</b> - provides the facility to pass or fail application tasks, viewing test results in real time as the program executes and results are saved	<a href="#">TestPoint Management</a> <sup>[1684]</sup>
Integration with the unit testing tools <b>JUnit</b> and <b>NUnit</b>	<a href="#">Unit Testing</a> <sup>[1680]</sup>

## 15.1 Model Validation

You use Model Validation to check UML models against known **UML rules** (which you identify in **configuring validation**) as well as any constraints defined within the model, using the Object Constraint Language (OCL). You can run Model Validation against a single UML element, a diagram or an entire package.

**Access:** **Project | Model Validation | Validate Selected (Ctrl + Alt + V)**

### Topics:

Topic	Detail	See also
Validating	Validating a UML: <ul style="list-style-type: none"> <li>• <b>Element</b> validates the element and its children, features (attributes and operations) and relationships (connectors)</li> <li>• <b>Diagram</b> validates the diagram itself (for correctness) as well as any elements and connectors within the diagram</li> <li>• <b>Package</b> validates the package and all sub-packages, elements, connectors and diagrams within it</li> </ul>	
Example - Model Violation	<p>The following UML diagram contains several basic violations:</p> <p>If you run Model Validation on this diagram, Enterprise Architect displays the following violations in the Output window:</p> <ul style="list-style-type: none"> <li>• It contains a UML ExpansionRegion (<i>ExpansionRegion1</i>) that</li> </ul>	

Topic	Detail	See also
	<p>is missing its child input ExpansionNode</p> <ul style="list-style-type: none"> <li>It contains an invalid self-generalization on <i>Class2</i> (UML elements cannot be self-generalized)</li> <li>It contains an OCL violation for the anonymous Association (between <i>Class2</i> and <i>Object1</i>)</li> <li>It contains a UML ExceptionHandler (<i>ExceptionHandler1</i>) that is missing its child input ObjectNode</li> </ul>	

**How To:**

To use Model Validation, follow the steps below:

Step	Action	See Also
1	Select the package, diagram or element either from the Project Browser or within an open diagram	
2	<p>Select the <b>Validate Selected</b> menu option</p> <p>Enterprise Architect performs the validation, and displays the results in the Output window (if the Output window does not automatically display, select the <b>View   System Output</b> menu option)</p> <p>While performing the validation, Enterprise Architect also displays a progress window containing the <b>Cancel Validation</b> button, which enables you to cancel the validation process at any time</p> <p>Alternatively, select the <b>Project   Model Validation   Cancel Validation</b> menu option</p>	<a href="#">Output Window</a> <sup>[128]</sup>

**Notes:**

- If you double-click on an error in the Output window, you select the diagram element that the error message refers to

- [Configuring Model Validation](#)<sup>[1701]</sup>

**15.1.1 Configure Model Validation**

Use the Model Validation Configuration dialog to enable and disable the rules that are run with the model validator. You can define additional rules in this dialog from any additional Add-Ins that might be installed besides Enterprise Architect.

**Access:** **Project | Model Validation | Configure**

**Topics:**

Topic	Detail	See also
Usage	<p>Click on the checkbox against each Validation Rule to apply in performing a model validation</p> <p>When you perform a validation, each violation listed on the Output window has a violation ID of the format <i>MVRxxnnnn</i>, where:</p> <ul style="list-style-type: none"> <li><i>MVR</i> stands for Model Validation Rule</li> <li><i>xx</i> is a hexadecimal number corresponding to the position of the validation rule in the Model Validation Configuration dialog, thus indicating which rule is applied and violated</li> <li><i>nnnn</i> is the number of the violation message</li> </ul> <p>Therefore:</p> <ul style="list-style-type: none"> <li>Messages with the ID <i>MVR01nnnn</i> indicate that the <b>Element: Well-Formedness</b> checkbox is selected and a violation of that rule has been detected</li> <li>Messages with the ID <i>MVR0Annnn</i> indicate that the <b>Feature: OCL Conformance</b> checkbox (10th in order on the dialog, or <i>Ath</i> in hexadecimal) is selected and a violation of that rule has been detected</li> </ul>	<a href="#">Model Validation</a> <sup>[1700]</sup>

**Notes:**

- To disable UML syntax ("*The requested connection is not UML compliant*"), select the **Tools | Options | Diagram** option, and in the General panel deselect the **Strict UML Syntax** checkbox

**Learn More:**

- [Rules Reference](#) <sup>[1702]</sup>

## 15.1.2 Rules Reference

**Topics:**

Topic	Detail	See also
Validation Rules	<p>Model Validation works against a set of validation rules, arranged in the following groups:</p> <ul style="list-style-type: none"> <li>(Element, Relationship, Feature, Diagram): <b>Well-Formedness</b> Checks whether or not an element, relationship, feature or diagram is well-formed; this group of rules includes checks such as whether the item is a valid UML item and whether a diagram contains valid elements within it</li> <li>Element: <b>Composition</b> Checks whether or not a UML element contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children</li> <li>(Element, Relationship, Feature): <b>Property Validity</b> Checks whether or not the item has the correct UML properties defined, and whether the properties contain incorrect or conflicting values</li> <li>(Element, Relationship, Feature): <b>Custom Properties</b> Validates an item against any defined constraints in OCL</li> </ul>	<a href="#">Well-Formedness</a> <sup>[1703]</sup> <a href="#">Element: Composition</a> <sup>[1703]</sup> <a href="#">Property Validity</a> <sup>[1704]</sup> <a href="#">OCL Conformance</a> <sup>[1704]</sup>

### 15.1.2.1 Well-Formedness

This group of rules checks whether or not an element, relationship, feature or diagram is well-formed. The rules includes checks such as whether the item is a valid UML item and whether a diagram contains valid elements within it.

#### Reported violations:

Violation ID	Description	Information
MVR010001	«Element» is not a valid UML Element	The element is not a recognized UML 2.3 element
MVR050001	«Relationship» is not a valid UML Relationship	The relationship is not a recognized UML 2.3 relationship
MVR050002	«Relationship» is not legal for «Start Element» --> «End Element»	The relationship between the given start and end elements is not valid for those elements
MVR050003	«Parent Element»:isLeaf=true and cannot be generalized by «Child Element»	The Generalization relationship cannot exist between parent and child elements because the parent element is defined as a leaf element
MVR050004	«Child Element»:isRoot=true and cannot generalize «Parent Element»	The Generalization relationship cannot exist between parent and child elements because the child element is defined as a root element
MVR050005	«Element» cannot generalize self	The element cannot be self-generalized
MVR0B0001	Statechart violation: «extended information»	The State diagram contains a UML violation; see the extended information for more information about the detected violation

### 15.1.2.2 Element Composition

This group of rules checks whether or not a UML element contains valid children, whether it contains the right number of valid children, and whether or not the element is missing any required children.

#### Reported violations:

Error ID	Description	Information
MVR020001	«Element» is missing required child element «Child Element»	The element is missing a child element of type <i>Child Element</i>
MVR020002	Invalid UML package child	The element cannot be a direct package child and must be a child of another element (for example: Ports must be children of other elements, and not direct UML package members)
MVR020003	Invalid child «Child Element name» («Child Element Type»)	The child element is invalid on the tested parent element

### 15.1.2.3 Property Validity

This group checks whether or not an element, relationship or feature has the correct UML properties defined for it and whether they contain incorrect or conflicting values.

#### Reported violations:

Error ID	Description	Information
MVR030001	«Element»:«Property» property is undefined	The element property contains no value
MVR030002	«Element»:«Property» property has invalid value: "«Value»"	The element property contains an invalid value
MVR030003	«Element»:isLeaf=true and cannot be abstract	The element's <i>isLeaf</i> and <i>isAbstract</i> properties are both set to <b>true</b> , which is invalid
MVR060001	«Relationship»:«Property» property is undefined	The relationship property contains no value
MVR060002	«Relationship»:«Property» property has invalid value: "«Value»"	The relationship property contains an invalid value
MVR090001	Attribute/AssociationEnd mismatch, «Attribute»: «Mismatch description», ...	The given attribute has an <i>associationEnd</i> of the same name but they differ in the listed details

#### Learn More:

- [Properties Dialog](#)<sup>[662]</sup> (Element)
- [Connector Properties](#)<sup>[758]</sup>

### 15.1.2.4 OCL Conformance

This group validates an element, relationship or attribute against any defined constraints in the Object Constraint Language (OCL). OCL is used to describe expressions on UML models, and to express constraints free of side-effects. You can add OCL constraints to any element, relationship or attribute in Enterprise Architect.

#### Reported violations:

Error ID	Description	Information
MVR040001	OCL violation: «violated OCL»	The element violates the OCL constraint specified
MVR070001	OCL violation: «violated OCL»	The relationship violates the OCL constraint specified
MVR0A0001	OCL violation: «violated OCL»	The attribute violates the OCL constraint specified

#### Topics:

Topic	Detail	See also
<b>Define OCL Constraints for an Element</b>	<p>You can add OCL constraints to an element using the Properties dialog (<b>Element   Properties</b>); select the Constraints page, click on the <b>Type</b> drop-down arrow and select <b>OCL</b></p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the <b>Element: (OCL) Conformance</b> checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	<p><a href="#">Model Validation Configuration</a><sup>[1701]</sup></p> <p><a href="#">Model Validation</a><sup>[1700]</sup></p>
<b>Define OCL Constraints for a Relationship</b>	<p>You can add OCL constraints to a relationship using the Properties dialog (right-click and select the <b>&lt;type&gt; Properties</b> context menu option); select the Constraints page, click on the <b>Type</b> drop-down arrow and select <b>OCL</b></p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the <b>Relationship: (OCL) Conformance</b> checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	
<b>Define OCL Constraints for an Attribute</b>	<p>You can add OCL constraints to a feature using the Properties dialog (<b>Element   Attributes</b>); select the Constraints tab, click on the <b>Type</b> drop-down arrow and select <b>OCL</b></p> <p>To perform an OCL Validation, display the Model Validation Configuration dialog and select the <b>Feature: (OCL) Conformance</b> checkbox; any OCL violations are recorded in the Model Validation tab of the Output window</p>	

**Notes:**

- To have a valid OCL constraint, the syntax must be correctly formed; if the expression is not correct, Enterprise Architect displays a message stating that the OCL constraint is not valid

## 15.2 Testing

### Topics:

Topic	Detail	See also
<b>Introduction to Testing</b>	<p>Enterprise Architect enables you to create and manage test scripts for model elements, covering unit, integration, scenario, system and acceptance tests; this can include test cases generated from xUnit testing and Testpoint Management</p> <p>You can import tests from other elements, generate them from scenarios, and generate test documentation and reports; you can also indicate the presence of tests on an element by displaying test information on the element in a diagram</p> <p>Enterprise Architect enables you to attach arbitrarily complex tests to any model element; keeping the model elements and the testing documentation in one integrated model significantly improves the communication between the test-team and the software developers and architects</p> <p>The detailed search facilities make it easy to find failing test cases, test cases not run and test cases that have been passed; using the testing and search capabilities, it is easy to navigate through the model and quickly locate problem spots, design flaws and other critical issues</p> <p>Enterprise Architect is not only a UML Modeling environment, it is also a complete Test Management environment</p>	<a href="#">xUnit Testing</a> <sup>[1680]</sup> <a href="#">Testpoint Management</a> <sup>[1684]</sup>
<b>Basic Tasks</b>	<p>Simple tasks that you might perform include:</p> <ul style="list-style-type: none"> <li>• Open the Testing Workspace</li> <li>• Use the Test Details dialog</li> </ul>	<a href="#">The Testing Workspace</a> <sup>[1707]</sup> <a href="#">The Test Details Dialog</a> <sup>[1708]</sup>
<b>Categories</b>	<p>Typically, you create:</p> <ul style="list-style-type: none"> <li>• <b>Unit tests</b> for things that are being built, such as Classes and components</li> <li>• <b>Integration tests</b> to test how components work together</li> <li>• <b>System tests</b> to ensure the system meets business requirements</li> <li>• <b>Acceptance tests</b> to test user satisfaction, and</li> <li>• <b>Scenario tests</b> to test the end-to-end suitability and functionality of the application</li> </ul>	<a href="#">Unit Tests</a> <sup>[1708]</sup> <a href="#">Integration Testing</a> <sup>[1710]</sup> <a href="#">System Testing</a> <sup>[1711]</sup> <a href="#">Acceptance testing</a> <sup>[1712]</sup> <a href="#">Scenario testing</a> <sup>[1713]</sup>
<b>Using Tests</b>	<p>Other tasks that you might perform when working with tests include:</p> <ul style="list-style-type: none"> <li>• Import a scenario as a test</li> <li>• Move or copy tests between test types</li> <li>• Import a test from other elements</li> </ul>	<a href="#">Import a Scenario as a Test</a> <sup>[1715]</sup> <a href="#">Move or Copy Tests Between Test Types</a> <sup>[1715]</sup>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Import a responsibility or constraint as a test</li> <li>• Create a maintenance item from a test</li> <li>• Generate a Test Details report</li> <li>• Show test script compartments</li> <li>• Create test documentation</li> </ul>	<a href="#">Import a Test from Other Elements</a> <sup>[1717]</sup> <a href="#">Import a Responsibility or Constraint as a Test</a> <sup>[1718]</sup> <a href="#">Create a Maintenance Item from a Test</a> <sup>[1719]</sup> <a href="#">Generate Test Details Report</a> <sup>[1800]</sup> <a href="#">Show Test Script Compartments</a> <sup>[1719]</sup> <a href="#">Create Test Documentation</a> <sup>[1720]</sup>

**Notes:**

- Most of the tasks identified above relate to a tests for a single element
- You can make a set of tests available to a number of elements by performing the above tasks on a **Test Case** element and then associating that Test Case with each of the other elements; the Test Case element also helps to make tests more visible in diagrams, the Project Browser, windows and searches

**Learn More:**

- [Test Case](#)<sup>[1302]</sup>

### 15.2.1 The Testing Workspace

The Testing window, or Workspace, provides a quick and convenient method of working with element tests. When you select an element in a diagram or in the Project Browser, if the Testing window is visible the lists of tests for that element are loaded ready for modification or addition.

**Access:** [View | More Element Tools | Testing](#) (Alt + 3)

**Topics:**

Topic	Detail	See also
<b>Using the Testing Workspace</b>	<p>The window has two formats - <b>Item</b> mode and <b>List</b> mode respectively</p> <p>To toggle between the modes, click on the <b>Show/Hide Properties</b> button in the window toolbar</p> <p>To add new items, click on the <b>New</b> icon in the window toolbar; in:</p> <ul style="list-style-type: none"> <li>• Item mode, this clears the fields for new data</li> <li>• List mode, this displays the Test details dialog</li> </ul> <p>By clicking on the <b>Auto</b> button in Item mode or on the Test details dialog, you can apply an automatic naming/numbering nomenclature that you have previously defined</p>	<a href="#">Test Dialog</a> <sup>[1708]</sup> <a href="#">Use Auto Naming and Auto Counters</a> <sup>[630]</sup> <a href="#">Unit testing</a> <sup>[1708]</sup> <a href="#">Integration testing</a> <sup>[1710]</sup> <a href="#">System testing</a> <sup>[1711]</sup> <a href="#">Acceptance testing</a> <sup>[1712]</sup>

Topic	Detail	See also
	<p>There are five tabs along the base of the window; one for each of the following types of testing:</p> <ul style="list-style-type: none"> <li>• Unit testing</li> <li>• Integration testing</li> <li>• System testing</li> <li>• Acceptance testing</li> <li>• Scenario testing</li> </ul> <p>The asterisk on a tab indicates that the tab contains saved information; if there is no information for a type of test, or the information has not yet been saved, its tab has no asterisk</p> <p>The tabs toggle between Item mode and List mode independently</p>	<p><a href="#">Scenario testing</a><sup>[1713]</sup></p>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records
- The Testing window can be docked to the application workspace

**Learn More:**

- [Permission List](#)<sup>[206]</sup>

### 15.2.2 The Test Details Dialog

The Test Details dialog opens to edit tests when the Testing window is in List mode.

Double-click on an existing test case or click on the **New** icon in the window toolbar. The Test Details dialog displays.

**Access:** **View | More Element Tools | Testing (Alt + 3)**

**Notes:**

- Add multiple test cases in one batch using the **New** and **Apply** buttons
- You can format the text in the Description, Input, Acceptance Criteria and Results tabs using the Notes toolbar at the top of the field; this text is also reflected in the Notes window, but cannot be edited there
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

**Learn More:**

- [Notes Toolbar](#)<sup>[772]</sup>

### 15.2.3 Unit Testing

Use Unit Testing to test Classes, Components and other elements as programmers build them.

**Access:** **View | More Element Tools | Testing > Unit**

The Unit testing tab displays in the Testing window by default.

If any **Unit tests** exist, the first Test item for the element is shown in the Testing window in Item mode, and all items are listed either in the panel to the left of the window, or in the window in List mode.

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

## 15.2.8 Move or Copy Tests Between Categories

When you define a test on the Unit, Integration, System, Acceptance or Scenario tab of the Testing window, you might decide that the test either is better suited to another category of tests, or forms a good template for tests in other categories. Enterprise Architect enables you to move or copy tests between categories.

### How To:

To move or copy a test, follow the steps below

Step	Action	See Also
1	Open either: <ul style="list-style-type: none"> <li>The Testing window, and the tab that contains the test you want to move or copy</li> <li>The <i>Testing</i> folder of the Element Browser window</li> </ul>	<a href="#">Element Browser</a> <sup>[689]</sup>
2	Right-click on the required test item in the list The item context menu displays	
3	Click on the appropriate option - <b>Move to</b> or <b>Copy to</b> A list of test categories displays	
4	Click on the test category to which to move or copy the test A confirmatory prompt displays	
5	Click on the <b>Yes</b> button to confirm the move or copy	
6	Click on the target tab of the Testing window to ensure that the test has been added, and make any required changes	

### Notes:

- If you move or copy a test into the Scenario category, some unassociated data could be lost

## 15.2.9 Import Scenario as Test

You can import a scenario from a Use Case or other element, or from all elements in a package, into the Testing window Scenario tab. This avoids having to duplicate the scenario information manually.

The scenario description is copied to the Scenario Test Description tab in the Testing window. If a scenario contains a Structured Specification, its **Action** steps are also copied to the Description tab under the heading **Structured Specification**.

### How To:

To import a scenario from a single element, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the scenario	

Step	Action	See Also
2	Open either: <ul style="list-style-type: none"> <li>The Testing window and the Scenario tab</li> <li>The <i>Testing</i> folder of the Element Browser window</li> </ul>	<a href="#">Element Browser</a> <sup>[689]</sup>
3	Right-click on the list of tests to display the context menu, and select the <b>Import element scenario(s)</b> menu option The Import Scenario dialog displays	
4	You can import scenarios from any element in the model by clicking on the <b>Select element</b> drop-down arrow and selecting the required element Select the scenarios to import from the Select items to import list	
5	Click on the <b>OK</b> button to import the selected scenario(s)	

To import scenarios from all elements in a package, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the parent package element or an element within the package	
2	Open either: <ul style="list-style-type: none"> <li>The Testing window and the Scenario tab</li> <li>The <i>Testing</i> folder of the Element Browser window</li> </ul>	<a href="#">Element Browser</a> <sup>[689]</sup>
3	Right-click on the list of tests and select the <b>Import Package Scenario(s)</b> context menu option The Import Scenario dialog displays This version of the Import Scenario dialog lists all scenarios against all elements in the package; it does not enable you to select a specific element, but does enable you to filter the list of scenarios to those from specific types of element	
4	In the <b>Limit selection to these Object Types only</b> field, type a comma-separated list of the object types for which to show scenarios Click on the <b>Refresh</b> button	
5	Click on the <b>OK</b> button to import the scenarios from each element as test scenarios for that element	

#### Reference:

The Import Scenario dialog has the following additional options:

Field	Usage	See also
<b>Show related elements only</b>	Filter selection to apply only to related elements	
<b>Limit selection to</b>	Indicates specific element types, separated by commas, to filter for	

Field	Usage	See also
these Object Types only	only those element types	
Refresh	Refresh the list of available scenarios	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

**15.2.10 Import Test From Other Elements**

You can import any test from a Use Case or other element into the Testing window. This avoids having to duplicate the test information manually.

**How To:**

To import a test, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the tests	
2	Open either: <ul style="list-style-type: none"> <li>The Testing window, or</li> <li>The <i>Testing</i> folder of the Element Browser window</li> </ul>	<a href="#">Element Browser</a>
3	Right-click on the list of tests and select the <b>Import Tests from Other Element</b> context menu option The Import Element Tests dialog displays	
4	You can import tests from any element in the model by clicking on the <b>Select element</b> drop-down arrow and selecting the required element Select the test to import from the <b>Select items to import</b> list	
5	Click on the <b>OK</b> button to import the selected test(s)	

**Reference:**

The Import Element Tests dialog has the following additional options:

Option	Action	See also
Show related elements only	Filter selection to apply only to related elements	
Limit Selection to these Object Types only	Indicates specific element types, separated by commas, to filter for only those element types	

Option	Action	See also
Refresh	Refresh available options	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

### 15.2.11 Import Responsibility or Constraint as Test

In the same way as you can import a scenario from an element as a test, you can also import an internal requirement (responsibility) or internal constraint as a test.

**How To:**

To import a requirement or constraint as a test, follow the steps below:

Step	Action	See Also
1	Open a diagram or the Project Browser and select the element into which to import the responsibility or constraint	
2	Open either: <ul style="list-style-type: none"> <li>The Testing window and the tab into which to import the test</li> <li>The <i>Testing</i> folder of the Element Browser window</li> </ul>	<a href="#">Element Browser</a> [689]
3	Right-click on the list of tests to display the context menu (if in the Element Browser, click on a test of the appropriate type)	
4	Click on the appropriate option, either: <ul style="list-style-type: none"> <li><b>Import element constraint(s)</b></li> <li><b>Import element requirement(s)</b></li> </ul> <p>The Import Constraint or Import Requirements dialog displays (the two dialogs are identical)</p> <p>The dialog lists all of the internal requirements or constraints in the selected element</p>	
5	Select one or more of the items to import as tests, and click on the <b>OK</b> button	
	Each item is added to the list of tests in the Testing window, as a standard, 'Not Run' test	
6	Edit the items to complete their definition as tests	

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Manage Tests** permission to add, update and delete test records

### 15.2.12 Create Maintenance Item From Test

If an element fails a test, one likely consequence is that a Defect (Issue) item has to be raised in model maintenance to correct the problem. You can generate this Defect item directly from the test that failed.

#### How To:

To create a Maintenance item from a test, follow the steps below:

Step	Action	See Also
1	In the Testing window, or the <i>Testing</i> folder of the Element Browser window, right-click on the test item from which to generate the Maintenance item	
2	On the context menu, select the <b>Create a Maintenance Defect from this test</b> menu option A message box displays	
3	Click on the <b>OK</b> button to clear the message	
4	Open the Maintenance window and select the Defects tab The window displays a defect item having the same name as the test, and the test <b>Description, Input, Acceptance Criteria</b> and <b>Results</b> texts are displayed in the defect Description tab	
5	Update the defect item as required	<a href="#">Maintenance Item Properties</a> <sup>[1727]</sup>

#### Notes:

- You can create Maintenance Defect items from several Test items at once; press and hold (**Shift**) as you select the Test items, and then right-click and proceed as above - each selected Test item then generates a Defect item

### 15.2.13 Show Test Script Compartments

Any element that is capable of displaying a compartment can be used to show test scripts in a diagram. To make use of the feature the element must have an attached test.

#### How To:

To show the Test Script compartment on an element in a diagram, follow the steps below:

Step	Action	See Also
1	Open a diagram containing the element with the attached test items	
2	Double-click on the diagram background to display the Diagram Properties dialog Click on the Elements tab	
3	In the Show Compartments panel, select the <b>Testing</b> checkbox	
4	Click on the <b>OK</b> button to save the setting The tests now appear as an item in the test scripts compartment of the diagram	

Step	Action	See Also
	element	

**Example:**

CCBookClientPanel		JPanel
~	bookpanel: CCBookPanel = new CCBookPanel()	
~	lbl_Price: JLabel = new JLabel("Price")	
+	CCBookClientPanel()	
+	GetBook() : CBook	
-	getUI() : void	
-	jbInit() : void	
+	SetBook(CBook) : void	
-	setUI() : void	
<b>test scripts</b>		
Acceptance: : (Pass) User Satisfaction		

**15.2.14 Test Documentation**

Enterprise Architect enables you to output the test scripts and results you have entered against elements in the model, in Rich Text format. For more information on entering test scripts and details see the previous sections of the Testing topic.

**Access:** **Project Browser Package context menu | Documentation | Testing Report**

**Notes:**

- You can also access the Generate Test Documentation dialog by selecting the **Project | Documentation | Testing Report** menu option
- The Generate Test Documentation dialog enables you to set up your report; you can configure which tests to include or exclude in the report, whether to include child packages and what file to output to

**Learn More:**

- [Testing](#)<sup>[1706]</sup>
- [Testing Report](#)<sup>[1800]</sup>

**Part**

## 16 Maintenance

This section discusses the Enterprise Architect facilities for:

- Creating and monitoring maintenance items on project elements
- Creating and monitoring change and issue items on the project

### Learn More:

- [Maintenance Items](#) [1725]
- [Changes and Defects](#) [1731]

## 16.1 Maintenance Diagram

A Maintenance diagram is a custom diagram used to describe change requests and issue items within a system model.

Change, Task and Issue elements can be linked back to other model elements in the system to illustrate how they must be modified, fixed or updated.

Maintenance models provide extensions to the UML model and enable change management of change items, and of the model elements that require the changes to be made to them.

**Example Diagram:** [Example Maintenance Diagram](#) 

### Tools:

Select Maintenance diagram elements and connectors from the Maintenance pages of the Toolbox.

Maintenance Diagram Elements	Maintenance Diagram Connectors
 Package	 Aggregate
 Issue	
 Change	
 Test Case	
 Entity	

### 16.1.1 Example Maintenance Diagram

An example Maintenance diagram is shown below.

## Changes

EA supports custom Elements of type 'Change'. These can be linked to other elements in the repository or used as a separate lists of any changes proposed for the model.

Below are a set of Change elements for the shopping basket with test definitions listed against them. They are ready for checking once they are confirmed as corrected.

The color markings reflect the Status of the element.

View Basket - add: alter quantity against the entries. <input type="checkbox"/>
<b>test scripts</b>
Unit: : (Not Run) Alter Quantity

View Basket - Add button to update Change <input type="checkbox"/>
<b>test scripts</b>
Unit: : (Deferred) Update Cart Button operative

Create Account: password confirmation fails <input type="checkbox"/>
<b>test scripts</b>
Unit: : (Not Run) Password Confirmation

## 16.2 Maintenance

### Topics:

Topic	Detail	See also
<b>Maintenance Items</b>	<p><i>Maintenance</i> items are defects, changes, issues and tasks. They all apply to individual model elements and can be used to record and capture problems, changes, issues and tasks as they arise, and document the solution and associated details. They are defined as follows:</p> <ul style="list-style-type: none"> <li>• A <b>defect</b> can be considered as a failure to meet a requirement for the current model element</li> <li>• A <b>change</b> can be considered as a change in requirement for the current model element</li> <li>• An <b>issue</b> records a risk factor that might affect the project being recorded for the current model element</li> <li>• A <b>task</b> is a means of recording work in progress and work outstanding for the current model element</li> </ul> <p>Note that each of these maintenance items applies at the model element level. For <i>changes</i>, <i>defects</i> and <i>issues</i> that apply to the whole system, see the Changes and Defects topic; for tasks that apply to the whole system, see the Project Tasks topic.</p>	<p><a href="#">Changes and Defects</a> <sup>[1731]</sup></p> <p><a href="#">Project Tasks</a> <sup>[358]</sup></p>
<b>Creating and Editing Maintenance Items</b>	<p>The following topics explain how to create and edit Maintenance items:</p> <ul style="list-style-type: none"> <li>• <b>The Maintenance Workspace</b> - describes the <b>Maintenance</b> window</li> <li>• <b>Maintenance Item Properties</b> - describes how to complete the <b>Maintenance</b> window tabs for the various maintenance items</li> <li>• <b>Move or Copy Maintenance Items</b> - describes how to move items between maintenance categories or generate items from an item in a different category</li> <li>• <b>Create Elements From Maintenance Items</b> - describes how to generate elements from maintenance items</li> <li>• <b>Show Maintenance Script in Diagram</b> - describes how to display maintenance items in elements on diagrams</li> <li>• <b>Insert Maintenance Feature</b> - describes how to add a maintenance item directly to an element via in-place editing</li> </ul>	<p><a href="#">The Maintenance Workspace</a> <sup>[1725]</sup></p> <p><a href="#">Maintenance Item Properties</a> <sup>[1727]</sup></p> <p><a href="#">Move or Copy Maintenance Items</a> <sup>[1728]</sup></p> <p><a href="#">Create Elements From Maintenance Items</a> <sup>[1729]</sup></p> <p><a href="#">Insert Maintenance Feature</a> <sup>[729]</sup></p>

### 16.2.1 The Maintenance Workspace

Enterprise Architect makes it easy to record and capture problems and issues as they arise, and document the solution and associated details. The **Maintenance** window provides a quick method of viewing and modifying the changes, issues defects and 'to do' items associated with a particular model element. You can include the maintenance items in the main RTF documentation and HTML produced by Enterprise

Architect. The **RTF Setup** dialog has checkboxes to show or hide element maintenance items.

**Access:** **View | Other Element Tools | Maintenance (Shortcut: Alt+4)**

**Topics:**

Topic	Detail	See also
Usage	<p>You can also use the <b>Element Browser</b> window to select and display specific items on the <b>Maintenance</b> window. Click on the  icon in the <b>Maintenance</b> window toolbar to display the <b>Element Browser</b>, open the <b>Maintenance</b> folder and select the required item. In the folder, the 'page' icon contains a <b>C</b> for Change items, <b>D</b> for Defect items, <b>T</b> for Task items, or <b>I</b> for Issue items.</p> <p>The window has two formats. In <b>List mode</b> a detailed list is provided showing several columns of information. In <b>Item mode</b> this list is cut down and instead an editor for the selected item is provided.</p> <p>To toggle between the modes, click on the <b>Show/Hide Properties</b> button in the window toolbar. Item mode displays a single item with others of the same type listed in the left-hand panel. You can also either switch to List mode or select another item from the <b>Element Browser</b> window. List mode displays all items of one type in the selected element; it does not, however, display as much detail on an item as Item mode does.</p> <p>Using the toolbar, you can <b>add or delete</b> items and show or hide the <b>Properties</b> window to enable you to <b>edit</b> each item in the list. Click on the <b>New</b> icon in the window toolbar to add new items. In Item mode, this clears the fields for new data. In List mode, this displays the <b>&lt;item type&gt; details for &lt;element type&gt; &lt;element name&gt;</b> dialog. By clicking on the <b>Auto</b> button in Item mode or on the <b>details</b> dialog, you can apply an automatic naming/numbering nomenclature that you have <b>previously defined</b>.</p> <p>An asterisk on a tab (as for the <b>Defects</b> tab, above) indicates that the tab contains saved information. If the tab has no information or the information has not yet been saved, there is no asterisk, as shown for the <b>Tasks</b> tab.</p> <p>You can also display the maintenance items in a <b>compartment</b> of each appropriate element in a diagram.</p>	<p><a href="#">Element Browser</a><sup>[689]</sup></p> <p><a href="#">Maintenance Item Properties</a><sup>[1727]</sup></p> <p><a href="#">Use Auto naming and Auto counters</a><sup>[630]</sup></p> <p><a href="#">Show Maintenance Scripts in Diagrams</a><sup>[1728]</sup></p>

**Learn More:**

## 16.2.2 Maintenance Item Properties

**Access:** [View | More Element Tools | Maintenance](#)

To create, edit or delete maintenance items, follow the steps below

### How To:

Step	Action	See Also
1.	Select the <b>View   More Element Tools   Maintenance</b> menu option. The Maintenance window displays.	
2.	Open a diagram or the <b>Project Browser</b> and select an element. In Item mode, the oldest maintenance item of each type for that element is shown in the <b>Maintenance</b> window, on the appropriate tab. The other items are listed either in the left hand panel or in List mode.	
3.	Click on the <b>Browse Element</b> icon in the window toolbar. The <b>Element Browser</b> window displays.	
4.	To: <ul style="list-style-type: none"> <li>• Add a new item, select the appropriate tab, click on the <b>New</b> icon in the <b>Maintenance</b> window toolbar and complete the fields as described in the table below</li> <li>• Modify an existing item, select the item from the left-hand list panel or from the <i>Maintenance</i> folder of the <b>Element Browser</b> window and edit the fields as described in the table below</li> <li>• Delete an existing item, select the item from the left-hand list panel or the Maintenance folder of the <b>Element Browser</b> window and click on the Delete icon in the <b>Maintenance</b> window toolbar</li> </ul>	
5.	Click on the <b>Save</b> button in the window toolbar.	

Complete or edit the following fields on the **Maintenance** window

Field	Usage	See Also
<b>Name</b>	Type the name or a short description of the defect.	
<b>Reported by</b>	Select the name of the person who reported the defect.	
<b>Reported</b>	Select the date on which the defect was reported.	
<b>Status</b>	Select the defect status, such as New or Complete.	
<b>Resolved by</b>	Select the name of the person who fixed the defect.	
<b>Resolved</b>	Select the date on which the defect was resolved.	
<b>Priority</b>	Select the priority assigned to resolving the defect.	
<b>Version</b>	Type the version number associated with this fix.	
<b>Description</b>	Type a longer description of the defect. You can format the text using the Notes toolbar at the top of the field. This text is also reflected in the <b>Notes</b> window, but cannot be edited there.	<a href="#">Notes Toolbar</a> 

Field	Usage	See Also
History	Enter any notes or references to previous occurrences of this defect. You can format the text using the Notes toolbar at the top of the field. This text is also reflected in the <b>Notes</b> window, but cannot be edited there.	

**Notes:**

- For information on element-level Defects, Issues, Changes and Tasks, see the *Maintenance* topic. For information on the **Maintenance** window, see the *Maintenance Workspace* topic
- This table describes the fields of the **Defects** tab of the **Maintenance** window. The **Changes**, **Issues** and **Tasks** tabs differ only in minor details

**Learn More:**

- [Maintenance](#)<sup>[1725]</sup>
- [Maintenance Workspace](#)<sup>[1725]</sup>

### 16.2.3 Move or Copy Maintenance Items

When you define an item on the **Defects**, **Changes**, **Issues** or **Tasks** tab of the **Maintenance** window, you might decide that the item either is better suited to another Maintenance category, or forms a good template for items in other categories. Enterprise Architect enables you to move or copy items between categories.

To move or copy a maintenance item, follow the steps below

**How To:**

Step	Action	See Also
1.	Open the Maintenance window and select the tab that contains the item you want to move or copy.	<a href="#">Maintenance Workspace</a> <sup>[1725]</sup>
2.	Right-click on the required maintenance item. The item context menu displays.	
3.	Click on the appropriate option - <b>Move to</b> or <b>Copy to</b> . A list of maintenance categories displays.	
4.	Click on the category to which to move or copy the item. A confirmatory prompt displays.	
5.	Click on the <b>Yes</b> button to confirm the move or copy.	
6.	Click on the target tab to ensure that the item has been added, and make any required changes.	<a href="#">Maintenance Item Properties</a> <sup>[1727]</sup>

## 16.2.4 Create Elements From Maintenance Item

A maintenance item identifies a defect, change, issue or task concerning an element. The maintenance item could itself be represented by an element if it has wider implications for the project or identifies - for example - an actor, activity or action that requires further definition.

You can create one or more elements from any maintenance item, using the **Maintenance** window. The new element is connected to the maintenance item's parent element by a Dependency connector. The item itself remains unchanged as a characteristic of its parent element.

To create an element from a maintenance item, follow the steps below:

### How To:

Step	Action	See Also
1.	Open the Maintenance window and select the tab that contains the item you want to create the element from.	<a href="#">Maintenance Workspace</a> <sup>[1725]</sup>
2.	Right-click on the required maintenance item. The item context menu displays. select the <b>Create as new Element</b> context menu option. The New Element dialog displays.	<a href="#">Add Elements Directly To a Package</a> <sup>[629]</sup>
3.	In the <b>Name</b> field, type a name for the new element.	
4.	In the Type field, click on the drop-down arrow and select the required element type. For <b>example</b> , you might create an Issue element for a Defect or Issue maintenance item, a Change element for a Change item, or an Action for a Task item.  You can, however, create a wide range of other element types should any of these be appropriate, and use the <b>Select Group</b> button to select a profile, MDG Technology or Add-In to create an element specific to that element group.	
5.	If necessary, in the <b>Stereotype</b> field click on the drop-down arrow and select a stereotype to apply to the new element.	
6.	If you want to immediately define the properties of the element, select the <b>Open Properties Dialog on Creation</b> checkbox.	
7.	If you are adding multiple elements in one session, deselect the <b>Close dialog on OK</b> checkbox.	
8.	If you want to add the element to the currently-open diagram, select the <b>Add to Current Diagram</b> checkbox.	
9.	Click on the <b>OK</b> button to create the element.	

The element is added to the **Project Browser** and - if requested - to the current diagram.

## 16.2.5 Show Maintenance Script in Diagram

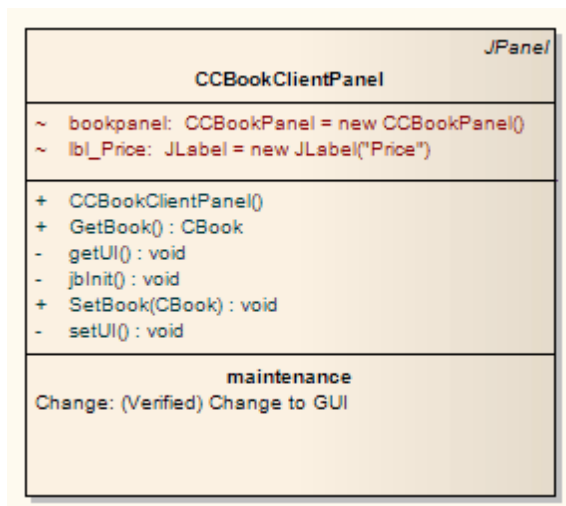

Any element that is capable of displaying a compartment can show **maintenance scripts** in a diagram. To make use of the feature the element must have an attached maintenance item.

To show maintenance compartments in a diagram, follow the steps below

**How To:**

Step	Action	See Also
1.	Open a diagram containing the element with the attached maintenance items.	
2.	Double-click on the diagram background to display the <b>Diagram Properties</b> dialog. Click on the <b>Elements</b> tab.	
3.	In the <b>Show Compartments</b> panel, select the <b>Maintenance</b> checkbox.	
4.	Click on the <b>OK</b> button to save the setting.	

The maintenance Items now appear as items in the maintenance scripts compartment of the diagram element.

**Example:****Learn More:**

## 16.3 Changes and Defects

### Topics:

Topic	Detail	See also
<b>Change and Defect Elements</b>	<p>Changes and Defects are structured comments that can be used in managing change in a project</p> <p>A Defect element (also known as an Issue element) corresponds to a failure to match the requirements for the current system</p> <p>A Change element corresponds to a change in requirements for the current system</p>	<a href="#">Changes</a> <sup>[1733]</sup> <a href="#">Defects</a> <sup>[1731]</sup>
<b>Using Structured Comments</b>	<p>You can track changes and defects (issues) in an Enterprise Architect model</p> <p>Change and Defect elements can be created in UML diagrams and connected using Realization, Dependency, Aggregation and other relationships to show what model element each affects and how each is resolved</p> <p>You can edit the element properties, and assign people (as Actor elements) to changes and defects</p>	<a href="#">Element Properties</a> <sup>[1734]</sup> <a href="#">Assign People to Defects or Changes</a> <sup>[1734]</sup>

### 16.3.1 Defects (Issues)

A *Defect* (or *Issue*) element is a structured comment that contains information about defects and issues that relate to the system or model. This corresponds in some sense to a failure to meet defined requirements for the current system. An Issue element looks the same as a Requirement element:

Enterprise Architect enables you to generate and handle issues in much the same way as you can handle and **color code** Requirements. See the **Requirements** topic for more information.

You can link Issues using *Realize* connectors to model elements that are responsible for the defect. You can even structure a hierarchy of Issues using aggregation.

To add an Issue to the model using the Toolbox, follow the steps below

**How To:**

Step	Action	See Also
1.	Open a Custom diagram.	
2.	From the <b>Custom</b> pages or <b>Common</b> page of the Toolbox, drag the Issue icon onto the diagram.	<a href="#">Custom Group</a> <sup>[564]</sup> <a href="#">Common Group</a> <sup>[554]</sup>
3.	Enter the details as required.	

To add an Issue to the model using the Insert New Element dialog, follow the steps below

**How To:**

Step	Action	See Also
1.	Right-click on a package in the <b>Project Browser</b> .	
2.	Select the <b>Insert   New Element</b> context menu option. The <b>New Element</b> dialog displays.	
3.	In the <b>Type</b> field, click on the drop-down arrow and select <b>Issue</b> .	
4.	In the <b>Name</b> field, type a name for the element.	
5.	Click on the <b>OK</b> button.	

**Notes:**

- Issue elements can be created with or without an identifying I in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the **Options** dialog, **Objects** page

**Learn More:**

- [Color Codes](#)<sup>[1162]</sup>
- [Requirements](#)<sup>[1155]</sup>
- [Objects](#)<sup>[434]</sup>

### 16.3.2 Changes

A *Change* element is a structured comment that contains information about requested changes to the system/model. This corresponds in some sense to a change in requirements for the current system. A Change element looks the same as a Requirement element:

Enterprise Architect enables you to generate and handle Changes in much the same way as you can handle and [color code](#) <sup>[1162]</sup> Requirements. See the [Requirements](#) <sup>[1155]</sup> topic for more information.

You can connect *Changes* using *Realization* connectors to model elements that implement the Change, and you can structure a hierarchy of changes using Aggregation.

Change elements can be created with or without an identifying **C** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements** checkbox on the Options dialog, Objects page.

#### How To:

To add a Change to the model using the Toolbox, follow the steps below

Step	Action	See Also
1	Open a Custom diagram.	
2	From the Custom pages or Common page of the Toolbox, drag the Change icon onto the diagram.	<a href="#">Custom Group</a> <sup>[564]</sup> <a href="#">Common Group</a> <sup>[554]</sup>
3	Enter the details as required.	

To add a Change to the model using the Insert New Element dialog, follow the steps below

Step	Action	See Also
1	Right-click on a package in the <b>Project Browser</b> .	
2	Select the <b>Insert   New Element</b> context menu option. The <b>New Element</b> dialog displays.	
3	In the <b>Type</b> field, click on the drop-down arrow and select <b>Change</b> .	
4	In the <b>Name</b> field, type a name for the element.	
5	Click on the <b>OK</b> button.	

#### Notes:

- Change elements can be created with or without an identifying **C** in the top right corner of the element. To toggle the display of this letter, select or deselect the **Show stereotype icon for requirements**

checkbox on the **Options** dialog, **Objects** page.

**Learn More:**

- [Color Codes](#) <sup>[1162]</sup>
- [Requirements](#) <sup>[1155]</sup>
- [Objects](#) <sup>[434]</sup>

### 16.3.3 *Element Properties*

The **Properties** dialog for Changes and Issues is similar to that used by Requirements. It has a **Properties** tab containing the name of the Issue and relevant management details (such as owner and dates). You can also associate files with the issue and add Tagged Values.

**Learn More:**

- [Associate Files](#) <sup>[689]</sup>
- [Add Tagged Values](#) <sup>[765]</sup>

### 16.3.4 *Assign People to Defects or Changes*

As an example of how you might use the **Relationship Matrix** to monitor issues or changes, the screen below illustrates staff (actors) being linked through *Realization* connectors to *Issues*. Each highlighted square indicates a responsibility of a staff member to work on or correct a named issue. This same approach can be used for any mix of model elements.

**Part**

## 17 Reporting

Model documentation is essential to realizing the full benefit of Enterprise Architect. Enterprise Architect provides a powerful mechanism for generating high quality, customized documentation directly from your model, in either RTF or HTML format.

## 17.1 RTF Documents

### Topics:

Topic	Detail	See also
<b>Rich Text Format Documentation</b>	<p>Rich text reports are documents produced by Enterprise Architect in Rich Text Format (RTF), a format common to many word processors</p> <p>You can also maintain complex documents by creating <b>virtual documents</b> in Enterprise Architect, setting up a Master Document (package) element and/or Model Document elements (Class elements of stereotype Model Document) and linking packages into the document, in whatever order or combination is most appropriate to your requirements</p> <p>You can select packages from different areas of the model, arrange them in any order, and edit or delete the packages; the virtual document automatically incorporates the changes each time you generate it</p> <p>Alternatively, as RTF is particularly targeted at Microsoft Word™, it also enables you to link a number of rich text documents into a single <b>master document</b></p> <p>Typically you create a Word master document, then some Enterprise Architect RTF reports, and you link the reports back into sub-sections of the master document and refresh them as required during project development; in this way the project document becomes an easily-managed and feature-rich work product</p> <p>You can also populate a Word document from specific sections of reports, based on <b>bookmarks</b> - for example, a Word document might have a section for a small part of your component model; using bookmarks you can generate a full component model, and then link into just one section of the report</p> <p>This way you can maintain a complex Word document from parts of Enterprise Architect reports; the RTF Generator performs one pass for one template, but using a Word master document and Enterprise Architect bookmarks enables you to incorporate material from several RTF documents with different formats based on different templates</p> <p>By adding tables of contents, figure tables, sections, and headers and footers, you can manage a complex document with relative ease; simply update the Enterprise Architect RTF reports then refresh the links in MS Word</p> <p>You can have several RTF reports open at the same time, as</p>	<p><a href="#">Virtual Documents</a> [1788]</p> <p><a href="#">Using MS Word</a> [1809]</p> <p><a href="#">RTF Bookmarks</a> [1811]</p> <p><a href="#">Diagram Tabs</a> [545]</p>

Topic	Detail	See also
	separate <b>tabs</b> in the central view area of the Enterprise Architect work area; you can also close the reports individually or all together, leaving views of other types (such as diagrams or code editors) still open	
<b>The RTF Generator</b>	Enterprise Architect has an enhanced RTF Document Generator that features: <ul style="list-style-type: none"> <li>• Powerful WYSIWYG RTF style template editor support, enabling: <ul style="list-style-type: none"> <li>• Headers and footers</li> <li>• Images</li> <li>• Indexes</li> <li>• Tabular Sections</li> <li>• Nested Sections</li> <li>• All model elements, connectors, diagrams and their properties</li> <li>• Template import and export using XML</li> <li>• Basic templates supplied for customization.</li> </ul> </li> <li>• A document generator that: <ul style="list-style-type: none"> <li>• Provides simplified options</li> <li>• Generates complex documents based on RTF templates</li> <li>• Has an embedded RTF viewer that you use to view RTF documents generated in Enterprise Architect directly within Enterprise Architect</li> </ul> </li> </ul>	
<b>More Information</b>	A tutorial on using the RTF Generator and creating RTF documentation is provided on the Sparx Systems website	<a href="http://www.sparxsystems.com/resources/whitepapers/">http://www.sparxsystems.com/resources/whitepapers/</a>

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Documents** permission to generate RTF documents

**Learn More:**

- [Generate RTF Documents](#)<sup>[1739]</sup>
- [Generate RTF Documentation Dialog](#)<sup>[1742]</sup>
- [RTF Document Options](#)<sup>[1746]</sup>
- [RTF Templates](#)<sup>[1753]</sup>
- [Custom Language Settings](#)<sup>[1808]</sup>
- [Include or Exclude a Package from Report](#)<sup>[1745]</sup>
- [List of Available Permissions](#)<sup>[206]</sup>

**17.1.1 Generate RTF Documents**

Creating a Rich Text Format (RTF) document is a simple and flexible process. An RTF document is based on a package or an element in your project (more usually a package). To produce a document, you must select the package or element to report on in the Project Browser, Package Browser, Diagram List or Model Search.

You should also set the diagram properties to determine how the diagrams in the package are set out in the RTF document. When you have prepared and selected your package, use the context menu to open the Generate RTF Documentation dialog and configure the details of your document. The next topic guides you through creating a rich text report.

#### Topics:

Topic	Detail	See also
<b>Open the Generate RTF Documentation Dialog</b>	<p>Use one of the following methods:</p> <ul style="list-style-type: none"> <li>• Select the <b>Project   Documentation   Rich Text Format (RTF) Report</b> menu option</li> <li>• In the Project Browser, right-click on the required package and, on the context menu, select the <b>Documentation   Rich Text Format (RTF) Report</b> menu option</li> <li>• In the Project Browser or a diagram, click on the required package or element and press ( <b>F8</b> )</li> <li>• In a diagram, click on a specific element and select the <b>Element   Advanced   Rich Text Format (RTF) Report</b> menu option</li> <li>• In the Diagram List, Package Browser or Model Search, select one or more items, right-click and, from the context menu, select either the <b>RTF Report   Generate report for each selected object</b> option or the <b>RTF Report   Generate one report for all selected</b> option</li> </ul>	<a href="#">Generate RTF Documentation Dialog</a> <sup>[1742]</sup>
<b>Generate RTF Report From Package Browser or Model Search</b>	<p>When you select to create an RTF Report from the Diagram List, Package Browser or Model Search tools, you can generate an element-level report rather than a package-level report, and you have additional flexibility in selecting:</p> <ul style="list-style-type: none"> <li>• The type of element to report on</li> <li>• The specific elements to report on, together or separately, whether in the same package or not</li> </ul> <p>For example, you might want to find all elements with test cases, with the intention of reporting on some or possibly all such elements; with the Diagram List or Package Browser, you would identify these elements yourself within the list of all elements in a selected package, but with the Model Search you could specifically identify the elements across a section of the model or across the whole model, as required</p> <p>The search filtering could be for specific test cases; however, the results are by element so if there are test cases outside the range in any element that has a filtered test, these elements are listed as well</p> <p>Having generated the list of elements, you can select individual elements, blocks of elements, or all elements and then (as above) use the context menu to generate a report on all of the elements, or separate reports on each element</p>	<a href="#">Diagram List</a> <sup>[464]</sup> <a href="#">Package Browser</a> <sup>[458]</sup> <a href="#">Model Search</a> <sup>[477]</sup>

#### How To:

To generate and view an example RTF report right now, follow the steps below:

Step	Action	See Also
------	--------	----------

1	Open the <i>EAExample</i> project	
2	Open the <i>QA Model</i> package and right-click on the Testing package	
3	Select the <b>Documentation   Rich Text Format (RTF) Report</b> context menu option The Generate RTF Documentation dialog displays	
4	In the <b>Output to file</b> field, select a convenient file location in which to hold the generated report	
5	In the <b>Use Template</b> field, click on the drop-down arrow and select ( <b>basic template</b> )	
6	Click on the <b>Generate</b> button	
7	When the report has been generated, click on the <b>View</b> button	

**Notes:**

- Reports can be configured to include all packages within a parent package, or just the top level

**Learn More:**

- [Diagram Options](#)<sup>[1741]</sup>

**17.1.1.1 Diagram Options**

This topic refers to options on the Diagram page of the Diagram Properties dialog, which are used when generating RTF reports for a particular diagram.

**Access:** **Diagram background context menu | Properties > Diagram page**

**Topics:**

Topic	Detail	See also
<b>Exclude Image from RTF Documents</b>	Select this checkbox to exclude the image of the current diagram from any RTF reports	
<b>Document Each Contained Element in RTF</b>	<p>Select this checkbox to ensure the RTF report generator includes details of elements that belong in other - external - packages but that are linked into this diagram within the package being reported on; the report includes external elements for each diagram on which you have selected the checkbox</p> <p>On the Generate RTF Documentation dialog, the <b>Include all Diagram Elements in Report</b> checkbox defaults to selected, to include external elements for <i>every</i> diagram covered by the report; therefore, to include external elements only for specific diagrams, deselect this checkbox</p> <p>In either case, you must enable the <i>Package.Diagram.Element</i> and <i>Package.Element</i> sections in your (customized) document generation templates in order to include this external element information in the report</p>	<p><a href="#">Generate RTF Documentation Dialog</a><sup>[1742]</sup></p> <p><a href="#">Report Elements From External Packages</a><sup>[1784]</sup></p>

Topic	Detail	See also
<b>Divide Diagram Into Multiple Sections</b>	Select this checkbox to divide each large diagram into separate pages in the RTF document  This option is only effective when the <b>Scaled Printing option</b> is set to <b>None</b> on the Print Advanced dialog	<a href="#">Scaled Printing Option</a> <sup>[604]</sup>
<b>Rotate Images</b>	Select this checkbox to rotate each diagram image by 90 degrees in the RTF document; this is only valid for <b>bitmap</b> (.bmp) images	

**Learn More:**

- [Diagram Tab](#)<sup>[573]</sup>

### 17.1.1.2 Generate RTF Documentation Dialog

The Generate RTF Documentation dialog enables you to set the exact contents and look and feel of your report.

Each tab of the dialog offers a number of RTF document generation options, as described in the following sections:

- Generate Tab (see below)
- RTF Templates
- Document Options
- Advanced Options
- Element Filters
- Other Filters
- Project Constants
- Word Substitution
- Language Substitution (Codepage)

When you have worked through these tabs and set the options you require, return to the Generate tab and click on the **Generate** button to produce your report.

**Reference:**

Option	Action	See also
<b>Model Document</b>  <b>Root Element Root Package</b>	Confirm the name of the element selected from the Project Browser, Diagram List or Model Search  If this is the specially-created model document element for a Virtual Document, the field is <b>Model Document</b>  Otherwise, this field identifies the selected element of the hierarchy to be reported on; that is, the <b>Root Element</b> or <b>Root Package</b>	<a href="#">Virtual Document</a> <sup>[1788]</sup>
<b>Output to File</b>	Type or select the location and filename for the generated documentation  The ( ... ) (Browse) button enables you to navigate to the location	
<b>Use Template</b>	Type or select the name of the RTF template to apply to document generation	

Option	Action	See also
	<p>You can select either a standard template (enclosed in parentheses) or a user-generated template</p> <p>The standard templates include the following:</p> <ul style="list-style-type: none"> <li>• (basic template)</li> <li>• (diagrams template)</li> <li>• (maintenance template)</li> <li>• (requirements template)</li> </ul>	
<b>Use Language Substitutions</b>	<p>Switch custom language word substitutions on</p> <p>Deselect to switch custom language word substitutions off</p>	<a href="#">Word substitutions</a> <small>[1752]</small>
<b>View Document On Completion</b>	<p>Open the document as soon as it has been generated</p>	
<b>Use Internal Viewer</b>	<p>Enable the <b>View</b> button to launch the generated RTF Documentation in the Enterprise Architect internal viewer</p> <p>Deselect to enable the <b>View</b> button to launch the generated RTF Documentation in the MS Windows default RTF file viewer</p>	<a href="#">Document options</a> <small>[1746]</small>
<b>Include all Diagram Elements in Report</b>	<p>Include elements in the report from external packages that are referenced from a diagram, for every diagram covered by the report; this defaults to selected</p> <p>The <i>Package.Diagram.Element</i> and <i>Package.Element</i> checkboxes must be selected in the current template</p> <p>If external elements are to be included only for specific diagrams, deselect this checkbox and - only for the diagrams for which you want to include external elements in the report - for each diagram select the <b>Document each contained element in RTF</b> checkbox in the diagram properties</p> <p>When both options are deselected, or when neither of the <i>Package.Diagram.Element</i> or <i>Package.Element</i> checkboxes are selected in the template, only elements in the current package are documented</p>	<a href="#">Diagram properties</a> <small>[1741]</small>
<b>Optimize for Open Office</b>	<p>Generate reports where diagrams are adjusted for clean rendering in Oracle Open Office</p> <p>The option also overwrites the value fields defined in a document section with the actual value text.; if you open a generated report in Word, you can format the text but you cannot display the original field code</p> <p>If the checkbox is <i>deselected</i>, diagrams displayed in Open Office are less distinct - value fields remain and are populated with the appropriate values; when you display a generated report in Word, you can right-click on the field and toggle between the value text and the field code</p> <p>If you use Open Office as your text editor, you <b>must</b> select this checkbox to show the field values; Open Office defaults to showing the field codes only, and you cannot toggle to the field values</p>	
<b>Generate</b>	<p>Generate the document (after you have set all the options you require, on all tabs of the dialog)</p>	

Option	Action	See also
<b>View</b>	Launch the generated RTF Documentation in the MS Windows default RTF file viewer, or in the Enterprise Architect internal viewer if you have selected the <b>Use Internal Viewer</b> checkbox	
<b>Edit Template</b>	Edit the currently-named template using the RTF Style Template Editor  You can only edit <i>user-defined</i> templates, not the standard templates provided with Enterprise Architect; standard template names are enclosed in parentheses	<a href="#">RTF Style Template Editor</a> <sup>[1755]</sup>
<b>Resource Document</b>	Save the current options as a document definition	<a href="#">Document definition</a> <sup>[1744]</sup>
<b>Abort</b>	Cancel report generation	

**Notes:**

- For an introduction to generating RTF documentation, see the *RTF Documents* topic
- If you have never selected the **Optimize for Open Office** checkbox, the document generator prompts you to confirm which document style you want to adopt - Microsoft Office or Oracle Open Office; once you have made a selection in this prompt, the document generator always acts on the status of the checkbox and does not display the prompt again

**17.1.1.3 Resource Documents**

The *Resource Document* feature enables a particular documentation configuration to be 'remembered', linking the loaded template within the Generate RTF Documentation dialog to the current highlighted package. If a particular template is always used with a specific package, and multiple cases of documentation exist to be propagated, saving these as Resource Documents can ease document generation later.

**How To:**

To create and use Resource Documents, follow the steps below:

Step	Action	See Also
1	Open the Generate RTF Document dialog	<a href="#">Generate RTF Documents</a> <sup>[1739]</sup>
2	Click on the <b>Resource Document</b> button	

Step	Action	See Also
	The Save current as document definition dialog displays	
3	In the <b>Enter Value</b> field, type a name for the document and click on the <b>OK</b> button The document is added to the Resources window for easy future access	
4	To generate documentation from the Resources window, right-click on the required document The context menu displays	
5	Select the required context menu option: <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Opens the corresponding .RTF file, as specified by the RTF template Filename property</li> <li>• <b>Generate Document</b> - Opens the Generate RTF Documentation dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generates documentation, with the document located at the path specified by the template's Filename property</li> <li>• <b>Delete Document</b> - Removes the specified document</li> </ul>	

Topic	Detail	See also
<b>Batch Generate Resource Documents</b>	<p>To generate a number of RTF documents at the same time, right-click on the <i>RTF Documents</i> folder name and select the <b>Generate Documents</b> context menu option; the Batch Document Generation dialog displays</p> <p>The dialog lists all resource documents in the <i>RTF Documents</i> folder, defaulted to selected; deselect the checkbox against each document that you do not want to generate (or click on the <b>Deselect All</b> button to clear all selections, then select those you require)</p> <p>Click on the <b>OK</b> button to generate each of the remaining reports into their respective target file locations</p> <p>The <b>Generate All Documents</b> context menu option automatically generates every document in the <i>RTF Documents</i> folder, without displaying the Batch Document Generation dialog</p>	

**Notes:**

- Resource Documents, saved into the **Resources** window, save the package, output file destination and template name from the **Generate** tab of the Generate RTF Documentation dialog, plus the data separately defined in the Options, Advanced and Element Filter tabs of the dialog

**Learn More:**

- [Document Options](#)<sup>[1746]</sup>
- [Element Filter](#)<sup>[1749]</sup>

**17.1.1.4 Exclude Package from Report**

You can exclude a particular package from any RTF or HTML report by marking it for exclusion.

**Access:** [Project Browser package context menu | Documentation | Generated Report Options](#)

**How To:**

To mark a package for exclusion from reporting, follow the steps below:

Step	Action	See Also
1	Select the <b>Generated Report Options</b> menu option The Generated Report Options dialog displays	
2	Select the <b>Exclude Package from Generated Reports</b> radio button	
3	Click on the <b>OK</b> button	

**Notes:**

- By default, packages are included in any generated reports
- When you exclude a package from reports, all of the selected package's subpackages are also excluded

**17.1.1.5 Document Options**

The RTF report options enable you to set type filters and order the elements.

**Topics:**

Topic	Detail	See also
<b>How to Access</b>	<p>You can access the options from two different places; the start point affects the persistence of options selected:</p> <ul style="list-style-type: none"> <li>• If you access the options on the Options and Advanced tabs of the Generate RTF Documentation dialog, you can define settings for the current report to be run; selections are non-persistent, and are reset when you exit the dialog or select a different template</li> <li>• If you access the options on the Document Options dialog, by clicking on the <b>File   Document Options</b> menu option on the RTF Style Template Editor dialog, the settings are saved with the template as the default settings for any run of this report</li> </ul>	<p><a href="#">Generate RTF Documentation</a> [1742]</p> <p><a href="#">File and Print Options</a> [1757]</p> <p><a href="#">RTF Style Template Editor</a> [1753]</p> <p><a href="#">RTF Element Filters</a> [1749]</p> <p><a href="#">Other</a> [1750]</p>
<b>Document Options dialog</b>	<p>The Document Options dialog provides the options from both of the Options and Advanced tabs of the Generate RTF Documentation dialog, plus the Element Filters and Other Filters tabs, except for:</p> <ul style="list-style-type: none"> <li>• The <b>Switch generator</b> button</li> <li>• The <b>Disable large OLE file support</b> option</li> <li>• The <b>Insert page breaks when generating a Master Document</b> option</li> </ul> <p>The dialog also contains the <b>Optimize for Open Office</b> option, as described for the Generate RTF Documentation dialog, and tabs for setting Element Filters and Other Filters</p> <p>Click on the <b>OK</b> button to save your changes</p>	<p><a href="#">Generate RTF Documentation</a> [1742]</p> <p><a href="#">Element Filters</a> [1749]</p> <p><a href="#">Other Filters</a> [1750]</p>

**Reference:**

The Options tab of the Generate RTF Documentation dialog has the following fields:

Field	Usage	See also
<b>Only include objects</b>	Filter elements according to date created or modified In the first two fields, select the qualifiers from the drop-down lists; in the third field, select the appropriate date	
<b>Where Package Phase</b>	Filter elements according to the value of the <b>Package Phase</b> field In the first field select the qualifier, and in the second type the required phase (or leave the default value <b>All</b> )	
<b>With element status</b>	Filter elements according to status In the first field, select the qualifier ( <b>like, not like, in, not in</b> ) and in the second field type the value to be used Values should be enclosed in quotes; for example: "Proposed" If you type more than one value, separate them with a comma; for example: "Proposed", "Implemented"	
<b>Connector Direction</b>	Filter connectors according to direction If you select <b>Both</b> , the connector is documented twice; once for the source element and once for the target For the remaining two values, the connector is documented only for the source or target element, as appropriate	
<b>Packages by</b>	Order packages in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date	
<b>Elements by</b>	Order elements in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date	
<b>Diagrams by</b>	Order diagrams in the generated documentation in either ascending or descending order of Name, Tree Order, Modified Date or Created Date	
<b>Exclude details for</b>	Exclude all elements of the selected type or types from the generated document	
<b>Exclude connector type</b>	Exclude all connectors of the selected type or types from the generated document	

The **Advanced** tab of the **Generate RTF Documentation** dialog has the following fields:

Field	Usage	See also
<b>Hide 'note-less' elements</b>	Exclude all elements without notes from the documentation	
<b>Diagram Format</b>	Set the diagram format for the images included within the	

Field	Usage	See also
	documentation to either Metafile or Bitmap	
<b>Skip root package</b>	Exclude the parent package from the documentation and include only the child packages	
<b>No bookmarks</b>	Stop RTF bookmarks being inserted into the generated document	
<b>Adjust Heading Levels</b>	<p>Enable the RTF Generator to automatically restrict the levels of heading generated for nested sub-packages in a document</p> <p>The generator reproduces heading levels down to the value you set; for example, if you have four nested levels of sub-packages and you set this field to:</p> <ul style="list-style-type: none"> <li>• <b>Heading 2</b>, all sub-packages in the report are documented under level 2 headings</li> <li>• <b>Heading 4</b>, the first level of subpackages are documented under level 2 headings, the next level under level 3 headings, and the remainder all under level 4 headings</li> <li>• <b>Heading 6</b>, the first level of subpackages are documented under level 2 headings, the next level under level 3 headings, the next under level 4 headings, and the next under level 5 headings; if you added further levels of sub-package they would all be documented under level 6 headings</li> </ul> <p>The field defaults to <b>Heading 9</b> to accommodate the maximum number of levels of nested subpackages</p>	
<b>Hide &lt;Anonymous&gt; elements</b>	Hide anonymous elements in the documentation	
<b>Use style defined in template for notes</b>	Override the character formatting specified in your <b>Notes</b> fields with the formatting set for the field in the template	
<b>Disable large OLE file support</b>	Disable support for large Object Linking and Embedding (OLE) files	
<b>Insert page breaks when generating a Master Document</b>	Insert a page break after each Model Document in a Master Document	<a href="#">Model Document in a Master Document</a> <sup>[1768]</sup>
<b>Include child elements even if the parent element is filtered out</b>	Document all child elements that are not otherwise filtered out by the restrictions, even if the parent elements are filtered out	
<b>Hide 'note-less' connectors</b>	Exclude all connectors without notes from the documentation	
<b>Switch generator</b>	<p>Switch from this Generate RTF Documentation dialog (the Enhanced Template Driven Generator) to the Rich Text Format Report dialog (Legacy Generator)</p> <p>This button is not available if you displayed the dialog from the Diagram List, Package Browser or Model Search</p>	<a href="#">Rich Text Format Report dialog</a> <sup>[1807]</sup>

### 17.1.1.6 Element Filters

The Element Filters tab enables you to include specific types of element in your report, rather than including every element type encountered.

#### Topics:

Topic	Detail	See also
<b>How to Access</b>	<p>As with the Document Options tabs, you can access the Element filter details from two different places; the start point affects the persistence of the filter definition:</p> <ul style="list-style-type: none"> <li>If you define the filters on the Element Filters tab of the Generate RTF Documentation dialog, you can create filter settings for the current report to be run; selections are non-persistent, and are reset when you close the dialog or select a different template</li> <li>If you access the filter definitions by clicking on the <b>File   Document Options</b> menu option on the RTF Style Template Editor dialog, the settings are saved with the template as the default settings for any run of this report</li> </ul> <p>You add filters by clicking on the <b>Add Filters</b> button; to edit the filters, either double-click on the panel contents or click on the <b>Edit Filter</b> button, to display the Edit Filters dialog</p> <p>The format is the element field name, the conditions placed on the field value, any actual value or delimiting value to search on, and whether the filter item is required (mandatory), as described below</p>	<p><a href="#">Generate RTF Documentation</a><sup>[1742]</sup></p> <p><a href="#">File and Print Options</a><sup>[1757]</sup></p> <p><a href="#">RTF Style Template Editor</a><sup>[1758]</sup></p> <p><a href="#">Add Filters</a><sup>[489]</sup></p>

#### Reference:

Column/Button	Action	See also
<b>Search In</b>	Select the type and name of each element field to search on	
<b>Condition</b>	Select the condition of the search parameter The available options are <b>Contains</b> , <b>Equal To</b> , <b>Not Equals</b> and <b>One Of</b>	<a href="#">Fields and Conditions</a> <sup>[491]</sup>
<b>Look For</b>	Specify the search term to perform the conditional search on This value can pertain to the selected element field; for example, the value could be a date for <i>DateCreated</i> or a text value for other fields The search term can contain multiple values, separated by commas	
<b>Required</b>	Indicate that the search results must include elements with your search term in that field; you select these checkboxes on the Add Filters dialog The fields listed as filters have an OR relationship when no <b>Required</b> checkboxes are selected; that is, if the search term is found in any one of those fields, then the element is displayed Any field having the <b>Required</b> checkbox ticked overrides fields where the <b>Required</b> checkbox is not ticked	<a href="#">Adding Filters</a> <sup>[489]</sup>
<b>Element Features</b>	Specify whether element features are optional or required; these appear as a new branch underneath the root element term in the	

Column/Button	Action	See also
<p>- Optional</p> <p>- Required</p>	<p><b>Search In</b> column</p> <p>If you scroll down the <b>Search In</b> column, you see sub-branches such as <i>Attribute</i>, <i>Change</i> and <i>Custom Property</i>; these are the element features</p> <p>You can add these features by clicking on the <b>Add Filter</b> button; the <b>Add Filters</b> dialog displays, with a list of all the filters you can choose for an element or element feature</p> <p>Click on the <b>Search On</b> drop-down arrow to see a list of the element features you can search on; each feature has its own set of filters such as <i>Name</i>, <i>Notes</i> and <i>Alias</i>, which you can add to your search</p> <p>To search on an element attribute name, you would add the <i>Attribute</i> feature with a <i>Name</i> filter to your search</p> <p>The <b>Optional</b> radio button enables you to generate a list of elements that meet <i>one</i> of the element features (<i>Element Type = Object</i>), or one of the feature filters (<i>Attribute Name = Class1</i>); for example, if your search is:</p> <p style="padding-left: 40px;"><i>Element Name = Class11, Attribute Name = m_Att1 or Scope = Public</i></p> <p>the search results list all the elements that have the <i>name</i> of <i>Class11</i> and all the elements that have an <i>Attribute Name</i> of <i>m_Att1</i> or a <i>Scope</i> of <i>Public</i></p> <p>The <b>Required</b> radio button enables you to generate a list of elements that <i>must</i> have the element features you have added; for example, if your search is:</p> <p style="padding-left: 40px;"><i>Element Name = Class, Attribute Name = m_Att1 or Scope = Public</i></p> <p>you would get elements that <i>must</i> have the <i>name</i> of <i>Class</i> AND an <i>Attribute</i> with a name of <i>m_att1</i> or a <i>Scope</i> of <i>Public</i></p>	
<b>Add Filter</b>	Add a new set of parameters to filter the search on	<a href="#">Adding Filters</a> [489]
<b>Edit Filter</b>	Open the Edit Filters dialog, which enables you to change the search parameters	
<b>Remove Filter</b>	Remove the selected filter from the search	

### 17.1.1.7 Other Filters

The Other Filters tab enables you to define a set of filters to restrict your report to specific features of elements (sub-element components such as attributes, responsibilities or constraints). If the feature does not have the defined characteristics, it is not reported for the element.

#### Topics:

Topic	Detail	See also
<b>How to Access</b>	<p>As with the Document Options tabs, you can access the filter details from two different places; the start point affects the persistence of the filter definition:</p> <ul style="list-style-type: none"> <li>If you define the filters on the Other Filters tab of the Generate RTF Documentation dialog, you can create filter settings for the current</li> </ul>	<a href="#">Generate RTF Documentation</a> [1742]

Topic	Detail	See also
	<p>report to be run; selections are non-persistent, and are reset when you close the dialog or select a different template</p> <ul style="list-style-type: none"> <li>If you access the filter definitions by clicking on the <b>File   Document Options</b> menu option on the RTF Style Template Editor dialog, the settings are saved with the template as the default settings for any run of this report</li> </ul> <p>You add filters by clicking on the <b>Add Filters</b> button; to edit the filters, either double-click on the panel contents or click on the <b>Edit Filter</b> button, to display the Edit Filters dialog</p> <p>The format is the feature field name, the conditions placed on the field value, the actual value or delimiting value to search on, and whether the filter item is required (mandatory)</p> <p>The fields and options on the Other Filters tab are described below</p>	<p><a href="#">File and Print Options</a> <sup>[1757]</sup></p> <p><a href="#">RTF Style Template Editor</a> <sup>[1755]</sup></p> <p><a href="#">Add Filters</a> <sup>[489]</sup></p>

**Reference:**

Column/Button	Action	See also
<b>Search In</b>	Select the name of each feature field to search on	
<b>Condition</b>	Select the condition of the search parameter The available options are <b>Contains, Equal To, Not Equals</b> and <b>One Of</b>	<a href="#">Fields and Conditions</a> <sup>[491]</sup>
<b>Look For</b>	Specify the search term to perform the conditional search on This value can pertain to the selected field; for example, the value could be a date for <i>DateCreated</i> or a text value for other fields The search term can contain multiple values, separated by commas	
<b>Required</b>	Indicate that the search results must include elements with your search term in that field; you select these checkboxes on the Add Filters dialog The fields listed as filters have an OR relationship when no <b>Required</b> checkboxes are selected; that is, if the search term is found in any one of those fields, then the element is displayed Any field having the <b>Required</b> checkbox ticked overrides fields where the <b>Required</b> checkbox is not ticked	<a href="#">Adding Filters</a> <sup>[489]</sup>
<b>Add Filter</b>	Add a new set of parameters to filter the search on	
<b>Edit Filter</b>	Open the Edit Filters dialog, which enables you to change the search parameters	
<b>Remove Filter</b>	Remove the selected filter from the search	

### 17.1.1.8 Project Constants

The Project Constants tab enables you to add values for your own project-specific fields in a report, to be inserted during compilation. The fields can be inserted into any template, in the text, headers or page headers and footers, using the RTF Style Template Editor context menu.

Field	Usage	See also
<b>Add</b>	Add a new field and value to the list A prompt displays for the two data items	
<b>Delete</b>	Remove the selected field from the list A prompt displays to confirm the deletion	
<b>Import</b>	Import a set of fields from an external XML file A browser displays to select the source file and location	
<b>Export</b>	Export all fields to an external XML file A browser displays to specify the target file and location	

#### Learn More:

- [Add Content](#)<sup>[1758]</sup>

### 17.1.1.9 Word Substitution

The Word Substitution tab of the Generate RTF Documentation dialog enables you to define translations of technical terms used in Enterprise Architect, in particular field names, into a language other than English for direct substitution into RTF documentation.

#### How To:

To add a translation for a term, follow the steps below:

Step	Action	See Also
1	Double-click on the term in the <b>English</b> column in the <b>Word Substitution</b> list; the <b>Enter Value</b> field displays	
2	Type the foreign language translation in the <b>Enter Value</b> field, and click on the <b>OK</b> button	

### 17.1.1.10 Language Substitution

The Codepage tab of the Generate RTF Documentation dialog enables you to define languages other than English for direct substitution into RTF documentation.

If you export RTF-format documents from Enterprise Architect in languages other than English, you can customize the codepage, default language ID and character set that Enterprise Architect uses when generating RTF. This makes it much easier to generate documentation appropriate to your country or locale.

#### How To:

Step	Action	See Also
1	From the drop-down lists in the <b>Language</b> , <b>Codepage</b> and <b>Charset</b> fields, select the language, codepage and character set that most closely match your location	
2	If required, modify the <b>Substitute Tag</b> by double-clicking on each and manually setting the value (for advanced use only)	
3	To clear the substitution list, double-click on each item in turn and delete the substitute value  Now when you generate RTF documents, the substitute tags are used in the output	

**Notes:**

- You can transport these tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options

**Learn More:**

- [Export Reference Data](#) <sup>[238]</sup>
- [Import Reference Data](#) <sup>[240]</sup>

## 17.1.2 RTF Templates

The Templates tab of the Generate RTF Documentation dialog enables you to create, edit and delete your own RTF style templates. You can also import RTF templates saved as XML files.

**Topics:**

Topic	Detail	See also
<b>Abstract</b>	<p>In versions of Enterprise Architect later than 7.1, a <i>Normal.rtf</i> template is provided as a system template, as an external file stored in:</p> <p style="text-align: center;"><i>%APPDATA%\Sparx Systems\EA\RTF Templates</i></p> <p>This provides user-editable defaults of styles, numbering and other base formats; any styles modified in the <i>Normal.rtf</i> file reflect in newly created templates - one useful style is the default list numbering, <i>MasterList</i></p> <p>To edit the <i>Normal.rtf</i> template, use the RTF Style Template Editor to create a new template called, for example, <i>Normal</i>, and use the <b>File   Import</b> menu option to import the <i>Normal.rtf</i> file into the <i>Normal</i> template; modify the <i>Normal</i> template as required, but ensure there is no text when you save it, just style definitions</p> <p>Export the modified template (<b>File   Export</b>) back into the <i>Normal.rtf</i> file in the <i>RTFTemplates</i> folder</p> <p>A related feature in the RTF Style Template Editor is the <b>File   Update Styles</b> menu option, which enables you to update existing templates to reflect any changes to <i>Normal.rtf</i></p>	<a href="#">File and Print Options</a> <sup>[1757]</sup>

**Reference:**

The Templates tab has the following functions:

Field	Field	See also
<b>Delete a template</b>	Click on the template name and click on the <b>Delete</b> button	
<b>Create a new template</b>	Click on the <b>New</b> button  The New Document Template dialog displays, on which you specify the template name and the name of any existing template to act as the base for the new template  To make it easier to get up and running, Enterprise Architect provides a basic template with default settings on which you can base new templates  Modify the template as required, using the RTF Style Template Editor	
<b>Open the RTF Style Template Editor</b>	Click on the template name and click on the <b>Edit</b> button  The Template: <Template name> screen displays, presenting the facilities of the RTF Style Template Editor	

**How To:**

To Import RTF templates saved to XML files using the **Project | Model Import/Export | Export Reference Data** menu option, follow the steps below:

Step	Action	See Also
1	Click on the <b>Import From Reference File</b> button	
2	On the Import Reference Data dialog, click on the <b>Select File</b> button and browse for and select the required file	
3	In the Select Datasets to Import panel, click on the required datasets	
4	Click on the <b>Import</b> button to import the template	

The imported template displays in the list on the Templates tab of the Generate RTF Documentation dialog.

**Notes:**

- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is switched on, you must have **Configure Resources** access permission to create RTF templates
- In the Normal.rtf template, you must not edit the *SSbookmark* style; this defines the section styles and must be preserved
- There are two methods of exporting and importing RTF templates out of and into models:
  - If the template is in a batch file, export it using the **Project | Model Import/Export | Export Reference Data** menu option and import it using the Templates tab, as above
  - If the template is a one-off copy, use the RTF Template Editor **File** menu options, **Export** and **Import**

**Learn More:**

### 17.1.2.1 RTF Style Template Editor

The RTF Style Editor enables you to create and edit custom RTF templates to define output RTF documentation associated with various sections of the *RTF Report* facility in Enterprise Architect. You typically use this facility to customize the look and feel of a report for your company or client.

**Access:** [View | More Project Tools | Project Resources > \(one of the following folders\) Templates, Document Templates, System or Model : View/Modify](#)

#### Topics:

Topic	Detail	See also
Usage	<p>You select particular model components and specify, from the component type, the fields to include in the generated document</p> <p>You can define formatting styles in the RTF Style Template Editor, and add a range of items such as tables of contents or headers to the document</p> <p>For information regarding specific commands to alter the format of the RTF documentation, see the entries under the <i>RTF Style Template Editor Options</i> topic</p>	<p><a href="#">Selecting Components for Recording</a><sup>[1778]</sup></p> <p><a href="#">RTF Style Template Editor Options</a><sup>[1755]</sup></p>

#### Notes:

- You can transport these RTF templates between models, using the **Export Reference Data** and **Import Reference Data** options
- You can also access this in alternative ways, by:
  - Selecting to edit the current template on the Generate tab of the Generate RTF Documentation dialog
  - Selecting to edit a style template on the Templates tab of the Generate RTF Documentation dialog

Frame and Drawing Objects	<a href="#">Frame and Drawing Objects</a> <sup>[1776]</sup>
Search/Replace Commands	<a href="#">Search/Replace Commands</a> <sup>[1777]</sup>

**Notes:**

- Throughout your template editing, be aware that:
  - To undo one or more immediately previous edits, press **(Ctrl+Z)**, or select the **Edit | Undo** menu option; you can still undo a change even after you have saved the change
  - To redo one or more immediately previous undone edits, press **(Ctrl+Y)**, or select the **Edit | Redo** menu option

**17.1.2.2.1 Scroll Through Text**

Scroll Using	Options
Keyboard Keys	Press: <ul style="list-style-type: none"> <li><b>( ↑ )</b>, <b>( ↓ )</b>, <b>( ← )</b> or <b>( → )</b> to scroll up or down a line, or left or right one character</li> <li><b>( Home )</b> to move to the beginning of the current line</li> <li><b>( End )</b> to move to the end of the current line</li> <li><b>( Ctrl+Page Up )</b> to move to the beginning of a file</li> <li><b>( Ctrl+Page Down )</b> to move to the end of a file</li> <li><b>( Page Up )</b> to display the previous page</li> <li><b>( Page Down )</b> to display the next page</li> <li><b>( Ctrl+← )</b> to move to the previous word</li> <li><b>( Ctrl+→ )</b> to move to the next word</li> <li><b>( Ctrl+↑ )</b> to move to the first column of the current line (if not already on the first column) or the first column of the previous line</li> <li><b>( Ctrl+↓ )</b> to move to the first column of the next line</li> <li><b>( F10 )</b> (or select the <b>Other   Jump</b> menu option), type in a line number to jump to, and click on the <b>OK</b> button</li> </ul>
Mouse	Click on the vertical and horizontal scroll bar to perform various scrolling functions  These functions are available only if the horizontal or the vertical bar has been enabled by the startup parameters

Scroll Using	Options
	<p><b>Vertical Scroll Bar:</b> Click on the arrows on either end to scroll the screen up or down by one line</p> <p>Click above the elevator to scroll the screen up by one page; similarly, click below the elevator to scroll the screen down by one page</p> <p>You can also drag the elevator to any position in the bar; as the elevator is dragged, the editor scrolls the screen up or down accordingly</p> <p><b>Horizontal Scroll Bar:</b> Click on the arrows on either end to scroll the screen left or right by one column; click on either side of the elevator to scroll the screen left or right by a 1/2 screen</p> <p>You can also drag the elevator to any position in the bar; as the elevator is dragged, the editor scrolls the screen left or right accordingly</p>

#### 17.1.2.2.2 File and Print Options

Command	Action	Shortcut	See also
<b>New</b>	<p>Clear an existing template from the edit window and start an empty, unnamed template</p> <p>The editor prompts you to save any modification to the previous template</p>		
<b>Revert</b>	Revert to the previously-saved copy of the template		
<b>Save</b>	<p>Save the text to the current file name</p> <p>If a file is not yet specified, the editor prompts you for a template name</p>	<b>Ctrl + S</b>	
<b>Save As</b>	Similar to <b>Save File</b> , but you specify a new template name for saving the template	<b>Ctrl + Shift + S</b>	
<b>Import</b>	<p>Import an existing RTF document into the Template Editor, so as to insert model elements from that document into the template</p> <p>This option is useful when creating templates from a predefined document with a particular 'look and feel'</p>		<a href="#">Import an existing RTF document</a> <sup>[178]</sup>
<b>Export</b>	<p>Save the template as an RTF document rather than as a template</p> <p>This can be useful for saving the template for other models</p>		
<b>Update Styles</b>	<p>Imports the styles from <i>Normal.rtf</i>, found in the RTF Templates directory</p> <p>This option is useful when creating a Master Document / Sub Documents that require consistent user-defined styles across multiple templates (including such things as numbering formats)</p>		
<b>Document Options</b>	Display the Document Options dialog which enables you to set the filter and order the		<a href="#">Document Options</a> <sup>[174]</sup>

Command	Action	Shortcut	See also
	elements		
<b>Page Layout</b>	Specify the page layout, before selecting the <b>Print</b> option  You can specify the margins (left, right, top and bottom) in inches		
<b>Printer Setup</b>	Invoke a printer-specific dialog for the default printer (the default printer selection is made from the <b>Windows Control</b> panel)  You select the parameters from a set of printer-specific options; these options include page size, page orientation, resolution and fonts	<b>Ctrl + Shift + P</b>	
<b>Print</b>	Print the contents of the current file; the editor displays a dialog where you can select the scope of the printing  You can also choose to print only a selected part of the file  To print a block of text, highlight the required text before invoking the <b>Print</b> function; this command prints a highlighted: <ul style="list-style-type: none"> <li>• Line block</li> <li>• Character block</li> </ul> The <b>Print</b> function prints on a default printer selected from the Windows <b>Control</b> panel; you can alter the printer setup or page layout prior to invoking the <b>Print</b> function	<b>Ctrl + P</b>	
<b>Print Preview</b>	Preview the document before printing; the editor displays up to two pages at a time  You can scroll to a different page using ( <b>Page Up</b> ), ( <b>Page Down</b> ) or the scroll bar  By default the preview rectangle is sized to fit the current window; however, you can use the zoom option to enlarge or shrink the preview rectangle as required  Click on the <b>Edit</b> button or the <b>File   Print Preview</b> menu option again to return to editing mode		
<b>Close</b>	Close the Template Editor; the editor prompts you to save any unsaved information		

#### 17.1.2.2.3 Cut and Paste Options

To	Action	See also
<b>Highlight a word</b>	Double-click on the word	
<b>Highlight a line</b>	Move the cursor onto the line and press ( <b>F8</b> )	
<b>Select all file content</b>	Press ( <b>Ctrl+A</b> ) or select the <b>Edit   Select All</b> menu option	

To	Action	See also
<b>Copy a block</b>	<p>Highlight the lines of text to be copied and press ( <b>Ctrl+C</b> ), or select the <b>Edit   Copy</b> menu option</p> <p>Move the cursor to the point at which to insert the text and press ( <b>Ctrl+V</b> ) or select the <b>Edit   Paste</b> menu option</p>	
<b>Move a block</b>	<p>Highlight the lines of text to be moved and press ( <b>Ctrl+X</b> ), or select the <b>Edit   Cut</b> menu option; the selected text is removed from the page</p> <p>Move the cursor to the point at which to insert the text and press ( <b>Ctrl+V</b> ) or select the <b>Edit   Paste</b> menu option</p>	
<b>Delete a block</b>	Highlight the lines of text to be deleted and press ( <b>Delete</b> )	
<b>Delete a line</b>	Press ( <b>Shift+F9</b> ) to delete the current line; the remaining lines close up	
<b>Paste special objects</b>	<p>Select the <b>Edit   Paste Special</b> menu option; the Paste Special dialog displays, listing the appropriate data type formats for pasting the copied object, as listed below:</p> <p>Click on the <b>Paste</b> button to embed the data into your application, or click on the <b>Paste Link</b> button to create a link to the original file</p> <p><b><u>Native Object Format</u></b></p> <p>If available, this is the first format in the list box; you can edit data in this format using the original application, by double-clicking the object</p> <p><b><u>Formatted Text</u></b></p> <p>A text format; this option offers the most suitable format if the data is pasted from another text output application, as the font and formatting attributes are reproduced accurately</p> <p><b><u>Unformatted Text</u></b></p> <p>Another text format; this option pastes the text without retaining the formatting information</p> <p><b><u>Picture Format</u></b></p> <p>The data is available in Picture format; you can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application</p> <p>This format is preferred over the Bitmap and the Device Independent Bitmap formats</p> <p><b><u>Device Independent Bitmap and Regular Bitmap formats</u></b></p> <p>The data is available in bitmap formats; you can later edit the object, by double-clicking on it and invoking the Microsoft MS Draw application</p> <p>The editor converts these formats into the Picture format before calling the drawing application</p>	

#### 17.1.2.2.4 View Options

Menu Option	Action	See also
<b>Page Mode</b>	Turn <b>Page Mode</b> on (the equivalent of <i>Print View</i> in Word) or off (the equivalent of <i>Normal View</i> in Word)  In <b>Page Mode</b> , the editor displays one page at a time; it is most useful for documents containing multiple columns, as the columns are displayed side by side	
<b>Fitted View</b>	Turn <b>Fitted View</b> on or off; this is a special case of <b>Page Mode</b> , in which the text wraps to the window width and the soft page breaks are not displayed  If you select <b>Fitted View</b> , <b>Page Mode</b> is automatically selected too; if you deselect <b>Page Mode</b> , <b>Fitted View</b> is automatically deselected too	
<b>Ruler</b>	Display or hide the ruler at the top of the page  The ruler shows tab stops and paragraph indentation marks; it can also be used to create or delete tab stops	
<b>Tool Bar</b>	Display or hide the tool bar above the ruler  The tool bar provides a convenient method of selecting fonts, point sizes, character styles and paragraph properties; the tool bar also shows the current selection for font, point size and character styles	
<b>Status Ribbon</b>	Display or hide the status ribbon at the bottom of the editing panel  The status ribbon displays the current page number, line number, column number and row number; it also indicates the current insert/overtyping mode	
<b>Paragraph Marker</b>	Display or hide the paragraph marker (an inverted 'P') at the end of each paragraph  This option is useful when working with lines with many different heights	
<b>Hidden Text</b>	Show or hide 'hidden' text  Text formatted with the hidden attribute is shown with a dotted underline; when the option is turned off, the hidden text is not visible	<a href="#">Character Formatting Options</a> <small>[1762]</small>
<b>Field Names</b>	Insert, show and hide field names  As you develop your RTF document, you right-click on sections to insert field markers; you cannot insert these markers unless you have selected the <b>Field Names</b> option  When you deselect the option, existing field names are obscured	
<b>Page Header/ Footer</b>	Display or hide the text of page headers and footers; if <b>Page Mode</b> is not selected, this option turns <b>Page Mode</b> on  When <b>Page Mode</b> is selected, you cannot edit the header or footer text unless you also select the <b>Edit   Edit Page Header/Footer</b> menu option  When <b>Page Mode</b> is deselected, you can see and edit page headers and footers at the start of the document	<a href="#">Headers and Footers</a> <small>[1767]</small>

Menu Option	Action	See also
<b>Page Border</b>	<p>Display or hide a page outline in <b>Page Mode</b></p> <p>When <b>Page Mode</b> is deselected, this option is not available</p> <p>When <b>Page Border</b> is selected, the document contents are shown within a page outline; when <b>Page Border</b> is deselected, the document contents are formatted within the boundaries of the editing screen</p>	
<b>Zoom</b>	<p>Shrink or enlarge the display of the document text, by selecting the appropriate percentage enlargement</p> <p>The editor supports zoom percentages from 25 to 200</p>	

#### 17.1.2.2.5 Image and Object Inserts

To	Action	See also
<b>Embed a picture in the document</b>	<p>Position the cursor at the point at which to insert the picture bitmap or Windows metafile, and either:</p> <ul style="list-style-type: none"> <li>• Select the <b>Insert   Embed Picture</b> menu option, or</li> <li>• Press ( <b>Alt+F8</b> )</li> </ul> <p>A browser dialog displays, through which you select the picture to embed in the document.; the picture displays at the current cursor location</p> <p>The embedded picture is saved within the document</p>	
<b>Link a picture file to the document</b>	<p>Position the cursor at the point at which to link the picture bitmap or Windows metafile, and select the <b>Insert   Link Picture</b> menu option</p> <p>A browser dialog displays, through which you select the picture to link to the document; the picture displays at the current cursor location</p> <p>Linked picture data is not saved with the document, only the filename is stored within the document</p>	
<b>Embed an Ole object in the text</b>	<p>Position the cursor at the point at which to embed the object, and select the <b>Insert   Ole Object</b> menu option; the Insert Object dialog displays, listing the applications that are available to create the object</p> <p>When you select an application, the editor launches it and you create the required object using this application; when you save the application, the editor inserts an icon that indicates the inserted object</p> <p>You can later edit the object using the application, by double-clicking on the object</p> <p>You can also use the <b>Edit   Paste Special</b> menu option to import the OLE objects, provided that the object is available in the clipboard</p>	<a href="#">Block editing</a> <sup>1758</sup>
<b>Edit an embedded picture</b>	<p>Click on the picture and select the <b>Edit   Edit Picture</b> menu option; the Edit Current Picture Parameters dialog displays, through which you can change the width and height of the picture, in inches</p>	

To	Action	See also
	You can also align the top, bottom, or middle of the picture with the base line of the text	
<b>Edit an embedded Ole object</b>	<p>Double-click on the icon that indicates the inserted Ole object; alternatively, position the cursor on the icon and select the <b>Edit   Edit Ole Object</b> menu option</p> <p>The editor opens the object in the application used to create it, and you can edit the object</p>	
<b>Insert a background picture for the text</b>	<p>Select the <b>Other   Background Picture</b> menu option; a browser dialog displays, through which you select the bitmap or metafile file to insert as a background picture</p> <p>The picture occupies the entire text area</p> <p>To remove the background picture, deselect the <b>Background Picture</b> menu option</p>	
<b>Insert an RTF File</b>	Position the cursor at the point at which to insert the file, and select the <b>Insert   Insert RTF File</b> menu option	

#### 17.1.2.2.6 Character Formatting

When you change the format of existing text, any new characters you type immediately following automatically assume the formatting characteristics of the existing text.

To	Action	See also
<b>Apply character format</b>	<p>Highlight the text to which to apply the format, and use one or more of the following menu options or key combinations, as required:</p> <ul style="list-style-type: none"> <li>• <b>Font   Normal</b>, or press ( <b>Alt+0</b> )</li> <li>• <b>Font   Bold</b>, or press ( <b>Ctrl+B</b> )</li> <li>• <b>Font   Underline</b>, or press ( <b>Ctrl+U</b> )</li> <li>• <b>Font   Double Underline</b>, or press ( <b>Ctrl+D</b> )</li> <li>• <b>Font   Italic</b>, or press ( <b>Ctrl+I</b> )</li> <li>• <b>Font   Superscript</b>, or press ( <b>Alt+4</b> )</li> <li>• <b>Font   Subscript</b>, or press ( <b>Alt+5</b> )</li> <li>• <b>Font   Strike</b>, or press ( <b>Alt+6</b> ) (puts a line through the text)</li> <li>• <b>Font   All Caps</b></li> <li>• <b>Font   Small Caps</b></li> </ul> <p>To reset any character format, highlight the text and select the <b>Font   Normal</b> menu option, or press ( <b>Alt+0</b> )</p>	
<b>Change font typeface and point size</b>	<p>Highlight the text to change and select the <b>Font   Fonts</b> menu option, or press ( <b>Alt+F10</b> )</p> <p>The Font Selection dialog displays, from which you select the required typeface and point size</p> <p>Click on the <b>OK</b> button</p>	
<b>Change character style</b>	<p>Highlight the text to change and select the <b>Font   Style</b> menu option</p> <p>The Select a Style dialog displays, listing the currently-defined</p>	<a href="#">Template stylesheet<sup>1772</sup></a>

To	Action	See also
	<p>character styles in the template stylesheet</p> <p>Select the required style and click on the <b>OK</b> button</p>	
<b>Change the color of text, background (permanent highlight) or underline</b>	<p>Highlight the text to change and select one or more of the following options, as required:</p> <ul style="list-style-type: none"> <li>• <b>Font   Text Color</b></li> <li>• <b>Font   Background Color</b></li> <li>• <b>Font   Underline Color</b></li> </ul> <p>In each case, the Color dialog displays, through which you can select or define the required color</p> <p>When you have selected a color, click on the <b>OK</b> button</p>	
<b>Change character spacing</b>	<p>Normal character spacing is 20 Twips; if you want to change this (or return to it), highlight the text to adjust, and select the <b>Font   Spacing</b> menu option</p> <p>The Character Spacing dialog displays</p> <p>Select the radio button to expand or compress spacing, or to return to normal spacing; if you are changing from normal spacing, enter the number of Twips to set the spacing to</p> <p>Click on the <b>OK</b> button</p>	
<b>Hide text</b>	<p>Hidden text is not displayed on the screen or printer, but remains in the document and is not deleted</p> <p>Highlight the text to hide and select the <b>Font   Hidden</b> menu option, or press ( <b>Ctrl+H</b> )</p> <p>The highlighted text is not displayed and the rest of the text closes up</p> <p>To view hidden text, select the <b>View   Hidden Text</b> menu option; you can then make the text normal again by highlighting it and deselecting the <b>Font   Hidden</b> menu option</p>	
<b>Box text</b>	<p>Highlight the text to box and select the <b>Font   Boxed</b> menu option; this creates a broken-line border around the selected text</p>	
<b>Insert a non-breaking space</b>	<p>Move the cursor to the point at which to insert the non-breaking space and select the <b>Insert   Non-breaking Space</b> menu option</p>	
<b>Insert a non-breaking dash</b>	<p>Move the cursor to the point at which to insert the non-breaking dash and select the <b>Insert   Non-breaking Dash</b> menu option</p>	
<b>Insert an optional hyphen</b>	<p>Move the cursor to the point at which to insert the hyphen and select the <b>Insert   Optional Hyphen</b> menu option</p>	

#### 17.1.2.2.7 Paragraph Formatting

The functions described below operate on the current paragraph, or on a **highlighted** block of text.

To	Action	See also
<b>Clear all paragraph</b>	Select the <b>Paragraph   Normal</b> menu option	

To	Action	See also
formatting	The editor pushes the paragraph back up to the page margin	
Set text flow in document	To set the text flow for: <ul style="list-style-type: none"> <li>A selected block of text, select the <b>Paragraph   Text Flow</b> menu option; the Paragraph Text Flow dialog displays</li> <li>The entire document, select the <b>Edit   Document Text Flow</b> menu option; the Document Text Flow dialog displays</li> </ul> <p>In either case, select the required text flow direction and click on the <b>OK</b> button</p>	
Center text	Select the <b>Paragraph   Center</b> menu option or press ( <b>Alt+8</b> )	
Right-justify text	Select the <b>Paragraph   Right Justify</b> menu option or press ( <b>Alt+9</b> )	
Justify both sides of text	Select the <b>Paragraph   Justify Both</b> menu option	
Set double line spacing	Select the <b>Paragraph   Double Space</b> menu option A double-spaced paragraph has a blank line after each text line	
Indent paragraph left	Select the <b>Paragraph   Indent Left</b> menu option or press ( <b>Alt+L</b> )  Select the option again to increase the indent	
Indent paragraph right	Select the <b>Paragraph   Indent Right</b> menu option or press ( <b>Alt+R</b> )  Select the option again to increase the indent	
Create hanging indent	Select the <b>Paragraph   Hanging Indent</b> menu option or press ( <b>Alt+T</b> )  Select the option again to increase the indent of all lines below the first	
Keep paragraph lines together	Select the <b>Paragraph   Keep Together</b> menu option  The editor attempts to keep all lines within the paragraph on the same page	
Keep paragraph with next	Select the <b>Paragraph   Keep with Next</b> menu option  The editor attempts to keep the last line of the current paragraph and the first line of the next paragraph on the same page	
Prevent 'widow' and 'orphan' lines	Select the <b>Paragraph   Widow/Orphan Control</b> menu option  The editor attempts to avoid having: <ul style="list-style-type: none"> <li>the first line of the paragraph on the previous page ('widow' line)</li> <li>the last line of the paragraph on the next page ('orphan' line)</li> </ul>	
Start text on new	Move the cursor to the point at which to start the new page, and	

To	Action	See also
page	select the <b>Paragraph   Page Break Before</b> menu option	
Insert border and shading for text block	Highlight the required text and select the <b>Paragraph   Border and Shading</b> menu option  The Paragraph Box Parameters dialog displays, on which you specify: <ul style="list-style-type: none"> <li>• which sides of the box to display (including a line between text lines)</li> <li>• whether the lines are thick or doubled</li> <li>• the degree of gray shading behind the text</li> <li>• the color of the lines</li> </ul>	
Define line spacing	Highlight the required lines and select the <b>Paragraph   Paragraph Spacing</b> menu option  The Paragraph Spacing Parameters dialog displays, on which you specify the line spacing and the point spacing before and after lines	
Set a background color for text space	Highlight a text string or block of text and select the <b>Paragraph   Background Color</b> menu option  The Color dialog displays, on which you select the background color  The editor highlights the full width of the page in that color, for the selected lines	
Create a bulleted list	Highlight the required lines of text and select the <b>Paragraph   Bullet</b> menu option  The editor formats the lines into a simple bullet list	
Create a numbered list	Highlight the required lines of text and select the <b>Paragraph   Numbering</b> menu option  The editor formats the lines into a simple numbered list	
Apply numbering to paragraphs	1) Set up a numbering list and overrides ( <b>Edit   List and Overrides</b> )  2) Apply the numbering levels to the template sections ( <b>Paragraph   List Numbering</b> )	<a href="#">User-Defined Section Numbering</a> <sup>[1774]</sup>
Apply a paragraph style from the template stylesheet	Select the <b>Paragraph   Style</b> menu option  The Select a Style dialog displays, listing the currently-defined paragraph styles in the template stylesheet  Select the required style and click on the <b>OK</b> button	<a href="#">Stylesheets and Table of Contents</a> <sup>[1772]</sup>

### 17.1.2.2.8 Tab Support

The RTF Style Template Editor supports *left*, *right*, *center* and *decimal* tabs. Tabs are very useful for creating columns and tables. A paragraph can have as many as twenty tab positions.

A tab usually applies to every line of the current paragraph. However, if you highlight a block of text before setting a tab, the tab then applies to every line in the highlighted text.

#### Topics:

Topic	Detail	See also
<b>Create and Set Tabs</b>	<p>You can create tabs quickly and easily using the ruler at the top of the screen</p> <p>To create a:</p> <ul style="list-style-type: none"> <li>• <b>Left</b> tab, click on the required tab position on the ruler; the left tab is indicated on the ruler by an <b>L</b> shape</li> <li>• <b>Right</b> tab, right-click on the required tab position on the ruler; the right tab is indicated on the ruler by a reversed <b>L</b> shape</li> <li>• <b>Center</b> tab, press <b>(Shift)</b> and click on the required tab position on the ruler; the center tab is indicated on the ruler by an inverted <b>T</b> shape</li> <li>• <b>Decimal</b> tab, press <b>(Shift)</b> and right-click on the required tab position on the ruler; the decimal tab stop is indicated on the ruler by an inverted <b>T</b> shape with a dot on the right hand side</li> </ul> <p>This tab is for numbers with a decimal point; numbers scroll left from the tab until you type a point, then numbers scroll right</p> <p>You can also set tabs using the <b>Paragraph   Set Tab</b> menu option, which displays the Set a Tab Position dialog; this enables you to specify the tab type, and provides two advantages over the ruler: you can set the tab position with more precision and with a clear value that you can duplicate; and you can add a tab leader line (dot, hyphen, or underline)</p> <ul style="list-style-type: none"> <li>• To clear a <b>single</b> tab position for selected text, select the <b>Paragraph   Clear Tab</b> menu option; the Clear a Tab Position dialog displays, on which you select the tab to clear</li> <li>• To clear <b>all</b> tab stops for selected text, select the <b>Paragraph   Clear All Tabs</b> menu option</li> <li>• To move a tab position using the mouse, click on the tab symbol on the ruler and drag it to the new position</li> </ul>	

#### Notes:

- The **Other | Snap To Grid** menu option affects the movement of the tabs (and the paragraph indentation markers) on the ruler; when you select this option, the movements of the tab markers are locked on to an invisible grid at intervals of 1/16 inch (half a ruler division)

### 17.1.2.2.9 Page Breaks and Repagination

You can force a page break in the document by selecting the **Insert | Insert Break | Page Break** menu option, or by pressing **(Ctrl+Enter)**. The forced page break is indicated by a solid line in the editing window.

If **Page Mode** is off, the editor also marks automatic page breaks when the text overflows a page; these are

indicated by a dotted line.

You can repaginate your document, using the **Edit | Repaginate** menu option. This updates the **Page Number** and **Page Count** fields, and recompiles the table of contents.

You insert the **Page Number** and **Page Count** fields as follows:

Topic	Detail	See also
<b>Insert the page number</b>	Position the cursor at the point at which to display the page number, and select the <b>Insert   Page Number</b> menu option  The page number is displayed in gray	
<b>Insert the page count</b>	Position the cursor at the point at which to display the total number of pages in the document, and select the <b>Insert   Page Count</b> menu option  The page count is displayed in gray.	

#### 17.1.2.2.10 Headers and Footers

To	Action	See also
<b>Edit the page header and footer text</b>	In <b>Page Mode</b> , select the <b>Edit   Edit Page Header/Footer</b> menu option  A paragraph marker displays at the top and bottom of each page, and you can type in, format or delete the appropriate text  If <b>Page Mode</b> is turned off, all page headers and footers are displayed in a block at the start of the document, with identifying labels; you can also edit the text here  Each section in a document can have its own page header and footer	
<b>Create the header and footer for the initial page of the document</b>	In <b>Page Mode</b> , select the <b>Edit   Edit Page Header/Footer</b> menu option and then select the <b>Edit   First Page Header/Footer   Create First Page Header</b> or <b>Create First Page Footer</b> menu option  A paragraph marker displays at the top or bottom of the first page, and you can type in and format the appropriate text  If <b>Page Mode</b> is turned off, all page headers and footers are listed in a block at the start of the document, with identifying labels; you can also edit the text here	
<b>Delete the header and footer for the initial page of the document</b>	Whilst you can delete the first page header or footer text by simple editing, you must specifically delete the 'first page' assignment in order to display the header and footer text of the next section on the first page  In <b>Page Mode</b> , select the <b>Edit   Edit Page Header/Footer</b> menu option and then select the <b>Edit   First Page Header/Footer   Delete First Page Header</b> or <b>Delete First Page Footer</b> menu option  This removes the first page text and assignment, and displays the next-defined header and footer text	
<b>Create a footnote</b>	Move the cursor to the position at which to insert the footnote marker, and select the <b>Insert   Footnote/Endnote   Footnote</b> menu option  The Footnote Parameters dialog displays, on which you enter the footnote marker and footnote text, and select whether to make the marker a superscript  Click on the <b>OK</b> button; the editor inserts the footnote marker at the	

To	Action	See also
	current cursor location and, in <b>Page Mode</b> , displays the footnote text at the bottom of the page	
<b>Edit footnote text</b>	<p>Select the <b>Edit   Edit Footnote/Endnote   Edit Footnote Text</b> menu option; the text of each footnote displays in the document text where its marker was inserted</p> <p>Locate the text and make the required changes; in <b>Page Mode</b> the modified footnote displays at the bottom of the page.</p> <p>When you have finished editing footnote text, <i>deselect</i> the <b>Edit   Edit Footnote/Endnote   Edit Footnote Text</b> menu option; the footnote text is no longer shown in the document text</p>	
<b>Create an endnote</b>	<p>Move the cursor to the position at which to insert the endnote marker, and select the <b>Insert   Footnote/Endnote   Endnote</b> menu option</p> <p>The Endnote Parameters dialog displays, on which you enter the endnote marker and endnote text, and select whether to make the marker a superscript</p> <p>Click on the <b>OK</b> button; the editor inserts the endnote marker at the current cursor location and, in <b>Page Mode</b>, displays the endnote text at the end of the section or document</p>	
<b>Edit endnote text</b>	<p>Select the <b>Edit   Edit Footnote/Endnote   Edit Endnote Text</b> menu option; the text of each endnote displays in the document text where its marker was inserted</p> <p>Locate the text and make the required changes; in <b>Page Mode</b>, the modified endnote displays at the bottom of the page</p> <p>When you have finished editing endnote text, <i>deselect</i> the <b>Edit   Edit Footnote/Endnote   Edit Endnote Text</b> menu option; the endnote text is no longer shown in the document text</p>	

#### 17.1.2.2.11 Hyperlinks and Bookmarks

To	Detail	See also
<b>Manage bookmarks</b>	<p>Each template contains a number of bookmarks that mark the sections; you can apply these bookmarks to related sections, create and assign your own, delete those that are not required, and locate specific bookmarks in the document</p> <p>In <b>Page Mode</b>, select the <b>Insert   Bookmark</b> menu option; the Bookmark dialog displays</p> <ul style="list-style-type: none"> <li>To assign a bookmark to the current cursor position, either type a new bookmark in the top field or select one from the list, and click on the <b>Insert</b> button</li> <li>To delete an existing bookmark, click on it in the list and click on the <b>Delete</b> button</li> <li>To mark a bookmark with the number of the page it is on, click on the bookmark in the list and click on the <b>Set Page Reference</b> button</li> <li>To locate a bookmark in the text, click on it in the list and click on the <b>Go to</b> button</li> </ul>	
<b>Insert hyperlinks</b>	Right-click on the point at which to create the hyperlink and select the	

To	Detail	See also
	<p><b>Insert   Hyperlink</b> context menu option; the Insert Hyperlink dialog displays</p> <p>You can create a hyperlink within an RTF document to an external document, Help topic or web page</p> <p>In the <b>Link Text</b> field, type the text to be hyperlinked and, in the <b>Link Code</b> field, type or paste the web page URL, help topic file or external file path and name</p> <p>To capture the help topic file name, right-click on the displayed topic, select the <b>Properties</b> context menu option, and copy the file name - when you insert the file name in the <b>Link Code</b> field, ensure that the file name has the prefix <code>\$Help://</code></p> <p>Click on the <b>OK</b> button; the hyperlinked text displays in the document</p> <p>Double-click on the link to display the web page or external document</p>	

#### 17.1.2.2.12 Table Commands

The **Table** menu enables you to create a new table, or to edit an existing table's attributes.

To	Action	See also
<b>Insert a table in the document</b>	<p>Position the cursor at the appropriate point, and select the <b>Table   Insert Table</b> menu option; the New Table Parameters dialog displays, in which you specify the number of table rows and columns</p> <p>The editor initially creates cells of equal width; you can, however, change the cell width by dragging the cell borders using the mouse</p> <p>When <b>Page Mode</b> is deselected, the table structure is not visible</p>	
<b>Add a header row</b>	<p>Select the rows to act on, and then select the <b>Table   Header Row</b> menu option</p> <p>Apply any heading settings and formatting to the rows in the highlighted block</p>	
<b>Insert a new row above the current row</b>	Select the <b>Table   Insert Row</b> menu option	
<b>Insert a new column to the left of the current column</b>	Select the <b>Table   Insert Column</b> menu option	
<b>Merge cells</b>	<p>Select the cells to merge and select the <b>Table   Merge Cells</b> menu option</p> <p>The width of the resulting cell is equal to the sum of the merged cells</p> <p>You can merge cells across a row, down a column, and in a block spanning both rows and columns</p>	
<b>Split a cell</b>	<p>Select the cell to split and select the <b>Table   Split Cell</b> menu option</p> <p>The selected cell is split into two cells of equal width; any text in the original cell is assigned to the first cell, and the second cell is created empty</p>	

To	Action	See also
<b>Delete cells</b>	<p>Select the cells to delete and select the <b>Table   Delete Cells</b> menu option; the Delete Table Cells dialog displays, on which you specify whether to delete:</p> <ul style="list-style-type: none"> <li>• <b>Cells</b> - deletes the highlighted cells</li> <li>• <b>Columns</b> - deletes all the cells in the highlighted column or columns</li> <li>• <b>Rows</b> - deletes all the cells in the highlighted row or rows</li> </ul> <p>If you delete all cells in a table, the table itself is automatically deleted</p>	
<b>Position the table on the page</b>	<p>Click on any part of the table and select the <b>Table   Row Position</b> menu option; the Table Row Alignment dialog displays, on which you select to left-align, center or right-align the table on the page</p> <p>This option has little effect if the table is wide enough to span the page or text column</p>	
<b>Set the height of a row, or all rows</b>	<p>Select the row to adjust and select the <b>Table   Row Height</b> menu option</p> <p>The Row Height Parameters dialog displays, enabling you to set an automatic row height, a minimum row height, or an exact row height</p> <p>You can apply the setting to the selected rows only, or to all rows in the table</p>	
<b>Keep row text together if it continues over a page</b>	<p>Select the rows to protect (preferably all rows in the table) and select the <b>Table   Keep Row Together</b> menu option</p> <p>If the row continues over the end of the page, the whole row is moved to the top of the next page</p>	
<b>Set text flow in rows</b>	<p>Select the rows and select the <b>Table   Row Text Flow</b> menu option; the Table Text Flow dialog displays, on which you select the direction of flow of the text and select to apply the setting to the selected rows or all rows in the table</p> <p>This option also moves the whole row over to the appropriate side of the page or column</p>	
<b>Set the width of selected cells</b>	<p>Select the cells to act on and select the <b>Table   Cell Width</b> menu option; the Set Cell Width dialog displays, on which you set the cell width and text margin and apply them to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows.</li> </ul>	
<b>Define the cell border width</b>	<p>Select the cells to act on and select the <b>Table   Cell Border Width</b> menu option; the Set Cell Border dialog displays, on which you set the width of the lines at any or all of the top, bottom, left and right of a cell, or whether to draw a uniform border around the cells</p> <p>You can also set the text margin, and apply all the settings to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Define the cell border color</b>	<p>Select the cells to act on and select the <b>Table   Cell Border Color</b> menu option</p>	

To	Action	See also
	<p>The Set Cell Border Color dialog displays, on which you set the color of the lines at any or all of the top, bottom, left and right of a cell, or whether to have a uniformly colored border around the cells</p> <p>You then apply the settings to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Define the cell shading</b>	<p>Select the cells to act on and select the <b>Table   Cell Shading</b> menu option; the Cell Shading Parameters dialog displays, on which you set the shading percentage</p> <p>The value <b>0</b> indicates the palest background, whereas the value <b>100</b> indicates a black background; you apply the setting to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Define the cell background color</b>	<p>Select the cells to act on and select the <b>Table   Cell Color</b> menu option; the Cell Color Parameters dialog displays, on which you set the cell background color</p> <p>You then apply the color to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Vertically align cells</b>	<p>Select the cells to act on and select the <b>Table   Cell Vertical Align</b> menu option; the Cell Vertical Alignment dialog displays, on which you select to align the selected cells by top, center, bottom or baseline</p> <p>You then select to align:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Rotate cell text</b>	<p>Select the cells to act on and select the <b>Table   Cell Rotate Text</b> menu option; the Cell Text Rotation dialog displays, on which you select to display text horizontally across the cell, vertically up the cell, or vertically down the cell</p> <p>You then select to apply the rotation to:</p> <ul style="list-style-type: none"> <li>• All cells in a highlighted block</li> <li>• The selected cells only</li> <li>• All cells in the selected column or columns, or</li> <li>• All cells in the selected row or rows</li> </ul>	
<b>Select column</b>	<p>Click on a cell and select the <b>Table   Select Current Column</b> menu option; the whole column is highlighted and selected for further formatting</p>	
<b>Show / hide table outline</b>	<p>Click on a table cell and select the <b>Table   Show Gridlines</b> menu option; this displays or hides the grid lines around the table cells</p>	

To	Action	See also
	The grid lines are for display purpose only and do not appear on the printed document	

### 17.1.2.2.13 Sections and Columns

The editor enables you to divide a document into multiple sections. A multiple section document is useful to:

- Vary the page margins from one page to another
- Create multiple columns of text

To	Action	See also
<b>Create a new section</b>	Select the <b>Insert   Insert Break   Section Break</b> menu option. This creates a new section on a new page  This option is not available when <b>Edit   Edit Page Header/ Footer</b> is active	
<b>Edit the section parameters</b>	Select the <b>Edit   Edit Section</b> menu option; the Section Parameters dialog displays  Define: <ul style="list-style-type: none"> <li>• The number of columns and column spacing - text in a multiple column section wraps at the end of the column; when the text reaches the end of the page, it resumes in the next column</li> </ul> <p>When <b>Page Mode</b> is off, the page contains a single very thin and long column; when <b>Page Mode</b> is on, the correct column layout is shown</p> <ul style="list-style-type: none"> <li>• The orientation - Portrait or Landscape</li> <li>• Whether to start the new section on the next page</li> <li>• The direction of text flow</li> <li>• Any special printing characteristics for the section</li> </ul> <p>You can also define any special page margins by selecting the <b>File   Page Layout</b> menu option</p>	<a href="#">File and Print Options</a> <sup>[1757]</sup>
<b>Delete a section break</b>	Move the cursor onto the section break line and press <b>( Delete )</b>	
<b>Create a column break</b>	Move the cursor to the appropriate point in the text and select the <b>Insert   Insert Break   Column Break</b> menu option  Normally in a multiple column section, the text flows from the end of one column to the top of the next column; a column break forces the text to the next column before the current column is completely filled  A column break is indicated by a line with a 'dot and dash' pattern; to delete the column break, simply position the cursor on the column break line and press <b>( Delete )</b>	

### 17.1.2.2.14 Stylesheets and Table of Contents

The editor supports *Character* and *Paragraph*-type stylesheet style items:

- The Character stylesheet style constitutes a set of character formatting attributes and is applied to a character string

- The Paragraph stylesheet style constitutes both a set of character formatting attributes and a set of paragraph formatting attributes, and is applied to one or more paragraphs

You can also include special, structured text in the document, such as **page number**, **date and time** and **text input** fields.

To	Action	See also
<b>Use double-byte characters</b>	Select the <b>Edit   Inline Ime</b> menu option This enables you to enter double-byte characters without using an external IME application	
<b>Create and edit styles</b>	Select the <b>Edit   Edit Style</b> menu option The Edit Stylesheet dialog displays Select the appropriate radio button to define a character style or a paragraph style Either select an existing style to modify from the list box, or type in a name for a new style; click on the <b>OK</b> button to begin recording the style properties You can use the ruler, toolbar or menu selections to modify the style items; these also reflect the currently-selected properties for the stylesheet item - please note that the paragraph properties are enabled only for the paragraph stylesheet items After you have defined the required style, either select the <b>Edit   Edit Style</b> menu option again or click anywhere in the document: <ul style="list-style-type: none"> <li>• If you modified an existing stylesheet item, the document automatically reflects the updated style</li> <li>• If you created a new stylesheet item, you can apply the style to highlighted text by selecting the <b>Font   Style</b> or <b>Paragraph   Style</b> menu options</li> </ul>	
<b>Apply character styles</b>	Select the <b>Font   Style</b> menu option to apply a stylesheet style to a highlighted character string	
<b>Apply paragraph styles</b>	Select the <b>Paragraph   Style</b> menu option to apply a stylesheet style to a highlighted paragraph or range of paragraphs	
<b>Insert a table of contents</b>	Create and apply the required heading styles using the <b>Edit   Edit Style</b> menu option, as above Move the cursor to the point at which to insert the table of contents and select the <b>Insert   Table of Contents</b> menu option The table of contents is automatically updated whenever repagination occurs	<a href="#">Repagination</a>
<b>Insert date and time fields</b>	Move the cursor to the point at which to insert the current date and time, and select the <b>Insert   Date and Time</b> menu option The Insert Current Date/Time dialog displays, from which you select the required date and time format The date and time are automatically updated whenever the page text is refreshed	
<b>Insert your own data fields</b>	<b>Not Supported In The Enterprise Architect RTF Generator</b> Move the cursor to the point at which to insert the data field and select the <b>Insert   Data Field</b> menu option The Data Field Parameters dialog displays, in which you enter the field

<b>Insert your own text entry field</b>	<p>Move the cursor to the point at which to insert the text entry field and select the <b>Insert   Text Input Field</b> menu option</p> <p>The Input Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> <li>• The field name</li> <li>• The initial value to display as a default</li> <li>• The maximum length of the field</li> <li>• The text font in which to display the text</li> </ul> <p>You also specify whether or not the field has a border</p> <p>For example: Hello {insert name field}</p>	
<b>Insert a selectable checkbox</b>	<p>Move the cursor to the point at which to insert the checkbox and select the <b>Insert   Checkbox Field</b> menu option</p> <p>The Checkbox Field Parameters dialog displays, in which you enter:</p> <ul style="list-style-type: none"> <li>• The field name</li> <li>• Whether it defaults to selected</li> <li>• The size of the box surrounding the check</li> </ul>	
<b>Define level numbering in generated document</b>	<p>Select the <b>Edit   List and Overrides</b> menu option</p> <p>Set up the numbering list and the list overrides</p> <p>Apply the numbering list to the headings set for packages and elements, using paragraph numbering</p>	<a href="#">User defined list numbering</a> [1774]

#### 17.1.2.2.15 User-Defined Section Numbering

You might want to define the numbering format for the section levels in your generated RTF document.

For example:

1. Package Level 1
  - 1.1 Package Level 2 (child package)
    - 1.1.1 Element Level 1
      - 1.1.1.1 Element (child element)

To define the numbering format you:

- First create a numbering list and
- Then create a set of list overrides for this list

The overrides must also have the initial 1.0.0 setting altered to 1.1.1. You can then apply the numbering list to the headings set for packages and elements, using paragraph numbering.

(For further information on applying continuous section numbering throughout a **Virtual Document**, see *Section Numbering in Virtual Documents*.)

#### How To:

To define the numbering format, follow the steps below:

Step	Action	See Also
1	In the Template Editor, select the <b>Edit   List and Overrides   Create List Item</b> menu	

Step	Action	See Also
	option The List Properties dialog displays	
2	In the <b>List Name</b> field, type a name for the list Click on the <b>OK</b> button to close the dialog	
3	Select the <b>Edit   List and Overrides   Create List Override</b> menu option The List Override Properties dialog displays	
4	In the <b>List to Override</b> field, type or select the name of the list you have just created Click on the <b>OK</b> button to close the dialog	
5	To set the list level properties for each level, select the <b>Edit   List and Overrides   Edit List Level</b> menu option The List Level Properties dialog displays	
6	To set the first level numbering (used in the Package Section), select the <b>List override</b> radio button and type or select the list override item you have just created	
7	Ensure that the <b>List Level</b> field is set to <b>1</b> (for Packages) and the <b>Number text</b> field is set to <b>~1~</b> Click on the <b>OK</b> button to save the values and close the dialog	
8	Open the dialog again ( <b>Edit   List and Overrides   Edit List Level</b> ) and set: <ul style="list-style-type: none"> <li>• <b>List Level</b> to <b>2</b> (for the <i>Element Section</i> or <i>Child Package Section</i>, for example)</li> <li>• <b>Start at</b> to <b>1</b> (to ensure that numbering at this level begins at 1.1 rather than 1.0)</li> </ul>	
9	Click on the <b>OK</b> button to close the dialog and save the changes	
10	Repeat steps 5 to 9 as required, incrementing the list level number and resetting <b>Start at</b> to <b>1</b> each time	

To apply the numbering levels you have defined (above), follow the steps below

Step	Action	See Also
1	In the Content window of the Template Editor, select the first item of text to be numbered (for example, <i>Package</i> )  <pre> package&gt;   Package: {Pkg.Name}   element&gt;   Element: {Element.Name}   child-elements&gt;   &lt;-child-elements   &lt;-element   child-packages&gt;   &lt;-child-packages   &lt;-package   </pre>	
2	Set the text style, using the style drop-down field in the Template Editor toolbar	

Step	Action	See Also
	<p><b>package-&gt;</b>¶  <b>Package:-{Pkg.Name}</b> ¶</p>	
3	<p>Click on the <b>Paragraph   List Numbering</b> menu option  The Apply Paragraph Numbering Using Lists dialog displays</p>	
4	<p>Select the required Numbering List and Override, and set the <b>Level</b> field to the required level  (1, for the top level)  Click on the <b>OK</b> button to close the dialog, and check that the required level has been applied to the selected text</p> <p><b>package-&gt;</b>¶  <b>1. Package:-{Pkg.Name}</b>¶</p>	
5	<p>Repeat steps 1 to 4 for the next level (Element), but at step 4 change the <b>Level</b> field to 2</p> <p><b>element-&gt;</b>¶  <b>1.1 Element:-{Element.Name}</b>¶</p>	
6	<p>Continue applying the overrides for lower section levels as necessary, then save the template and generate your RTF report  The output should now resemble the following example:</p> <pre> 1.      <b>Package: Formal Requirements</b> 1.1    <b>Package: Manage Users</b> 1.1.1  <b>Element: REQ011 - Manage User Accounts</b> 1.1.2  <b>Element: REQ016 - Add Users</b> 1.2    <b>Package: Manage Inventory</b> 1.2.1  <b>Element: REQ019 - Manage Inventory</b> 1.2.2  <b>Element: REQ020 - Receive Books</b> 1.2.3  <b>Element: REQ021 - List Stock Levels</b> </pre>	

**Learn More:**

- [Section Numbering in Virtual Documents](#)<sup>[1796]</sup>
- [Virtual Document](#)<sup>[1788]</sup>

### 17.1.2.2.16 Frames and Drawing Objects

A frame is a rectangular area that can contain both text and pictures on the page. The text *outside* the frame flows around it. A drawing object can be a text box, rectangle or a line. The drawing object *overlays* the text around it. You can see frames and drawing objects only if **View | Page Mode** is selected. However, the *content* of a frame or text box is still visible if **Page Mode** is deselected.

To	Action	See also
Embed a frame or drawing object at the cursor position	Select the <b>Insert   Frame</b> or <b>Insert   Drawing Object</b> menu option	
Insert text into the frame or drawing object text box	Click inside the outline and type the text at the cursor position	
Rotate text to display it down the side of the frame or text box	Select the <b>Edit   Edit Frame/Drawing Object   Rotate Text</b> menu option and select the text direction	
Insert a picture into a frame or drawing object text box	Copy the picture, click inside the outline and paste the picture at the cursor position	
Size a frame or drawing object	Click inside the outline, click on a sizing tab on the outline and drag the tab to the required position  If the frame or text box contains only a picture, the picture size is automatically adjusted to fill the outline; any text inside the outline is automatically wrapped to adjust to the new width  In a frame the frame height is automatically adjusted, if necessary, to enclose all lines; in a text box, you must adjust the height manually to enclose the text	
Move the frame or drawing object	Click inside the outline and then move the cursor just outside the outline so that the cursor changes to a plus-shape  Drag the plus shape (and hence the outline) to the new location	
Edit the relationship between a frame or drawing object and a point on the page (the vertical base position)	Click on the outline and select the <b>Edit   Edit Frame/Drawing Object   Vertical Base Position</b> menu option  Select the point to lock the outline to; outlines locked to the top of the page or the top of the margin retain their vertical position when you insert text before them	
Edit the border and the background of a drawing object	Select the <b>Edit   Edit Frame/Drawing Object   Edit Drawing Object</b> menu option  On the Line and Fill Attributes dialog, select the options for the preferred border, line color, fill color and wrapping effect on the template text	
Delete a frame or drawing object	Click on the outline and press ( <b>Delete</b> )  The editor prompts you to confirm the deletion; click on the <b>OK</b> button  Note that the deletion is actually reversible - press ( <b>Ctrl+Z</b> ) or select the <b>Edit   Undo</b> menu option	

#### 17.1.2.2.17 Search and Replace Commands

The first three menu options below all invoke the Search String Parameters dialog, if no search term has been defined.

Specify the term to search for, whether to search from the start of the file or forwards or backwards from the

current cursor position, and whether the search should exactly match the case of the search term.

To	Action	See also
Search for a text string	Select the <b>Other   Search</b> menu option, or press ( <b>F5</b> ) The Search String Parameters dialog displays The editor searches for the first instance of the specified character string as defined by the parameters	
Find the next instance of a previously-defined text string in the file	Select the <b>Other   Search Forward</b> menu option, or press ( <b>Ctrl+F</b> ) The editor searches forwards for the next instance of the specified text string in the file, and highlights it	
Find the previous instance of the previously-defined text string in the file	Select the <b>Other   Search Backward</b> menu option, or press ( <b>Ctrl+Shift+F</b> ) The editor searches backwards for the previous instance of the text string in the file, and highlights it	
Replace a text string	Select the <b>Other   Replace</b> menu option, or press ( <b>F6</b> ) The Replace String Parameters dialog displays, in which you specify: <ul style="list-style-type: none"> <li>• The text string to locate</li> <li>• The text string to replace it with</li> <li>• Whether to search the whole document or a highlighted block of text</li> <li>• Whether to confirm each replacement before making the change</li> </ul>	

### 17.1.2.3 Setting Sections for Reporting

#### How To:

To select model components to be documented in the report, using the RTF Style Template Editor, follow the steps below:

Step	Action	See Also
1	Expand the Sections tree on the <template name> screen	
2	Select the checkbox next to the component name; the component name is then displayed as a section tag in the Content panel More specific guidance is provided for selecting the following components: <ul style="list-style-type: none"> <li>• Linked Documents and Document Artifact Contents</li> <li>• Tabular Sections</li> <li>• Embedded Sections</li> <li>• Child Sections</li> <li>• Constraint and Scenario Sections</li> <li>• Reporting elements held in external packages</li> </ul>	<a href="#">Reporting Linked Documents</a> <sup>1779</sup> <a href="#">Tabular Sections</a> <sup>1779</sup> <a href="#">Embedded Elements Sections</a> <sup>1782</sup> <a href="#">Child Sections</a> <sup>1781</sup> <a href="#">Constraint and Scenario Sections</a> <sup>1783</sup> <a href="#">Report Elements</a>

Step	Action	See Also
		<a href="#">From External Packages</a> <sup>[1784]</sup>
3	Add content to each report component  The position of the section tags within the Sections tree determines the position of the model component in the Content panel; for encapsulated components, selecting a child component automatically selects the parent also	<a href="#">Add Section Content</a> <sup>[1786]</sup>

**How To:**

To move a model component to a different position in the documentation template, follow the steps below

Step	Action	See Also
1	Select the component in the Sections panel	
2	Click on  and  to move the component up and down the Sections panel	

**Notes:**

- To enable you to include elements from external packages, if the Package.Diagram.Element checkboxes are selected, you must select either the **Document each contained element in RTF** checkbox in the Diagram Properties dialog for at least one included diagram, or the **Include all diagram elements in report** checkbox on the Generate RTF Documentation dialog

**Learn More:**

- [Diagram Options](#) <sup>[1741]</sup>
- [Generate RTF Documentation](#) <sup>[1742]</sup>

**17.1.2.3.1 Tabular Sections**

The RTF Style Template Editor supports rendering a document section as a table. A tabular section is defined as a table containing any number of columns, but with only *two* rows:

- The first row is used to describe the headings of the columns, which you type in and format yourself
- The second row defines the output, which you specify by right-clicking in each cell and selecting the output type from the field list; the output is then generated iteratively for every occurrence of the section in question

**Topics:**

Topic	Detail	See also
<b>Example Tabular Section</b>	In the following example, the <b>Model &gt; Glossary &gt;</b> section is defined as a tabular section:	

Topic	Detail	See also															
	<pre>model &gt;</pre> <h2 style="margin: 0;">Model Glossary</h2> <pre>glossary &gt;</pre> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Term</th> <th style="text-align: left;">Type</th> <th style="text-align: left;">Meaning</th> </tr> </thead> <tbody> <tr> <td style="border: none;">(ModelGlossary.Term)</td> <td style="border: none;">(ModelGlossary.Type)</td> <td style="border: none;">(ModelGlossary.Meaning)</td> </tr> </tbody> </table> <pre>&lt;glossary</pre> <pre>&lt;model</pre> <p>This renders the following document output:</p> <h2 style="margin: 0;">Model Glossary</h2> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: left;">Term</th> <th style="text-align: left;">Type</th> <th style="text-align: left;">Meaning</th> </tr> </thead> <tbody> <tr> <td>Accounting Periods</td> <td>Business</td> <td>A defined period of time whereby performance reports may be extracted. (normally 4 week periods).</td> </tr> <tr> <td>Association</td> <td>Technical</td> <td>A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.</td> </tr> </tbody> </table>	Term	Type	Meaning	(ModelGlossary.Term)	(ModelGlossary.Type)	(ModelGlossary.Meaning)	Term	Type	Meaning	Accounting Periods	Business	A defined period of time whereby performance reports may be extracted. (normally 4 week periods).	Association	Technical	A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.	
Term	Type	Meaning															
(ModelGlossary.Term)	(ModelGlossary.Type)	(ModelGlossary.Meaning)															
Term	Type	Meaning															
Accounting Periods	Business	A defined period of time whereby performance reports may be extracted. (normally 4 week periods).															
Association	Technical	A relationship between two or more entities. Implies a connection of some type - for example one entity uses the services of another, or one entity is connected to another over a network link.															

**Notes:**

- Under some circumstances, a table might repeat the header row rather than the output row; if this occurs, create another row in the table between the header row and the output row, and leave this blank
- If you type a carriage return between the end of the table and the section terminator, the table you generate has a line space between the rows; for example:

```
package*>@
@
element*>@
* ElementName* Author*
* (ElementName)* (ElementAuthor)*
@
<element@
<package@
```

← Carriage Return

This generates the following table:

	Element Name	Author
	Choose Recipient	John Redfern

Line Space

	Manage Contacts	Walter Frederick
--	-----------------	------------------

To avoid this, ensure that there is no carriage return between the end of the table and the section terminator, as follows:

```

package">@
@
@
element">@
*      ElementName*      Author*
*      [Element Name]*    [Element Author]*
<element@
<package@
    
```

← No Carriage Return

This generates a table with no space between the rows, as follows:

	Element Name	Author
	Choose Recipient	John Redfern
	Manage Contacts	Walter Frederick

### 17.1.2.3.2 Child Sections

Child sections can be rendered in RTF documentation using one of the following two methods:

- Render model components directly into the RTF as defined by the section's content and fields.
- Render indirectly to the RTF by using a parent section to describe the content

The second option occurs as a result of creating a section that has a placeholder section tag (that is, no content within the tags). This method is used to create recursive documentation of child packages.

#### Topics:

Topic	Detail	See also
<b>Example: Rendered Sub-section</b>	<p>This example shows a template with content between the <i>Child Element</i> tags; in this example, child elements of the parent are rendered using the <i>Child Elements</i> section, because it contains valid content and fields</p> <pre> element"&gt;{   {Element.Name}   Type: → → {Element.Type}..{Element.BaseClasses}   Status: → → {Element.Status}..Version: {Element.Version}..Phase: {Element.Phase}   Package: → → {Element.ParentPackage}..Keywords: {Element.Tag}   Detail: → → Created on: {Element.DateCreatedShort}   {Element.Notes}   child element"&gt;     → Child: {Element.Name}   &lt;child element   &lt;element                     </pre>	
<b>Example: Non-rendered Sub-section</b>	<p>This example shows a template with no content between the child element tags; in this example, child elements of the parent are rendered using the element section, because the child element section is empty - the child element section is used as a placeholder</p>	

Topic	Detail	See also												
	<pre> element&gt; * {Element.Name} Type: -&gt; -&gt; {Element.Type} -&gt; {Element.BaseClasses} Status: -&gt; -&gt; {Element.Status} -&gt; Version: {Element.Version} -&gt; Phase: {Element.Phase} Package: -&gt; -&gt; {Element.ParentPackage} -&gt; Keywords: -&gt; {Element.Tag} Detail: -&gt; -&gt; Created on: {Element.DateCreatedShort} {Element.Notes} child element&gt; * &lt;child element &lt;element </pre>													
Child Document Sections and Their Corresponding Parent Sections	<table border="1"> <thead> <tr> <th>Child Section</th> <th>Section rendered when us</th> </tr> </thead> <tbody> <tr> <td>Package-&gt;Child Package</td> <td>Package</td> </tr> <tr> <td>Package-&gt;Element-&gt;Child Element</td> <td>Package-&gt;Element</td> </tr> <tr> <td>Package-&gt;Element-&gt;Diagram</td> <td>Package-&gt;Diagram</td> </tr> <tr> <td>Package-&gt;Diagram-&gt;Element</td> <td>Package-&gt;Element</td> </tr> <tr> <td>Package-&gt;Diagram-&gt;Connector</td> <td>Package-&gt;Element-&gt;Conne</td> </tr> </tbody> </table>	Child Section	Section rendered when us	Package->Child Package	Package	Package->Element->Child Element	Package->Element	Package->Element->Diagram	Package->Diagram	Package->Diagram->Element	Package->Element	Package->Diagram->Connector	Package->Element->Conne	
	Child Section	Section rendered when us												
	Package->Child Package	Package												
	Package->Element->Child Element	Package->Element												
	Package->Element->Diagram	Package->Diagram												
	Package->Diagram->Element	Package->Element												
Package->Diagram->Connector	Package->Element->Conne													

**Notes:**

- In principle, it is better to leave Child sections blank to replicate their parent sections

Child sections do not contain the same sub-section detail as their parents; for example: **Element:: Child Element** does not contain sub-sections such as Scenario or Attribute, so where Child Element sections are populated, these sub-sections are not rendered

An exception to this is cases where sub-sections are not required, but different formatting of the section fields is preferred

**17.1.2.3.3 Embedded Elements Sections**

The RTF Report Template editor enables you to report on the following embedded elements on an element:

- ActivityParameter
- RequiredInterface
- ActionPin
- Port
- EntryPoint
- ExpansionNode
- ObjectNode
- ProvidedInterface
- ExitPoint
- Part

**Topics:**

Topic	Detail	See also
Add Section For	To report on the embedded elements on an element, select the	

Topic	Detail	See also
<b>Embedded Elements</b>	<p><b>Package   Element   Embedded Elements</b> checkboxes</p> <p>The embedded elements list is rendered into the RTF documentation at:</p> <pre>embedded elements &gt;</pre> <pre>&lt;embedded elements</pre>	

Notes:

- It is better to leave Embedded Elements sections blank to replicate their parent sections

Embedded Elements sections do not contain the same sub-section detail as their parents; for example: **Element::Embedded Elements** does not contain sub-sections such as Scenario or Attribute, so where Embedded Elements sections are populated, these sub-sections are not rendered

**17.1.2.3.4 Reporting Linked Documents**

Topics:

Topic	Detail	See also
<b>Linked Documents and Document Artifact Contents</b>	<p>Linked documents and documents created via the Document Artifact element are rendered into RTF Documentation by selecting the <b>Linked Document</b> checkbox in the RTF Style Template Editor</p> <p>The <b>Linked Document</b> checkbox is within the <b>Package   Element</b> and <b>Package   Package Element</b> hierarchies, towards the end; however, remember that checkboxes can be moved up and down the hierarchy to position information in the generated document as you require</p> <p>In some templates, the <b>Linked Document</b> checkbox is only available as a child of the <b>External Requirements</b> checkbox</p> <p>The linked document is rendered into the RTF documentation at:</p> <pre>linked document &gt;</pre> <pre>&lt;linked document</pre>	<p><a href="#">Linked Documents</a> <sup>731</sup></p> <p><a href="#">Creating Document Artifacts</a> <sup>732</sup></p>

**17.1.2.3.5 Constraint and Scenario Sections**

The template content options enable you to include sections in your reports for:

- *constraints* on Package Elements, Elements, Connectors and Attributes, and
- *scenarios* for Package Elements and Elements

There are additional options in these types of section that enable you to determine what types of constraint or scenario are included in your reports, as described below.

Topics:

Topic	Detail	See also
<b>Constraints</b>	The following constraint options are available for selection, as checkboxes in the	

Topic	Detail	See also
	Sections panel of the RTF Style Template Editor: <ul style="list-style-type: none"> <li>• <b>Pre-Constraint</b> - select this checkbox to include all constraints of the type 'pre-condition' in this section of the report</li> <li>• <b>Post-Constraint</b> - select this checkbox to include all constraints of the type 'post-condition' in this section of the report</li> <li>• <b>Constraint</b> - select this checkbox to include all constraints that have not been generated in the Pre-Constraint and Post-Constraint sections of the report</li> </ul>	
<b>Scenarios</b>	The following scenario options are available for selection, as checkboxes in the Sections panel of the RTF Style Template Editor: <ul style="list-style-type: none"> <li>• <b>Element &gt; Scenario</b> - select this checkbox to include all scenarios in this section of the report; if any of the following sections are also selected, the report includes all scenarios that are not exception paths</li> <li>• <b>Element &gt; Scenario &gt; Exception</b> - select this checkbox to include all exceptions for each scenario</li> <li>• <b>Element &gt; Scenario &gt; Structured Scenarios</b> - select this checkbox to include all scenario steps in the scenario sections of the report</li> <li>• <b>Element &gt; Scenario &gt; Structured Scenarios &gt; Exception</b> - select this checkbox to include the steps for each exception path in the scenario sections of the report</li> </ul>

### 17.1.2.3.6 Report Elements From External Packages

Elements can be re-used in different diagrams across a model; this can often mean that a diagram contains elements that are held in packages other than the diagram's parent package.

When generating an RTF report on a package, you might want to include elements that are not held in that package, but that are referenced in diagrams within the package. To do this you must:

- Select the appropriate diagram options on the Generate RTF Documentation dialog and/or the Diagram page of the diagram Properties dialog
- Enable the appropriate template sections in the report template, as described in this topic

**Access:** [Project Browser package context menu | Documentation | Rich Text Format \(RTF\) Report \(F8\)](#)

**How To:**

To enable the template sections, follow the steps below:

Step	Action	See also
1	Select the <b>Rich Text Format (RTF) Report</b> menu option The Generate RTF Documentation dialog displays	
2	In the <b>Use Template</b> field, click on the drop-down arrow and select the appropriate customized template (not a system-provided one)	

Step	Action	See also
3	Click on the <b>Edit Template</b> button to display the RTF Template Editor	
4	<p>In the Sections panel on the left-hand side of the editor window, select the <b>Package::Element</b> checkbox</p> <p>Selecting the checkbox adds the following set of sections to the Content panel of the template:</p> <pre data-bbox="338 555 778 770">package &gt; [right-click-to-insert-Package-field(s)] element &gt; [right-click-to-insert-Element-field(s)] child elements &gt; &lt; child elements &lt; element &lt; package</pre>	
5	<p>Delete the <i>[right-click-to-insert-Element-field(s)]</i> text to leave a blank area</p> <p>Right-click and select the <b>Insert Field   Name</b> context menu option, this inserts an <b>Element.Name</b> field in the template</p>	
6	<p>In the Sections panel, select the <b>Package::Diagram::Element</b> checkbox</p> <p>Selecting the checkbox adds the following set of sections to the Content panel of the template:</p> <pre data-bbox="338 1055 799 1301">package-&gt;¶ [right-click-to-insert-Package-field(s)]¶ diagram-&gt;¶ [right-click-to-insert-Diagram-field(s)]¶ element-&gt;¶ [right-click-to-insert-Element-field(s)]¶ &lt;-element¶ &lt;-diagram¶ &lt;-package¶</pre>	
7	<p>To report on the linked elements in:</p> <ul data-bbox="373 1368 1241 1491" style="list-style-type: none"> <li>• the same style as defined in the <b>Package::Elements</b> section, delete the <i>[right-click-to-insert-Element-field(s)]</i> text to leave a blank area</li> <li>• a different style to the elements within the selected package, set up the style as appropriate</li> </ul> <p>If using the Legacy RTF generator, the <i>Element</i> checkbox is automatically checked in your customized template, when you select the <b>Document each contained element in RTF</b> checkbox</p> <p><b>Package::Diagram::Element</b>, if left blank, replicates the format of <b>Package::Element</b> including sub-element sections (for example, <b>Package::Element::Scenario</b>); <b>Package::Diagram::Element</b> does not have an option to add these sections</p>	

**Learn more:**

### 17.1.2.3.7 Add Section Content

The RTF Style Template Editor uses pairs of tags to define the layout of the documentation content. To insert a pair of model component tags into the **Content** section of the Editor, use the Sections panel of the RTF Style Template Editor.

The beginning of a model component is represented by a yellow highlighted `<sectionname >` tag; the end of the model component is represented by `</sectionname`.

#### How To:

To add model component content, follow the steps below

Step	Action	See Also
1	<p>Right-click in the area between the opening and closing tags; this displays a context menu that enables you to:</p> <ul style="list-style-type: none"> <li>perform simple text editing (cut, copy and paste)</li> <li>select from a list of defined project constants to insert at the cursor position; if no project constants have been defined, the menu option is not available</li> <li>select from a context-sensitive list of fields to add to this component section of the RTF Documentation; any additional information entered between the tags is also included in the generated RTF Documentation</li> </ul> <p>For example, in the <code>&lt;connector &gt;</code> section shown below, the user has right-clicked in the fourth column of the table, underneath the <code>&lt;constraint</code> tag; they can then select to add another field to the Notes on each connector listed in the table</p> 	<p><a href="#">Project Constants</a> <sup>[1752]</sup></p>

#### Topics:

Topic	Detail	See also
<b>The valueOf Field</b>	<p>For certain sections, you can add a field to capture a special characteristic of a model component, as defined by a specific Tagged Value; this is the <b>valueOf</b> field, shown in the list for a connector section in the above graphic</p> <p>The sections that provide the <b>valueOf</b> field are:</p>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Package</li> <li>• Element</li> <li>• Connector</li> <li>• Attribute</li> <li>• Operation</li> <li>• External Requirement</li> </ul> <p>When you select the <b>valueOf</b> field from the context menu, the template editor prompts you to specify the tag (Tagged Value) from which to extract the value for the report output; this tag should be one of the tags associated with the model component, such as ConnectorAltName for a connector</p> <p>When you provide the tag name, the template editor adds the field at the cursor position, in the format:</p> <p style="text-align: center;">{Connector.valueOf(tagname)}</p> <p>For example: {Connector.valueOf(ConnectorAltName)}</p> <p>For clarity, you could type some lead-in text or the meaning of the Tagged Value immediately preceding the value field; for example:</p> <p><b>Alternative Name:</b> {Connector.valueOf(ConnectorAltName)}</p>	

**Notes:**

- If you select a field with short date format (such as *Pkg.DateCreatedShort*, *Diagram.DateModifiedShort* or *Element.DateCreatedShort*) the format is actually drawn from the MS Windows settings

To use a different short date format, click on the **Start** icon on the Windows desktop and select the **Control Panel | Regional and Language Options | Customize** option

**17.1.2.4 Import RTF Template**

Enterprise Architect provides a number of RTF document templates, and enables you to create others. However, you might already have corporate formats and templates in use in your organization, so Enterprise Architect also enables you to import existing templates into the RTF Generator.

**How To:**

To import an external template, follow the steps below:

Step	Action	See Also
1	Save the external template as an RTF document	
2	In Enterprise Architect, create a new blank template; name the template but do not specify an existing template to copy from	<a href="#">RTF Templates</a> <small>[1754]</small>
3	When the template is listed on the Templates tab of the Generate RTF Documentation dialog, click on the name and click on the <b>Edit</b> button  The RTF Document Template Editor dialog displays	
4	Right-click on the document and select the <b>File   Import</b> context menu option  The Microsoft Word File Open dialog displays	

Step	Action	See Also
5	Locate your template RTF file, and click on the <b>Open</b> button  The Open dialog closes, returning you to the Document Template Editor dialog; this now contains your imported template	
6	Right-click and select the <b>File   Save</b> menu option  If necessary, make any changes to the template and select <b>File   Save</b> again before selecting <b>File   Close</b> to exit the dialog	<a href="#">RTF Style Template Editor Options</a> <sup>[1755]</sup>

**Notes:**

- Standard graphical images (such as a logo in the header, main text or footer) are imported; however, any Word-based meta-file graphics are not imported
- You can select the new template to use in generating an RTF document, either on the Generate RTF Documentation dialog or in a Master Document or Model Document element

**Learn More:**

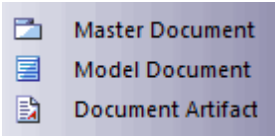

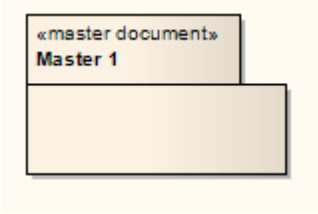

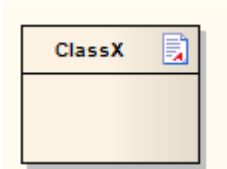

- [Generate RTF Documentation](#) <sup>[1739]</sup>
- [Master Document](#) <sup>[1790]</sup>
- [Model Document](#) <sup>[1791]</sup>

### 17.1.3 Virtual Documents

*Virtual documents* enable you to structure and filter your **RTF** and **HTML** reports by selecting, grouping and ordering individual packages independent of the organization of the Project Browser.

**Topics:**

Topic	Detail	See also
<b>Abstract</b>	<p>You can create separate virtual documents defining, say, Requirements, Use Cases or Design elements of a project, or you can combine these separate reports - retaining their own different formats - into a single generated document with common headers and footers and a central contents list; this combined document could apply your corporate standards</p> <p>You generate virtual documents in Enterprise Architect from individual <b>Model Document</b> elements; you can also, if required, combine several Model Documents under a <b>Master Document</b> package element</p> <p>You can create as many Model Documents as required, for as many combinations of information as required</p> <p>Each Model Document element has its own template; for example, a specifically-designed Requirements template for a Requirements document, or a Use Case template for a section on Use Cases</p> <p>For HTML, the template is identified on the report generation dialog; for RTF, the template is identified in a Tagged Value</p> <p>The content of the report is defined as either:</p> <ul style="list-style-type: none"> <li>• A list of packages (defined as attributes) dragged onto the element in whatever order or combination is most</li> </ul>	<a href="#">Create Model Document</a> <sup>[1791]</sup> <a href="#">Create Master Document</a> <sup>[1790]</sup> <a href="#">Add Packages to Model Document</a> <sup>[1793]</sup> <a href="#">Delete Package in Model Document</a> <sup>[1794]</sup> <a href="#">Create and Modify Searches</a> <sup>[484]</sup> <a href="#">Import RTF Template</a> <sup>[1787]</sup> <a href="#">Document Order</a> <sup>[1794]</sup>

Topic	Detail	See also
	<p>appropriate to your requirements - you can easily <b>add</b> or <b>delete</b> packages as necessary; or</p> <ul style="list-style-type: none"> <li>• (Not for HTML reports) a standard model search (defined as Tagged Values) created within the Model Search facility - note that diagram searches are not supported; when you generate the document, this search captures the required data throughout the model and populates the document</li> </ul> <p>The Master Document element has its own template Tagged Value, which defines the headers, footers and central contents list; you can <b>import your corporate standards template</b> and edit the Tagged Value to identify that</p> <p>The template in the Master Document overrides the templates in the Model Documents; for example, headers and footers in the Master Document template override any header and footer definitions in the Model Document templates - this enables you to apply consistent and continuous styles and page numbering throughout the report generated through the Master Document</p> <p>If you want the Model Documents to have their own styles, applied through their own RTFTemplate Tagged Values, either leave the Master Document RTFTemplate Tagged Value blank (for completely separate overall styles) or remove the definition of specific styles from the Master Document template</p> <p>You can control the sequence in which information is presented in the document; see the <i>Document Order</i> topic</p>	
<p><b>Document Elements</b></p>	<p>The Master Document and Model Document elements are available from the Documentation page of the Toolbox; on the Toolbox, select <b>More tools   Documentation</b> (this Toolbox page also provides the <b>Document Artifact</b> element, which is not related to virtual documents but is used for adding a linked document to an element)</p> <div data-bbox="475 1323 751 1458" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;">  </div> <p>When you drag the Master Document and Model Document elements onto a diagram, the following symbols display, respectively:</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div data-bbox="475 1630 794 1843" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;">  </div> <div data-bbox="981 1659 1209 1827" style="border: 1px solid #ccc; padding: 5px; margin: 10px 0;">  </div> </div>	<p><a href="#">Document Artifact</a><sup>[953]</sup></p>

**Notes:**

- In a Model Document for an RTF report, you should not define both a list of packages and a search; if both are present, when you generate the RTF document Enterprise Architect works from the package list only

- You cannot use **RTF Bookmarking** in Master Document elements, which effectively replace RTF Bookmarking in Word

RTF Bookmarking requires each bookmark to be unique; when you generate a report with a standard RTF template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the Elements-details being generated and the elements in the repository

As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1; there is no simple method that enables the generated data to be uniquely identified directly in association with the original element

#### Learn More:

- [Model and Master Documents](#)<sup>[1828]</sup>
- [RTF Bookmarking](#)<sup>[1811]</sup>

### 17.1.3.1 Create Master Document

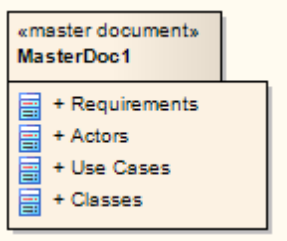

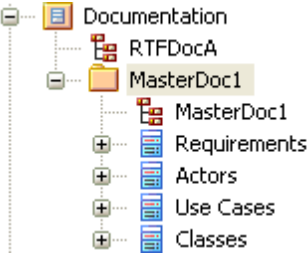

Whilst you can create Model Document elements separately and generate individual documents from each one, you have added flexibility and scope if you organize Model Documents under a Master Document.

You can generate a document with a **corporate template** for the covers, contents, headers and footers, whilst each section (generated from a separate Model Document) has its own appearance defined by a template appropriate to the section content.

#### How To:

To create a Master Document element, follow the steps below:

Step	Action	See Also
1	Open or create the diagram in which to create the Master Document	
2	In the Toolbox, select <b>More tools   Documentation</b>	
3	Drag the <i>Master Document</i> icon onto the diagram The system prompts you for the name of the Master Document	
4	Type the element name and click on the <b>OK</b> button The system creates the Master Document element and a child Custom diagram of the same name	
5	If creating a Master Document for an HTML report, go to step 7  Otherwise, open the Tagged Values window ( <b>View   Tagged Values</b> ) and click on the Master Document element  The <i>RTFTemplate</i> Tagged Value displays in the window. This Tagged Value is filled with the valid template names	
6	The RTFTemplate Tagged Value defaults to ( <i>model document: master template</i> )  If you want to use an alternative master template, click on the drop down arrow at the right of the field and click on that template in the list	
7	Return to the Project Browser and open the Master Document child diagram At this point, you <b>create the Model Document</b> elements in the child diagram, to	<a href="#">Create Model Document</a> <sup>[1791]</sup>

Step	Action	See Also
	<p>provide the content for the generated document</p> <p>When you have added all your Model Document elements to the Master Document diagram, the Master Document element resembles the following:</p>  <p>Your completed Master document element and child diagram display in the Project Browser as shown below:</p> 	

#### Learn More:

- [Import RTF Template](#)<sup>[1787]</sup>

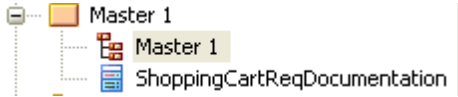

### 17.1.3.2 Create Model Document

You can create as many Model Document elements as are necessary to provide the sections of your generated document (under a Master Document) or to provide the independent documents you require.

#### How To:

To create a Model Document element, follow the steps below:

Step	Action	See Also
1	<p>Open the Master Document child diagram or (if you are creating independent Model Documents) create a new diagram</p> <p>The new diagram can live anywhere outside the packages you are adding to the document; you could create a Class diagram called Documentation within a specific Documentation package, and use this to hold the independent Model Document elements for your virtual documents</p>	<a href="#">Create Master Document</a> <sup>[1790]</sup>
2	<p>From the Documentation page of the Toolbox (<b>More tools   Documentation</b>) drag the <i>Model Document</i> icon onto the diagram to create a new Model Document element</p>	

Step	Action	See Also
	<p>Give the element an appropriate name: for example, if the documentation is relevant to the shopping cart requirements of a model, you could call it <i>ShoppingCartReqDocumentation</i></p> <p>Click on the <b>OK</b> button</p>	
3	<p>If you are creating a Model Document element for an HTML report, go now to the <i>Add Packages to Model Document</i> topic</p> <p>Otherwise, open the Tagged Values window (<b>View   Tagged Values</b>) and click on the Model Document element</p> <p>The RTFTemplate, SearchName and SearchValue Tagged Values display in the window</p>	<a href="#">Add Packages to Model Document</a> <sup>[1793]</sup>
4	<p>Click on the drop-down arrow to the right of the <b>RTFTemplate</b> field, and click on the template to use for this Model Document</p>	
5	<p>If you are creating a list of packages for the Model Document, go now to the <i>Add Packages to Model Document</i> topic</p> <p>Otherwise, click on the drop-down arrow to the right of the <b>SearchName</b> field, and click on the model search type to populate this Model Document</p>	<a href="#">Add Packages to Model Document</a> <sup>[1793]</sup>
6	<p>If necessary, type a search term in the <b>SearchValue</b> field</p>	
7	<p>Create further Model Document elements as required.</p> <p>Your Model Document element appears in the Project Browser with a Class icon, as shown below:</p>  <p>When you have created all the required Model Document elements, see the <i>Document Order</i> topic</p>	<a href="#">Document Order</a> <sup>[1794]</sup>

**Notes:**

- Diagram Searches are not supported
- Custom SQL searches are supported if they are returning elements; the SQL must include *ea\_guid AS CLASSGUID* and the *object type*

**Learn More:**

- [Creating Search Definitions](#)<sup>[486]</sup>

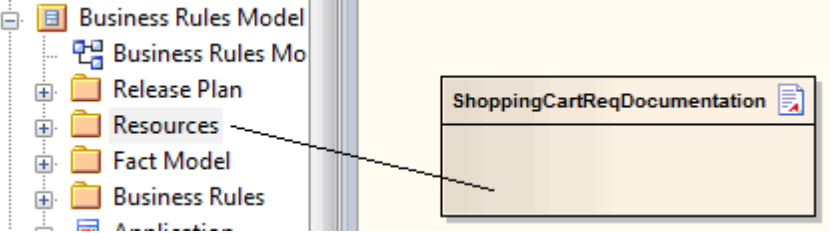

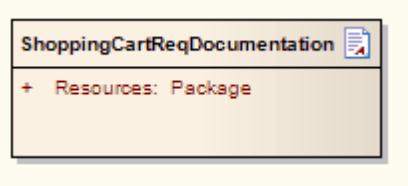

### 17.1.3.3 Add Packages to Model Document

#### How To:

To add packages to your Model Document element, follow the steps below

(As the example Model Document element here is called *ShoppingCartDocumentation*, the steps indicate how to add shopping cart-related packages to the element.)

Step	Action	See Also
1	Keeping the documentation diagram open, find a package in the Project Browser to add to the documentation; for example, a Resources package in a Dynamic view	
2	Drag and drop the package from the Project Browser onto the Model Document element, as shown below: 	
3	The title of the package displays in the Model Document element in the <i>Attributes</i> compartment, as shown below:  <p>This means that the Resources package is included in the document when you generate it</p>	
4	Using the above method, you can add as many packages from as many different views as required <p>The next step is to generate your document in RTF or HTML, but consider the impact of your package list on the Document Order; you can also delete packages if required</p>	<a href="#">Generating RTF Documents</a> <sup>[1796]</sup> <a href="#">Generating a Master Document - HTML</a> <sup>[1829]</sup> <a href="#">Document Order</a> <sup>[1794]</sup> <a href="#">Delete Packages from a Model Document</a> <sup>[1794]</sup>

### 17.1.3.4 Delete Package in Model Document

You can delete a package from your Model Document element.

This example includes four packages:

- Resources Package
- Activity Diagram Package
- View Cart Package
- Sequence Diagram Package

#### How To:

To delete a package from a Model Document element, follow the steps below:

Step	Action	See Also
1	In the Project Browser, expand the element to list the package attributes	
2	Right-click on the package to delete, and select the <b>Delete Attribute</b> context menu option	

Alternatively:

Step	Action	See Also
1	In either the Project Browser or the diagram, right-click on the Model Document element and select the <b>Attributes</b> context menu option The Attributes dialog displays	
2	On the <b>Attributes</b> list, click on the package to delete	
3	Click on the <b>Delete</b> button to remove the package from the document element	

### 17.1.3.5 Document Order

The order in which information is compiled into a document depends on:

- The sequence of Model Document elements in a Master Document element
- Whether you define a Model Search in a Model Document element (not for HTML reports)
- Whether you define a package list in a Model Document element

When you have considered and, if necessary, amended the order in which information is compiled, you can generate the document in RTF or HTML.

**Topics:**

Topic	Detail	See also
<b>Model Document Sequence</b>	<p>When you generate a document from a Master Document element, the sequence in which the sections are generated is determined by the order in which the child Model Document elements are listed in the Project Browser</p> <p>You can create elements anywhere in a diagram, therefore the generator refers to the Project Browser sequence</p> <p>If necessary, change the sequence using the green Up and Down arrows in the Project Browser toolbar to move an element up or down within the package</p>	
<b>Model Search</b>	<p>A Model Search operates on the database, and accesses records in the order in which they are stored; this order depends on many factors, and can change with database maintenance</p> <p>Therefore, the sequence of information provided by the search is unpredictable</p>	
<b>Package Order</b>	<p>When you create a package list in a Model Document element, the sequence of information is determined by the order in which the package attributes are listed within the element</p> <p>You can change the sequence using the Attributes dialog, and if you prefer a package to be in a different section of the document, you can move the attribute from one Model Document element to another</p> <p>Both these procedures are described below</p>	

**How To:**

To change the sequence of Packages in a Model Document element, refer to the example element and follow the steps below:

Images	Step	Action	See Also
	1	Right-click on the Model Document and select the <b>Attributes</b> option from the context menu	
	2	On the <b>Attributes</b> list, click on a package to move and click on the Up or Down (hand) buttons to change the order in which the packages are included in the documentation	
	3	When you are satisfied with the order of your packages, click on the <b>Close</b> button	

To move a package attribute from one Model Document to another, follow the steps below

Step	Action	See Also
1	Expand the Model Document elements in the Project Browser, so that both list their package attributes	
2	Click-and-hold on the attribute to move, and drag it onto the name of the target Model Document element	
3	Release the mouse button  The attribute is removed from the source element and added to the top of the list of attributes in the target element	
4	If necessary, move the attribute down the attribute list, as described in <i>To change the sequence of Packages</i> , above

- [Generate the Document \(RTF\)](#) <sup>[1796]</sup>
- [Generate a Master Document HTML](#) <sup>[1829]</sup>

### 17.1.3.6 Section Numbering in Virtual Documents

Virtual documents can contain several sections based on separate templates. To ensure that section and subsection numbering continues sequentially through the sections, you can either use:

- The *MasterList* style from the **Normal.rtf** file (which is the default applied to all new templates, such as those used in each Master Document and Model Document element); this provides a simple but consistent list numbering style that you can start off with. Alternatively, use:
- Your own numbering style

If you design your own styles in the template used in each model document, each template must use the same **List Overrides** for section numbering. These have a unique ID, so to propagate the List Overrides across multiple templates, you must:

Step	Action	See Also
1	Set up the common List Overrides in the <i>Normal.rtf</i> template (your own customized override list)	
2	Within each of the other templates used in the virtual document, using the template editor, select <b>File   Update Styles</b> to update the templates to include the common List Overrides	<a href="#">File and Print Options</a> <sup>[1757]</sup>
3	In each template use this common List Level for progressive numbering throughout the virtual document	

Learn More:

- [RTF Templates](#) <sup>[1753]</sup>
- [User Defined Section Numbering](#) <sup>[1774]</sup>

### 17.1.3.7 Generate the Document (RTF)

How To:

To generate the documentation defined in the Master Document and/or Model Documents, follow the steps

below

Step	Action	See Also
1	On the documentation diagram, click on the Master Document element (or on an independent Model Document element)	
2	Select the <b>Element   Advanced   Rich Text Format ( RTF) Report</b> menu option The Generate RTF Documentation dialog displays	
3	Set the options for your RTF document as required See the <i>Generate RTF Documentation Dialog</i> and related topics for further information on these settings	<a href="#">Generate RTF Documentation Dialog</a> <sup>[1742]</sup>
4	Click on the <b>Generate</b> button to create the documentation	
5	If you have not selected the <b>View Document on Completion</b> checkbox, click on the <b>View</b> button to view the documentation	

The RTF Report Generator works through the defined content of the Master Document element and/or the Model Document elements and pulls in the information from either the listed packages or the executed searches, formatted according to the templates identified in the *RTFTemplate* Tagged Value for each document element.

### 17.1.4 Other Documents

Enterprise Architect has other RTF based documentation that you can output:

Topic	Link
<b>Dependency Report</b> - shows a list of any elements that are dependent (in a Dependency connector) on another element for their specification	<a href="#">Dependency Report</a> <sup>[1797]</sup>
<b>Diagrams Only Report</b> - lists only the relevant diagrams from the target package	<a href="#">Diagrams Only Report</a> <sup>[1798]</sup>
<b>Implementation Report</b> - lists, for a specified package, the elements that require implementers, together with any source elements in Realize (Implements) relationships with those elements	<a href="#">Implementation Report</a> <sup>[1799]</sup>
<b>Resource Report</b> - shows how your resources are deployed in your project, displaying a list of all elements that have resources allocated to them	<a href="#">Resource Report</a> <sup>[372]</sup>
<b>Testing Report</b> - outputs the test scripts and results you have entered against elements in the model, in Rich Text format	<a href="#">Testing Report</a> <sup>[1800]</sup>
<b>Testing Details Report</b> - enables you to review the testing details for a package, as filtered reports on all elements in the package hierarchy under the selected package	<a href="#">Testing Details Report</a> <sup>[1800]</sup>

#### 17.1.4.1 Dependency Report

A Dependency report shows a list of any elements in the package (selected from the Project Browser) that are dependent on another element for their specification.

For example, a Use Case derives its specification from the Requirement that it realizes.

Each of the elements in the first column of the report is the source or dependent in a Dependency connector to the corresponding target element in the **Dependent on** column.

**Access:** [Project | Documentation | Dependency Details](#)

**How to:**

On the Dependency Details dialog, run the report and make selections from the options as indicated below:

Field	Usage	See also
<b>Root Package</b>	Confirm the root package; all elements and packages under this package appear in the report  If you want to change the package, click on the replacement package in the Project Browser and click on the <b>Refresh</b> button	
<b>Refresh</b>	Run the report	
<b>Locate Object</b>	Locate the selected element in the Project Browser	
<b>Print</b>	Print the list	
<b>Save Report</b>	Display a small dialog in which you specify the file location into which to save the report as an RTF file	
<b>Details</b>	List dependency details; lists the elements in the current package and the elements that they are dependent on	<a href="#">Dependency</a> [98]

#### 17.1.4.2 Diagrams Only Report

You can also produce an RTF report that contains only the relevant diagrams from the target package. This is convenient for printing or handling a lot of diagrams in batch, rather than exporting or printing each one at a time.

**Access:** [Project Browser package context menu | Documentation | Diagrams Only Report](#)

**How To:**

To produce a Diagrams Only report, follow the steps below:

Step	Action	See Also
1	On the Export Diagrams to RTF Document dialog, in the <b>Output Path</b> field, type or browse for the output location to create the report in	
2	Select the options you require, as follows: <ul style="list-style-type: none"> <li>Select the <b>Embed Diagrams in Document</b> checkbox to ensure the diagrams are created within the RTF file, not as linked image files</li> <li>Select the <b>Include all child packages</b> checkbox to document all of the diagrams included in any child package</li> <li>Select the <b>Include Diagram Name</b> checkbox to include the diagram name within the generated documentation</li> </ul>	

Step	Action	See Also
	<ul style="list-style-type: none"> <li>Select the <b>Order Diagrams Alphabetically</b> checkbox to generate the documentation in alphabetical order</li> </ul>	
3	Click on the <b>Generate</b> button to run the report	
4	When the report is generated, click on the <b>View</b> button to show the RTF output	

### 17.1.4.3 Implementation Report

An *Implementation report* shows a list of the elements in the package (selected in the Project Browser) that require implementers, together with any source elements in Realize (Implements) relationships with those elements.

**Access:** [Project | Documentation | Implementation Details](#)

#### How to:

On the Implementation Details dialog, make selections from the options as indicated below, and run the report:

Field	Usage	See also
<b>Root Package</b>	Confirm the root package; all elements and packages under this package appear in the report  If you want to report on a different package, click on that package in the Project Browser	
<b>Set Target Types</b>	By default Enterprise Architect only reports on a limited number of element types, such as Use Cases and Requirements; you can expand the range of element types to include  Set the list of types to report on, using the Implementation Targets dialog	<a href="#">Implementation Targets Dialog</a> <sup>[1800]</sup>
<b>Refresh List</b>	Run the report and display the results	
<b>Locate Object</b>	Locate the selected element in the Project Browser	
<b>Show Unimplemented</b>	Show non-implemented elements  Non-implemented elements are those that don't have any other element to realize them (for example, a Use Case that has no Component or Class to implement the Use Case behavior)	
<b>Show Implemented</b>	Show implemented elements  These are elements that do have some element associated with them in a Realize relationship (for example a Use Case that has a Component that implements it)	<a href="#">Realize</a> <sup>[1009]</sup>
<b>Details</b>	List elements in the current package hierarchy and elements that implement them	
<b>Print</b>	Print the list	

Field	Usage	See also
Save Report	Specify the file location into which to save the report as an RTF file	

#### 17.1.4.3.1 Implementation Targets Dialog

The Implementation Targets dialog is accessed by clicking on the **Set Target Types** button on the Implementation Details dialog.

This dialog enables you to set the types of elements that appear in the report as requiring implementation. Double-click on an element in either list to move it to the other list.

#### 17.1.4.4 Testing Report

Enterprise Architect enables you to output the test scripts and results you have entered against elements in the model, in Rich Text format.

**Access:** [Project | Documentation | Testing Report](#)

##### How To:

To view a Testing report, follow the steps below:

Step	Action	See Also
1	In the Project Browser, click on the package to report on The package name displays in the <b>Root Package</b> field	
2	In the Report on panel, select the check box against each type of test to include in the report	
3	If you intend to report on tests on elements in the subordinate packages, select the <b>Include child packages</b> checkbox	
4	In the <b>Output file</b> field, type in or browse for the file path of the report output file	
5	Click on the <b>Generate</b> button to output the report, and open it at the specified file location	

#### 17.1.4.5 Testing Details Report

The Testing Details report enables you to review the testing details for a package, running filtered reports on all elements in the package hierarchy under the selected package.

**Access:** [Project | Documentation | Testing Details](#)

##### Use to:

- Show the testing details for the elements in a package, for tests that meet specific criteria

##### How to:

On the Testing tab, make selections from the options as indicated below, and run the report:

Field	Usage	See also
Run By	Select a name to filter for tests run by that person; click on the <b>x</b> button to clear the field	
Checked By	Select a name to filter for tests checked by that person. Click on the <b>x</b> button to clear the field	
Test Type	Select the radio button for the required test type	
Status	Select the radio button for the required test status	
Locate Object	(After clicking on an element in the Test Details list) locate the element in the Project Browser	
Refresh	Re-run the report query	
Print	Print a summary of the test results	

**Notes:**

- If required, you can display the test details on the Testing window, by double-clicking on the test line in the report

**Learn More:**

- [The Testing Workspace](#)<sup>[1707]</sup>

### 17.1.5 The Legacy RTF Report Generator

**Topics:**

Topic	Detail	See also
Abstract	<p>Creating a <b>Rich Text Format</b> (RTF) document is a simple and flexible process. An RTF document is based on a package or an element in your project (more usually a package). To produce a document, you select the package or element to report on in the <b>Project Browser</b>, <b>Package Browser</b>, <b>Diagram List</b> or <b>Model Search</b>, then press ( <b>F8</b> ) to display the <b>Generate RTF Documentation</b> dialog. On the <b>Advanced</b> tab, click on the <b>Switch generator</b> button to access the Legacy <b>Rich Text Format Report</b> dialog.</p> <p>The <b>Rich Text Format Report</b> dialog enables you to set the exact contents and look and feel of your report. You enter the file name of the report, a heading, additional notes, template name (for saving the set-up) and other options. You can also select the style of the report; either plain or formal.</p> <p>Optionally, you can set up a filter, the details to include, element types to exclude, whether to process child packages, whether to show diagrams and the diagram format.</p> <p>You can switch back to the <b>Generate RTF Documentation</b> dialog by clicking on the <b>Switch RTF Generator</b> button.</p>	

**Notes:**

- The Legacy Generator is available if you have RTF templates created in releases of Enterprise Architect prior to 4.1, and you prefer to generate RTF reports using the original generator. However, as you can generate reports from these templates using the post-Enterprise Architect 4.1 RTF Generator, the Legacy Generator and instructions for its use are no longer updated. However, reports produced using the Legacy RTF Generator do reflect the Notes formatting feature in any text associated with elements
- The Rich Text Format Report dialog panels are individually described in the subsequent topics of this section (listed below). The dialog has a lot of options; get to know them all to produce output at the level of detail suited to your project

#### Learn More:

- [Document a Single Element](#)<sup>[1802]</sup>
- [Set the Main RTF Properties](#)<sup>[1802]</sup>
- [Apply a Filter](#)<sup>[1803]</sup>
- [Exclude Elements](#)<sup>[1804]</sup>
- [RTF Diagram Format](#)<sup>[1804]</sup>
- [Model Include](#)<sup>[1804]</sup>
- [RTF Report Options](#)<sup>[1805]</sup>
- [RTF Report Selections](#)<sup>[1805]</sup>
- [Generate the Report](#)<sup>[1806]</sup>
- [Diagrams Only Report](#)<sup>[1798]</sup>
- [Report Templates](#)<sup>[1806]</sup>
- [Include or Exclude a Package from Report](#)<sup>[1745]</sup>
- [Save as Document](#)<sup>[1808]</sup>
- [Generate RTF Documentation Dialog](#)<sup>[1742]</sup>
- [Notes Toolbar](#)<sup>[772]</sup>

### 17.1.5.1 Document a Single Element

RTF documentation can also be generated for a single element.

**Access:** Select an element and then go to: **Element | Advanced | Rich Text Format (RTF) Report**

Click on the **Switch Generator** button to display the **Rich Text Format Report** dialog. See **The Legacy RTF Report Generator** and its related topics for further information.

#### Learn More:

- [Generate RTF Documentation Dialog](#)<sup>[1742]</sup>
- [The Legacy RTF Report Generator](#)<sup>[1801]</sup>

### 17.1.5.2 Set the Main RTF Properties

The main section of the **Rich Text Format Report** dialog enables you to set the output location and appearance of the final RTF document.

#### How To:

Step	Action	See Also
1.	Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> topic for how to do this).	<a href="#">The Legacy RTF Report Generator</a> <sup>[1801]</sup>

Step	Action	See Also
2.	Supply an <b>Output Filename</b> to save the report into; always include the extension .RTF as part of the filename.	
3.	Provide a <b>Template Name</b> to save this report set-up.	
4.	Select a report <b>Style</b> : Formal or Basic.	
5.	Type a <b>Heading</b> for your report; this appears as the first heading item in your output.	
6.	Select your required <b>Heading Style and Initial Heading Level Indent</b> from the drop-down lists.	

**Notes:**

- It is recommended that you enter a full path name for your report. The images in your report are saved externally in an images directory, and supplying the full directory path avoids confusion over the location of these images. Also, if you move your report you must also move the images directory

**17.1.5.3 Apply a Filter****Topics:**

Topic	Detail	See also
Usage	<p>You can apply a filter on the <b>Rich Text Format Report</b> dialog to include or exclude elements by date modified, phase or status. This helps to track changes and break a document into multiple delivery phases.</p> <p>Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> for how to do this).</p> <ul style="list-style-type: none"> <li>• To enable the date filter, select the checkbox in the date field.</li> <li>• In the first two <b>Only include objects</b> fields, click on the drop-down arrows and select the appropriate criteria (<b>Modified/ Created, Before/After</b>).</li> <li>• The package phase filter applies at the package level (not the element level) and ignores the phase of the root package that you are documenting. To enable the phase filter, in the <b>Where Package Phase</b> field click on the drop-down arrow and select an operator; Enterprise Architect filters out all packages that do not meet the selection criteria. All elements in the package are ignored, regardless of their individual phase.</li> <li>• The element status filter enables you to limit the output by element status. Unlike the package phase filter, this filter applies to every element. You can filter against a status of like or <i>unlike</i> a criterion, for example, <i>like proposed</i>, or against the <i>in</i> and <i>not in</i> operators, such as <i>in approved</i>, <i>not in validated</i>. When using the <i>in</i> and <i>not in</i> operators, enter a comma-separated list of status types as your criteria expression</li> </ul>

### 17.1.5.4 Exclude Elements

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The Rich Text Format Report dialog enables you to exclude elements of any type from your final output; this is useful when you want to highlight particular items and not clutter up a report with too much detail</p> <p>Open the Rich Text Format Report dialog (see <i>The Legacy RTF Report Generator</i> for details on how to do this)</p> <p>Click on each element to exclude, or click on the <b>All</b> button to exclude all elements</p> <p>Click on the <b>None</b> button to clear your selections</p>	<a href="#">The Legacy RTF Report Generator</a> <small>[1807]</small>

### 17.1.5.5 RTF Diagram Format

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>You can output diagrams to Bitmap files, GIF files or Windows Metafiles</p> <p>Open the Rich Text Format Report dialog (see <i>The Legacy RTF Report Generator</i> for details on how to do this)</p> <p>In the Diagram format panel (bottom center of the dialog) select the required format for the report</p> <p>Generally the two metafile options (EMF and WMF) are recommended; however, there are times that the others might be suitable</p>	<a href="#">The Legacy RTF Report Generator</a> <small>[1807]</small>

### 17.1.5.6 Model Include

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The Model Include panel of the Rich Text Format Report dialog has the following options:</p> <ul style="list-style-type: none"> <li>• Glossary to include the project glossary</li> <li>• Tasks to include project tasks</li> <li>• Issues to include project issues</li> </ul> <p>Select the appropriate checkbox to include the items in the generated RTF documentation</p>	<a href="#">Project Glossary</a> <small>[364]</small> <a href="#">Project Tasks</a> <small>[358]</small> <a href="#">Project Issues</a> <small>[360]</small>

### 17.1.5.7 RTF Report Options

Additional RTF report options you can select from the **Options** panel on the **Rich Text Format Report** dialog are shown below.

#### Topics:

Topic	Detail	See also
Usage	<p>You can select whether or not to recursively document packages, show diagrams or add a page break before each new package. Select the:</p> <ul style="list-style-type: none"> <li>• <b>Process all Children</b> checkbox to recursively process all child packages within the main package</li> <li>• <b>Show Diagrams</b> checkbox to include diagrams in your document. Clear this item for no diagrams</li> <li>• <b>New page per package</b> checkbox to force a page break on each new package (excepting empty packages)</li> <li>• <b>Document all elements</b> checkbox to include all elements included in the project</li> <li>• <b>Document Packages</b> checkbox to document the package as an element in addition to the documentation that would normally be produced for package documentation</li> <li>• <b>Hide 'note-less' elements</b> checkbox to exclude all elements without notes from the documentation</li> <li>• <b>Embed Diagrams in Document</b> checkbox to ensure that the diagram images are contained within the RTF document rather than stored in a linked external file</li> <li>• <b>Skip root package</b> checkbox to exclude the parent package from the documentation and include only the child packages</li> <li>• <b>Document Linked Elements</b> checkbox to include the object details for linked elements that do not originate from the selected package</li> <li>• <b>Use Heading styles for Details</b> checkbox to ensure that the details are formatted as heading styles rather than formatted text; this option is only available when the Heading Style field in the <b>Main</b> section of the <b>Rich Text Format Report</b> dialog is set to Max 9 levels - elements are package + 1.</li> </ul>	<p><a href="#">Setting the Main RTF Properties</a></p> <p>1802</p>

### 17.1.5.8 RTF Report Selections

The **For each Object Include** section of the **Rich Text Format Report** dialog enables you to select the documentation sections to include in your report.

#### Topics:

Topic	Detail	See also
Usage	<p>What you include or exclude governs how simple or detailed your report is. You can create multiple reports at different levels of detail for different audiences. Experiment with these options to see what effect inclusion or exclusion has. Most items are self-explanatory.</p> <p>Selecting the checkbox against a category item in the list selects all of the options that are contained in the category. To expand a</p>	

Topic	Detail	See also
	<p>category, click on the +symbol next to the category name. To exercise greater control over a category of options expand the top level item and then select the required individual items from the list.</p> <p>Sometimes an item applies only to a certain type of element; for example, <b>Attributes</b> only applies to Class elements and a few other element types. The <b>Child Diagrams</b> option shows or hides any diagrams that are attached under a model element; for example, a Use Case might have a Scenario diagram attached.</p>	

**Notes:**

- Use this feature to produce the right level of detail for your audience. Technical readers might want to see everything, whilst management might require only the general outline

**17.1.5.9 Generate the Report****Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>Once you have set up the document properties as required, click on the <b>Generate</b> button to generate the report.</p> <p>When you have generated the document, click on the <b>View</b> button to open the report in MS Word.</p>	

**17.1.5.10 Legacy RTF Style Templates**

The **Legacy RTF Style Editor** enables you to edit the RTF associated with various sections of the RTF Report facility in Enterprise Architect. You would typically use this functionality to customize a report's look and feel for your company or client.

If you have previously defined and saved a template, click on the **Load** button on the **Rich Text Format Report dialog** to open the list of defined templates. Select one in order to load it as the current template; all the features saved become the current features. This enables you to define a set of standard report types that streamline document production.

**Access:** [View | More Project Tools | Project Resources | Resources](#)

To create or Edit RTF Style Templates, follow the steps below

**How To:**

Step	Action	See Also
1.	Select the <b>View   More Project Tools   Project Resources</b> menu option to display the <b>Resources</b> window.	
2.	Expand the <b>Templates</b> folder	
3.	To edit an <i>existing</i> Legacy template, expand the <b>Legacy Templates</b> tree and double-click on the template name, or right-click and select the <b>Modify</b>	

Step	Action	See Also
	<b>Document Template</b> context menu option. The <b>RTF Style Editor</b> displays.	
4.	Alternatively, to create a <b>new Legacy template</b> , right-click on <b>Legacy Templates</b> and select the <b>Create RTF Style Template (Legacy)</b> context menu option. Enterprise Architect displays a prompt for the new template name.	
5.	Type the name of the new template and click on the OK button. The <b>RTF Style Editor</b> displays.	

**Topics:**

Topic	Detail	See also
<b>RTF Style Editor</b>	<p>The <b>RTF Style Editor</b> contains a list of all available RTF fragments for modification and customization.</p> <p>Each fragment typically contains RTF plus one or more special tag names that Enterprise Architect replaces with information during generation. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding RTF.</p> <p>Special tag names are delimited by # characters; for example, <b>#NOTES#</b></p> <p>Click on the:</p> <ul style="list-style-type: none"> <li>• <b>Get Default</b> button to retrieve the default Enterprise Architect template for the currently-selected template item in the left hand list</li> <li>• <b>Save</b> button to save the version of the template for this style only</li> <li>• <b>Delete</b> button to remove your modified version of the template, which causes Enterprise Architect to use the default template during report generation</li> </ul> <p>To select a template during report generation, click on the <b>Style</b> drop-down arrow on the <b>Rich Text Format Report</b> dialog. Once a style is selected, Enterprise Architect applies that to the current report. Select &lt;Basic&gt; for the inbuilt style.</p>	<a href="#">The Legacy RTF Report Generator</a> <small>[1807]</small>

**Notes:**

- The RTF Style Editor discussed here automatically displays when you modify or create a Legacy RTF template. If you select a template created in the enhanced **RTF Style Template Editor**, that editor opens automatically instead
- You can transport these RTF templates between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu
- To delete a template, right-click on it and select the **Delete Document Template** context menu option
- You can also **alter the custom language settings**

**Learn More:**

- [RTF Style Template Editor](#)<sup>[1755]</sup>
- [Export Reference Data](#)<sup>[238]</sup>

- [Import Reference Data](#)<sup>[240]</sup>
- [Custom Language Settings](#)<sup>[1808]</sup>

### 17.1.5.11 Save as Document

The *Document* feature enables a particular documentation configuration to be 'remembered', linking the loaded template within the **Rich Text Format Report** dialog to the current highlighted package. If a particular template is always used with a specific package, and multiple cases of documentation exist to be propagated, saving these as Documents can ease document generation later.

To create and use Documents, follow the steps below

#### How To:

Step	Action	See Also
1.	Open the <b>Rich Text Format Report</b> dialog (see <b>The Legacy RTF Report Generator</b> for instructions on how to do this).	<a href="#">The Legacy RTF Report Generator</a> <sup>[1807]</sup>
2.	Click on the <b>Save as Document</b> button. The Save current as document definition dialog displays:	
3.	In the <b>Enter Value</b> field, type a name for the document and click on the <b>OK</b> button. The document is added to the Resources window for easy future access	
4.	To generate documentation from the <b>Resources</b> window, right-click on the required document. The context menu displays.	
5.	Select the required option. The context menu options are: <ul style="list-style-type: none"> <li>• <b>Open Document</b> - Opens the corresponding .RTF file, as specified by the RTF template Filename property</li> <li>• <b>Generate Document</b> - Opens the <b>Rich Text Format Report</b> dialog, loaded with the specified template</li> <li>• <b>Auto Generate Document</b> - Generates documentation, with the document located at the path specified by the template's Filename property</li> <li>• <b>Delete Document</b> - Removes the specified document</li> </ul>	

### 17.1.5.12 Custom Language Settings

If you export RTF-format documents from Enterprise Architect in languages other than English, you can customize the codepage, default language ID and character set that Enterprise Architect uses when generating RTF. This makes it much easier to generate documentation appropriate to your country or locale.

You can also set up a list of word substitutions. For instance, where Enterprise Architect would include the word *Figure*, you can specify another word to replace it that is either in your language or more meaningful to your readers.

To Set Up Substitutions, follow the steps below

#### How To:

Step	Action	See Also
1.	Open the <b>Rich Text Format Report</b> dialog (see The Legacy RTF Report Generator for how to do this).	<a href="#">The Legacy RTF Report Generator</a> <sup>[180]</sup>
2.	In the <b>Language</b> panel (bottom left of dialog) click on the Adjust button. The <b>Customize RTF Language</b> dialog displays.	
3.	Double-click on an item to set or clear its <b>Substitute</b> word.	
4.	When you have finished, click on the <b>OK</b> button.	

To Set Up Codepage and Character Set, Follow the steps below

**How To:**

Step	Action	See Also
1.	From the drop-down lists in the <b>Language</b> , <b>Codepage</b> and <b>Charset</b> fields, select the language, codepage and character set that most closely match your location.	
2.	If required, modify the <b>Substitute Tags</b> by double-clicking on each and manually setting the value (for advanced use only).	
3.	To clear the substitution list, double-click on each item in turn and delete the substitute value.	
4.	When you have completed the settings, click on the <b>OK</b> button to save them.	

Now when you generate RTF documents, the substitute tags are used in the output.

**Notes:**

- You can transport these language and tag definitions between models, using the **Export Reference Data** and **Import Reference Data** options on the **Project | Model Import/Export** menu

**Learn More:**

- [Export Reference Data](#)<sup>[238]</sup>
- [Import Reference Data](#)<sup>[240]</sup>

### 17.1.6 Use MS Word

When Enterprise Architect only supported the 'Legacy' RTF Report Generator, MS Word provided many additional features in RTF report generation.

However, as the 'enhanced' RTF Report Generator has been developed within Enterprise Architect, the facilities provided by Word have been incorporated into the RTF Generator or otherwise rendered unnecessary. It is therefore likely that you would no longer have any requirement to use Word in generating your RTF reports.

These topics on the use of MS Word are therefore included only to support users who are still working with the 'Legacy' RTF Report Generator, or who are using Word for personal preference.

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>To further enhance and customize RTF documentation it is possible to create a custom master document, which can be used to add a table of contents, table of figures, headers and footers and to refresh linked files</p> <p>In addition it is possible to create documents with sustainable links to generated 'pieces' of Enterprise Architect output, pre-divided by Enterprise Architect using <b>bookmarks</b></p> <p>As an alternative to the <i>Word</i> master document and to RTF Bookmarking, internal to Enterprise Architect, see <i>Virtual Documents</i></p> <p>In addition to creating Word master documents, you can:</p> <ul style="list-style-type: none"> <li>• <b>Open a Report in Microsoft Word</b></li> <li>• <b>Change Linked Images to Embedded</b></li> <li>• <b>Apply Other Features of Word</b></li> </ul>	<p><a href="#">RTF Bookmarks</a><sup>[1811]</sup></p> <p><a href="#">Virtual Documents</a><sup>[1788]</sup></p> <p><a href="#">Open a Report in Microsoft Word</a><sup>[1810]</sup></p> <p><a href="#">Change Linked Images to Embedded</a><sup>[1811]</sup></p> <p><a href="#">Other Features of Word</a><sup>[1813]</sup></p>

**Notes:**

- You can develop a report using the combined facilities of Word and Enterprise Architect with few problems, as long as you leave definition of the section styles to the final stages in Enterprise Architect just prior to report generation

Word truncates the section bookmarks, as it uses a smaller field length for sections

In Word, you can review and edit reports generated by Enterprise Architect, but you cannot import them back into Enterprise Architect without damaging the section style definition

### 17.1.6.1 Open a Report in Microsoft Word

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>To open an RTF file in MS Word, simply load Word and open the file as a normal document</p> <p>Word converts the file; if Word is the default handler of RTF files, double-click on the output file to load up and view the report</p>	

**Notes:**

- If you have Word configured to view RTF files, you can also click on the **View Output** button on the Generate RTF Documentation dialog

### 17.1.6.2 Change Linked Images to Embedded

One of the options available when generating RTF documentation is the ability to store image files in a separate directory to the RTF document. If at a later stage it becomes desirable to embed the images in the RTF documentation, this is especially important when the document is to be distributed. If the images are stored in a separate directory recipients of the document see only the placeholder of images rather than the actual images.

If you import an RTF document into Word with the images not embedded into the document, you have the option of breaking the links to the images and saving the image in the document.

To break image links in Word, follow the steps below

#### How To:

Step	Action	See Also
1	Open the required RTF file in Word.	
2	Select the <b>Edit   Links</b> menu option.	
3	Highlight all links in the <b>Links</b> list.	
4	Select the <b>Save Picture in Document</b> checkbox.	
5	Click on the <b>Break Link</b> button.	
6	When prompted, click on the <b>Yes</b> button to break links.	

Word breaks the links and saves copies of the images inside the document. You can distribute this document without the image directory.

### 17.1.6.3 RTF Bookmarks

Bookmarks are markers that are automatically placed in your rich text document when you generate it. You can create a master document in Word and link to sections of an Enterprise Architect report based on bookmarks. For example, a Word document might have a section for a small part of your component model. Using bookmarks you can generate a full component model, and then link into just one section of the report.

This way you can maintain a complex Word document from parts of Enterprise Architect reports. If you link into Enterprise Architect reports, then you can regenerate the report and refresh Word links to update the master document without having manually changed anything. For more information on refreshing links, see the **Refresh Links** topic.

Bookmarks are GUID-based numbers that can be created for packages, diagrams and elements. A package bookmark applies from the beginning of a package to the end, and includes all child packages and elements underneath.

To bookmark a Section of Enterprise Architect for RTF Documentation, follow the steps below

#### How To:

Step	Action	See Also
1.	In the Enterprise Architect <b>Project Browser</b> , right-click on the package to include in the documentation. The context menu displays.	
2.	Select the <b>Documentation   Copy RTF Bookmark</b> menu option to paste the package into the clipboard as a bookmark for use in Word.	

To Insert a Bookmarked Section of an Enterprise Architect RTF Document into Word, follow the steps below

**How To:**

Step	Action	See Also
1.	Open the Word document and position the cursor at the point at which to insert the file.	
2.	Select the Word <b>Insert   File</b> menu option. The <b>Insert</b> dialog displays.	
3.	Locate and click on the file to insert, then click on the <b>Range</b> button.	
4.	In the <b>Range</b> cell type or paste the information from the clipboard.	
5.	Click on the <b>OK</b> button.	
6.	<p>Click on the drop-down arrow next to the <b>Insert</b> button. Select the <b>Insert as Link</b> option.</p> <p>The <b>Insert</b> option sets a permanent copy; the <b>Insert as Link</b> option creates a link that is updateable on altering the source document. For <b>Insert as Link</b> to operate you must first set <b>Refresh Links</b>.</p> <p>Every package is bookmarked in the RTF document according to the following rules:</p> <ul style="list-style-type: none"> <li>• All alphabetic and numeric characters remain the same</li> <li>• All other characters (including spaces) are converted to underscores</li> </ul> <p>For example UC01: Use Case Model becomes UC01__Use_Case_Model.</p>	<a href="#">Refresh Links</a> <small>[1815]</small>

**Notes:**

- You cannot use RTF Bookmarking in **Master Document** elements, which effectively replace RTF Bookmarking in Word.

RTF Bookmarking requires each bookmark to be unique. When you generate a report with a standard RTF template (including in a single Model Document element), each bookmark is unique and there is a 1:1 association between the Elements-details being generated and the elements in the repository. As Master Documents are intended to contain multiple sub-documents, the association ceases to be 1:1. There is no simple method that enables the generated data to be uniquely identified directly in association with the original element

**Learn More:**

- [Refresh Links](#)[1815]
- [Create a Master Document](#)[1790]

#### 17.1.6.4 Other Features of Word

Word offers a considerable number of document enhancement tools to complete your project documentation. Here are some of the things you can do with Word in Enterprise Architect generated RTF documentation:

Topic	Link
Add a Table of Contents	<a href="#">Add a Table of Contents</a> <sup>[1813]</sup>
Add a Table of Figures	<a href="#">Add a Table of Figures</a> <sup>[1814]</sup>
Add Headers and Footers	<a href="#">Add Headers and Footers</a> <sup>[1814]</sup>
Manipulating Tables in Word	<a href="#">Manipulating Tables in Word</a> <sup>[1814]</sup>
Refresh Linked Files	<a href="#">Refresh Linked Files</a> <sup>[1815]</sup>

##### Notes:

- Enterprise Architect provides the basic content for your document - use Word to add the presentation and linkages

##### 17.1.6.4.1 Add Table of Contents

Among the features of MS word that can be incorporated into generated Enterprise Architect reports is the option to include a table of contents. A table of contents can be used to aid navigation of documentation and enhance the readability of Enterprise Architect RTF reports. This option provides hyperlinks to the diagrams included in the RTF documentation in the electronic version, and page numbers for both the printed and electronic documentation.

To include a Table of Contents in the RTF documentation, follow the steps below

##### How To:

Step	Action	See Also
1	Open the Enterprise Architect RTF report to which to add a Table of Contents in MS Word	
2	Select the <b>Insert   Reference   Index and Tables</b> menu option	
3	Click on the Table of Contents tab to set the options that are available for formatting the table of contents	

The format of the table of contents is dependant on the heading levels created when the RTF is generated. To set the heading style for details in Enterprise Architect RTF documentation, see the RTF **Document Options** topic.

##### Learn More:

- [Document Options](#) <sup>[1746]</sup>

#### 17.1.6.4.2 Add Table of Figures

Among the features of MS word that can be incorporated into generated Enterprise Architect reports is the option to include a table of figures. A table of figures can be used to aid the navigation of the documentation and enhance the readability of Enterprise Architect RTF reports. This option provide hyperlinks to the diagrams included in the RTF documentation in the electronic version and page numbers for both the printed and electronic documentation.

To include a Table of Figures in the RTF documentation, follow the steps below

##### How To:

Step	Action	See Also
1.	Open the Enterprise Architect RTF report to which to add a Table of Figures in MS Word.	
2.	Select the <b>Insert   Reference   Index and Tables</b> menu option.	
3.	Click on the <b>Table of Figures</b> tab to set the options that are available for formatting the table of figures.	

#### 17.1.6.4.3 Add Headers and Footers

Among the features of MS word that can be used to enhance the appearance of Enterprise Architect RTF reports is the ability to add headers and footers to the documentation.

To include headers and footers in the RTF documentation follow the steps below

##### How To:

Step	Action	See Also
1.	In MS Word, open the Enterprise Architect RTF report to which to add headers and footers.	
2.	Select the <b>View   Header and Footer</b> menu option.	

This enables you to enter information into the header section and the footer section of the RTF Documentation.

#### 17.1.6.4.4 Manipulate Tables in Word

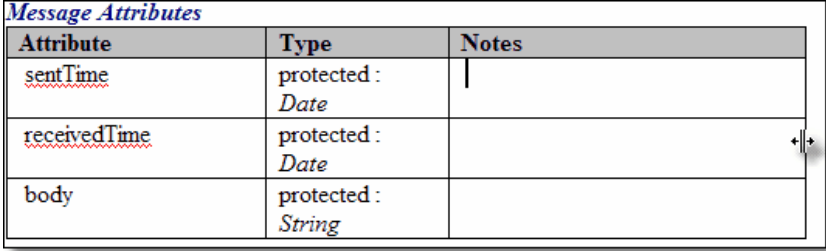

When generating RTF documentation from Enterprise Architect, tables are included when items such as **Attributes** and **Methods** are selected in the **For each Object** section in the **Rich Text Format Report** dialog. MS Word offers several levels of customization for tables and can be used to tidy the formatting of the tables in situations where the margins of the table exceed the dimensions of the page size selected in Word for printing.

##### Resize Tables

When the amount of detail for a documented item such as an attribute or operation exceeds the margins of the page in MS Word it is necessary to manually resize the table in order to view all of the details.

To manually resize the table follow the steps below

**How To:**

Step	Action	See Also												
1.	Select the table that exceeds the margin size.													
2.	<p>Mouse over the border of the table until the mouse pointer changes into the icon shown below.</p>  <p>The screenshot shows a table with the following content:</p> <table border="1"> <thead> <tr> <th>Attribute</th> <th>Type</th> <th>Notes</th> </tr> </thead> <tbody> <tr> <td>sentTime</td> <td>protected : Date</td> <td></td> </tr> <tr> <td>receivedTime</td> <td>protected : Date</td> <td></td> </tr> <tr> <td>body</td> <td>protected : String</td> <td></td> </tr> </tbody> </table>	Attribute	Type	Notes	sentTime	protected : Date		receivedTime	protected : Date		body	protected : String		
Attribute	Type	Notes												
sentTime	protected : Date													
receivedTime	protected : Date													
body	protected : String													
3.	Drag the cursor to the left to reduce the width of the table and then select the <b>File   Print Preview</b> menu option to confirm that the table borders are within the page margins.													
4.	Resize all of the tables that overhang the margins of the page by using the steps detailed above.													

**Applying Styles to Tables**

One of the customizable properties of MS Word when working with tables is the ability to apply a style to a table, which enables you to rapidly change the appearance of the table.

To apply styles to a table, follow the steps below

**How To:**

Step	Action	See Also
1.	Open the Enterprise Architect RTF report in which to change the table styles.	
2.	Locate and select the table for which to adjust the appearance.	
3.	Select the <b>Table   Table Auto Format</b> menu option. The <b>Table Autoformat</b> dialog displays.	

From here you can specify a predefined table style from the **Table styles** list, or create a new style by clicking on the **New** button. The table styles defined in the **Table Autoformat** dialog only apply to one table at a time so you must apply the style to each table created individually.

**17.1.6.4.5 Refresh Links**

If you link into Enterprise Architect reports, then you can regenerate the report and refresh MS Word links to update the Word master document without having manually changed anything.

To ensure that links are refreshed in the master document, you must select the **Update automatic links at Open** checkbox in Word.

To ensure that this setting is established follow the steps below

**How To:**

<b>Step</b>	<b>Action</b>	<b>See Also</b>
1.	From within MS Word select the <b>Tools   Options</b> menu option.	
2.	Select the <b>General</b> tab and select the <b>Update automatic links at Open</b> checkbox.	

## 17.2 HTML Reports

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>Enterprise Architect provides automated web-based publishing of models. A new outline structure closely mirrors the model hierarchy and makes it very simple to explore models on-line. With a great new look and the ability to explore very large models efficiently on-line, the new web-publishing capability is a significant enhancement.</p> <p>Enterprise Architect enables export of an entire model or a single branch of the model to HTML Web pages. The <b>HTML report</b> provides an easy to use, highly detailed, Javascript based model tree. In addition, hyperlinked elements make browsing to related information very simple.</p> <p>The current implementation is based on internal and external templates and generated Javascript. The ability to edit all templates is to be added in a future version of Enterprise Architect.</p>	<a href="#">Create an HTML report</a> <sup>[1817]</sup>

### Notes:

- You can create **Web Style Templates** to customize your HTML output
- You can use Master Documents and Model Documents to select specific areas of your model for reporting
- In the Corporate, Business and Software Engineering, System Engineering and Ultimate editions of Enterprise Architect, if security is enabled you must have **Generate Documents** permission to generate HTML documents

### Learn More:

- [Web Style Templates](#)<sup>[1819]</sup>
- [Permission List](#)<sup>[206]</sup>

### 17.2.1 Create an HTML Report

To create an HTML report, follow the steps below

#### How To:

Step	Action	See Also
1	<p>In the Project Browser, right-click on the root package for the report (all child packages are included in the output).</p> <p>The context menu displays.</p>	

Step	Action	See Also
2	Select the <b>Documentation   HTML Report</b> menu option. The Generate HTML Report dialog displays.	<a href="#">Generate HTML Report dialog</a> <sup>[1819]</sup>
3	In the <b>Output to</b> field, select an output directory for your report. Set any other required options.	
4	Click on the <b>Generate</b> button to generate the report. The <b>Progress</b> field shows total percentage complete.	
5	Once the report is complete, click on the <b>View</b> button to launch your default HTML viewer and view the web pages.	

**Topics:**

Topic	Detail	See also
<b>Compatibility</b>	<p>The web report produced is compatible with any standard web server, on either Unix or Windows platforms. Simply bundle up the entire output directory and place it within the context of your web server. All path names should be relative and case sensitive.</p> <p>When you view the HTML report in your HTML viewer, you can switch directly to a page for a specific diagram or element by specifying the appropriate GUID after the report web address. That is:</p> <pre>ht t p : // pat h/ pat h/ pat h/ I ndex . ht m? gui d=xxxxxxxxxxxxxx</pre> <p>The word <i>guid</i> must be in lower case, and the value must not include braces { }. For example:</p> <pre>ht t p : // . . . / pat h/ I ndex . ht m?gui d=DC62B0DA- 0D60-4447-85E6-B9BBAE7FC90F</pre> <p>You can obtain the GUID for the diagram or element using the <b>Copy Reference</b> option on the Project Browser <b>Diagram</b>, <b>Element</b> and <b>Package</b> context menu options.</p> <p>The page locator does not work directly in Internet Explorer. Firefox automatically converts the path to <b>file:///C:/path</b> protocol, and actions it. That protocol also works in Internet Explorer. Therefore, to use the absolute references without a web server you must access the path using the <b>file:///</b> protocol.</p>	<a href="#">Diagram Menu</a> <sup>[453]</sup> <a href="#">Element Menu</a> <sup>[450]</sup> <a href="#">Package Menu</a> <sup>[446]</sup>
<b>Quick Start</b>	To generate an HTML report right now, follow the steps above on the System Model package of the EAExample project.	

**Notes:**

- If you are using Microsoft Internet Explorer 7.0 or later, and you do not have it open, its security profile might block the report display; click on the explanation banner at the top of the screen and select the **Allow Blocked Content** context menu option

## 17.2.2 The Generate HTML Report Dialog

The **Generate HTML Report** dialog is used to generate documentation about your model in HTML format. There are various settings to choose from to control the output, as described below.

Field	Usage	See also
<b>Package</b>	Display the name of the package you are creating documentation for.	
<b>Title</b>	Type the title for your HTML documentation; defaults to <b>Package</b> .	
<b>Output to</b>	Type the directory path your documentation is saved to.	
<b>Style</b>	Select a web style template to apply to your documentation (optional).	<a href="#">Web Style Templates</a> <sup>[1819]</sup>
<b>File</b>	Specify the file extension for your HTML documentation files; the default is <b>.htm</b> .	
<b>Header Image</b>	Enter or select the file path for the header image graphic to display on your HTML output. If you do not specify a file path, the image defaults to the Enterprise Architect logo.	
<b>Preserve White space in Notes</b>	Preserve existing white space in your notes; deselect to remove white space.	
<b>No page for Note and Text items</b>	Omit the page for your notes and text items in the HTML report.	
<b>Default Diagram</b>	Select the diagram the report should open to when the generated documentation is loaded.	
<b>Image Format</b>	Select the image file format to save your images in, either PNG or GIF.	
<b>Include</b>	Select each area of your model to include in your report.	
<b>System</b>	Select each section to generate in your report.	

Click on the **Generate** button to generate the HTML report with the settings you have defined.

Click on the **View** button to display the report you have generated.

### Notes:

- You can also select packages in your model to exclude them (and their subordinate packages) from the HTML reports you generate

### Learn more:

- [Exclude Package from Report](#) <sup>[1749]</sup>

## 17.2.3 Web Style Templates

The *HTML and CSS Style Editor* enables you to edit the HTML associated with various sections of the HTML Report facility in Enterprise Architect. You would typically use this functionality to customize a report's look and feel for your company or client. The editor is derived from, and provides the facilities of, the common Code Editor.

**How To:**

To create or edit web style templates, follow the steps below:

Step	Action	See Also
1	Open the Resources window ( <b>View   More Project Tools   Project Resources</b> ) and expand the <i>Templates</i> folder.	
2	<p>To:</p> <ul style="list-style-type: none"> <li>• Create a new template, right-click on the Web Style Templates folder and select the <b>Create HTML Template</b> context menu option; enter a name for the new template when prompted to do so.</li> <li>• Edit an existing template, expand the Web Style Templates folder and either double-click on the template name or right-click and select the <b>Modify HTML Style Template</b> context menu option</li> </ul> <p>In either case, the <b>HTML and CSS Style Editor</b> displays.</p> <p>To delete a template, right-click on it and select the Delete HTML Template context menu option.</p>	

**Topics:**

Topic	Detail	See also
<b>Usage</b>	<p>The <b>HTML and CSS Style Editor</b> contains a list of all available HTML fragments for modification and customization.</p> <p>Each fragment typically contains HTML plus one or more special tag names that Enterprise Architect replaces with information during generation. Currently you cannot alter the content within the tag names, but you can omit a complete tag by removing it, or alter its basic display properties in the surrounding HTML.</p> <p>Special tag names are delimited by # characters - for example, <b>#NOTES#</b>.</p> <p>The:</p> <ul style="list-style-type: none"> <li>• <b>Get Default</b> button retrieves the default Enterprise Architect template for the currently selected template item in the left hand list</li> <li>• <b>Save</b> button saves your version of the template for this style only</li> <li>• <b>Delete</b> button removes your modified version of the template, which causes Enterprise Architect to use the default template during report generation</li> </ul> <p>To select a template during generation, use the Style drop-down arrow on the <b>Generate HTML Report dialog</b>. Once a style is selected, Enterprise Architect applies that to the current report. Select &lt;default&gt; for the inbuilt style.</p>	<a href="#">HTML Template Fragments</a> <small>[182]</small>

**Notes:**

- Each time Enterprise Architect generates the web report it overwrites these files, so you must back up your modified versions and copy them back in after every update

### 17.2.5 Master Documents and Model Documents

Enterprise Architect enables you to generate HTML documentation using Master Document and Model Document elements, just as you do for **RTF reports**. However, there are two differences:

- You do not specify the template in the document elements; you must select it on the Generate HTML Report dialog, in the **Style** field
- You do not use the *SearchName* and *SearchValue* Tagged Values in the Model Document elements to select the generated elements

**Learn More:**

- [Virtual Documents](#)<sup>[1788]</sup>
- [Generate HTML Report Dialog](#)<sup>[1819]</sup>

**17.2.5.1 Generate a Master Document (HTML)**

To generate the HTML documentation defined in the Master Document and/or Model Documents, follow the steps below

**How To:**

Step	Action	See Also
1	On the documentation diagram, click on the Master Document element (or on an independent Model Document element).	
2	Select the <b>Project   Documentation   HTML Report</b> option. The Generate HTML Report dialog displays.	
3	Set the options for your HTML document as required. Ensure that you select your Master Document template in the <b>Style</b> field.	<a href="#">Generate HTML Report Dialog</a> <sup>[1819]</sup>
4	Click on the <b>Generate</b> button to create the documentation. The HTML Report Generator works through the defined content of the Master Document element and/or the Model Document elements and pulls in the information from the listed packages, formatted according to the template identified in the <b>Style</b> field.	
5	Click on the <b>View</b> button to view the documentation.

## 18.1 Scripting

### Topics:

Topic	Detail	See also
Usage	<p>Scripts executed in Enterprise Architect have access to the currently open model and are a powerful tool for querying and updating the model in situations that would otherwise require you to perform time consuming and repetitive GUI tasks</p> <p>Enterprise Architect supports management of scripts using the following script engines:</p> <ul style="list-style-type: none"> <li>• JavaScript</li> <li>• Microsoft JScript</li> <li>• Microsoft VBScript</li> </ul> <p>The management interface for Scripting is the Scripting window, which contains the:</p> <ul style="list-style-type: none"> <li>• Script Tree View (Scripts tab), which you use to review, create and edit scripts</li> <li>• Script Console (Console tab), which you use to operate on an executing script.</li> </ul> <p>Scripts are managed in groups: the first group in the list is always Local Scripts, which are files in the Scripts subdirectory of the Enterprise Architect installation - any instance of Enterprise Architect that has a currently open model can see these scripts; you cannot create, edit, drag-and-drop or delete Local scripts</p> <p>All other groups are User Scripts, which you create yourself; a user group can be <b>one of five types</b>, each of which applies a template and certain conditions to the scripts you create within that group</p> <p>User scripts are only visible inside the model in which they were created; the contents of the scripts are stored with the model, although they can be saved to the file system easily using the Script Editor</p>	<p><a href="#">Script Tab</a> <sup>[1833]</sup></p> <p><a href="#">Console Tab</a> <sup>[1835]</sup></p> <p><a href="#">Script Group Properties</a> <sup>[1834]</sup></p> <p><a href="#">Script Editor</a> <sup>[1415]</sup></p>

### Notes:

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you intend to use the Scripting facility under Crossover/WINE, you must also install Internet Explorer version 6.0 or above

## 18.1.1 Scripts Tab

### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>The Scripts tab is composed of a toolbar and a view of all scripts according to group</p> <p>To execute a script, press ( <b>Ctrl</b> ) while you double-click on the script name</p> <p>To write or edit a user script, double-click on the script name to display the Script Editor; this usually displays a script template, determined by the user group type as assigned on creation or on the Script Group Properties dialog</p> <p>You can move or copy a script from one user scripts folder to another; to:</p> <ul style="list-style-type: none"> <li>• Move a script, highlight it in the Scripts tab and drag it into the user scripts folder it now belongs to</li> <li>• Copy a script, highlight it in the Scripts tab and press ( <b>Ctrl</b> ) while you drag it into the user scripts folder in which to duplicate it</li> </ul>	<a href="#">Script Editor</a> <sup>[1415]</sup> <a href="#">Script Group Properties</a> <sup>[1834]</sup>
<b>Context Menus</b>	<p>The script groups and their scripts also have context menus that provide some or all of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Group Properties</b> - to display or edit script group properties in the Script Group Properties dialog</li> <li>• <b>Run Script</b> - to execute the selected script</li> <li>• <b>Rename Script</b> - to change the name of the selected group or script</li> <li>• <b>New VBScript/JScript/JavaScript</b> - add a new script to the selected user group</li> <li>• <b>Import Workflow Script</b> - to display the Browser dialog through which you locate and select a workflow script source (.vbs) file to import into the Workflow script folder</li> <li>• <b>Delete Group/Script</b> - to delete the selected user group or script</li> </ul>	<a href="#">Script Group Properties</a> <sup>[1834]</sup>

The Scripts tab toolbar provides the following options:

### Reference:

Icon	Action	See also
	<p>Create a new script group; this option displays a short menu of the types of script group you can create, namely:</p> <ul style="list-style-type: none"> <li>• Normal group ()</li> <li>• Project Browser group ()</li> <li>• Diagram group ()</li> <li>• Workflow Group ()</li> <li>• Search Group ()</li> </ul> <p>The new group is added to the end of the list in the Scripting window, with the '</p>	

Icon	Action	See also
	<i>New group</i> ' text highlighted so that you can type in the group name	
	<p>Create a new script file in the selected script group; displays a short menu of the types of script you can create, namely:</p> <ul style="list-style-type: none"> <li>• VBScript ()</li> <li>• JScript ()</li> <li>• JavaScript ()</li> </ul> <p>The new script is added to the end of the list in the selected group, with the '<i>New script</i>' text highlighted so that you can type in the script name</p>	
	Refresh the script tree in the Scripting window; this icon also reloads any changes made to a workflow script	
	<p>Compile and execute the selected script</p> <p>The output from the script is written to the Script tab of the Output window, which you display using the <b>View Script Output</b> button (below)</p>	
	Stop an executing script; the icon is disabled if no script is executing	
	<p>Delete a <i>script</i> from the model; you cannot use this icon to delete a script <i>group</i> (see the <i>Context Menu</i> item above), scripts in the Local Scripts group, or a script that is executing</p> <p>The system prompts you to confirm the deletion only if the <b>Confirm Deletes</b> checkbox is selected in the Project Browser panel of the General page of the Options dialog; if this option is not selected, no prompt is displayed</p> <p>Script deletion is permanent - scripts cannot be recovered</p>	<a href="#">Script Tab</a> <sup>[183]</sup> <a href="#">General setting</a> <sup>[42]</sup>
	Display the Output window with the results of the most recently executed script displayed in the Script tab	

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions
- If you add, delete or change a script, you might have to reload the model in order for the changes to take effect
- If you select to delete a script group that contains scripts, the system always prompts you to confirm the action regardless of any system settings for delete operations; be certain that you intend to delete the group and its scripts before confirming the deletion - deletion of script groups and scripts is permanent

**18.1.1.1 Script Group Properties****Topics:**

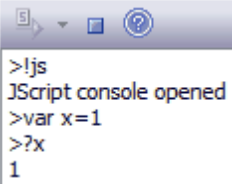

Topic	Detail	See also
<b>Usage</b>	<p>The Script Group Properties dialog enables you to set the following properties of the script group:</p> <ul style="list-style-type: none"> <li>• <b>Name</b> - The name of the script group; the dialog also displays the automatically-assigned GUID of the group</li> <li>• <b>Group Type</b> - The type of scripts contained in the group; this can be one of:</li> </ul>	<a href="#">Package Context Menu</a> <sup>[446]</sup> <a href="#">Workflow Scripts</a> <sup>[232]</sup> <a href="#">Model Search</a> <sup>[477]</sup>

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• <b>Normal</b> - (📄) Ordinary scripts</li> <li>• <b>Project Browser</b> - (📁) Scripts that are listed in and can be executed from the Project Browser <b>Scripts</b> context menu option</li> <li>• <b>Workflow</b> - (📄) Scripts executed by Enterprise Architect's workflow engine; you can create only VB scripts of this type</li> <li>• <b>Search</b> - (🔍) Scripts that can be executed as <b>model searches</b>; these scripts are listed in the <b>Search</b> field of the Model Search window, in the last category in the list</li> <li>• <b>Diagram</b> - (📄) Scripts that are listed in and can be executed from the Scripts submenu of the <b>Diagram</b> context menu</li> <li>• <b>Notes</b> - Your own notes on the script group</li> </ul>	<a href="#">Diagram Context Menu</a> <sup>[540]</sup>

## 18.1.2 Console Tab

### Topics:

Topic	Detail	See also
<b>Abstract</b>	<p>The script console is a tab of the Scripting window. It is a command line interpreter with which you can quickly enable a script engine and enter commands to act on the script.</p> <p>You type the commands in the field at the bottom of the tab; when you press the ( <b>Enter</b> ) key, the script console executes the commands and displays any output immediately.</p> <p>You can input two types of command:</p> <ul style="list-style-type: none"> <li>• Console commands</li> <li>• Script commands</li> </ul>	
<b>Console Commands</b>	<p>Console commands are preceded by the ! character and instruct the console to perform an action. The available console commands are listed below; to list these commands on the <b>Console</b> tab itself (as shown above) type ? in the console field (without the preceding ! character) and press ( <b>Enter</b> )</p> <ul style="list-style-type: none"> <li>• <b>c(lear)</b> - clears the console display</li> <li>• <b>sa(ve)</b> - saves the console display to a file</li> <li>• <b>h(elp)</b> - prints a list of commands, as for ?</li> <li>• <b>VB</b> - opens a VBScript console</li> <li>• <b>JA</b> - opens a JavaScript console</li> <li>• <b>JS</b> - opens a JScript console</li> <li>• <b>st(op)</b> - closes any script running console</li> <li>• <b>i(nclude)</b> name - executes the named script item; name is of the format <i>GroupName.ScriptName</i> (spaces are allowed in names)</li> <li>• <b>?</b> - (without the !) lists commands</li> <li>• <b>?name</b> - Outputs the value of a variable name (only if a script console is opened)</li> </ul>	
<b>Script Commands</b>	A script command is script code that depends on the script	

Topic	Detail	See also
	<p>engine. Script commands can be executed only once a script console has been created.</p> <p>Examples:</p> <p>The following lines, entered into the console, create a <i>VBScript</i> console and then execute the script <i>MyScript</i> in the user group <i>MyGroup</i>.</p> <pre>&gt;! VB &gt;! i My Group. My Scri pt</pre> <p>The following lines, entered into the console, create a <i>JScript</i> console and then create a variable called <i>x</i> with the value <b>1</b>.</p> <pre>&gt;! JS &gt;var x = 1</pre> <p>The following image shows the result of entering the above <i>JScript</i> example. Remember that you can use <b>?&lt;variable name&gt;</b> to get the current value of any item you have created during the console session.</p> 	
<p><b>Console Tab Toolbar</b></p>	<p>The <b>Console</b> tab has two operations available through the toolbar:</p> <ul style="list-style-type: none"> <li>• Open Console (  ) - click on the down-arrow and select to open a VBScript console, JScript console or JavaScript console</li> <li>• Stop Script (  ) - click to stop an executing script and close the current console.</li> </ul>	

**Notes:**

- This facility is available in the Corporate, Business and Software Engineering, Systems Engineering and Ultimate editions

## 18.2 Enterprise Architect Object Model

### Topics:

Topic	Detail	See also
<b>Introduction</b>	<p>Automation provides a way for other applications to access the information in an Enterprise Architect model using Windows OLE Automation (ActiveX). Typically this involves scripting clients such as MS Word or Visual Basic, or using scripts created within Enterprise Architect using the <b>Scripting window</b>.</p> <p>The Automation Interface provides a way of accessing the internals of Enterprise Architect models. Examples of things you can do using the Automation Interface include:</p> <ul style="list-style-type: none"> <li>• Perform repetitive tasks, such as update the version number for all elements in a model</li> <li>• Generate code from a State Machine diagram</li> <li>• Produce custom reports</li> <li>• Perform ad hoc queries</li> </ul>	<a href="#">Scripting</a> <sup>[1832]</sup>
<b>Connecting to the Automation Interface</b>	All development environments capable of generating <i>ActiveX</i> Com clients should be able to connect to the Enterprise Architect Automation Interface. This guide provides detailed instructions on connecting to the interface using Microsoft Visual Basic 6.0, Borland Delphi 7.0, Microsoft C# and Java. There are also more detailed steps on how to set-up Visual Basic; the principles are applicable to other languages.	<a href="#">Connecting to the Interface</a> <sup>[1838]</sup> <a href="#">Set References in Visual Basic</a> <sup>[1840]</sup>
<b>Examples and Tips</b>	Instruction on how to use the Automation Interface is provided by means of sample code. See pointers to the samples and other available resources. Also, consult the extensive Reference Section.	<a href="#">Pointers to the Samples</a> <sup>[1841]</sup> <a href="#">Available Resources</a> <sup>[1843]</sup> <a href="#">Reference</a> <sup>[1843]</sup>
<b>Calling Executables from Enterprise Architect</b>	Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the <b>Project Browser</b> to the application being called. For instructions, go to the Call from Enterprise Architect topic. A more sophisticated method is to create Add-Ins, which are discussed in a separate topic.	<a href="#">Call from Enterprise Architect</a> <sup>[1842]</sup> <a href="#">Add-Ins</a> <sup>[1982]</sup>

### 18.2.1 Using the Automation Interface

This section provides instructions on how to connect to and use the Automation Interface, including:

Topic	Link
Connecting to the Interface	<a href="#">Connecting to the Interface</a> <sup>[1838]</sup>

Topic	Link
Setting References In Visual Basic	<a href="#">Setting References In Visual Basic</a> <sup>[1840]</sup>
Examples and Tips	<a href="#">Examples and Tips</a> <sup>[1841]</sup>

### 18.2.1.1 Connect to the Interface

All development environments capable of generating ActiveX Com clients should be able to connect to the Enterprise Architect Automation Interface.

By way of example, the following sections describe how to connect using several such tools. The procedure might vary slightly with different versions of these products.

#### How To - Microsoft Visual Basic 6.0

Step	Action	See Also
1.	Create a new project.	
2.	Select the <b>Project   References</b> menu option.	
3.	Select <i>Enterprise Architect Object Model 2.0</i> from the list. (If this does not appear, go to the command line and re-register Enterprise Architect using  <i>EA.exe /unregister</i>  then  <i>EA.exe /register</i> ).	
4.	See the general library documentation on the use of Classes. The following example creates and opens a repository object:  <pre>Public Sub ShowRepository()     Dim MyRep As New EA.Repository     MyRep.OpenFile "c:\eat est.eap" End Sub</pre>	

#### How To - Borland Delphi 7.0

Step	Action	See Also
1.	Create a new project.	
2.	Select the <b>Project   Import Type Library</b> menu option.	
3.	Select <b>Enterprise Architect Object Model 2.0</b> from the list. (If this does not appear, go to the command line and re-register Enterprise Architect using  <i>EA.exe /unregister</i>  then  <i>EA.exe /register</i> ).	

Step	Action	See Also
4.	Click on the <b>Create Unit</b> button.	
5.	Include <i>EA_TLB</i> in Project1's <i>Uses</i> clause.	
6.	See the general library documentation on the use of Classes. The following example creates and opens a repository object: <pre> procedure TForm1.Button1Click(Sender: TObject); var   r: TRepository;   b: boolean; begin   r := TRepository.Create(nil);   b := r.OpenFile('c:\eat est.eap'); end; </pre>	

#### How To - Microsoft C#

Step	Action	See Also
1.	Select the Visual Studio <b>Project   Add Reference</b> menu option.	
2.	Click on the <b>Browse</b> tab.	
3.	Navigate to the folder in which you installed Enterprise Architect (usually <i>Program Files/ Sparx Systems/ EA</i> ) and select <i>Interop. EA.dll</i> .	
4.	See the general library documentation on the use of Classes. The following example creates and opens a repository object: <pre> private void button1_Click(object sender, System.EventArgs e) {   EA.Repository r = new EA.RepositoryClass();   r.OpenFile("c:\\eat est.eap"); } </pre>	

#### How To - Java

Step	Action	See Also
1.	Copy the file <i>SSJavaCOM.dll</i> from the <i>Java API</i> subdirectory of your installed directory (usually <i>Program Files/ Sparx Systems/ EA</i> ) into any location within the Windows PATH. For example, the <i>windows\system32</i> directory.	
2.	Copy the <i>eaapi.jar</i> file from the <i>Java API</i> subdirectory of your installed directory (usually <i>Program Files/ Sparx Systems/ EA</i> ) to a location in the Java CLASSPATH or where the Java class loader can find it at run time.	
3.	All of the Classes described in the documentation are in the package <i>org.sparx</i> . See the <b>general library documentation</b> for their use. The following example creates and opens a repository object.	<a href="#">Reference</a> 

Step	Action	See Also
	<pre> public void OpenRepository() {     org.sparx.Repository r = new org.sparx. Repository();     r.OpenFile("c:\\eat est.eap"); } </pre>	

### 18.2.1.1.1 Set References In Visual Basic

This topic describes how to use the Enterprise Architect ActiveX interface with Visual Basic (VB). Use is ensured for Visual Basic version 6. This might vary slightly with versions other than version 6.

It is assumed that you have accessed VB through a Microsoft Application such as VB 6.0, MS Word or MS Access. If the code is not called from within Word, the *Word VB* reference must also be set.

On creating a new VB project, set a reference to an Enterprise Architect Type Library and a Word Type Library. Follow the steps below:

#### How To

Step	Action	See Also
1.	Select the <b>Tools   References</b> menu option. The following dialog displays:	
2.	Select the <b>Enterprise Architect Object Model 2.10</b> checkbox from the list.	
3.	Do the same for VB or VB Word: select the checkbox for the <b>Microsoft Word 10.0 Object Library</b> .	
4.	Click on the <b>OK</b> button.	

#### Notes:

- If Enterprise Architect Object Model 2.10 does not appear in the list, go to the command line and manually re-enter Enterprise Architect using the following:
  - To unregister Enterprise Architect: `ea.exe /unregister`
  - To register Enterprise Architect: `ea.exe /register`
- **Visual Basic 5/6** users should also note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:

```

Reference=* \ G{ 64FB2BF4- 9EFA- 11D2- 8307- C45586000000} #2. 2#0#... \ . . . \ . . .
\ Program Files\ Sparx Systems\ EA\ EA. TLB#Ent erpri se Archi tect Obj ect
Model 2. 02

```

If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line. Then open the project in Visual Basic and use Project-References to create a new reference to the Enterprise Architect Object model

Reference to objects in Enterprise Architect and Word should now be available in the **Object Browser**. This can be accessed from the main menu by selecting **View | Object Browser**, or by pressing ( **F2** )

The drop-down list on the top-left of the window should now include Enterprise Architect and Word. If MS-Project is installed this must also be set up

### 18.2.1.2 Examples and Tips

#### Topics:

Topic	Detail	See also
<b>Usage</b>	<p>Instructions for using the interface are provided through sample code. There are several sets of examples:</p> <ul style="list-style-type: none"> <li>• VB 6 and C# examples are available in the Code Samples folder under your Enterprise Architect installation (default: C: \ P r o g r a m F i l e s \ S p a r x S y s t e m s \ E A \ C o d e S a m p l e s )</li> <li>• Enterprise Architect can be set up to <b>call an external application</b></li> <li>• Several VB.NET code snippets are provided in the <b>reference section</b></li> <li>• A comprehensive example of using Visual Basic to create MS Word documentation is available from the internet at <b>www.sparxsystems.com/resources/developers/autint_vb.html</b></li> <li>• Additional samples are available from the Sparx Systems website; see the <b>Available Resources</b> topic</li> </ul>	<p><a href="#">Call an External Application</a> <sup>[1842]</sup></p> <p><a href="#">Code Samples</a> <sup>[1967]</sup></p> <p><a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a> (Online Resource)</p> <p><a href="#">Available Resources</a> <sup>[1843]</sup></p>
<b>Tips and Tricks</b>	<p>Additionally, you should note the following tips and tricks:</p> <ul style="list-style-type: none"> <li>• An instance of the Enterprise Architect (EA.exe) process is executed when you initialize a new repository object. This process must remain running in order to perform automation tasks. If the main window is visible, you can safely minimize it, but it must remain running.</li> <li>• The Enterprise Architect ActiveX Interface is a functional interface rather than a data interface. When you load data through the interface there is a noticeable delay as Enterprise Architect user interface elements (such as Windows, menus) are loaded and the specified database connection is established.</li> <li>• Collections use a zero-based index; for example, Repository.Models(0) represents the first model in the repository.</li> <li>• During the development of your client software your program might terminate unexpectedly and leave EA.exe running in such a state that it is unable to support further interface calls. If your program terminates abnormally, ensure that Enterprise Architect is not left running in the background (see the Windows <b>Task Manager / Process</b> tab).</li> <li>• A handle to a currently running instance of Enterprise Architect can be obtained through the use of a GetObject() call. For more information, refer to the reference page for the <b>App</b> object. Accessing your Enterprise Architect model via the App object enables querying the current User Interface status, such as using GetContextItem() on the <b>Repository</b> object to detect the current selection by the user, allowing for rapid prototyping and testing</li> </ul>	<p><a href="#">Repository Class</a> <sup>[1870]</sup></p> <p><a href="#">App Class</a> <sup>[1845]</sup></p>
<b>Enterprise Architect Not Closing</b>	<p>If your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it. To force the release of the COM pointers, call the memory management functions as shown</p>	<p><a href="#">Tricks and Traps</a> <sup>[1987]</sup></p>

Topic	Detail	See also
	<p>below:</p> <pre>GC. Collect (); GC. Wait For Pending Finalizers ();</pre> <p>There are additional concerns when controlling a running instance of Enterprise Architect that loads Add-Ins - see the <b>Tricks and Traps</b> topic for details.</p>	

### 18.2.1.2.1 Call from Enterprise Architect

Enterprise Architect can be set up to call an external application. You can pass parameters on the current position selected in the **Project Browser** to the application being called.

**Access:** **Tools | Customize > Tools**

To define an application that you can run from Enterprise Architect, select the **Tools | Customize** menu option. The **Customize** dialog displays. Select the **Tools** tab.

**Topics:**

Topic	Detail	See also
<b>Uses</b>	<p>With this you can:</p> <ul style="list-style-type: none"> <li>• Add a command line for an application</li> <li>• Define parameters to pass to this application</li> </ul> <p>The parameters required for running the AutInt executable are:</p> <ul style="list-style-type: none"> <li>• The Enterprise Architect file parameter \$f and</li> <li>• The current PackageID \$p</li> </ul> <p>Hence the arguments should simply contain: \$f , \$p</p>	

The available parameters for passing information to external applications are:

Parameter	Description	Notes
\$d	Diagram ID	ID for accessing associated diagram.
\$D	Diagram GUID	GUID for accessing the associated diagram.
\$e	Comma separated list of element IDs	All elements selected in the current diagram.
\$E	Comma separated list of element GUIDs	All elements selected in the current diagram.
\$f	Project Name	For example: C: \ p r o j e c t s \ E A e x a m p l e . e a p .
\$F	Calling Application (Enterprise Architect)	'Enterprise Architect'.
\$p	Current Package ID	For example: 144.
\$P	Package GUID	GUID for accessing this package.

Once this has been set up, the application can be called from the main menu in Enterprise Architect using the **Add-Ins | <YourApplication>** menu option.

### 18.2.1.2.2 Available Resources

Other available resources include:

Resource	Download Link
VB 6 Add-In for generating MS Word documentation.	<a href="http://www.sparxsystems.com/resources/developers/autint_vb.html">www.sparxsystems.com/resources/developers/autint_vb.html</a>
VB 6 Add-In to display a custom ActiveX graph control within the Enterprise Architect window as a new view.	<a href="http://www.sparxsystems.com/resources/developers/autint_vb_custom_view.html">www.sparxsystems.com/resources/developers/autint_vb_custom_view.html</a>
A basic Add-In framework written in C#. Useful as a starting point for authoring your own custom Enterprise Architect Add-In.	<a href="http://www.sparxsystems.com/bin/CS_AddinFramework.zip">www.sparxsystems.com/bin/CS_AddinFramework.zip</a>

### 18.2.2.1 Interface Overview Package

This package provides an overview of the main components of the Automation Interface. These include the:

Topic	Detail	Link
<b>Repository Package</b>	Represents the model as a whole and provides entry to model packages and collections	<a href="#">Repository Package</a> <sup>[1853]</sup>
<b>Element Package</b>	Identifies the basic structural units (such as Class, Use Case and Object)	<a href="#">Element Package</a> <sup>[1888]</sup>
<b>Element Features Package</b>	Identifies the attributes and operations defined on an element	<a href="#">Element Features Package</a> <sup>[1912]</sup>
<b>Diagram Package</b>	Describes the visible drawings contained in the model	<a href="#">Diagram Package</a> <sup>[1935]</sup>
<b>Connector Package</b>	Defines the relationships between elements	<a href="#">Connector Package</a> <sup>[1925]</sup>

The following diagram illustrates the main interface packages and their associated contents. Each element in this document is creatable by Automation and can be accessed through the various collections that exist or, in some cases, directly.

The *Repository* Class is the starting point for all use of the automation interface. It contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

### 18.2.2.2 App Object

The *App* object represents a running instance of Enterprise Architect. Its object provides access to the Automation Interface.

Attribute	Type	Notes
Project	Project	Read only. Provides a handle to the Project Interface.
Repository	Repository	Read only. Provides a handle to the Repository object.
Visible	Boolean	Read/Write. Whether or not the application is visible.

Topic	Detail	Link
<b>GetObject() Support</b>	The <i>App</i> object is creatable and a handle can be obtained by creating one. In addition, clients can use the equivalent of	

Topic	Detail	Link
	<p>Visual Basic's <i>GetObject()</i> to obtain a reference to a currently running instance of Enterprise Architect.</p> <p>Use this method to more quickly test changes to Add-Ins and external clients, as the Enterprise Architect application and data files do not have to be constantly re-loaded.</p> <p>For example:</p> <pre>Dim App as EA.App Set App = GetObject(, "EA.App") MsgBox App.Repository.Models.Count</pre> <p>Another example, which uses the App object without saving it to a variable:</p> <pre>Dim Rep as EA.Repository Set Rep = GetObject(, "EA.App"). Repository MsgBox Rep.ConnectionString</pre>	

### 18.2.2.3 Enumerations

The following enumerations are defined by the Automation Interface:

Enumeration	Link
Constant Layout Styles	<a href="#">ConstLayoutStyles</a> <sup>[1847]</sup>
Create Baseline Flag	<a href="#">CreateBaselineFlag</a> <sup>[1847]</sup>
Create Model Type	<a href="#">CreateModelType</a> <sup>[1847]</sup>
Document Break	<a href="#">DocumentBreak</a> <sup>[1848]</sup>
Document Type	<a href="#">DocumentType</a> <sup>[1848]</sup>
EA Edition Types	<a href="#">EAEditionTypes</a> <sup>[1848]</sup>
Enumeration Relation Set Type	<a href="#">EnumRelationSetType</a> <sup>[1849]</sup>
Export Package XML Flag	<a href="#">ExportPackageXMLFlag</a> <sup>[1849]</sup>
Mail Interface Message Flag	<a href="#">MessageFlag</a> <sup>[1850]</sup>
MDG Menus	<a href="#">MDGMenus</a> <sup>[1849]</sup>
Object Type	<a href="#">ObjectType</a> <sup>[1850]</sup>
PropType	<a href="#">PropType</a> <sup>[1851]</sup>
Reload Type	<a href="#">ReloadType</a> <sup>[1852]</sup>
Scenario Diagram Type	<a href="#">ScenarioDiagramType</a> <sup>[1852]</sup>
Scenario Step Type	<a href="#">ScenarioStepType</a> <sup>[1853]</sup>
Scenario Test Type	<a href="#">ScenarioTestType</a> <sup>[1853]</sup>
XML Type	<a href="#">XMLType</a> <sup>[1853]</sup>

### 18.2.2.3.1 ConstLayoutStyles

The *enum* values defined here are used exclusively for the *Lay Out a Diagram* method. They enable you to define the layout options as depicted in the **Diagram | Layout Diagram** menu option.

Value	Meaning
<i>IsCrossReduceAggressive</i>	Perform aggressive Cross-reduction in the layout process (time consuming)
<i>IsCycleRemoveDFS</i>	Use the <i>Depth First Cycle Removal</i> algorithm
<i>IsCycleRemoveGreedy</i>	Use the <i>Greedy Cycle Removal</i> algorithm
<i>IsDiagramDefault</i>	Use existing layout options specified for this diagram
<i>IsInitializeDFSIn</i>	Initialize the layout using the <i>Depth First Search Inward</i> algorithm
<i>IsInitializeNaive</i>	Initialize the layout using the <i>Naïve Initialize Indices</i> algorithm
<i>IsInitializeDFSOut</i>	Initialize the layout using the <i>Depth First Search Outward</i> algorithm
<i>IsLayeringLongestPathSink</i>	Layer the diagram using the <i>Longest Path Sink</i> algorithm
<i>IsLayeringLongestPathSource</i>	Layer the diagram using the <i>Longest Path Source</i> algorithm
<i>IsLayeringOptimalLinkLength</i>	Layer the diagram using the <i>Optimal Link Length</i> algorithm
<i>IsLayoutDirectionDown</i>	Direct connectors to point down
<i>IsLayoutDirectionLeft</i>	Direct connectors to point left
<i>IsLayoutDirectionRight</i>	Direct connectors to point right
<i>IsLayoutDirectionUp</i>	Direct connectors to point up
<i>IsProgramDefault</i>	Use factory default layout options as specified by Enterprise Architect

#### Learn More:

- [Lay Out a Diagram](#) <sup>[62]</sup>

### 18.2.2.3.2 CreateBaselineFlag

The *CreateBaselineFlag* enumeration is used in Baseline Management, when creating a Baseline.

Value	Meaning
<i>cbSaveToStub</i>	Baseline this package with only immediate children (child packages are included as stubs only)

### 18.2.2.3.3 CreateModelType

The *CreateModelType* enumeration is used in the **CreateModel** method on the Repository Class.

Value	Meaning
<i>cmEAPFromBase</i>	Create a copy of the EABase model file to the specified file path

Value	Meaning
<i>cmEAPFromSQLRepository</i>	Create a .eap file shortcut to an SQL-based repository; requires user interaction to provide sql connection details

**Learn More:**

- [CreateModel Method](#)<sup>[1875]</sup>

**18.2.2.3.4 DocumentBreak**

The *DocumentBreak* enumeration is used in the **InsertBreak** method on the *DocumentGenerator* Class.

Value	Meaning
<i>breakPage</i>	Insert a page break in the document
<i>breakSection</i>	Insert a section break in the document

**Learn More:**

- [InsertBreak Method](#)<sup>[1964]</sup>

**18.2.2.3.5 DocumentType**

The *DocumentType* enumeration is used in the **SaveDocument** method on the *DocumentGenerator* Class.

Value	Meaning
<i>dtHTML</i>	Save the document file to disk as an HTML document
<i>dtRTF</i>	Save the document file to disk as an RTF document

**Learn More:**

- [SaveDocument](#)<sup>[1965]</sup>

**18.2.2.3.6 EAEditionTypes**

Topic	Detail	See Also
<b>General Usage</b>	<p>The <i>EAEditionTypes</i> enumeration identifies the current level of licensed functionality available; for example:</p> <pre>EAEditionTypes theEdition = theRepository.GetEAEdition(); if ( theEdition == EAEditionTypes. piDesktop ) ... else if ( theEdition == EAEditionTypes.piProfessional ) ...</pre> <p>The enumeration defines the following formal values:</p> <ul style="list-style-type: none"> <li>• <i>piLite</i></li> <li>• <i>piDesktop</i></li> <li>• <i>piProfessional</i></li> </ul>	

Topic	Detail	See Also
	<ul style="list-style-type: none"> <li>• <i>piCorporate</i></li> <li>• <i>piBusiness</i></li> <li>• <i>piSystemEng</i></li> <li>• <i>piUltimate</i></li> </ul> <p>There is no separate value for the trial edition; the <i>Repository.GetEAEdition()</i> function returns the appropriate <b>EAEditionTypes</b> value for whichever edition the user has selected to trial</p>	

### 18.2.2.3.7 EnumRelationSetType

This enumeration represents values returned from the *GetRelationSet* method of the **Element** object.

Value	Meaning
<i>rsDependEnd</i>	List of elements that depend on the current element
<i>rsDependStart</i>	List of elements that the current element depends on
<i>rsGeneralizeEnd</i>	List of elements that are generalized by the current element
<i>rsGeneralizeStart</i>	List of elements that the current element generalizes
<i>rsParents</i>	List of all parent elements of the current element
<i>rsRealizeEnd</i>	List of elements that are realized by the current element
<i>rsRealizeStart</i>	List of elements that the current element realizes

#### Learn More:

- [Element Class](#) 1892

### 18.2.2.3.8 ExportPackageXMIFlag

The *ExportPackageXMIFlag* enumeration is used in package control, when exporting to XML.

Value	Meaning
<i>epSaveToStub</i>	Export this package with only immediate children (child packages are included as stubs only)

### 18.2.2.3.9 MDGMenus

Use this enumeration when providing the *HiddenMenus* property to *MDG\_GetProperty*.

These options are exclusive of one another and can be read or added to hide more than one menu.

Value	Meaning
<i>mgBuildProject</i>	Hide <b>Build Project</b> menu option
<i>mgMerge</i>	Hide <b>Merge</b> menu option

Value	Meaning
<i>mgRun</i>	Hide <b>Run</b> menu option

Learn More:

- [MDG.GetProperty](#)<sup>[2061]</sup>

#### 18.2.2.3.10 MessageFlag

The *MessageFlag* enumeration is used in both the **SendMessage** and **ComposeMailMessage** methods of the MailInterface, to specify a flag to attach to the message.

Value	Meaning
<b>mfNone</b>	Do not flag the message
<b>mfComplete</b>	Flag the message as 'Complete'
<b>mfPurple</b>	Flag the message with a 'Purple' flag
<b>mfOrange</b>	Flag the message with a 'Orange' flag
<b>mfGreen</b>	Flag the message with a 'Green' flag
<b>mfYellow</b>	Flag the message with a 'Yellow' flag
<b>mfBlue</b>	Flag the message with a 'Blue' flag
<b>mfRed</b>	Flag the message with a 'Red' flag

#### 18.2.2.3.11 ObjectType

Topic	Detail	See Also
<b>General Usage</b>	<p>The <i>ObjectType</i> enumeration identifies Enterprise Architect object types even when referenced through a Dispatch interface</p> <p>For example:</p> <pre> Object ob = Repository.GetElementById ( 13 ); if ( ob.ObjectType == otElement ) ; else if ( ob.ObjectType == otAuthor ) ... </pre>	
<b>Valid Enumeration Values</b>	<p><i>otAttribute</i>  <i>otAttributeConstraint</i>  <i>otAttributeTag</i>  <i>otAuthor</i>  <i>otClient</i>  <i>otCollection</i>  <i>otConnector</i>  <i>otConnectorConstraint</i>  <i>otConnectorEnd</i>  <i>otConnectorTag</i>  <i>otConstraint</i></p>	

Topic	Detail	See Also
	<i>otCustomProperty</i> <i>otDatatype</i> <i>otDiagram</i> <i>otDiagramLink</i> <i>otDiagramObject</i> <i>otEffort</i> <i>otElement</i> <i>otEventProperties</i> <i>otEventProperty</i> <i>otFile</i> <i>otIssue</i> <i>otMailInterface</i> <i>otMethod</i> <i>otMethodConstraint</i> <i>otMethodTag</i> <i>otMetric</i> <i>otModel</i> <i>otNone</i> <i>otPackage</i> <i>otParameter</i> <i>otParamTag</i> <i>otPartition</i> <i>otProject</i> <i>otProjectIssues</i> <i>otProjectResource</i> <i>otProperties</i> <i>otProperty</i> <i>otPropertyType</i> <i>otReference</i> <i>otRepository</i> <i>otRequirement</i> <i>otResource</i> <i>otRisk</i> <i>otRoleTag</i> <i>otScenario</i> <i>otScenarioExtension</i> <i>otScenarioStep</i> <i>otStereotype</i> <i>otSwimlane</i> <i>otSwimlaneDef</i> <i>otSwimlanes</i> <i>otTaggedValue</i> <i>otTask</i> <i>otTerm</i> <i>otTest</i> <i>otTransition</i>	

#### 18.2.2.3.12 PropType

The *PropType* enumeration gives the automation programmer an indication of what sort of data is going to be stored by this property.

Value	Meaning
<i>ptArray</i>	An array containing values of any type

Value	Meaning
<i>ptBoolean</i>	True or False
<i>ptEnum</i>	A string being an entry in the semi-colon separated list specified in the validation field of the Property
<i>ptFloatingPoint</i>	4 or 8 byte floating point value
<i>ptInteger</i>	16-bit or 32-bit signed integer
<i>ptString</i>	Unicode string

### 18.2.2.3.13 ReloadType

This enumeration represents values returned from the *GetReloadItem* and *PeekReloadItem* methods of the *ModelWatcher* Class. It has four possible values, which define the type of change that was made to a model.

Value	Meaning
<i>rtElement</i>	The <i>Item</i> parameter represents a particular element that must be reloaded
<i>rtEntireModel</i>	Entire model must be reloaded to ensure that all changes are reloaded
<i>rtNone</i>	No change in the model
<i>rtPackage</i>	The <i>Item</i> parameter represents a particular package that must be reloaded

### 18.2.2.3.14 ScenarioDiagramType

The *ScenarioDiagramType* enumeration provides the following enumeration values to the **Project.GenerateDiagramFromScenario()** method. They specify the type of diagram to generate.

Value	Meaning	See also
<i>sdActivity</i>	Generate an Activity diagram	<a href="#">Generated Activity diagram</a> <sup>[679]</sup>
<i>sdActivityWithAction</i>	Generate an Activity diagram with an Action	<a href="#">Generated Activity diagram</a> <sup>[679]</sup>
<i>sdActivityWithActionPin</i>	Generate an Activity diagram with an ActionPin	<a href="#">Generated Activity diagram</a> <sup>[679]</sup>
<i>sdActivityWithActivityParameter</i>	Generate an Activity diagram with an ActivityParameter	<a href="#">Generated Activity diagram</a> <sup>[679]</sup>
<i>sdRobustness</i>	Generate a Robustness diagram	<a href="#">Generated Robustness diagram</a> <sup>[685]</sup>
<i>sdRuleFlow</i>	Generate a RuleFlow diagram	<a href="#">Generated RuleFlow diagram</a> <sup>[680]</sup>
<i>sdSequence</i>	Generate a Sequence diagram	<a href="#">Generated Sequence diagram</a> <sup>[683]</sup>
<i>sdState</i>	Generate a State Machine diagram	<a href="#">Generated State Machine diagram</a> <sup>[681]</sup>

[Learn More:](#)

- [Project.GenerateDiagramFromScenario\(\) Method](#)<sup>[1950]</sup>

#### 18.2.2.3.15 ScenarioStepType

The *ScenarioStepType* enumeration is used to identify the **steps** of a scenario, and the entity performing the step.

Value	Meaning	See also
<i>stActor</i>	Identify that the step is an action performed by an actor	
<i>stSystem</i>	Identify that the step is an action performed by the system	

#### Learn More:

- [Scenario Step Class](#)<sup>[1909]</sup>

#### 18.2.2.3.16 ScenarioTestType

The *ScenarioTestType* enumeration provides the following enumeration values to the **Project.GenerateTestFromScenario()** method. They specify the type of test to generate.

Value	Meaning	See also
<i>stExternal</i>	Generate an external Test Case element	
<i>stInternal</i>	Generate an internal test	

#### Learn More:

- [Project.GenerateTestFromScenario\(\) Method](#)<sup>[1952]</sup>
- [Generate Test Classes](#)<sup>[687]</sup>

#### 18.2.2.3.17 XMType

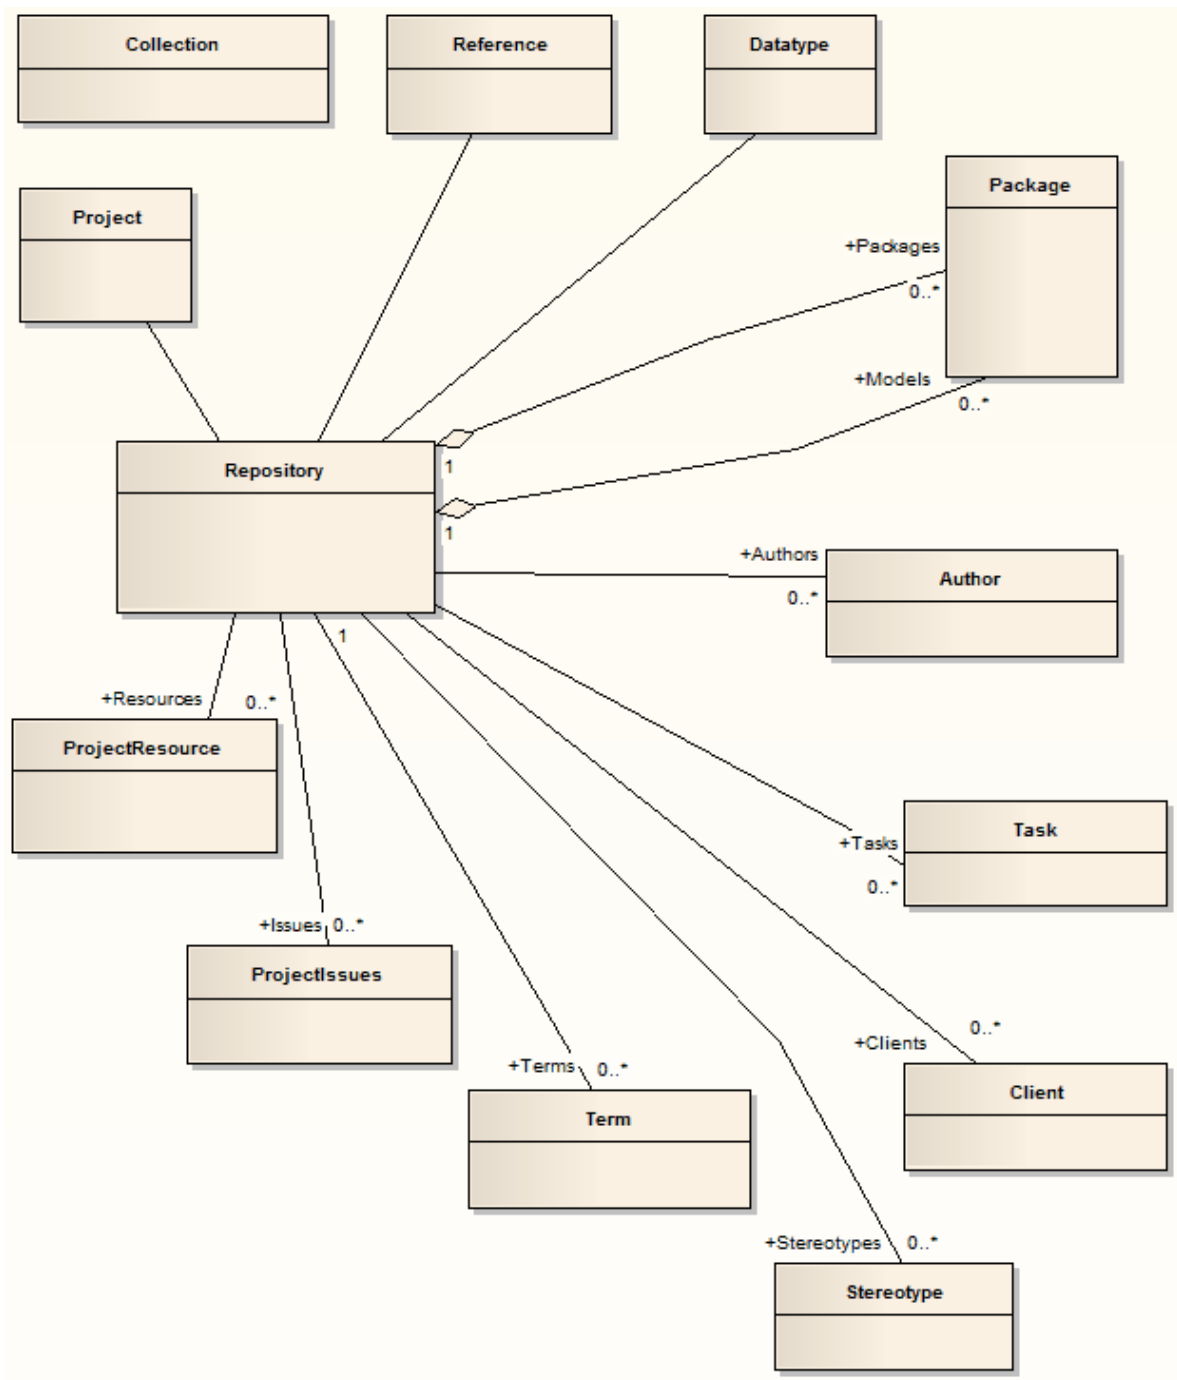

The following enumeration values are used in the *Project.ExportPackageXML()* method. They enable specification of the XML export type.

*xmiEADefault*  
*xmiRoseDefault*  
*xmiEA10*  
*xmiEA11*  
*xmiEA12*  
*xmiEA20*  
*xmiEA21*  
*xmiMOF13*  
*xmiMOF14*  
*xmiRose10*  
*xmiRose11*  
*xmiRose12*

#### 18.2.2.4 Repository Package

The *Repository* package contains the high level system objects and entry point into the model itself using the *Models* collection and the other system level collections.

This diagram illustrates the **Repository** and its first level functions and collections.

**Learn More:**

- [Repository Class](#) 1870

**18.2.2.4.1 Author Class**

An *Author* object represents a named model author. It can be accessed using the Repository *Authors* collection.

Associated table in .EAP file: *t\_authors*

Author Attributes

Attribute	Type	Notes
Name	String	Read/Write. Author name.
Notes	String	Read/Write. Notes about the author.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
Roles	String	Read/Write. Roles the author might play in this project.

Author Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Updates the current Author object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.4.2 Client Class**

A Client represents one or more people or organizations related to the project. Accessed using the Repository *Clients* collection.

Associated table in .EAP file: *t\_clients*

Client Attributes

Attribute	Type	Notes
EMail	String	Read/Write. EMail address.
Fax	String	Read/Write. Fax number.
Mobile	String	Read/Write. Mobile phone if available.
Name	String	Read/Write. Client name.
Notes	String	Read/Write. Notes about client.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through the <i>Dispatch</i> interface.
Organization	String	Read/Write. Associated organization.
Phone1	String	Read/Write. Main phone number.
Phone2	String	Read/Write. Second phone number.

Attribute	Type	Notes
Roles	String	Read/Write. Roles this client might play in the project.

#### Client Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Updates the current Client object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.4.3 Collection Class

Topic	Detail	Link
General Usage	<p>This is the main collection Class used by all elements within the Automation Interface. It contains methods to iterate through the collection, refresh the collection and delete an item from the collection. It is important to realize that when <i>AddNew</i> is called, the item is not automatically added to the current collection. The typical steps are:</p> <ul style="list-style-type: none"> <li>• Call <i>AddNew</i> to add a new item</li> <li>• Modify the item as required</li> <li>• Call <i>Update</i> on the item to save it to the database</li> <li>• Call <i>Refresh</i> on the collection to include it in the current set</li> </ul> <p>Delete is much the same; until <i>Refresh</i> is called, the collection still contains a reference to the deleted item, which should not be called.</p> <p>Each can be used to iterate through the collection for languages that support this type of construct.</p>	

#### Collection Attributes

Attribute	Type	Notes
Count	Short	Read only. The number of objects referenced by this list.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

#### Collection Methods

Method	Type	Notes	See Also
<b>AddNew (string Name, string Type)</b>	<i>Object</i>	<p>Adds a new item to the current collection.</p> <p>Note that the interface is the same for all collections; you must provide a <i>Name</i> and <i>Type</i> argument. What these are used for depends on the actual collection member. Also note that you must call <i>Update()</i> on the returned object to complete the <i>AddNew</i>. If <i>Update()</i> is not called the object is left in an indeterminate state.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String</li> <li>Type: String (up to 30 characters long)</li> </ul>	
<b>Delete (short index)</b>	<i>Void</i>	<p>Deletes the item at the selected reference.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>index: Short</li> </ul>	
<b>DeleteAt (short index, boolean Refresh)</b>	<i>Void</i>	<p>Deletes the item at the selected index. The second parameter is currently unused.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>index: Short</li> <li>Refresh: Boolean</li> </ul>	
<b>GetAt (short index)</b>	<i>Object</i>	<p>Retrieves the array object using a numerical index. If the index is out of bounds, an error occurs.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>index: Short</li> </ul>	
<b>GetByName (string Name)</b>	<i>Object</i>	<p>Gets an item in the current collection by Name.</p> <p>If the collection does not contain any items, the method returns a null value. If the collection contains items, but it was unable to find an object with the specified name, the method raises an exception.</p> <p>Only supported for the following collections: <b>Model</b>, <b>Package</b>, <b>Element</b>, <b>Diagram</b>, and element <b>TaggedValue</b>.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String</li> </ul>	<p><a href="#">Package Class</a> [1860]</p> <p><a href="#">Element Class</a> [1892]</p> <p><a href="#">Diagram Class</a> [1936]</p> <p><a href="#">TaggedValue Class</a> [1910]</p>
<b>GetLastError ()</b>	<i>String</i>	<p>Returns a string value describing the most recent error that occurred in relation to this object.</p> <p>This function is rarely used as an exception is thrown when an error occurs.</p>	
<b>Refresh ()</b>	<i>Void</i>	<p>Refreshes the collection by re-querying the model and reloading the collection. Should be called after adding a new item or after deleting an item.</p>	

#### 18.2.2.4.4 Datatype Class

A *Datatype* is a named type that can be associated with attribute or method types. It typically is related to either code engineering or database modeling. Datatypes also indicate which language or database system they relate to. Accessed using the Repository *Datatypes* collection.

Associated table in .EAP file: *t\_datatypes*

##### Datatype Attributes

Attribute	Type	Notes
<b>DatatypeID</b>	<i>Long</i>	Read/Write. Instance ID for this datatype within the current model. System maintained.
<b>DefaultLen</b>	<i>Long</i>	Read/Write. Default length (DDL only).
<b>DefaultPrec</b>	<i>Long</i>	Read/Write. Default precision (DDL only).
<b>DefaultScale</b>	<i>Long</i>	Read/Write. Default scale (DDL only).
<b>GenericType</b>	<i>String</i>	Read/Write. The associated generic type for this data type.
<b>HasLength</b>	<i>String</i>	Read/Write. Indicates datatype has a length component.
<b>MaxLen</b>	<i>Long</i>	Read/Write. Maximum length (DDL only).
<b>MaxPrec</b>	<i>Long</i>	Read/Write. Maximum precision (DDL only).
<b>MaxScale</b>	<i>Long</i>	Read/Write. Maximum scale (DDL only).
<b>Name</b>	<i>String</i>	Read/Write. The datatype name (such as <i>integer</i> ). This appears in the related drop-down datatype lists where appropriate.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1858]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Product</b>	<i>String</i>	Read/Write. The datatype product, such as Java, C++, Oracle.
<b>Size</b>	<i>Long</i>	Read/Write. The datatype size.
<b>Type</b>	<i>String</i>	Read/Write. The type can be <i>DDL</i> for database datatype or <i>Code</i> for language datatypes.
<b>UserDefined</b>	<i>Long</i>	Read/Write. Indicates if datatype is a user defined type or system generated.  Datatypes distributed with Enterprise Architect are all system generated. Datatypes created in the <b>Datatype</b> dialog are marked <b>1 (true)</b> .

##### Datatype Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.

Method	Type	Notes
Update ()	Boolean	Updates the current Datatype object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.4.5 EventProperties Class

An *EventProperties* object is passed to *BroadcastFunctions* to facilitate parameter passing.

##### EventProperties Attributes

Attribute	Type	Notes
Count	Long	Read only. Number of parameters being passed to this broadcast event.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

##### EventProperties Methods

Method	Type	Notes
Get (object Index)	<a href="#">EventProperty</a> <small>[1859]</small>	Read only. Returns an <i>EventProperty</i> in the list, raising an error if <i>Index</i> is out of range. Parameters: <ul style="list-style-type: none"> <li>Index: Variant - can either be a number representing a zero-based index into the array, or a string representing the name of the <i>EventProperty</i>. For example, <i>Props.Get(3)</i> or <i>Props.Get("ObjectID")</i>.</li> </ul>

#### 18.2.2.4.6 EventProperty Class

*EventProperty* objects are always part of an **EventProperties** collection, and are passed to Add-In methods responding to **broadcast events**.

##### EventProperty Attributes

Attribute	Type	Notes
Description	String	Explanation of what this property represents.
Name	String	A string distinguishing this property from others in the list.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Distinguishes objects referenced through a Dispatch interface.
Value	Variant	A string, number or object reference representing the property value.

Learn More:

- [EventProperties Class](#) <sup>[1859]</sup>
- [Broadcast Events](#) <sup>[1998]</sup>

#### 18.2.2.4.7 ModelWatcher Class

The *ModelWatcher* object enables an automation client to track changes in a particular model.

##### ModelWatcher Attributes

Attribute	Type	Notes
ObjectType	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.

##### ModelWatcher Methods

Methods	Type	Notes
<b>GetReloadItem</b> (object Item)	<a href="#">ReloadType</a> <sup>[1852]</sup>	<p>The object that must be reloaded in order to see all changes is returned through the <i>Item</i> parameter. If there are no changes or the entire model must be reloaded, this value is returned as <b>null</b> (C#) or <b>Nothing</b> (VB).</p> <p>Calling this method clears the records so that the next time it is called the return values refer only to new changes. Returns a value from the <i>ReloadType</i> enumeration that specifies which type of change, if any, has occurred.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Item: Object</li> </ul>
<b>PeekReloadItem</b>	<a href="#">ReloadType</a> <sup>[1852]</sup>	This method behaves identically to <i>GetReloadItem()</i> but does not clear the change record.

##### Notes:

- After your model has been loaded, you only create the ModelWatcher once. If you **reload** the model, or load another model, the created ModelWatcher is still valid.

##### Learn More:

- [Refresh View of Shared Project](#) <sup>[183]</sup>

#### 18.2.2.4.8 Package Class

A *Package* object corresponds to a Package element in the Enterprise Architect Project Browser. It is accessed either through the *Repository Models* collection (a Model is a special form of Package) or through the Package *Packages* collection. Note that a Package has an Element object as an attribute; this corresponds to an Enterprise Architect Package element in the *t\_object* table and is used to associate additional information (such as scenarios and constraints) with the logical package. To set additional information for a package, reference the Element object directly. Also note that if you add a Package to a diagram, you should add an instance of the element (not the Package itself) to the *Diagram Object Class* for a diagram.

Associated table in .EAP file: *t\_package*

##### Package Attributes

Attribute	Type	Notes
Alias	String	Read only Alias
BatchLoad	Long	Read/Write Flag to indicate that the package is batch loaded during batch import from controlled packages <b>Not currently used</b>
BatchSave	Long	Read/Write Boolean value to indicate whether the package is included in the batch XML export list or not.
CodePath	String	Read/Write. The path to where associated source code is found. Not currently used.
Connectors	<a href="#">Collection</a> <small>[1856]</small>	Read only. Collection of connectors.
Created	Date	Read/Write. Date the package was created.
Diagrams	<a href="#">Collection</a> <small>[1856]</small>	Read only. A collection of diagrams contained in this package.
Element	<a href="#">Element</a> <small>[1892]</small>	Read only. The associated element object. Use to get/set common information such as Stereotype, Complexity, Alias, Author, Constraints, Tagged Values and Scenarios.
Elements	<a href="#">Collection</a> <small>[1856]</small>	Read only. A collection of elements that belong to this package.
Flags	String	Read/Write. Extended information about the package.
IsControlled	Boolean	Read/Write. Indicates if the package has been marked as <i>Controlled</i> .
IsModel	Boolean	Read only. Indicates if the package is a model or a package.
IsNamespace	Boolean	Read/Write. <b>True</b> is 'package is a Namespace root'. Use <b>0</b> and <b>1</b> to set <b>False</b> and <b>True</b> .
IsProtected	Boolean	Read/Write. Indicates if the package has been marked as <i>Protected</i> .
IsVersionControlled	Boolean	Read. Indicates whether or not this package is under version control.
LastLoadDate	Date	Read/Write. The date XML was last loaded for the package.
LastSaveDate	Date	Read/Write. The date XML was last saved from the package.
LogXML	Boolean	Read/Write. Indicates if XML export information is to be logged.
Modified	Date	Read/Write. Date the package was last modified.
Name	String	Read/Write. The name of the package.
Notes	String	Read/Write. Notes about this package.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
Owner	String	Read/Write. The package owner when using controlled packages.
PackageGUID	Variant	Read only. The global Package ID. Valid across models.
PackageID	Long	Read only. The local Package ID number. Valid only in this model file.
Packages	<a href="#">Collection</a> [1856]	Read only. A collection of contained packages that can be walked through.
ParentID	Long	Read/Write. The ID of the package that is the parent of this one. 0 indicates this package is a <i>model</i> (that is, it has no parent).
TreePos	Long	Read/Write. The relative position in the tree compared to other packages (use to sort packages).
UMLVersion	String	Read/Write. The UML version for XML export purposes.
UseDTD	Boolean	Read/Write. Indicates if a DTD is to be used when exporting XML.
Version	String	Read/Write. The version of the package.
XMLPath	String	Read/Write. The path to where the XML is saved when using controlled packages.

#### Package Methods

Method	Type	Notes
ApplyGroupLock (string aGroupName)	Boolean	Applies a group lock to the package object, for the specified group, on behalf of the current user.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.  Parameter: <ul style="list-style-type: none"> <li>aGroupName: String - The name of the security group for which to apply the lock.</li> </ul>
ApplyUserLock ()	Boolean	Applies a user lock to the package object for the current user.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.
Clone	LDISPATCH	Inserts a copy of the package into the same parent as the original package.  Returns the newly-created package.
FindObject (string DottedID)	LPDISPATCH H	Returns a package, element, attribute or operation matching the parameter <i>DottedID</i> . If the <i>DottedID</i> is not found, an error is returned: <i>Can't find matching object</i> .  Parameter: <ul style="list-style-type: none"> <li>DottedID: String - Is in the form <i>object.object.object</i> where <i>object</i> is replaced by the name of a package, element attribute or operation. Examples include</li> </ul>

Method	Type	Notes
		MyNamespace.Class1, CStudent.m_Name, MathClass.DoubleIt(int).
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	Removes an existing User or Group lock from the package object.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.
<b>Update ()</b>	<i>Boolean</i>	Update the current package object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.  Note that a package object also has an <i>element</i> component that must be taken into account. The package object contains information about the package attributes such as hierarchy or contents. The element attribute contains information about, for example, Stereotype, Constraints or Files - all the attributes of a typical element.
<b>VersionControlAdd (string ConfigGuid, string XMLFile, string Comment, boolean KeepCheckedOut)</b>	<i>Void</i>	Places the package under version control, using the specified Version Control Configuration and the specified XML filename.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.  It is recommended that the package be saved using <i>Update()</i> before calling <i>VersionControlAdd()</i> , so that any outstanding changes are not lost.  Parameters: <ul style="list-style-type: none"> <li>• ConfigGuid: String - Name corresponding to the Unique ID of the version control configuration to use.</li> <li>• XMLFile: String - Name of the XML file to use for this package. This filename is relative to the Working Copy folder specified for the Config.</li> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable).</li> <li>• KeepCheckedOut: Boolean - Specify <b>True</b> to add to version control and keep package checked-out.</li> </ul>
<b>VersionControlCheckin (string Comment)</b>	<i>Void</i>	Perform checkin of the version controlled package (also see <i>VersionControlCheckinEx</i> , below)  Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information  Parameters: <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> </ul>
<b>VersionControlCheckinEx (string Comment, boolean PreserveCrossPkgRefs)</b>	<i>Void</i>	Perform checkin of the version controlled package  Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information.

Method	Type	Notes
		<p>Parameters:</p> <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> <li>• PreserveCrossPkgRefs: Boolean - Flag to indicate whether to preserve or discard pre-existing Cross Package References when checking-in; this parameter overrides the setting in the Options dialog, XML Specifications page</li> </ul> <p>Unsatisfied cross package references are preserved or discarded according to this setting, without prompting the user; see <b>Learn More</b> below</p>
<b>VersionControlCheckout</b> (string Comment)	Void	<p>Perform checkout of the version controlled package</p> <p>Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Comment: String - Log message that is added to the version controlled file's history (where applicable)</li> </ul> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke the <b>Repository.ScanXMIAndReconcile()</b> method from time to time, following the re-importation of controlled packages - for example, after using <b>Package.VersionControlGetLatest()</b> to update a number of packages, or after performing a number of package check-outs</p>
<b>VersionControlGetLatest</b> (boolean ForceImport)	Void	<p>Updates the local working copy of the package file associated with the object package, before re-importing the package data from the package file</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ForceImport: Boolean - Used if the package data in the model is found to be up-to-date with respect to the version controlled package file; if: <ul style="list-style-type: none"> <li>• <b>False</b>, the package data that exists in the model is accepted as being up-to-date and no attempt is made to re-import data from the package file</li> <li>• <b>True</b>, Enterprise Architect re-imports the package from the package file regardless</li> </ul> </li> </ul> <p>See also the version control menu option <b>Get Latest</b></p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke the <b>Repository.ScanXMIAndReconcile()</b> method from time to time, following the re-importation of controlled packages - for example, after using <b>Package.VersionControlGetLatest()</b> to update a number of packages, or after performing a number of package check-outs</p>
<b>VersionControlGetStatus ()</b>	Long	<p>Returns the version control status of the package, as recorded in the current Enterprise Architect project database</p> <p>Throws an exception if the operation fails; use <i>GetLastError()</i></p>

Method	Type	Notes
		<p>to retrieve error information</p> <p>Return value maps to the following enumerated type:</p> <pre>enum EnumCheckOutStatus {     csUncontrolled = 0,     csCheckedIn,     csCheckedOutToThisUser,     csReadOnlyVersion,     csCheckedOutToAnotherUser,     csOfflineCheckedIn,     csCheckedOutOfflineByUser,     csCheckedOutOfflineByOther,     csDeleted, };</pre> <p><i>csUncontrolled</i> - Either unable to communicate with the version control provider associated with the package or the package file is unknown to the provider</p> <p><i>csCheckedIn</i> - The package is not checked-out to anybody in the current project database</p> <p><i>csCheckedOutToThisUser</i> - The package is marked as checked-out to the current user, in the current project database</p> <p><i>csReadOnlyVersion</i> - Package is marked as read-only; an earlier revision of the package has been retrieved from version control</p> <p><i>csCheckedOutToAnotherUser</i> - The package is marked as checked-out in the current project database, by a user other than the current user</p> <p><i>csOfflineCheckedIn</i> - The package is not checked-out to anybody in the current project database; however, the version control configuration associated with the package was unable to connect to the VC server</p> <p><i>csCheckedOutOfflineByUser</i> - Indicates that the package was 'checked out' in this database, by this user, whilst disconnected from version control</p> <p><i>csCheckedOutOfflineByOther</i> - Indicates that the package was checked out in this project database, by another user, whilst disconnected from version control</p> <p><i>csDeleted</i> - The package file has been deleted from version control</p>
<b>VersionControlPutLatest (string CheckInComment)</b>	Void	<p>Perform a checkin of the version controlled package, whilst keeping the package checked-out.</p> <p>Throws an exception if the operation fails. Use <i>GetLastError</i> () to retrieve error information.</p> <p>When a package that was previously marked as <i>Checked Out Offline</i>, is successfully 'Put' (checkedin) to version control, that package's flags are updated to clear the <i>Checked Out Offline</i> indicator.</p> <p>Parameters:</p>

Method	Type	Notes
		<ul style="list-style-type: none"> <li>Comment: String - Log message added to the version controlled file's history (where applicable).</li> </ul>
<b>VersionControlRemove ()</b>	<i>Void</i>	<p>Removes version control from the package.</p> <p>Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.</p>
<b>VersionControlResynchPackageStatus (boolean ClearSettings)</b>		<p><b>Synchronizes</b> the version control status of the single object package recorded in your current model with the package status reported by your version control provider.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ClearSettings: Boolean - used if the package file associated with the specified package is reported by the version control provider as uncontrolled. If ClearSettings is: <ul style="list-style-type: none"> <li><b>True</b>, the version control settings are cleared from the package</li> <li><b>False</b>, the version control settings remain unchanged</li> </ul> </li> </ul>

**18.2.2.4.9 ProjectIssues Class**

A system-level Issue. Indicates a problem or risk associated with the system as a whole. Accessed using the Repository *Issues* collection.

Associated table in .EAP file: *t\_issues*

**ProjectIssues Attributes**

Attribute	Type	Notes
<b>Category</b>	<i>String</i>	Read/Write. The category this issue belongs to.
<b>Date</b>	<i>Date</i>	Read/Write. Date created.
<b>DateResolved</b>	<i>Date</i>	Read/Write. Date issue resolved.
<b>Name</b>	<i>String</i>	Read/Write. Issue name (that is, the issue itself).
<b>IssueID</b>	<i>Long</i>	Read only. The ID of this issue.
<b>Notes</b>	<i>String</i>	Read/Write. Associated description of issue.
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Owner</b>	<i>String</i>	Read/Write. Owner of issue.

Attribute	Type	Notes
Priority	String	Read/Write. Issue priority. Generally should use Low, Medium or High.
Resolution	String	Read/Write. Description of resolution.
Resolver	String	Read/Write. Person resolving issue.
Severity	String	Read/Write. Issue severity. Should be marked as Low, Medium or High.
Status	String	Read/Write. Current issue status.

#### ProjectIssues Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.4.10 ProjectResource Class

A *Project Resource* is a named person who is available to work on the current project in any capacity. Accessed using the Repository *Resources* collection.

Associated table in .EAP file: *t\_resources*

#### ProjectResource Attributes

Attribute	Type	Notes
Email	String	Email address.
Fax	String	Fax number.
Mobile	Variant	Mobile number if available.
Name	String	Name of resource.
Notes	String	A description if appropriate.
ObjectType	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.
Organization	<a href="#">Package</a> <sup>[1860]</sup> : String	Organization resource associated with.
Phone1	Variant	Main phone.
Phone2	Variant	Alternative phone.
Roles	String	The roles this resource can play in the current project.

ProjectResource Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Resource object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.4.11 ProjectRole Class**

A *ProjectRole* object represents a named project role. Accessed using the Repository *ProjectRole* collection.

Associated table in .EAP file: *t\_projectroles*

ProjectRole Attributes

Attribute	Type	Notes
<b>Description</b>	<i>String</i>	Read/Write. The project role item description.
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the project role item.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Role</b>	<i>String</i>	Read/Write. The project role item name.

ProjectRole Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Updates the current ProjectRole object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.4.12 PropertyType Class**

A *PropertyType* object represents a defined property that can be applied to UML elements as a Tagged Value. Accessed using the Repository *PropertyTypes* collection. Each *PropertyType* corresponds to one of the predefined Tagged Values for the model.

Associated table in .EAP file: *t\_propertytypes*

Author Attributes

Attribute	Type	Notes
Description	String	Read/Write. Short description for the property.
Detail	String	Read/Write. Configuration information for the property.
ObjectType	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.
Tag	String	Read/Write. Name of the property (Tag Name).

Author Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current <i>PropertyType</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.4.13 Reference Class**

This Interface provides access to the various lookup tables within Enterprise Architect. Use the Repository *GetReferenceList()* method to get a handle to a list. Valid lists are:

- Diagram
- Element
- Constraint
- Requirement
- Connector
- Status
- Cardinality
- Effort
- Metric
- Scenario
- Status
- Test

Reference Attributes

Attribute	Type	Notes
Count	Short	Count of items in the list.
ObjectType	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
Type	String	The list type (for example, DiagramTypes).

#### Reference Methods

Method	Type	Notes
GetAt (short Index)	String	Get the item at the specified index. Parameters: <ul style="list-style-type: none"> <li>Index: Short - The index of the item to retrieve from the list.</li> </ul>
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Refresh ()	Short	Refresh the current list and return the count of items.

#### 18.2.2.4.14 Repository Class

The *Repository* is the main container of all structures such as models, packages and elements. You can iteratively begin accessing the model using the *Models* collection. It also has some convenient methods to directly access the structures without having to locate them in the hierarchy first.

Associated table in .EAP file: <none>

#### Repository Attributes:

Attribute	Type	Notes	See Also
Authors	<a href="#">Collection</a> <small>[1856]</small>	Read only. The system <i>Authors</i> collection. Contains 0 or more <i>Author objects</i> , each of which can be associated with, for example, elements or diagrams as the item author or owner. Use <i>AddNew</i> , <i>Delete</i> and <i>GetAt</i> to manage Authors.	
BatchAppend	Boolean	Read/Write. Set this property to <b>true</b> when your automation client has to rapidly insert many elements, operations, attributes and/or operation parameters. Set to <b>false</b> when work is complete.  This can result in 10- to 20-fold improvement in adding new elements in bulk.	
Clients	<a href="#">Collection</a> <small>[1856]</small>	Read only. A list of <i>Clients</i> associated with the project. You can modify, delete and add new <i>Client objects</i> using this collection.	
ConnectionString	String	Read only. The filename/connection string of the current Repository.	
Datatypes	<a href="#">Collection</a> <small>[1856]</small>	Read only. The <i>Datatypes</i> collection. Contains a list of <i>Datatype objects</i> , each representing a data type definition for either data modeling or code generation	

Attribute	Type	Notes	See Also
		purposes.	
<b>EAEdition</b>	<a href="#">EAEdition Types</a> <sup>[1848]</sup>	Read only. Returns the current level of core licensed functionality available  This property returns <b>Corporate</b> when the edition is <i>Business and Software Engineering</i> , <i>Systems Engineering</i> or <i>Ultimate</i> . Use <b>EAEditionEx</b> to identify which of these extended editions is available.	
<b>EAEditionEx</b>	<a href="#">EAEdition Types</a> <sup>[1848]</sup>	Read only. Returns the current level of extended licensed functionality available	
<b>EnableCache</b>	<i>Boolean</i>	Read/Write. An optimization for pre-loading package objects when dealing with large sets of automation objects.	
<b>EnableUIUpdates</b>	<i>Boolean</i>	Read/Write. Set this property to <b>false</b> to improve the performance of changes to the model; for example, bulk addition of elements to a package. To reveal the changes to the user, call <i>Repository.RefreshModelView()</i> .	
<b>FlagUpdate</b>	<i>Boolean</i>	Read/Write. Instructs Enterprise Architect to update the Repository with the <i>LastUpdate</i> value.	
<b>InstanceGUID</b>	<i>String</i>	Read only. The identifier string identifying the Enterprise Architect runtime session.	
<b>IsSecurityEnabled</b>	<i>Boolean</i>	Read only. Checks whether User Security is enabled for the current repository.	
<b>Issues</b>	<a href="#">Collection</a> <sup>[1856]</sup>	Read only. The <i>System Issues</i> list. Contains <i>ProjectIssues</i> objects, each detailing a particular issue as it relates to the project as a whole.	
<b>LastUpdate</b>	<i>String</i>	Read only. The identifier string identifying the Enterprise Architect runtime session and the timestamp for when it was set.	
<b>LibraryVersion</b>	<i>Long</i>	Read only. The build number of the Enterprise Architect runtime.	
<b>Models</b>	<a href="#">Collection</a> <sup>[1856]</sup> of type <a href="#">Package</a> <sup>[1860]</sup>	Read only. <i>Models</i> are of type <i>package</i> and belong to a collection of packages. This is the top level entry point to an Enterprise Architect project file. Each model is a <i>root node</i> in the <b>Project Browser</b> and can contain items such as Views and packages.  A model is a special form of a package; it has a <i>ParentID</i> of <b>0</b> . By iterating through all models, you can access all the elements within the project hierarchy.  You can also use the <i>AddNew</i> function to create a new model. A model can be deleted, but remember that everything contained in the model is deleted as well.	
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through the Dispatch interface.	
<b>ProjectGUID</b>	<i>String</i>	Read only. Returns a unique ID for the project.	

Attribute	Type	Notes	See Also
<b>ProjectRoles</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. The system Roles collection. Contains <b>0</b> or more Role objects, each of which can be associated with, for example, elements or diagrams as the item author or owner. Use <i>AddNew</i> , <i>Delete</i> and <i>GetAt</i> to manage Roles	
<b>PropertyTypes</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. Collection of <b>Property Types</b> available to the Repository.	<a href="#">Property Type Class</a> <small>[1868]</small>
<b>Resources</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. Contains available <i>ProjectResource</i> objects to assign to work items within the project. Use the <b>add new</b> , <b>modify</b> and <b>delete</b> functions to manage resources.	
<b>Stereotypes</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. The <b>Stereotype</b> collection. A list of <i>Stereotype objects</i> that contain information on a stereotype and which elements it can be applied to.	<a href="#">Stereotype Class</a> <small>[1886]</small>
<b>SuppressEADialogs</b>	<i>Boolean</i>	Read/Write. Set this property in the <b>EA_OnPostNewElement</b> or <b>EA_OnPostNewConnector</b> broadcast events to control whether Enterprise Architect should suppress showing the default <b>Properties</b> dialogs to the user when an element or connector is created.	<a href="#">EA_OnPostNewElement</a> <small>[2026]</small> <a href="#">EA_OnPostNewConnector</a> <small>[2026]</small>
<b>Tasks</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. A list of system tasks (to do list). Each entry is a <b>Task</b> Item; you can modify, delete and add new tasks.	<a href="#">Task Class</a> <small>[1887]</small>
<b>Terms</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. The project <i>Glossary</i> . Each <b>Term</b> object is an entry in the Glossary. Add, modify and delete Terms to maintain the Glossary.	<a href="#">Term Class</a> <small>[1888]</small>

**Repository Methods:**

Method	Type	Notes	See Also
<b>ActivateDiagram (Long DiagramID)</b>		Activates an already open diagram (that is, makes it the active tab) in the main Enterprise Architect user interface.  Parameters: <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to make active.</li> </ul>	
<b>ActivatePerspective (string, long)</b>	<i>Boolean</i>	<b>Deprecated</b> - no longer in use.	
<b>ActivateTab (string Name)</b>		Activates an open Enterprise Architect tabbed view.  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the view to activate.</li> </ul>	
<b>ActivateTechnology (string Name)</b>		Activates an enabled MDG Technology  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the Technology to</li> </ul>	

Method	Type	Notes	See Also
		activate	
<b>ActivateToolbox (string Toolbox, long Options)</b>	<i>Boolean</i>	<p>Activates a Toolbox page in the GUI</p> <p>Returns <b>true</b> if the specified Toolbox page is successfully activated, otherwise returns <b>false</b></p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Toolbox: String - the name of the Toolbox page to activate</li> <li>• Options: Long - reserved for future use</li> </ul>	
<b>AddDefinedSearches (string sXML)</b>		<p>Enables you to enter a set of defined searches that last in Enterprise Architect for the life of the application; when Enterprise Architect loads again they must be inserted again by your Add-In</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• sXML: String - the XML of the defined searches; you can get this XML by performing an <i>export</i> of the searches from the Manage Searches dialog in Enterprise Architect</li> </ul>	<a href="#">Create and Manage Searches</a> [484]
<b>AddPerspective (string Perspective, long Options)</b>	<i>Boolean</i>	<b>Deprecated</b> - no longer in use	
<b>AddTab (string TabName, string ControlID)</b>	<i>activeX custom control</i>	<p>Adds an ActiveX custom control as a tabbed window. Enterprise Architect creates a control and, if successful, returns its Unknown pointer, which can be used by the caller to manipulate the control.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• TabName: String - used as the tab caption</li> <li>• ControlID: String - the ProgID of the control; for example, Project1, UserControl1</li> </ul>	
<b>AddWindow (string WindowName, string ControlID)</b>	<i>activeX custom control</i>	<p>Adds an ActiveX custom control as a window to the Add-Ins docked window. Enterprise Architect creates a control and, if successful, returns its Unknown pointer, which can be used by the caller to manipulate the control.</p> <p>The window can be shown by selecting it from the list in the Workspace Layouts toolbar - click on the third icon from the right and look at the end of the list.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• WindowName: String - used as the window title</li> <li>• ControlID: String - the ProgID of the control; for example, Project1, UserControl1</li> </ul>	<a href="#">Workspace Layouts</a> [116]
<b>AdviseConnectorChange (long ConnectorID)</b>		<p>Provides an Add-In or automation client with the ability to advise the Enterprise Architect user interface that a particular connector has changed and, if it is visible in any open diagram, to reload and refresh that connector for the user.</p> <p>Parameters:</p>	

Method	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>ConnectorID: Long - the ID of the connector.</li> </ul>	
<b>AdviseElementChange (long ObjectID)</b>		<p>Provides an Add-In or automation client with the ability to advise the Enterprise Architect user interface that a particular element has changed and, if it is visible in any open diagram, to reload and refresh that element for the user.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ObjectID: Long - the ID of the element.</li> </ul>	
<b>ChangeLoginUser (string Name, string Password)</b>	<i>Boolean</i>	<p>Sets the currently logged on user to be that specified by a name and password; this logs the user into the repository when security is enabled</p> <p>If security is not enabled an exception (<i>Security not enabled</i>) is thrown</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the name of the user</li> <li>Password: String - the password of the user</li> </ul>	
<b>ClearAuditLogs (Object StartDateTime, Object EndDateTime)</b>	<i>Boolean</i>	<p>Clears all Audit Logs from the model</p> <p>If <i>StartDateTime</i> and <i>EndDateTime</i> are not null then only log items that fall into this period are cleared</p> <p>Returns <b>true</b> for success, <b>false</b> for failure</p> <ul style="list-style-type: none"> <li>This method cannot be undone. It is strongly advised that you call <i>SaveAuditLogs</i> first to backup the logs</li> <li>This method might fail if the user logged into the model does not have the correct access permission</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>StartDateTime: Variant ( DateTime ) - the earliest date and time of log entries to clear.</li> <li>EndDateTime; Variant ( DateTime ) - the latest date and time of log entries to clear.</li> </ul>	
<b>ClearOutput (string Name)</b>		<p>Removes all the text from a tab in the Output window</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the name of the tab to remove text from</li> </ul>	<a href="#">CreateOutputTab</a> <small>[1875]</small> <a href="#">EnsureOutputVisible</a> <small>[1875]</small> <a href="#">WriteOutput</a> <small>[1886]</small>
<b>CloseAddins ()</b>		<p>Called by automation controllers to ensure that Add-Ins created in .NET do not linger after all controller references to Enterprise Architect have been cleared</p>	
<b>CloseDiagram (long DiagramID)</b>		<p>Closes a diagram in the current list of diagrams that Enterprise Architect has open</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to close</li> </ul>	
<b>CloseFile ()</b>		<p>Closes any open file</p>	

Method	Type	Notes	See Also
CreateDocumentGenerator()	<a href="#">DocumentGenerator</a> <sup>[1962]</sup>	Returns a pointer to the <i>EA.DocumentGenerator</i> interface	
CreateModel (CreateModelType CreateType, string FilePath, long ParentWnd)	Boolean	Creates a new .eap model file based on the standard Enterprise Architect Base model, or a shortcut .eap based on a provided SQL connection  Returns <b>true</b> when the new file is created, otherwise returns <b>false</b>  Parameters: <ul style="list-style-type: none"> <li>CreateType: CreateModelType - Specify whether to make a new copy of the EABase. eap model, or create a .eap file shortcut to a DBMS repository. The latter option requires a dialog to be opened for the user to provide SQL connection details.</li> <li>FilePath: String - Destination for new .eap file</li> <li>ParentWnd: Long - Window handle to act as the parent for the SQL connection dialog; only required when using <i>cmEAPFromSQLRepository</i>.</li> </ul>	<a href="#">CreateModelType</a> <sup>[1847]</sup>
CreateOutputTab (string Name)		Creates a tab in the <b>Output</b> window.  Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the tab to create.</li> </ul>	<a href="#">CreateOutputTab</a> <sup>[1875]</sup> <a href="#">EnsureOutputVisible</a> <sup>[1875]</sup> <a href="#">WriteOutput</a> <sup>[1886]</sup>
DeletePerspective (string Perspective, long Options)	Boolean	<b>Deprecated</b> - no longer in use	
DeleteTechnology (string ID)	Boolean	Removes a specified MDG Technology resource from the repository.  Returns <b>true</b> , if the technology is successfully removed from the model. Returns <b>false</b> otherwise. <ul style="list-style-type: none"> <li>This applies to technologies imported into pre-7.0 versions of Enterprise Architect (imported technologies), not to technologies referenced in version 7.0 and later (referenced technologies).</li> </ul> <b>Parameters:</b> <ul style="list-style-type: none"> <li>ID: String - the ID of the technology.</li> </ul>	<a href="#">Deploy an MDG Technology</a> <sup>[1097]</sup>
EnsureOutputVisible (string Name)		Ensures that a specified tab in the <b>Output</b> window is visible to the user. The <b>Output</b> window is made visible if it is hidden.  <b>Parameters:</b> <ul style="list-style-type: none"> <li>Name: String - the name of the tab to make visible.</li> </ul>	<a href="#">CreateOutputTab</a> <sup>[1875]</sup> <a href="#">EnsureOutputVisible</a> <sup>[1875]</sup> <a href="#">WriteOutput</a> <sup>[1886]</sup>
ExecutePackageB		Enables you to run the active package build script	

Method	Type	Notes	See Also
<b>uildScript (long ScriptOptions, string PackageGuid)</b>		based on your current selection in the <b>Project Browser</b> . You can also run a script by passing in the package GUID.  Parameters: <ul style="list-style-type: none"> <li>ScriptOptions: Long - the script type; can be any one of these numerical values: <ul style="list-style-type: none"> <li>1 = Build</li> <li>2 = Test</li> <li>3 = Run</li> <li>4 = Create Workbench Instance</li> <li>5 = Debug.</li> </ul> </li> <li>PackageGuid: String - the ID of the package for which to run the script.</li> </ul>	
<b>Exit</b>		Shuts down Enterprise Architect immediately. Used by .NET programmers where the garbage collector does not immediately release all referenced COM objects.	
<b>GetActivePerspective ()</b>	<i>String</i>	<b>Deprecated</b> - no longer in use.	
<b>GetAttributeByGuid (string Guid)</b>	<a href="#">Attribute</a> <small>1913</small>	Returns a pointer to an attribute in the repository, located by its GUID. This is usually found using the <i>AttributeGUID</i> property of an attribute.  Parameters: <ul style="list-style-type: none"> <li>Guid: String - the GUID of the attribute to locate.</li> </ul>	
<b>GetAttributeByID (string Id)</b>	<a href="#">Attribute</a> <small>1913</small>	Returns a pointer to an attribute in the repository, located by its ID. This is usually found using the <i>AttributeID</i> property of an attribute.  Parameters: <ul style="list-style-type: none"> <li>Id: String - the ID of the attribute to locate.</li> </ul>	
<b>GetConnectorByGuid (string Guid)</b>	<a href="#">Connector</a> <small>1926</small>	Returns a pointer to a connector in the repository, located by its GUID. This is usually found using the <i>ConnectorGUID</i> property of a connector.  Parameters: <ul style="list-style-type: none"> <li>Guid: String - the GUID of the connector to locate.</li> </ul>	
<b>GetConnectorByID (long ConnectorID)</b>	<a href="#">Connector</a> <small>1926</small>	Searches the repository for a connector with a specific ID.  Parameters: <ul style="list-style-type: none"> <li>ConnectorID: Long - the ID of the connector to locate.</li> </ul>	
<b>GetContextItem (object Item)</b>	<a href="#">ObjectTypes</a> <small>1850</small>	Sets a pointer to an item in context within Enterprise Architect.  Also returns the corresponding <i>ObjectType</i> .  For additional information about <i>ContextItems</i> and the supported <i>ObjectTypes</i> see the	

Method	Type	Notes	See Also
		<p><b>GetContextItemType</b> method (below).</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Item: Object - the item to point to.</li> </ul>	
<b>GetContextItemType ()</b>	<a href="#">ObjectType</a> <small>[1850]</small>	<p>Returns the <i>ObjectType</i> of an item in context within Enterprise Architect. A <i>ContextItem</i> is defined as an item selected anywhere within the Enterprise Architect GUI including:</p> <ul style="list-style-type: none"> <li>An item selected in the <b>Project Browser</b></li> <li>An item selected in an open diagram</li> <li>An item selected in certain dialogs, such as the attribute <b>Properties</b> dialog.</li> </ul> <p>The supported <i>ObjectTypes</i> can be any one of the following values:</p> <ul style="list-style-type: none"> <li><i>otElement</i></li> <li><i>otPackage</i></li> <li><i>otDiagram</i></li> <li><i>otAttribute</i></li> <li><i>otMethod</i></li> <li><i>otConnector</i></li> </ul>	
<b>GetCurrentContextObject ()</b>	<i>Object</i>	Returns the current context Object.	
<b>GetCounts ()</b>	<i>String</i>	Returns a set of counts from a number of tables within the base Enterprise Architect repository. These can be used to determine whether records have been added or deleted from the tables for which information is retrieved.	
<b>GetCurrentDiagram ()</b>	<a href="#">Diagram</a> <small>[1936]</small>	Returns a selected diagram.	
<b>GetCurrentLoginUser (boolean GetGuid = false)</b>	<i>String</i>	<p>If security is not enabled in the repository, an error is generated.</p> <p>If <i>GetGuid</i> is <b>True</b>, a GUID generated by Enterprise Architect representing the user is returned; otherwise the text as entered in <i>System Users/User Details/Login</i> is returned.</p>	
<b>GetDiagramByGuid (string Guid)</b>	<a href="#">Diagram</a> <small>[1936]</small>	<p>Returns a pointer to a diagram using the global reference ID (global ID). This is usually found using the diagram <i>GUID</i> property of an element, and stored for later use to open an diagram without using the collection <i>GetAt()</i> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Guid: String - the GUID of the diagram to locate.</li> </ul>	
<b>GetDiagramByID (long DiagramID)</b>	<a href="#">Diagram</a> <small>[1936]</small>	<p>Gets a pointer to a diagram using an absolute reference number (local ID). This is usually found using the <i>DiagramID</i> property of an element, and stored for later use to open a diagram without using the collection <i>GetAt()</i> function.</p> <p>Parameters:</p>	

Method	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to locate.</li> </ul>	
<b>GetElementByGuid</b> (string Guid)	<a href="#">Element</a> <small>[1892]</small>	<p>Returns a pointer to an element in the repository, using the element's GUID reference number (global ID). This is usually found using the <i>ElementGUID</i> property of an element, and stored for later use to open an element without using the collection <i>GetAt()</i> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Guid: String - the GUID of the element to locate.</li> </ul>	
<b>GetElementByID</b> (long ElementID)	<a href="#">Element</a> <small>[1892]</small>	<p>Gets a pointer to an element using an absolute reference number (local ID). This is usually found using the <i>ElementID</i> property of an element, and stored for later use to open an element without using the collection <i>GetAt()</i> function.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>ElementID: Long - the ID of the element to locate.</li> </ul>	
<b>GetElementsByQuery</b> (string QueryName, string SearchTerm)		<p>Enables the user to run a search in Enterprise Architect, returning the result as a collection.</p> <p>For example <i>GetElementsByQuery</i> ('Simple','Class1'), where results contain elements with <i>Class1</i> in the <b>Name</b> and <b>Notes</b> fields.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>QueryName: String - the name of the search to run, for example 'Simple'.</li> <li>SearchTerm: String - the term to search for.</li> </ul>	
<b>GetElementSet</b> (string IDList, long Options)	<a href="#">Collection</a> <small>[1856]</small>	<p>Returns a set of elements as a collection based on a comma-separated list of <i>ElementID</i> values. By default, if no values are provided in the IDList parameter, all objects for the entire project are returned.</p> <p>Parameters</p> <ul style="list-style-type: none"> <li>IDList: String - a comma-separated list of <i>ElementID</i> values</li> <li>Options: Long - modifies default behaviour of this method <ul style="list-style-type: none"> <li>1 - Returns empty collection when empty IDList parameter is given</li> <li>2 - Use IDList string as an SQL query to populate this collection</li> </ul> </li> </ul>	
<b>GetFieldFromFormat</b> (string Format, string Text)	String	<p>Converts a field from your preferred format to Enterprise Architect's internal format; returns the field in Enterprise Architect's internal format</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Format: String - The format to convert the field from; valid formats are: <ul style="list-style-type: none"> <li>HTML - Full HTML</li> <li>RTF - Rich Text Format</li> </ul> </li> </ul>	

Method	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>• TXT - Plain text</li> <li>• Text: String - The field to be converted</li> </ul>	
<b>GetFormatFromField (string Format, string Text)</b>	<i>String</i>	<p>After accessing a field that contains formatting, use this method to convert it to your preferred format; returns the field in the format specified</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Format: String - The format to convert the field to; valid formats are: <ul style="list-style-type: none"> <li>• HTML - Full HTML</li> <li>• RTF - Rich Text Format</li> <li>• TXT - Plain text</li> </ul> </li> <li>• Text: String - The field to be converted</li> </ul>	
<b>GetLastError ()</b>	<i>String</i>	<p>Returns a string value describing the most recent error that occurred in relation to this object</p> <p>This function is rarely used as an exception is thrown when an error occurs</p>	
<b>GetMailInterface()</b>	<i>MailInterface</i>	Returns an instance of the <i>EA.MailInterface</i> ; use this interface to automate the process of creating and sending model mail messages	<a href="#">MailInterface Package</a> <small>[1965]</small>
<b>GetMethodByGuid (string Guid)</b>	<a href="#">Method</a> <small>[1918]</small>	<p>Returns a pointer to a method in the repository; this is usually found using the <i>MethodGUID</i> property of a method</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Guid: String - the GUID of the method to look for</li> </ul>	
<b>GetMethodById (string Id)</b>	<a href="#">Method</a> <small>[1918]</small>	<p>Returns a pointer to a method in the repository; this is usually found using the <i>MethodID</i> property of a method</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Id: String - the ID of the method to look for</li> </ul>	
<b>GetPackageByGuid (string Guid)</b>	<a href="#">Package</a> <small>[1860]</small>	<p>Returns a pointer to a package in the repository using the package's GUID reference number (global ID). This is usually found using the <i>PackageGUID</i> property of the package.</p> <p>Each package in the model also has an associated element with the same GUID, so if you have an element with <i>Type="Package"</i> then you can load the package by calling:</p> <p><i>GetPackageByGuid(Element.ElementGUID)</i></p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• Guid: String - the GUID of the package to look for</li> </ul>	
<b>GetPackageById (long PackageID)</b>	<a href="#">Package</a> <small>[1860]</small>	<p>Get a pointer to a package using an absolute reference number (local ID). This is usually found using the <i>PackageID</i> property of an package, and stored for later use to open a package without using the collection <i>GetAt()</i> function.</p>	

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>PackageID: Long - the ID of the package to locate</li> </ul>	
<b>GetProjectInterface ()</b>	<a href="#">Project</a> <sup>[1944]</sup>	Return a pointer to the <b>EA.Project interface</b> (the XML-based automation server for Enterprise Architect). Use this interface to work with Enterprise Architect using XML, and also to access utility functions for loading diagrams, running reports and so on.	<a href="#">EA.Project interface</a> <sup>[1944]</sup>
<b>GetReferenceList (string Type)</b>	<a href="#">Reference</a> <sup>[1869]</sup>	Uses the list type to get a pointer to a <i>Reference List</i> object.  Parameters: <ul style="list-style-type: none"> <li>Type: String - specifies the list type to get; valid list types are: <p style="margin-left: 20px;"><i>Diagram</i> <i>Element</i> <i>Constraint</i> <i>Requirement</i> <i>Connector</i> <i>Status</i> <i>Cardinality</i> <i>Effort</i> <i>Metric</i> <i>Scenario</i> <i>Status and</i> <i>Test.</i></p> </li> </ul>	
<b>GetTechnologyVersion (string ID)</b>	String	Returns the version of a specified MDG Technology resource.  Parameters: <ul style="list-style-type: none"> <li>ID: String - the specified technology ID.</li> </ul>	
<b>GetTreeSelectedElements ()</b>	<a href="#">Collection</a> <sup>[1856]</sup>	Returns the set of elements currently selected in the <b>Project Browser</b> as a collection.	
<b>GetTreeSelectedItem (object SelectedItem)</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Gets an object variable and type corresponding to the currently selected item in the tree view.  To use this function, create a generic object variable and pass this as the parameter. Depending on the return type, cast it to a more specific type.  The object passed back through the parameter can be a package, element, diagram, attribute or operation object.  Parameters: <ul style="list-style-type: none"> <li>SelectedItem: Object - the object to get the variable and type for.</li> </ul>	
<b>GetTreeSelectedItemType ()</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Returns the type of the object currently selected in the tree. One of: <ul style="list-style-type: none"> <li><i>otDiagram</i></li> <li><i>otElement</i></li> <li><i>otPackage</i></li> </ul>	

Method	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>• <i>otAttribute</i></li> <li>• <i>otMethod</i>.</li> </ul>	
<b>GetTreeSelectedObject ()</b>	<i>Object</i>	The related method <b>GetTreeSelectedItem()</b> has an output parameter that is inaccessible by some scripting languages. As an alternative, this method provides the selected item through the return value.	<a href="#">GetTreeSelectedItem</a> <sup>[1880]</sup>
<b>GetTreeSelectedPackage ()</b>	<a href="#">Package</a> <sup>[1860]</sup>	Returns the package in which the currently selected tree view object is contained.	
<b>HasPerspective (string Perspective)</b>	<i>String</i>	<b>Deprecated</b> - no longer in use.	
<b>ImportPackageBuildScripts (string PackageGuid, string BuildScriptXML)</b>		Imports build scripts into a package in Enterprise Architect. Parameters: <ul style="list-style-type: none"> <li>• PackageGuid: String - the GUID of the package into which to import the build scripts.</li> <li>• BuildScriptXML: String - the build script XML data, which you can export from within Enterprise Architect.</li> </ul>	
<b>ImportTechnology (string Technology)</b>	<i>Boolean</i>	Installs a given MDG Technology resource into the repository.  Returns <b>True</b> , if the technology is successfully loaded into the model. Otherwise returns <b>False</b> .  This applies to technologies imported into pre-7.0 versions of Enterprise Architect (imported technologies), not to technologies referenced in version 7.0 and later (referenced technologies).  <b>Parameters:</b> <ul style="list-style-type: none"> <li>• Technology: String - the contents of the technology resource file.</li> </ul>	<a href="#">Deploy an MDG Technology</a> <sup>[1091]</sup>
<b>IsTabOpen (string TabName)</b>	<i>String</i>	Checks whether a named Enterprise Architect tabbed view is open and active. This includes open diagram windows or custom controls added using <b>Repository.AddTab()</b> .  Returns: <ul style="list-style-type: none"> <li>• <b>2</b> to indicate that a tab is open and active (top-most)</li> <li>• <b>1</b> to indicate that it is open but not top-most, or</li> <li>• <b>0</b> to indicate that it is not visible at all.</li> </ul> Parameters: <ul style="list-style-type: none"> <li>• TabName: String - the name of the tab to check for; TabName is case sensitive</li> </ul>	<a href="#">Repository.AddTab()</a> <sup>[1873]</sup>
<b>IsTechnologyEnabled (string ID)</b>	<i>Boolean</i>	Checks whether a specified technology is enabled in Enterprise Architect.  Returns <b>True</b> if the MDG Technology resource is enabled. Otherwise returns <b>False</b> .	

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>ID: String - the technology ID to check for.</li> </ul>	
<b>IsTechnologyLoaded (string ID)</b>	<i>Boolean</i>	Checks whether a specified technology is loaded into the repository.  Returns <b>True</b> if the MDG Technology resource is loaded into the repository. Otherwise returns <b>False</b> .  Parameters: <ul style="list-style-type: none"> <li>ID: String - the technology ID to check for.</li> </ul>	
<b>OpenDiagram (long DiagramID)</b>		Provides a method for an automation client or Add-In to open a diagram. The diagram is added to the tabbed list of open diagrams in the main Enterprise Architect view.  Parameters: <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to open.</li> </ul>	
<b>OpenFile (string Filename)</b>	<i>Boolean</i>	This is the main point for opening an Enterprise Architect project file from an automation client, and working with the contained objects.  If the required project is a DBMS repository, and you have created a shortcut .EAP file containing the database connection string, you can call this shortcut file to access the DBMS repository.  You can also connect to a SQL database by passing in the connection string itself instead of a filename. A valid connection string can be obtained from the <b>Open Project</b> dialog by selecting a recently opened SQL repository.  Parameters: <ul style="list-style-type: none"> <li>Filename: String - the filename of the Enterprise Architect project to open.</li> </ul>	<a href="#">Open a Project</a> <sup>[139]</sup>
<b>OpenFile2 (string FilePath, string Username, string Password)</b>	<i>Boolean</i>	As for <i>OpenFile()</i> except this enables the specification of a password.  Parameters: <ul style="list-style-type: none"> <li>Filepath: String - the file path of the Enterprise Architect project to open.</li> <li>Username: String - the user login ID</li> <li>Password: String - the user password.</li> </ul>	
<b>RefreshModelView (long PackageID)</b>		Reloads a package or the entire model, updating the user interface.  Parameters: <ul style="list-style-type: none"> <li>PackageID: Long - the ID of the package to reload: if <b>0</b>, the entire model is reloaded; if a valid package ID, only that package is reloaded.</li> </ul>	
<b>RefreshOpenDiagrams (boolean FullReload)</b>		Refreshes the diagram contents for all diagrams open in Enterprise Architect.  Parameters:	

Method	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>FullReload: Boolean - if <b>false</b> the displayed contents of elements and connectors are refreshed in each diagram; if <b>true</b> each of the diagrams is completely reloaded from the repository.</li> </ul>	
<b>ReloadDiagram</b> (long DiagramID)		<p>Reloads a specified diagram. This would commonly be used to refresh a visible diagram after code import/export or other batch process where the diagram requires complete refreshing.</p> <ul style="list-style-type: none"> <li>Calling this method within a call to <b>EA_OnNotifyContextItemModified</b> is not supported</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to be reloaded.</li> </ul>	<a href="#">EA_OnNotifyContextItemModified</a> <sup>[2007]</sup>
<b>RemoveOutputTab</b> (string Name)		<p>Removes a specified tab from the <b>Output</b> window.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>Name: String - the name of the tab to be removed</li> </ul>	
<b>RunModelSearch</b> (string sQueryName, string sSearchTerm, string sSearchOptions, string sSearchData)		<p>Runs a search, displaying the results in Enterprise Architect's Model Search window</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>sQueryName: String - the name of the search to run, for example <i>Simple</i></li> <li>sSearchTerm: String - the term to search for</li> <li>sSearchOptions: String - currently not being used</li> <li>sSearchData: String - enables you to supply a list of results in the form of XML, which is appended onto the result list in Enterprise Architect - see <b>XML Format</b>; this parameter is not mandatory so pass in an empty string to run the search as per normal</li> </ul>	<a href="#">XML Format</a> <sup>[1990]</sup>
<b>SaveAllDiagrams</b> ()		Saves all open diagrams	
<b>SaveAuditLogs</b> (string FilePath, object StartDateTime, object EndDateTime)	<i>Boolean</i>	<p>Saves the Audit Logs contained within a model to a specified file</p> <p>If <i>StartDateTime</i> and <i>EndDateTime</i> are not null then only log items that fall into this period are saved</p> <p>Returns <b>true</b> for success, <b>false</b> for failure</p> <ul style="list-style-type: none"> <li>This might fail if the user logged into the model does not have the correct access permission</li> </ul> <p>Parameters:</p> <ul style="list-style-type: none"> <li>FilePath: String - the file to save the Audit Logs to</li> <li>StartDateTime: Variant ( DateTime ) - the earliest date and time of log entries to save</li> <li>EndDateTime; Variant ( DateTime ) - the latest date and time of log entries to save</li> </ul>	

Method	Type	Notes	See Also
<b>SaveDiagram (long DiagramID)</b>		<p>Saves an open diagram; assumes the diagram is open in the main user interface Tab list</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramID: Long - the ID of the diagram to save</li> </ul>	
<b>ScanXMIAndReconcile()</b>		<p>Scans the package XMI files associated with each of the project's controlled packages and restores any diagram objects or cross-references that are detected as missing from the project</p> <p>This function is useful in team environments where each user maintains their own private copy of the model database (i.e. multiple private EAP files) and model updates are propagated through the use of controlled packages; it provides no benefit when the model is hosted in a single shared database that is accessed by all team members</p> <p>Each controlled package is compared with its associated XMI file and, if the cross-reference information in the model does not match the XMI, Enterprise Architect updates the model with the information from the XMI and records the update in the Output window</p> <p>You can roll back such updates by right-clicking on the entry in the Output window and selecting the context menu option <b>Rollback Update</b> (or <b>Rollback Selected Updates</b> if multiple entries are selected)</p> <p>Closing the model clears the entries in the Output window; an entry in the Output window is also cleared as and when you roll-back the update for it</p> <p>This functionality is invoked automatically as part of the <b>Get All Latest</b> operation</p> <p>When working in an environment that uses a Private Model deployment and your model contains a significant number of cross-package references, it is recommended that you invoke this function from time to time, following the re-importation of controlled packages - for example, after using <b>Get Latest</b> to update a number of packages, or after performing a number of package check-outs</p> <ul style="list-style-type: none"> <li>As a general rule, avoid running this function while you have uncommitted changes in your model</li> <li>Generally, you should: <ul style="list-style-type: none"> <li>Check-out a number of packages</li> <li>Invoke <b>ScanXMIAndReconcile</b></li> <li>Make your modifications</li> <li>Commit any outstanding changes before you check-out more packages and run <b>ScanXMIAndReconcile</b> again</li> </ul> </li> </ul>	
<b>ShowDynamicHelp (string Topic)</b>		Shows a help topic as a view	

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>Topic: String - specifies the help topic</li> </ul>	
<b>ShowInProjectView (object Item)</b>		Selects a specified object in the Project Browser Accepted object types are <i>Package</i> , <i>Element</i> , <i>Diagram</i> , <i>Attribute</i> , and <i>Method</i> ; an exception is thrown if the object is of an invalid type Parameters: <ul style="list-style-type: none"> <li>Item: Object - the object to highlight</li> </ul>	
<b>ShowProfileToolbox (string Technology, string Profile, boolean Show)</b>		Shows/hides the contents of a specified technology or profile in the Toolbox To show/hide a profile in the Toolbox, specify the profile's ID value in the <i>Profile</i> parameter and set the <i>Technology</i> parameter to a null string To show/hide a technology in the Toolbox, specify the technology's ID in the <i>Technology</i> parameter and set the <i>Profile</i> parameter to a null string Parameters: <ul style="list-style-type: none"> <li>Technology: String - the ID of the technology</li> <li>Profile: String - the ID of the profile</li> <li>Show: Boolean - if <b>true</b>, show the technology or profile; if <b>false</b>, hide the technology or profile</li> </ul>	
<b>ShowWindow (long Show)</b>		Shows or hides Enterprise Architect Parameters: <ul style="list-style-type: none"> <li>Show: Long</li> </ul>	
<b>SQLQuery (string SQL)</b>	String	Enables execution of a SQL <i>select</i> statement against the current repository Returns an XML formatted string value of the resulting recordset Parameters: <ul style="list-style-type: none"> <li>SQL: String - contains the SQL Select statement</li> </ul>	
<b>SynchProfile (string Profile, string Stereotype)</b>	Boolean	Synchronizes Tagged Values and constraints of a UML Profile item using the Synch Profiled Elements dialog Parameters: <ul style="list-style-type: none"> <li>Profile: String - the name of the profile that contains the stereotype</li> <li>Stereotype: String - the name of the profile stereotype for which the default tags and constraints are to be synchronized</li> </ul>	<a href="#">Synchronize Tagged Values and Constraints</a> <small>[103]</small>
<b>VersionControlResynchPkgStatuses (boolean ClearSettings)</b>		<b>Synchronizes the version control status</b> of each version controlled package within the current model with the status reported by your version control provider	<a href="#">Resynchronize the Status of Version Controlled Packages</a> <small>[298]</small>

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>ClearSettings: Boolean - if <b>true</b>, clear the version control settings from packages that are reported by the version control provider as <i>uncontrolled</i>; if <b>false</b>, leave the version control settings unchanged for packages reported as <i>uncontrolled</i></li> </ul>	
<b>WriteOutput (string Name, string String, long ID)</b>		Writes text to a specified tab in the <b>Output</b> window, and associates the text with an ID.  Parameters: <ul style="list-style-type: none"> <li>Name: String - specifies the tab on which to display the text.</li> <li>String: String - specifies the text to display.</li> <li>ID: Long - specifies the ID the text is associated with.</li> </ul>	<a href="#">ClearOutput</a> <sup>[1874]</sup> <a href="#">CreateOutputTab</a> <sup>[1875]</sup> <a href="#">EnsureOutput Visible</a> <sup>[1875]</sup>

#### 18.2.2.4.15 Stereotype Class

The *Stereotype* element corresponds to a UML stereotype, which is an extension mechanism for varying the behavior and type of a model element. Use the Repository *Stereotypes* collection to add new elements and delete existing ones.

Associated table in .EAP file: *t\_stereotypes*

#### Stereotype Attributes

Attribute	Type	Notes
<b>AppliesTo</b>	<i>String</i>	Read/Write. A reference to the stereotype <i>Base Class</i> , that is, which element it applies to.
<b>MetapathLoadPath</b>	<i>String</i>	Read/Write. Path to an associated metapath. The automation interface does not yet support loading metapaths. To do this you must use the <b>Stereotype</b> tab of the <b>UML Types</b> dialog in Enterprise Architect.
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the stereotype.
<b>Name</b>	<i>String</i>	Read/Write. The stereotype name. Appears in the <b>Stereotype</b> drop list for elements that match the <i>AppliesTo</i> attribute.
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>StereotypeGUID</b>	<i>String</i>	Read/Write. Unique identifier for stereotype, generally set and maintained by Enterprise Architect.
<b>Style</b>	<i>String</i>	Read/Write. Additional style specifier for stereotype.
<b>VisualType</b>	<i>String</i>	Read/Write. Indicates an inbuilt visual style associated with a stereotype. Not currently implemented.

#### Stereotype Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current stereotype object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.4.16 Task Class

A Task is an entry in the System ToDo list. Accessed using the Repository *Tasks* collection.

Associated table in .EAP file: *t\_tasks*

#### Task Attributes

Attribute	Type	Notes
<b>ActualTime</b>	<i>Long</i>	Read/Write. Time already expended on task, in hours, days or other units.
<b>AssignedTo</b>	<i>String</i>	Read/Write. Person this task is assigned to; that is, the responsible resource.
<b>EndDate</b>	<i>Date</i>	Read/Write. Date task scheduled to finish.
<b>History</b>	<i>String</i>	Read/Write. Memo field to hold, for example, task history or notes.
<b>Name</b>	<i>Variant</i>	Read/Write. Task name.
<b>Notes</b>	<i>Variant</i>	Read/Write. Description of the task.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Owner</b>	<i>String</i>	Read/Write. The task owner.
<b>Percent</b>	<i>Long</i>	Read/Write. Percent the task is complete.
<b>Phase</b>	<i>String</i>	Read/Write. The phase of the project the task relates to.
<b>Priority</b>	<i>String</i>	Read/Write. Priority associated with this task.
<b>StartDate</b>	<i>Date</i>	Read/Write. Date task is to start.
<b>Status</b>	<i>Variant</i>	Read/Write. Current task status.
<b>TaskID</b>	<i>Long</i>	Read only. Local ID of task.
<b>TotalTime</b>	<i>Long</i>	Read/Write. The total expected time the task might run - in hours, days or some other unit.
<b>Type</b>	<i>String</i>	Read/Write. Sets or returns string representing the type.

#### Task Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Task object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.4.17 Term Class

A *Term* object represents one entry in the system glossary. Accessed using the Repository *Terms* collection.

Associated table in .EAP file: *t\_glossary*

#### Term Attributes

Attribute	Type	Notes
<b>Meaning</b>	<i>String</i>	Read/Write. The description of the term; its meaning.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Term</b>	<i>String</i>	Read/Write. The glossary item name.
<b>TermID</b>	<i>Long</i>	Read only. A local ID number to identify the term in the model.
<b>Type</b>	<i>String</i>	Read/Write. The type this term applies to (for example, business or technical).

#### Term Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Term object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.5 Element Package

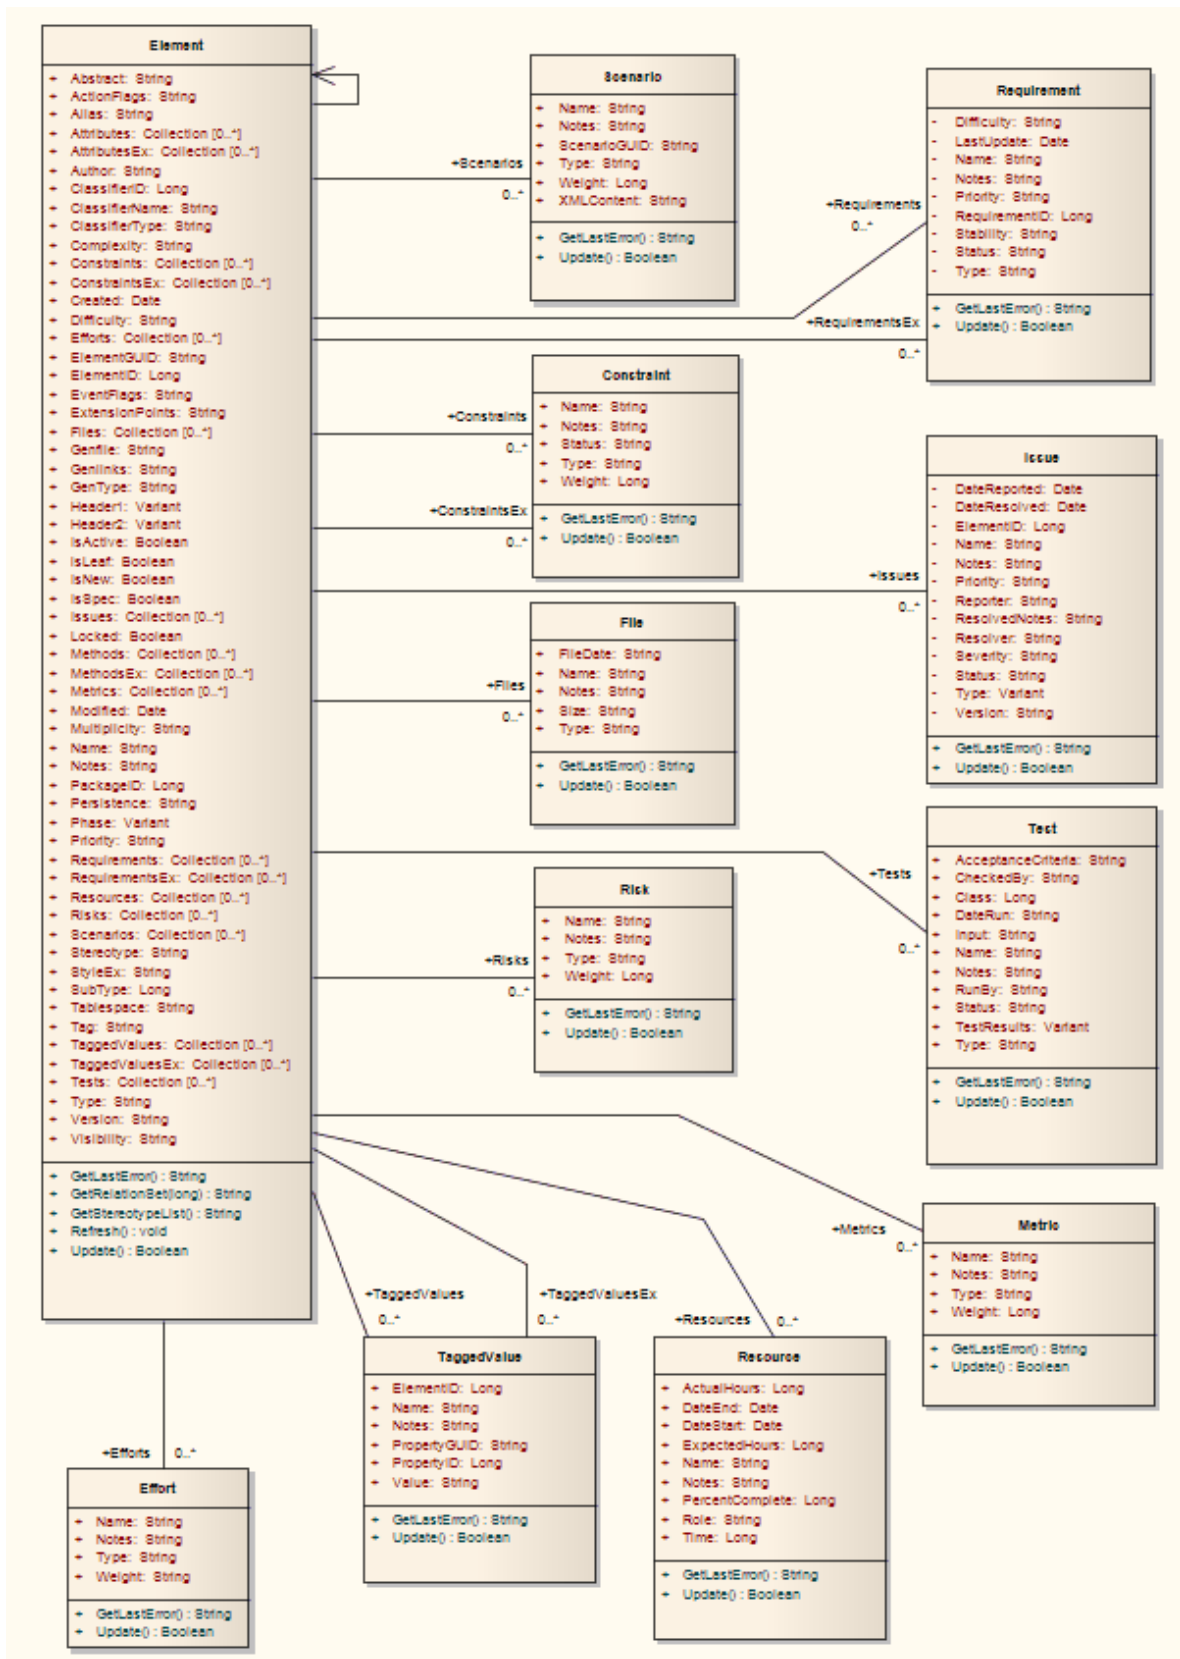

The *Element* package contains information about an element and its associated extended properties such as testing and project management information. An element is the basic item in an Enterprise Architect model. Classes, Use Cases and Components are all different types of UML element.

The diagram below illustrates the relationships between an *element* and its associated extended information. The related information is accessed through the collections owned by the element (for example, Scenarios and Tests). It also includes a full description of the element object (the basic model structural

unit).

**Example:**

### 18.2.2.5.1 Constraint Class

A *Constraint* is a condition imposed on an element. Constraints are accessed through the Element *Constraints* collection.

Associated table in .EAP file: *t\_objectconstraints*

#### Constraint Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write. The name of the constraint (that is, the constraint).
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the constraint.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>ParentID</b>	<i>Long</i>	Read only. The <i>ElementID</i> of the element to which this constraint applies.
<b>Status</b>	<i>String</i>	Read/Write. Current status.
<b>Type</b>	<i>String</i>	Read/Write. Constraint type.
<b>Weight</b>	<i>Long</i>	Read/Write. A weighting factor.

#### Constraint Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>Constraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.5.2 Effort Class

An *Effort* is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Accessed through the Element *Efforts* collection.

Associated table in .EAP file: *t\_objecteffort*

#### Effort Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write. The name of the effort.
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the effort.

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write. The effort type.
<b>Weight</b>	<i>Long</i>	Read/Write. A weighting factor.
<b>Weight2</b>	<i>Float</i>	Read/Write. A weighting factor.

#### Effort Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Saves the effort to the model.

#### 18.2.2.5.3 Element Class

An *Element* is the main modeling unit. It corresponds to (for example) Class, Use Case, Node or Component. You create new elements by adding to the Package *Elements* collection. Once you have created an element, you can add it to the *DiagramObject* Class of a diagram to include it in the diagram.

Elements also have a collection of connectors. Each entry in this collection indicates a relationship to another element.

There are also some extended collections for managing additional information about the element, including things such as Tagged Values, Issues, Constraints and Requirements.

Associated table in .EAP file: *t\_object*

#### Element Attributes

Attribute	Type	Notes	See Also
<b>Abstract</b>	<i>String</i>	Read/Write  Indicates if the element is Abstract (1) or Concrete (0)	
<b>ActionFlags</b>	<i>String</i>	Read/Write  A structure to hold flags concerned with Action semantics	
<b>Alias</b>	<i>String</i>	Read/Write  An optional alias for this element	
<b>AssociationClassConnectorID</b>	<i>Long</i>	Read only  If the element is an AssociationClass, <i>AssociationClassConnectorID</i> contains the	<a href="#">CreateAssociationClass()</a> <small>[1900]</small>  (Information on

Attribute	Type	Notes	See Also
		Connector ID of the respective Association connector	creating AssociationClasses from elements)
<b>Attributes</b>	<a href="#">Collection</a> <small>1856</small>	Read only Collection of Attribute objects for the current element; use the <b>AddNew</b> and <b>Delete</b> functions to manage attributes	
<b>AttributesEx</b>	<a href="#">Collection</a> <small>1856</small>	Read only Collection of Attribute objects belonging to the current element and its parent elements	
<b>Author</b>	String	Read/Write The element author	<a href="#">Repository: Authors</a> <small>1870</small>
<b>BaseClasses</b>	<a href="#">Collection</a> <small>1856</small>	Read only List of Base Classes for this element, presented as a collection for convenience	
<b>ClassifierID</b>	Long	<b>Deprecated</b> See <i>ClassifierID</i>	
<b>ClassifierID</b>	Long	Read/Write The ElementID of a Classifier associated with this element; that is, the base type  Only valid for instance type elements (such as Object or Sequence)	
<b>ClassifierName</b>	String	Read/Write Name of associated Classifier (if any)	
<b>ClassifierType</b>	String	Read only Type of associated Classifier	
<b>Complexity</b>	String	Read/Write  A complexity value indicating how complex the element is; used for metric reporting and estimation  Valid values are: <b>1</b> for Easy, <b>2</b> for Medium, <b>3</b> for Difficult	
<b>CompositeDiagram</b>	<a href="#">Diagram</a> <small>1936</small>	Read only If the element is Composite, returns its associated diagram; otherwise returns null	
<b>Connectors</b>	<a href="#">Collection</a> <small>1856</small>	Read only Returns a collection containing the connectors to other elements	
<b>Constraints</b>	<a href="#">Collection</a> <small>1856</small>	Read only Collection of <b>Constraint</b> objects	<a href="#">Constraint Class</a> <small>1897</small>

Attribute	Type	Notes	See Also
ConstraintsEx	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of Constraint objects belonging to the current element and its parent elements	
Created	Date	Read/Write The date the element was created	
CustomProperties	<a href="#">Collection</a> <small>[1856]</small>	Read only List of advanced properties for an element The collection of advanced properties differs depending on element type; for example, an Action and an Activity have different advanced properties Currently only editable from the user interface	
Diagrams	<a href="#">Collection</a> <small>[1856]</small>	Read only Returns a collection of sub-diagrams (child diagrams) attached to this element as seen in the tree view	
Difficulty	String	Read/Write A difficulty level associated with this element for estimation/metrics; only useable for Requirement, Change and Issue element types, otherwise ignored Valid values are: <b>Low</b> , <b>Medium</b> , <b>High</b>	
Efforts	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of <b>Effort</b> objects	<a href="#">Effort Class</a> <small>[1897]</small>
ElementGUID	String	Read only A globally unique ID for this element; that is, unique across all model files	
ElementID	Long	Read only The local ID of the Element; valid for this file only	
Elements	<a href="#">Collection</a> <small>[1856]</small>	Read only Returns a collection of child elements (sub-elements) attached to this element as seen in the tree view	
EmbeddedElements	<a href="#">Collection</a> <small>[1856]</small>	Read only List of elements that are embedded into this element, such as Ports, Parts, Pins and Parameter Sets	
EventFlags	String	Read/Write A structure to hold a variety of flags to do with signals or events	
ExtensionPoints	String	Read/Write	

Attribute	Type	Notes	See Also
		Optional extension points for a Use Case as a comma-separated list	
<b>Files</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of <b>File</b> objects	<a href="#">File Class</a> <small>[1902]</small>
<b>GenFile</b>	<i>String</i>	Read/Write The file associated with this element for code generation and synchronization purposes; can include macro expansion tags for local conversion to full path	
<b>Genlinks</b>	<i>String</i>	Read/Write Links to other Classes discovered at code reversing time; Parents and Implements connectors only	
<b>GenType</b>	<i>String</i>	Read/Write The code generation type; for example, Java, C++, C#, VBNet, Visual Basic, Delphi	
<b>Header1</b>	<i>Variant</i>	Read/Write A user defined string for inclusion as header in the source files generated	
<b>Header2</b>	<i>Variant</i>	Read/Write Same as for <b>Header1</b> , but used in the CPP source file	
<b>IsActive</b>	<i>Boolean</i>	Read/Write Boolean value indicating whether the element is active or not <b>1</b> = True, <b>0</b> = False	
<b>IsComposite</b>	<i>Boolean</i>	Read/Write Indicates whether the element is composite or not <b>1</b> = True, <b>0</b> = False	
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write Boolean value indicating whether the element is in leaf node or not <b>1</b> = True, <b>0</b> = False	
<b>IsNew</b>	<i>Boolean</i>	Read/Write Boolean value indicating whether the element is new or not <b>1</b> = True, <b>0</b> = False	
<b>IsSpec</b>	<i>Boolean</i>	Read/Write Boolean value indicating whether the element is	

Attribute	Type	Notes	See Also
		a specification or not 1 = True, 0 = False	
Issues	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of Issue objects	
Locked	Boolean	Read/Write Indicates if the element has been locked against further change	
MetaType	String	Read only The element's domain-specific meta type, as defined by an applied stereotype from an MDG Technology	
Methods	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of Method objects for current element	
MethodsEx	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of Method objects belonging to the current element and its parent elements	
Metrics	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of Metric elements for current element	
MiscData	String	Read only This low-level property provides information about the contents of the <b>PData</b> x fields These database fields are not documented, and developers must gain understanding of these fields through their own endeavors to use this property <b>MiscData</b> is zero based, therefore: <ul style="list-style-type: none"> <li>• <b>MiscData(0)</b> corresponds to <b>PData1</b></li> <li>• <b>MiscData(1)</b> to <b>PData2</b></li> </ul> and so on	
Modified	Date	Read/Write The date the element was last modified	
Multiplicity	String	Read/Write Multiplicity value for this element	
Name	String	Read/Write The element name; should be unique within the current package	
Notes	String	Read/Write Further descriptive text about the element	
ObjectType	<a href="#">ObjectTyp</a>	Read only	

Attribute	Type	Notes	See Also
	<a href="#">e</a> <sup>[1850]</sup>	Distinguishes objects referenced through a Dispatch interface	
PackageID	Long	Read/Write A local ID for the package containing this element	
ParentID	Long	Read/Write If this element is a child of another, used to set or retrieve the <i>ElementID</i> of the other element; if not, returns <b>0</b>	
Partitions	<a href="#">Collection</a> <sup>[1856]</sup>	Read only List of logical partitions into which an element can be divided  Only valid for elements that support partitions, such as Activities and States	
Persistence	String	Read/Write The persistence associated with this element; can be <b>Persistent</b> or <b>Transient</b>	
Phase	String	Read/Write The phase this element is scheduled to be constructed in; any string value	
Priority	String	Read/Write The priority of this element as compared to other project elements; only applies to Requirement, Change and Issue types, otherwise ignored  Valid values are: <b>Low</b> , <b>Medium</b> and <b>High</b>	
Properties	<a href="#">Properties</a> <sup>[1924]</sup>	Returns a list of specialized properties that apply to the element that might not be available using the automation model  The properties are purposely undocumented because of their obscure nature and because they are subject to change as progressive enhancements are made to them	
PropertyType	Long	Read/Write The ElementID of a Type associated with this element; only valid for Port and Part elements	
Realizes	<a href="#">Collection</a> <sup>[1856]</sup>	Read only List of Interfaces realized by this element for convenience	
Requirements	<a href="#">Collection</a> <sup>[1856]</sup>	Read only Collection of <b>Requirement</b> objects	<a href="#">Requirement Class</a> <sup>[1905]</sup>
RequirementsEx	<a href="#">Collection</a> <sup>[1856]</sup>	Read only Collection of <b>Requirement</b> objects belonging to the current element and its parent elements	<a href="#">Requirement Class</a> <sup>[1905]</sup>

Attribute	Type	Notes	See Also
Resources	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of <b>Resource</b> objects for current element	<a href="#">Resource Class</a> <small>[1906]</small>
Risks	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of <b>Risk</b> objects	<a href="#">Risk Class</a> <small>[1906]</small>
RunState	String	Read/Write The object's runstate list as a string	
Scenarios	<a href="#">Collection</a> <small>[1856]</small>	Read only Collection of <b>Scenario</b> objects for current element	<a href="#">Scenario Class</a> <small>[1907]</small>
StateTransitions	<a href="#">Collection</a> <small>[1856]</small>	Read only List of State Transitions that an element can support; applies in particular to Timing elements	
Status	String	Read/Write Sets or gets the status, such as <b>Proposed</b> or <b>Approved</b>	
Stereotype	String	Read/Write The primary element stereotype; the first of the list of stereotypes you can access using the <i>StereotypeEx</i> attribute	
StereotypeEx	String	Read/Write All the applied stereotypes of the element in a comma-separated list	
StyleEx	String	Read/Write Advanced style settings; reserved for the use of Sparx Systems	
Subtype	Long	Read/Write A numeric subtype that qualifies the <b>Type</b> of the main element; for example: <ul style="list-style-type: none"> <li>• For Event: <b>0</b> = Receiver, <b>1</b> = Sender</li> <li>• For Class: <b>1</b> = Parameterised, <b>2</b> = Instantiated, <b>3</b> = Both, <b>0</b> = Neither, <b>17</b> = Association Class</li> </ul> If <b>17</b> , because an Association Class has been created through the user interface, <b>MiscData(3)</b> contains the ID of the related Association; as MiscData is read-only, you cannot create an Association Class through the Automation Interface <ul style="list-style-type: none"> <li>• For Note: <b>1</b> = Note linked to connector, <b>2</b> = Constraint linked to connector</li> <li>• For StateNode: <b>100</b> = ActivityInitial, <b>101</b> = ActivityFinal</li> <li>• For Activity: <b>0</b> = Activity, <b>8</b> = composite</li> </ul>	<a href="#">Type</a> <small>[1899]</small>

Attribute	Type	Notes	See Also
		<p>Activity (also set to <b>8</b> for other composite elements such as Use Cases)</p> <ul style="list-style-type: none"> <li>For Synchronization: <b>0</b> = Horizontal, <b>1</b> = Vertical</li> </ul> <p>Note that there are many more Types than indicated in the above examples</p>	
<b>Tablespace</b>	<i>String</i>	<p>Read/Write</p> <p>Associated tablespace for a Table element</p>	
<b>Tag</b>	<i>String</i>	<p>Read/Write</p> <p>Corresponds to the <b>Keywords</b> field in the Enterprise Architect user interface</p>	<a href="#">General Settings</a> <sup>[664]</sup>
<b>TaggedValues</b>	<a href="#">Collection</a> <sup>[1856]</sup> of type <a href="#">TaggedValue</a> <sup>[1910]</sup>	<p>Read only</p> <p>Returns a collection of <b>TaggedValue</b> objects</p>	<a href="#">TaggedValue Class</a> <sup>[1910]</sup>
<b>TaggedValuesEx</b>	<a href="#">Collection</a> <sup>[1856]</sup> of type <a href="#">TaggedValue</a> <sup>[1910]</sup>	<p>Read only</p> <p>Returns a collection of <b>TaggedValue</b> objects belonging to the current element and the elements specialized or realized by the current element</p>	<a href="#">TaggedValue Class</a> <sup>[1910]</sup>
<b>Tests</b>	<a href="#">Collection</a> <sup>[1856]</sup>	<p>Read only</p> <p>Collection of <b>Test</b> objects for current element</p>	<a href="#">Test Class</a> <sup>[1917]</sup>
<b>TreePos</b>	<i>Long</i>	<p>Read/Write</p> <p>Sets or gets the tree position</p>	
<b>Type</b>	<i>String</i>	<p>Read/Write</p> <p>The element type (such as Class, Component)</p> <p>Note that Type is case sensitive inside Enterprise Architect and should be provided with an initial capital (proper case); valid types are:</p>	
		<p><b>Action</b></p> <p><b>Activity</b></p> <p><b>ActivityPartition</b></p> <p><b>ActivityRegion</b></p> <p><b>Actor</b></p> <p><b>Artifact</b></p> <p><b>Association</b></p> <p><b>Boundary</b></p> <p><b>Change</b></p> <p><b>Class</b></p> <p><b>Collaboration</b></p> <p><b>Component</b></p> <p><b>Constraint</b></p> <p><b>Decision</b></p> <p><b>DeploymentSpecification</b></p> <p><b>DiagramFrame</b></p>	<p><b>InteractionOccurrence</b></p> <p><b>InteractionState</b></p> <p><b>Interface</b></p> <p><b>InterruptibleActivityRegion</b></p> <p><b>Issue</b></p> <p><b>Node</b></p> <p><b>Note</b></p> <p><b>Object</b></p> <p><b>Package</b></p> <p><b>Parameter</b></p> <p><b>Part</b></p> <p><b>Port</b></p> <p><b>ProvidedInterface</b></p> <p><b>Report</b></p> <p><b>RequiredInterface</b></p> <p><b>Requirement</b></p>

Attribute	Type	Notes	See Also	
		<b>EmbeddedElement</b> <b>Entity</b> <b>EntryPoint</b> <b>Event</b> <b>ExceptionHandler</b> <b>ExitPoint</b> <b>ExpansionNode</b> <b>ExpansionRegion</b> <b>GUIElement</b> <b>InteractionFragment</b>	<b>Screen</b> <b>Sequence</b> <b>State</b> <b>StateNode</b> <b>Synchronization</b> <b>Text</b> <b>TimeLine</b> <b>UMLDiagram</b> <b>UseCase</b>	
<b>Version</b>	<i>String</i>	Read/Write The version of the element		
<b>Visibility</b>	<i>String</i>	Read/Write The Scope of this element within the current package Valid values are: <b>Public</b> , <b>Private</b> , <b>Protected</b> or <b>Package</b>		

### Element Methods

Method	Type	Notes	See Also
<b>ApplyGroupLock</b> (string aGroupName)	<i>Boolean</i>	Applies a group lock to the element object, for the specified group, on behalf of the current user Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information Parameter: <ul style="list-style-type: none"> <li>aGroupName: String - the name of the user group for which to set the group lock</li> </ul>	
<b>ApplyUserLock</b> ()	<i>Boolean</i>	Applies a user lock to the element object for the current user Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information	
<b>CreateAssociationClass</b> (long ConnectorID)	<i>Boolean</i>	Makes this element an AssociationClass of the Association with the provided <b>Connector ID</b> ; the return value indicates whether the function succeeded in converting the element to an AssociationClass AssociationClasses are created only where: <ol style="list-style-type: none"> <li>The current element is valid</li> <li>The current element is a Class</li> <li>The current element is not already an AssociationClass</li> <li>The specified connector exists</li> <li>The specified connector is an Association</li> </ol>	

Method	Type	Notes	See Also
		<p>6. The specified connector is not already in an AssociationClass pair</p> <p>7. The current element is not at either end of the specified connector</p> <p>Parameter:</p> <ul style="list-style-type: none"> <li>ConnectorID: Long - the Connector ID of an Association connector</li> </ul>	
<b>GetLastError ()</b>	<i>String</i>	<p>Returns a string value describing the most recent error that occurred in relation to this object</p> <p>This function is rarely used as an exception is thrown when an error occurs</p>	
<b>GetLinkedDocument ()</b>	<i>String</i>	<p>Returns a string value containing the element's linked document contents, in RTF format</p> <p>If the element contains no linked document, an empty string is returned</p>	
<b>GetRelationSet (EnumRelationSetType Type)</b>	<i>String</i>	<p>Returns a string containing a comma-separated list of ElementIDs of directly- and indirectly-related elements based on the given type</p> <p>Recurses using the same relation type on all elements it finds, retrieving all dependencies and sub-dependencies of the current element; for example, <i>Object1</i> depends on <i>Object2</i>, which depends on <i>Object3</i>, therefore this method returns <i>Object2</i> and <i>Object3</i></p> <p>To obtain only the direct relationships of the element, use the <i>Connector</i> collection instead</p>	<a href="#">EnumRelationSetType</a> <sup>[1849]</sup> <a href="#">Connector</a> <sup>[1925]</sup>
<b>GetStereotypeList ()</b>	<i>String</i>	<p>Returns a comma-separated list of stereotypes allied to this element</p>	
<b>IsAssociationClass</b>	<i>Boolean</i>	<p>Returns whether or not the current element is an AssociationClass</p>	
<b>LoadLinkedDocument (string Filename)</b>	<i>Boolean</i>	<p>Loads the RTF document from the specified file into the element's linked document</p> <p>Parameter:</p> <ul style="list-style-type: none"> <li>FileName: String - the name of the file from which to load the RTF document</li> </ul>	
<b>Refresh ()</b>	<i>Void</i>	<p>Refreshes the element features in the Project Browser</p> <p>Usually called after adding or deleting attributes or methods, when the user interface is required to be updated as well</p>	
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	<p>Releases a user lock or group lock on the element object</p> <p>Throws an exception if the operation fails; use <i>GetLastError()</i> to retrieve error information</p>	
<b>SaveLinkedDocument</b>	<i>Boolean</i>	<p>Saves the linked document for this element to</p>	

Method	Type	Notes	See Also
<b>ent (string Filename)</b>		the specified RTF file Parameter: <ul style="list-style-type: none"> <li>• FileName: String - the name of the RTF file to which to save the linked document</li> </ul>	
<b>SetAppearance (long Scope, long Item, long Value)</b>	<i>Void</i>	Sets the visual appearance of the element Parameter: <ul style="list-style-type: none"> <li>• Scope: Long - Scope of appearance set to modify  <b>1</b> – Base (Default appearance across entire model)   To set appearance for the element (diagram object) in a selected diagram only, see <i>Setting The Style</i> in the <i>Diagram Object Class</i> topic</li> <li>• Item: Long - Appearance feature to modify  <b>0</b> – Background color  <b>1</b> – Font Color  <b>2</b> – Border Color  <b>3</b> – Border Width</li> <li>• Value: Long - Value to set appearance to</li> </ul>	<a href="#">DiagramObject Class</a> <small>[1947]</small>
<b>UnlinkFromAssociation</b>	<i>Boolean</i>	Performs the opposite of <b>CreateAssociationClass()</b>	<a href="#">CreateAssociationClass()</a> <small>[1900]</small>
<b>Update ()</b>	<i>Boolean</i>	Update the current element object after modification or appending a new item  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information	

#### 18.2.2.5.4 File Class

##### public Class

A *File* represents an associated file for an element. It is accessed through the Element *Files* collection.

Associated table in .EAP file: *t\_objectfiles*

##### File Attributes

Attribute	Type	Notes
<b>FileDate</b>	<i>String</i>	Read/Write. The file date when entry is created.
<b>Name</b>	<i>String</i>	Read/Write. The file name can be a logical file or a reference to a web address (using <i>http://</i> ).
<b>Notes</b>	<i>String</i>	Read/Write. Notes about the file.
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
Size	String	Read/Write. The file size.
Type	String	Read/Write. File type.

#### File Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current File object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.5.5 Issue (Maintenance) Class

An *Issue* is either a *Change* or a *Defect*, is associated with the containing element, and is accessed through the *Issues* collection of an element.

Associated table in .EAP file: *t\_objectproblems*

#### Issue Attributes

Attribute	Type	Notes
DateReported	Date	Read/Write. Date issue reported.
DateResolved	Date	Read/Write. Date issue resolved.
ElementID	Long	Read/Write. ID of element associated with this issue.
Name	String	Read/Write. The Issue name; that is, the Issue itself.
Notes	String	Read/Write. Issue description.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
Priority	String	Read/Write. Issue priority. Generally should use <b>Low</b> , <b>Medium</b> and <b>High</b> .
Reporter	String	Read/Write. Person reporting issue.
Resolver	String	Read/Write. Person resolving issue.
ResolverNotes	String	Read/Write. Notes entered by resolver about resolution.
Severity	String	Read/Write. Issue severity. Should be marked as <b>Low</b> , <b>Medium</b> or <b>High</b> .
Status	String	Read/Write. The current status of the issue.
Type	Variant	Read/Write. Issue type - can be <b>Defect</b> or <b>Change</b> , <b>Issue</b> and <b>ToDo</b> .
Version	String	Read/Write. Version associated with issue. Note that this method is only available through a Dispatch interface. For example:

Attribute	Type	Notes
		Object ob = Issue; Print ob.Version;

#### Issue Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Issue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.5.6 Metric Class

A *Metric* is a named item with a weighting that can be associated with an element for purposes of building metrics about the model. Accessed through the Element *Metrics* collection.

Associated table in .EAP file: *t\_objectmetrics*

#### Metric Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read/Write. The name of the metric.
<b>Notes</b>	<i>String</i>	Read/Write. Notes about this metric.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write. The metric type.
<b>Weight</b>	<i>Long</i>	Read/Write. A user defined weighting for estimation or metric purposes.

#### Metric Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Metric object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.5.7 Requirement Class

An *Element Requirement* object holds information about the responsibilities of an element in the context of the model. Accessed using the *Element Requirements* collection.

Associated table in .EAP file: *t\_objectrequires*

#### Requirement Attributes

Attribute	Type	Notes
Difficulty	String	Read/Write. Estimated difficulty to implement.
LastUpdate	Date	Read/Write. Date requirement last updated.
Name	String	Read/Write. The requirement itself.
Notes	String	Read/Write. Further notes about requirement.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
ParentID	Long	Read only. The <i>ElementID</i> of the element to which this requirement applies.
Priority	String	Read/Write. Assigned priority of the requirement.
RequirementID	Long	Read only. A local ID for this requirement.
Stability	String	Read/Write. Estimated stability of the requirement.  This is an indication of the probability of the requirement - or understanding of the requirement - changing. High stability indicates a low probability of the requirement changing.
Status	String	Read/Write. Current status of the requirement.
Type	String	Read/Write. Requirement type.

#### Requirement Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Requirement object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.5.8 Resource Class

An Element *Resource* is a named person/task pair with timing constraints and percent complete indicators. Use this to manage the work associated with delivering an Element.

Associated table in .EAP file: *t\_objectresources*

#### Resource Attributes

Attribute	Type	Notes
ActualHours	Long	Read/Write. Time already expended on the task, in hours, days or other units.
DateEnd	Date	Read/Write. Expected end date.
DateStart	Date	Read/Write. Date to start work.
ExpectedHours	Long	Read/Write. The total expected time the task might run, in hours, days or other units.
History	String	Read/Write. Gets or sets history text.
Name	String	Read/Write. Name of resource (for example, person's name).
Notes	String	Read/Write. Descriptive notes.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
PercentComplete	Long	Read/Write. Current percent complete figure.
Role	String	Read/Write. Role they play in implementing the element.
Time	Long	Read/Write. Time expected; numeric indicating number of days.

#### Resource Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Resource object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.5.9 Risk Class

A *Risk* object represents a named risk associated with an element and is used for project management purposes. Accessed through the Element *Risks* collection.

Associated table in .EAP file: *t\_objectrisks*

Risk Attributes

Attribute	Type	Notes
Name	String	Read/Write. The risk.
Notes	String	Read/Write. Further notes describing the risk.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
Type	String	Read/Write. The risk type associated with this element.
Weight	Long	Read/Write. A weighting for estimation or metric purposes.

Risk Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Risk object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.5.10 Scenario Class**

A *Scenario* corresponds to a Collaboration or Use Case instance. Each Scenario is a path of execution through the logic of a Use Case. Scenarios can be added to using the Element *Scenarios* collection.

Associated table in .EAP file: *t\_objectscenarios*

Scenario Attributes

Attribute	Type	Notes	See Also
Name	String	Read/Write. The Scenario name.	
Notes	String	Read/Write. Description of the Scenario. Usually contains the steps to execute the scenario.	
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.	
ScenarioGUID	String	Read/Write. A unique ID for the Scenario. Used to identify the Scenario unambiguously within a model.	
Steps	Collection of <a href="#">ScenarioStep</a> <small>[1909]</small>	Read only. A collection of step objects for this Scenario. Use the <b>AddNew</b> and <i>Delete</i> functions to manage steps. <i>AddNew</i> passes the step name and "1" as the type for an actor step.	<a href="#">Collection Class</a> <small>[1856]</small>
Type	String	Read/Write. The scenario type (for example, <i>Basic Path</i> ).	

Attribute	Type	Notes	See Also
Weight	Long	Read/Write. Currently used to position scenarios in the scenario list (that is, <i>List Position</i> ).	
XMLContent	String	Read/Write. A structured field that can contain scenario details in XML format. It is recommended that you use the <b>Steps</b> collection to read or modify this field.	

#### Scenario Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Scenario object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.5.11 ScenarioExtension Class

##### ScenarioExtension Attributes

Attribute	Type	Notes
ExtensionGUID	String	Read/Write. A unique GUID for this Extension.
Join	String	Read/Write. The GUID of the step where this Extension rejoins the Scenario.
JoiningStep	<a href="#">ScenarioStep</a> <small>[1908]</small>	Read only. The actual step where this Extension rejoins the Scenario, if any.
Level	String	Read only. The number of this Extension as shown in the scenario editor. This is derived from the value of <i>Pos</i> for this object and the owning step.
Name	String	Read/Write. The Extension name.  <ul style="list-style-type: none"> <li>This should match the name of the linked scenario</li> </ul>
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
Pos	Long	Read/Write. The position of the Extension in the Extensions list
Scenario	<a href="#">Scenario</a> <small>[1907]</small>	Read only. The scenario that is executed as an alternative path for this Extension.

##### ScenarioExtension Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ScenarioExtension</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.5.12 ScenarioStep Class

#### ScenarioStep Attributes

Attribute	Type	Notes	See Also
<b>Extensions</b>	<i>Collection of ScenarioExtension</i>	Read only. A collection of <i>ScenarioExtension</i> objects that specify how the scenario is extended from this step. The arguments to <b>AddNew</b> should match the name and GUID of the alternative scenario being linked to.	<a href="#">Collection</a> <sup>[1856]</sup> <a href="#">ScenarioExtension</a> <sup>[1908]</sup>
<b>Level</b>	<i>String</i>	Read only. The number of this Step as shown in the scenario editor. This is derived from the value of <i>Pos</i> .	
<b>Link</b>	<i>String</i>	Read/Write. The GUID of a Use Case that is relevant to this step.	
<b>LinkedElement</b>	<i>Element</i>	Read only. The actual element specified by Link, if any.	<a href="#">Element</a> <sup>[1892]</sup>
<b>Name</b>	<i>String</i>	Read/Write. The Step name.	
<b>ObjectType</b>	<i>ObjectType</i>	Read only. Distinguishes objects referenced through a Dispatch interface.	<a href="#">ObjectType</a> <sup>[1850]</sup>
<b>Pos</b>	<i>Long</i>	Read/Write. The position of the Step in the Scenario Step list.	
<b>Results</b>	<i>String</i>	Read/Write. Any results that are given from this step.	
<b>State</b>	<i>String</i>	Read/Write. A description of the state the system enters when this Step is executed.	
<b>StepGUID</b>	<i>String</i>	Read/Write. A unique GUID for this Step.	
<b>StepType</b>	<i>ScenarioStepType</i>	Read/Write. Identifies whether this step is being performed by a user or the system.	<a href="#">ScenarioStepType</a> <sup>[1853]</sup>
<b>Uses</b>	<i>String</i>	Read/Write. Input and requirements that are relevant to this step.	
<b>UsesElementList</b>	<i>Collection of Element</i>	Read only. Indicates that the Structured Specification tab <b>Uses</b> field is a linked element list.	<a href="#">Collection</a> <sup>[1856]</sup> <a href="#">Element</a> <sup>[1892]</sup> <a href="#">Set Up Scenario Specification</a> <sup>[67]</sup>

ScenarioStep Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ScenarioStep</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.5.13 TaggedValue Class**

A *TaggedValue* is a named property and value associated with an element. It is accessed through the *TaggedValues* collection.

Associated table in .EAP file: *t\_objectproperties*

TaggedValue Attributes

Attribute	Type	Notes
<b>ElementID</b>	<i>Long</i>	Read/Write. The local ID of the associated element.
<b>FQName</b>	<i>String</i>	Read only. The fully-qualified name of the tag.
<b>Name</b>	<i>String</i>	Read/Write. Name of the tag.
<b>Notes</b>	<i>String</i>	Read/Write. Further descriptive notes about this tag.  If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#"><i>ObjectType</i></a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>PropertyGUID</b>	<i>String</i>	Read/Write. The tag global ID.
<b>PropertyID</b>	<i>Long</i>	Read only. The tag local ID.
<b>Value</b>	<i>String</i>	Read/Write. The value assigned to this tag.  This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).  When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute.

TaggedValue Methods

Method	Type	Notes
<b>GetLastError()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in

Method	Type	Notes
		relation to this object. This function is rarely used as an exception is thrown when an error occurs.
<b>Update()</b>	<i>Boolean</i>	Update the current TaggedValue object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.5.14 Test Class

A *Test* is a single Test Case applied to an element. Tests are added and accessed through the Element *Tests* collection.

Associated table in .EAP file: *t\_objecttests*

#### Test Attributes

Attribute	Type	Notes
<b>AcceptanceCriteria</b>	<i>String</i>	Read/Write. The acceptance criteria for successful execution.
<b>CheckedBy</b>	<i>String</i>	Read/Write. Results confirmed by.
<b>Class</b>	<i>Long</i>	Read/Write. The test Class: 1 = Unit Test 2 = Integration Test 3 = System Test 4 = Acceptance Test 5 = Scenario Test.
<b>DateRun</b>	<i>Date</i>	Read/Write. Date last run.
<b>Input</b>	<i>String</i>	Read/Write. Input data.
<b>Name</b>	<i>String</i>	Read/Write. The test name.
<b>Notes</b>	<i>String</i>	Read/Write. Detailed notes about test to be carried out.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>RunBy</b>	<i>String</i>	Read/Write. Person conducting test.
<b>Status</b>	<i>String</i>	Read/Write. Current status of test.
<b>TestResults</b>	<i>Variant</i>	Read/Write. Results of test.
<b>Type</b>	<i>String</i>	Read/Write. The test type, such as Load or Regression.

#### Test Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred

Method	Type	Notes
		in relation to this object. This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current Test object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.6 Element Features Package

The *ElementFeatures* package contains descriptions of the model interfaces that enable access to operations and attributes, and their associated Tagged Values and constraints.

This diagram illustrates the components associated with element features. These include *Attributes* and *Methods*, and the associated constraints and Tagged Values related to them. It also includes the *Parameter* object that defines the arguments associated with an operation (method).

#### Example:

### 18.2.2.6.1 Attribute Class

An *attribute* corresponds to a UML Attribute. It contains further collections for constraints and Tagged Values. Attributes are accessed from the Element *Attributes* collection.

Associated table in .EAP file: *t\_attribute*

#### Attribute Attributes

Attribute	Type	Notes
<b>AllowDuplicates</b>	<i>Boolean</i>	Read/Write. Indicates if duplicates are allowed in the collection. If the attribute represents a database column, this when set represents the <b>Not Null</b> option.

Attribute	Type	Notes
AttributeGUID	String	Read only. A globally unique ID for the current attribute. System generated.
AttributeID	Long	Read only. Local ID number of the attribute.
ClassifierID	Long	Read/Write. Classifier ID, if appropriate; indicates the base type associated with attribute, if not a primitive type.
Container	String	Read/Write. The container type.
Containment	String	Read/Write. Type of containment. Can be <b>Not Specified, By Reference</b> or <b>By Value</b> .
Constraints	<a href="#">Collection</a> [1856]	Read only. A collection of <i>AttributeConstraint</i> objects. Used to access and manage constraints associated with this attribute.
Default	String	Read/Write. Initial value assigned to this attribute.
IsCollection	Boolean	Read/Write. Indicates if the current feature is a collection or not. If the attribute represents a database column, this when set represents a Foreign Key.
IsConst	Boolean	Read/Write. Flag indicating if the attribute is <b>Const</b> or not.
IsDerived	Boolean	Read/Write. Indicates if the attribute is derived (that is, a calculated value).
IsOrdered	Boolean	Read/Write. Indicates if a collection is ordered or not. If the attribute represents a database column, this when set represents a Primary Key.
IsStatic	Boolean	Read/Write. Indicates if the current attribute is a static feature or not. If the attribute represents a database column, this when set represents the <b>Unique</b> option.
Length	String	Read/Write. The attribute length, where applicable.
LowerBound	String	Read/Write. A value for the collection lower bound.
Name	String	Read/Write. The attribute name.
Notes	String	Read/Write. Further notes about this attribute.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
ParentID	Long	Read only. Returns the <i>ElementID</i> of the element that this attribute is a part of.
Pos	Long	Read/Write. Position of the attribute in the Class attribute list.
Precision	String	Read/Write. Precision value.
Scale	String	Read/Write. Scale value.
Stereotype	String	Read/Write. Sets or gets the stereotype for this attribute.
StereotypeEx	String	Read/Write. All the applied stereotypes of the attribute in a comma-separated list.
Style	String	Read/Write. Contains the <b>Alias</b> property for this attribute.
StyleEx	String	Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.

Attribute	Type	Notes
<b>TaggedValues</b>	<a href="#">Collection</a> [1856] of type <a href="#">AttributeTag</a> [1916]	Read only. A collection of AttributeTag objects. Use to access and manage Tagged Values associated with this attribute.
<b>TaggedValuesEx</b>	<a href="#">Collection</a> [1856] of type <a href="#">TaggedValue</a> [1910]	Read only. Collection of TaggedValue objects belonging to the current attribute and the TaggedValuesEx property of its classifier.
<b>Type</b>	String	Read/Write. The attribute type (by name; also see <i>ClassifierID</i> ).
<b>UpperBound</b>	String	Read/Write. A value for the collection upper bound.
<b>Visibility</b>	String	Read/Write. The scope of the attribute. Can be <b>Private</b> , <b>Protected</b> , <b>Public</b> or <b>Package</b> .

#### Attribute Methods

Method	Type	Notes
<b>GetLastError ()</b>	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	Boolean	Updates the current attribute object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### Notes:

- The Attribute Class in Enterprise Architect does not have an **Alias** property. You can access the **Alias** property of the Attribute Class using the **Style** property.

#### **18.2.2.6.2 AttributeConstraint Class**

An *AttributeConstraint* is a constraint associated with the current Attribute.

Associated table in .EAP file: *t\_attributeconstraints*

#### AttributeConstraint Attributes

Attribute	Type	Notes
<b>AttributeID</b>	Long	Read/Write. ID of the attribute this constraint applies to.
<b>Name</b>	String	Read/Write. The constraint.
<b>Notes</b>	String	Read/Write. Descriptive notes about constraint.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
Type	String	Read/Write. Type of constraint.

#### AttributeConstraint Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current <i>AttributeConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.6.3 AttributeTag Class

An *AttributeTag* represents a Tagged Value associated with an attribute.

Associated table in .EAP file: *t\_attributetag*

#### AttributeTag Attributes

Attribute	Type	Notes
AttributeID	Long	Read/Write. Local ID of attribute associated with this Tagged Value.
FQName	String	Read only. The fully-qualified name of the tag.
Name	String	Read/Write. Name of tag.
Notes	String	Read/Write. Further descriptive notes about this tag.  If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
TagGUID	String	Read/Write. A globally unique ID for this Tagged Value.
TagID	Long	Read only. Local ID to identify Tagged Value.
Value	String	Read/Write. The value assigned to this tag.  This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above).  When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute.

#### AttributeTag Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Updates the current <i>AttributeTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.6.4 CustomProperties Collection

The *CustomProperties* collection contains 0 or more *Cust Properties* associated with the current element. These properties provide advanced UML configuration options, and must not be added to or deleted. The value of each property can be set.

##### CustomProperty

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read only. The CustomProperty name.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Value</b>	<i>String</i>	Read/Write. The value associated with this custom property. Can be a string, the boolean values <b>true</b> or <b>false</b> , or an enumeration value from a defined list. The UML 2.3 specification in general provides information on enumeration kinds relevant here.

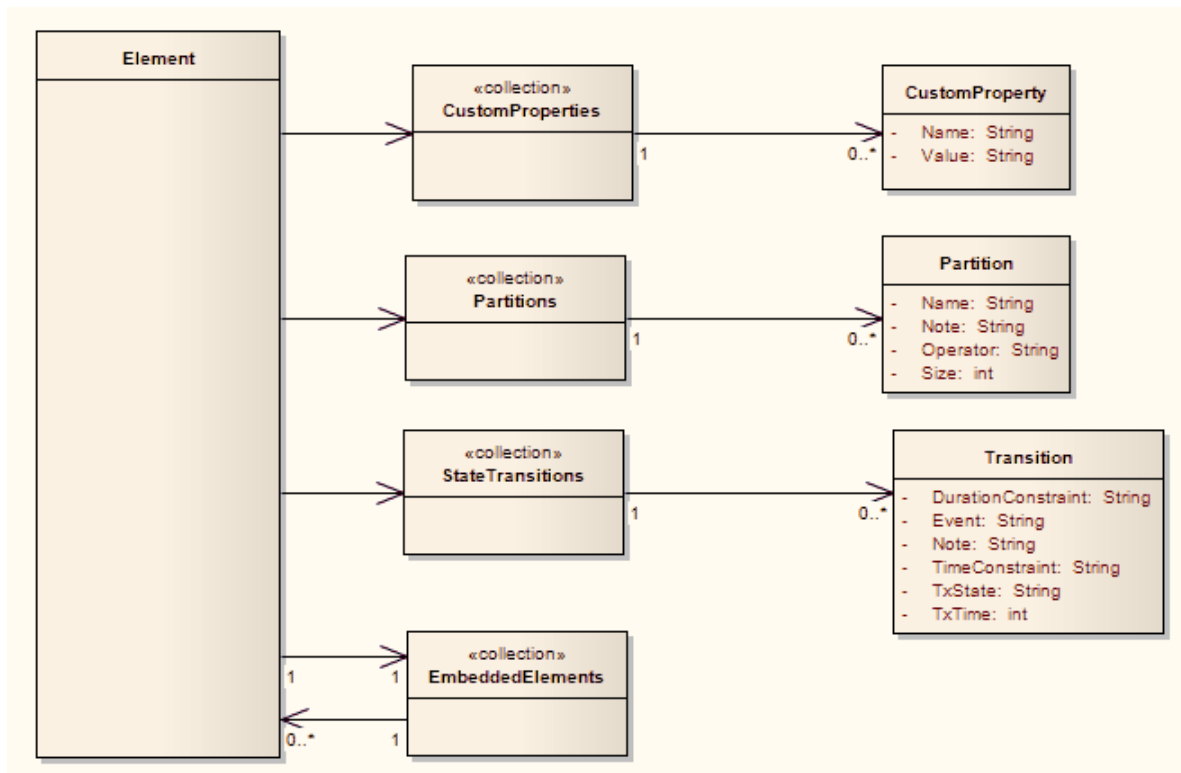

- The number and type of properties vary depending on the actual element

#### 18.2.2.6.5 EmbeddedElements Collection

In UML 2.3 an element can have one or more embedded elements such as Ports, Pins, Parameters or ObjectNodes. These are attached to the boundary of the host element and cannot be moved off the element. They are owned by their host element. This collection gives easy access to the set of elements embedded on the surface of an element. Note that some embedded elements can have their own embedded element collection (for example, Ports can have Interfaces embedded on them).

The *EmbeddedElements* collection contains Element objects.

##### Example:

#### 18.2.2.6.6 Method Class

A *method* represents a UML *operation*. It is accessed from the Element *Methods* collection and includes collections for parameters, constraints and Tagged Values.

Associated table in .EAP file: *t\_operation*

#### Method Attributes

Attribute	Type	Notes
<b>Abstract</b>	<i>Boolean</i>	Read/Write. Flag indicating if the method is abstract ( <b>1</b> ) or not ( <b>0</b> ).
<b>Behavior</b>	<i>String</i>	Read/Write. Some further explanatory behavior notes (for example, pseudocode).  In earlier releases of Enterprise Architect this attribute had the UK/ Australian spelling 'Behaviour'; this is still present for backwards compatibility, but please now use the 'Behavior' attribute for consistency.
<b>ClassifierID</b>	<i>String</i>	Read/Write. Classifier ID that applies to the <i>ReturnType</i> .
<b>Code</b>	<i>String</i>	Read/Write. Optional field to hold the method Code (used for the <b>Initial Code</b> field).
<b>Concurrency</b>	<i>Variant</i>	Read/Write. Concurrency type of method.
<b>IsConst</b>	<i>Boolean</i>	Read/Write. Flag indicating the method is <b>Const</b> .
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write. Flag to indicate if the method is <i>Leaf</i> (cannot be overridden).
<b>IsPure</b>	<i>Boolean</i>	Read/Write. Flag indicating the method is defined as Pure in C++.

Attribute	Type	Notes
IsQuery	Boolean	Read/Write. Flag to indicate if the method is a query (that is, does not alter Class variables).
IsRoot	Boolean	Read/Write. Flag to indicate if the method is <i>Root</i> .
IsStatic	Boolean	Read/Write. Flag to indicate a static method.
IsSynchronized	Boolean	Read/Write. Flag indicating a Synchronized method call.
MethodGUID	String	Read/Write. A globally unique ID for the current method. System generated.
MethodID	Long	Read only. A local ID for the current method, only valid within this .EAP file.
Name	String	Read/Write. The method name.
Notes	String	Read/Write. Descriptive notes about the method.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
Parameters	<a href="#">Collection</a> <small>[1856]</small>	Read only. The <i>Parameters</i> collection for the current method. Use to add and access parameter objects for the current method.
ParentID	Long	Read only. Returns the <i>ElementID</i> of the element that this method belongs to.
Pos	Long	Read/Write. Specifies the position of the method within the set of operations defined for a Class.
PostConditions	<a href="#">Collection</a> <small>[1856]</small>	Read only. PostConditions (constraints) as they apply to this method. Returns a <i>MethodConstraint</i> object of type <b>post</b> .
PreConditions	<a href="#">Collection</a> <small>[1856]</small>	Read only. PreConditions (constraints) as they apply to this method. Returns a <i>MethodConstraint</i> object of type <b>pre</b> .
ReturnsArray	Boolean	Read/Write. Flag to indicate the return value is an array.
ReturnType	String	Read/Write. Return type for the method; can be a primitive data type or a Class or Interface type.
StateFlags	String	Read/Write. Some flags as applied to methods in State elements.
Stereotype	String	Read/Write. The method stereotype (optional).
StereotypeEx	String	Read/Write. All the applied stereotypes of the method in a comma-separated list.
Style	String	Read/Write. Contains the <b>Alias</b> property for this method.
StyleEx	String	Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.
TaggedValues	<a href="#">Collection</a> <small>[1856]</small> of type <a href="#">MethodTag</a> <small>[1927]</small>	Read only. <i>TaggedValues</i> collection for the current method. Accesses a list of <i>MethodTag</i> objects.
Throws	String	Read/Write. Exception information.
Visibility	String	Read/Write. The method scope: <b>Public</b> , <b>Protected</b> , <b>Private</b> or <b>Package</b> .

Method Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current method object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.6.7 MethodConstraint Class**

A *MethodConstraint* is a condition imposed on a method. It is accessed through either the Method *PreConditions* or Method *PostConditions* collection.

Associated table in .EAP file: *t\_operationpres* and *t\_operationposts*

MethodConstraint Attributes

Attribute	Type	Notes
<b>MethodID</b>	<i>Long</i>	Read/Write. The local ID of the associated method.
<b>Name</b>	<i>String</i>	Read/Write. The name of the constraint.
<b>Notes</b>	<i>String</i>	Read/Write. Descriptive notes about this constraint.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<i>String</i>	Read/Write. The constraint type.

MethodConstraint Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>MethodConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.6.8 MethodTag Class

A *MethodTag* is a Tagged Value associated with a method.

Associated table in .EAP file: *t\_operationtag*

#### MethodTag Attributes

Attribute	Type	Notes
<b>FQName</b>	<i>String</i>	Read only. The fully-qualified name of the tag.
<b>MethodID</b>	<i>Long</i>	Read/Write. The ID of the associated method.
<b>Name</b>	<i>String</i>	Read/Write. The tag or name of the property.
<b>Notes</b>	<i>String</i>	Read/Write. Further descriptive notes about this tag. If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>TagGUID</b>	<i>String</i>	Read/Write. A unique GUID for this Tagged Value.
<b>TagID</b>	<i>Long</i>	Read only. A unique ID for this Tagged Value.
<b>Value</b>	<i>String</i>	Read/Write. The value assigned to this tag. This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above). When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute.

#### MethodTag Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object. This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Updates the current <i>MethodTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.6.9 Parameter Class

A *Parameter* object represents a method argument and is accessed through the *Method Parameters* collection.

Associated table in .EAP file: *t\_operationparams*

Parameter Attributes

Attribute	Type	Notes
Alias	String	Read/Write. An optional alias for this parameter.
ClassifierID	String	Read/Write. A ClassifierID for the parameter, if known.
Default	String	Read/Write. A default value for this parameter.
IsConst	Boolean	Read/Write. Flag indicating the parameter is <i>Const</i> (cannot be altered).
Kind	String	Read/Write. The parameter kind - <b>in</b> , <b>inout</b> , <b>out</b> , <b>return</b> .
Name	String	Read/Write. The parameter name; must be unique for a single method.
Notes	String	Read/Write. Descriptive notes.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
OperationID	Long	Read only. ID of the method associated with this parameter.
ParameterGUID	String	Read/Write. A globally unique ID for the current Parameter. System generated.
Position	Long	Read/Write. The position in the argument list.
Stereotype	String	Read/Write. The first stereotype of the parameter.
StereotypeEx	String	Read/Write. All the applied stereotypes of the parameter in a comma-separated list.
Style	String	Read/Write. Some style information.
StyleEx	String	Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.
TaggedValues	<a href="#">Collection</a> <small>[1850]</small> of type <a href="#">ParamTag</a> <small>[1923]</small>	Read/Write. GUID of the parameter with which this <i>ParamTag</i> is associated.
Type	Variant	Read/Write. The parameter type; can be a primitive type or defined classifier.

Parameter Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current Parameter object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.6.10 ParamTag Class

A *ParamTag* is a Tagged Value associated with a method parameter.

#### ParamTag Attributes

Attribute	Type	Notes
ElementGUID	String	Read/Write. GUID of the parameter with which this ParamTag is associated.
FQName	String	Read only. The fully qualified name of the tag.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
PropertyGUID	String	Read/Write. A system generated GUID to identify the Tagged Value.
Tag	String	Read/Write. The actual tag name.
Value	String	Read/Write. The value associated with this tag.

#### ParamTag Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.
Update ()	Boolean	Updates the current <i>ParamTag</i> object after modifying or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

### 18.2.2.6.11 Partitions Collection

A collection of internal element partitions (regions). This is commonly seen in **Activity, State, Boundary, Diagram Frame** and similar elements. Not all elements support partitions.

This collection contains a set of *Partition* elements. The set is read/write: information is not saved until the host element is saved, so ensure that you call the *Element.Save* method after making changes to a Partition.

#### Partition Attributes

Attribute	Type	Notes
Name	String	Read/Write. The partition name; can represent a condition or constraint in some cases.
Note	String	Read/Write. A free text note associated with this partition.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
Operator	String	Read/Write. An optional operator value that specifies the partition type.

Attribute	Type	Notes
<b>Size</b>	<i>String</i>	Read/Write. Vertical or horizontal width of partition in pixels.

#### Learn More:

- [Activity](#)<sup>[875]</sup>
- [State](#)<sup>[919]</sup>
- [Boundary](#)<sup>[1291]</sup>
- [Diagram Frame](#)<sup>[890]</sup>

#### 18.2.2.6.12 *Properties Class*

##### Properties

Properties Attributes

Attribute	Type	Notes
<b>Count</b>	<i>Long</i>	The number of properties that are available for this object.
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.

Properties Methods

Method	Type	Notes
<b>Item (object Index)</b>	<i>Property</i>	Returns a property either by name or by zero-based integer offset into the list of properties.  Parameter: <ul style="list-style-type: none"> <li>• Index: Variant - either a string representing the property name or an integer representing the zero-based offset into the property list.</li> </ul>

##### Property

Property Attributes

Attribute	Type	Notes
<b>Name</b>	<i>String</i>	Read only. Identifies the property. The object to which the properties list applies can have an automation property with the same name, in which case the data accessed through <b>Value</b> is identical to that obtained through the automation property.
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Type</b>	<a href="#">PropType</a> <sup>[1851]</sup>	Read only. Provides an indication of what sort of data is going to be stored by this property. This restriction can be further defined by the Validation attribute.

Attribute	Type	Notes
<b>Validation</b>	<i>String</i>	Read only. Optional string that is used to validate any data that is passed to the Value attribute. This string is used by the programmer at run time to provide an indication of what's expected, and by Enterprise Architect to ensure that the submitted data is appropriate.
<b>Value</b>	<i>Variant</i>	Read/write. The value of the property as defined in the other fields.

### 18.2.2.6.13 Transitions Collection

Applies only to *Timeline elements*. A Timeline element displays 0 or more state transitions at set times on its extent. This collection enables you to access the transition set. You can also access additional information by referring to the connectors associated with the Timeline, and by referencing messages passed between timelines. Note that any changes made to elements in this collection are only saved when the main element is saved.

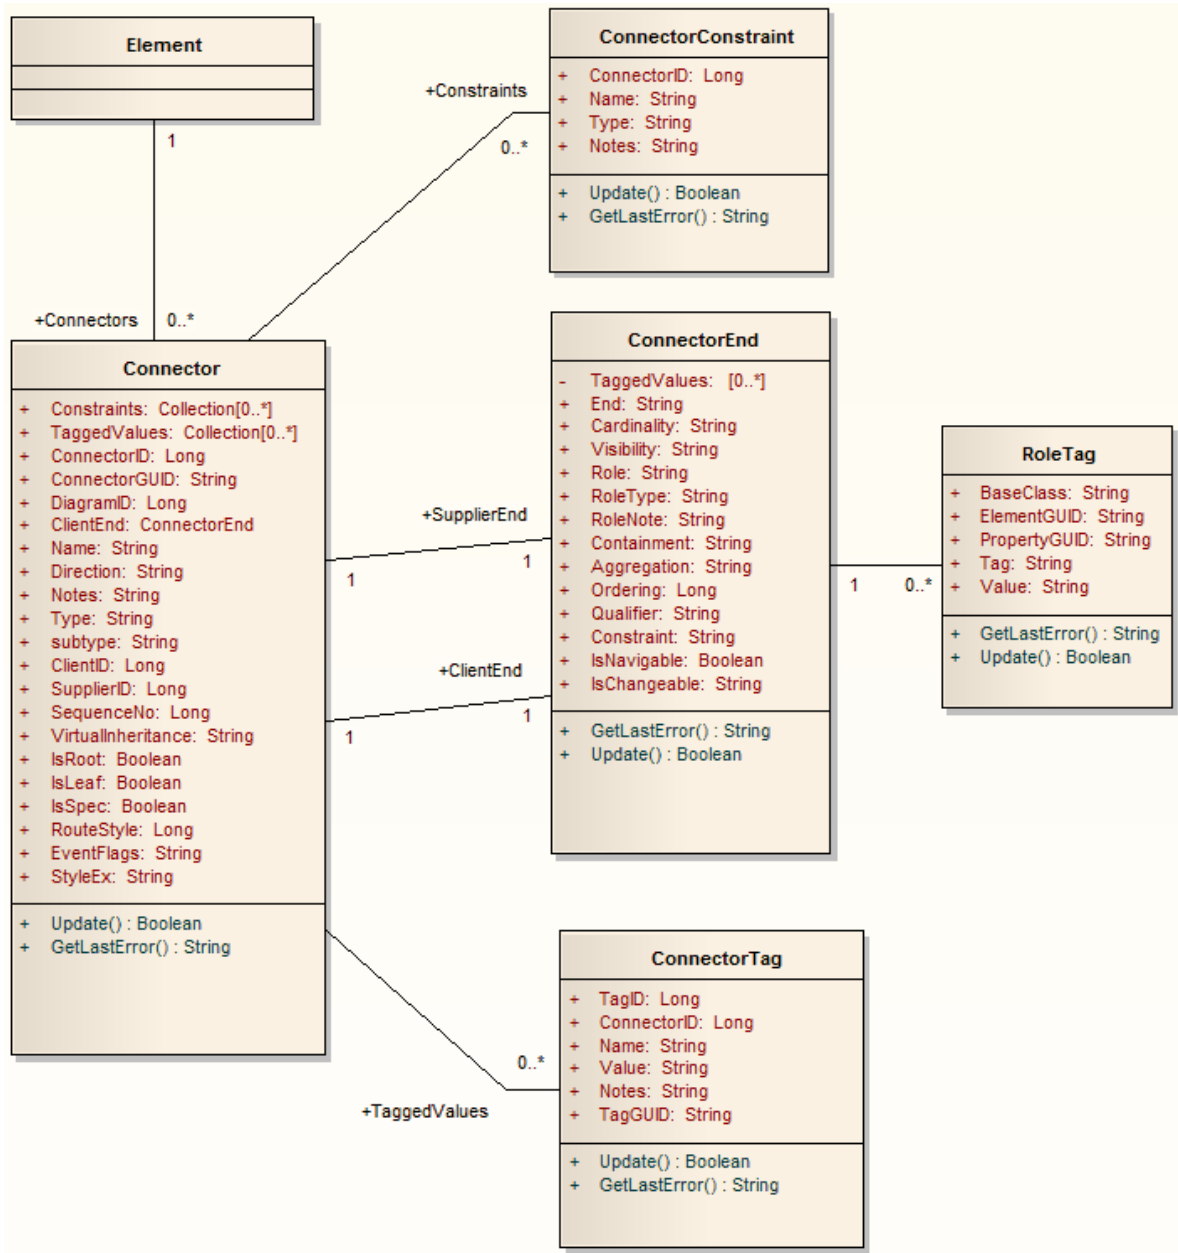

#### Transition Attributes

Attribute	Type	Notes
<b>DurationConstraint</b>	<i>String</i>	Read/Write. A constraint on the time duration that the transition takes.
<b>Event</b>	<i>String</i>	Read/Write. Event (optional) that initiated transition.
<b>Note</b>	<i>String</i>	Read/Write. A free text note.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small> 1850 </small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>TimeConstraint</b>	<i>String</i>	Read/Write. A constraint on when the transition has to be complete by.
<b>TxState</b>	<i>String</i>	Read/Write. The state to transition to. Defined in the <b>Timeline Properties</b> dialog.
<b>TxTime</b>	<i>String</i>	Read/Write. The time that the transition occurs. Value depends on range set in diagram.

### 18.2.2.7 Connector Package

The *Connector* package details how connectors between elements are accessed and managed.

#### Example:

18.2.2.7.1 Connector Class

Reference:

Topic	Detail	See also
General Usage	<p>A <i>Connector</i> object represents the various kinds of connectors between UML elements; it is accessed from either the <i>Client</i> or <i>Supplier</i> element, using the <i>Connectors</i> collection of that element</p> <p>When creating a new connector you must assign it a valid type from the following list:</p> <ul style="list-style-type: none"> <li>• Aggregation</li> <li>• Assembly</li> </ul>	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Association</li> <li>• Collaboration</li> <li>• CommunicationPath</li> <li>• Connector</li> <li>• ControlFlow</li> <li>• Delegate</li> <li>• Dependency</li> <li>• Deployment</li> <li>• ERLink</li> <li>• Generalization</li> <li>• InformationFlow</li> <li>• Instantiation</li> <li>• InterruptFlow</li> <li>• Manifest</li> <li>• Nesting</li> <li>• NoteLink</li> <li>• ObjectFlow</li> <li>• Package</li> <li>• Realization</li> <li>• Sequence</li> <li>• StateFlow</li> <li>• UseCase</li> </ul> <p>Associated table in .EAP file: <i>t_connector</i></p>	

### Connector Attributes

Attribute	Type	Notes	See Also
<b>Alias</b>	<i>String</i>	Read/Write An optional alias for this connector	
<b>ClientEnd</b>	<a href="#">ConnectorEnd</a> <sup>[193]</sup>	Read only A pointer to the <i>ConnectorEnd</i> object representing the source end of the relationship	
<b>ClientID</b>	<i>Long</i>	Read/Write <i>ElementID</i> of the element at the source end of this connector	
<b>Color</b>	<i>Long</i>	Read/Write Sets the color of the connector	
<b>ConnectorGUID</b>	<i>VARIANT</i>	Read only A globally unique ID for the current connector; system generated	
<b>ConnectorID</b>	<i>Long</i>	Read only Local identifier for the current connector; system generated	
<b>Constraints</b>	<a href="#">Collection</a> <sup>[185]</sup>	Read only	<a href="#">Constraint</a> <sup>[189]</sup>

Attribute	Type	Notes	See Also
		Collection of <b>constraint</b> objects	
<b>CustomProperties</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only Returns a collection of advanced properties associated with an element in the form of <b>CustomProperty</b> objects	<a href="#">CustomPropertyCollection</a> <small>[1917]</small>
<b>DiagramID</b>	<i>Long</i>	Read/Write The <i>DiagramID</i> of the connector	
<b>Direction</b>	<i>String</i>	Read/Write Connector direction; can be set to one of the following: <ul style="list-style-type: none"> <li>• <b>Unspecified</b></li> <li>• <b>Bi-Directional</b></li> <li>• <b>Source -&gt; Destination</b></li> <li>• <b>Destination -&gt; Source</b></li> </ul>	
<b>EndPointX</b>	<i>Long</i>	Read/Write The x-coordinate of the connector's end point Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen	
<b>EndPointY</b>	<i>Long</i>	Read/Write The y-coordinate of the connector's end point Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen	
<b>EventFlags</b>	<i>String</i>	Read/Write Structure to hold a variety of flags concerned with event signaling on messages	
<b>IsLeaf</b>	<i>Boolean</i>	Read/Write Flag indicating connector is a <i>leaf</i>	
<b>IsRoot</b>	<i>Boolean</i>	Read/Write Flag indicating connector is a <i>root</i>	
<b>IsSpec</b>	<i>Boolean</i>	Read/Write Flag indicating connector is a specification	
<b>MetaType</b>	<i>String</i>	Read only The connector's domain-specific meta type, as defined by an applied stereotype from an MDG Technology	
<b>MiscData</b>	<i>String</i>	Read only This low-level property returns an array providing information about the contents of the <b>PData</b> fields; these database fields are not documented and developers must gain understanding of these fields through their own endeavors to use this property <b>MiscData</b> is zero based, therefore: <ul style="list-style-type: none"> <li>• <b>MiscData(0)</b> corresponds to <b>PData1</b></li> </ul>	

Attribute	Type	Notes	See Also
		<ul style="list-style-type: none"> <li>• MiscData(1) to PData2</li> </ul> and so on	
<b>Name</b>	<i>String</i>	Read/Write The connector name	
<b>Notes</b>	<i>String</i>	Read/Write Descriptive notes about the connector	
<b>ObjectType</b>	<a href="#">ObjectTyp</a> <small>e<sup>[1850]</sup></small>	Read only Distinguishes objects referenced through a Dispatch interface	
<b>Properties</b>	<a href="#">Properties</a> <small>[1924]</small>	Returns a list of specialized properties applicable to the connector that might not be available using the automation model  The properties are purposely undocumented because of their obscure nature and because they are subject to change as progressive enhancements are made to them	
<b>RouteStyle</b>	<i>Long</i>	Read/Write The route style	
<b>SequenceNo</b>	<i>Long</i>	Read/Write The <i>SequenceNo</i> of the connector	
<b>StartPointX</b>	<i>Long</i>	Read/Write The x-coordinate of the connector's start point Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen	
<b>StartPointY</b>	<i>Long</i>	Read/Write The y-coordinate of the connector's start point Connector end points are specified in Cartesian coordinates with the origin to the top left of the screen	
<b>StateFlags</b>	<i>String</i>	Read/Write Structure to hold a variety of flags concerned with State signaling on messages, the list delimited by semi-colons	
<b>Stereotype</b>	<i>String</i>	Read/Write Sets or gets the stereotype for this connector end	
<b>StereotypeEx</b>	<i>String</i>	Read/Write All the applied stereotypes of the connector in a comma-separated list	
<b>StyleEx</b>	<i>String</i>	Read/Write Advanced style settings; reserved for the use of Sparx Systems	
<b>Subtype</b>	<i>String</i>	Read/Write	

Attribute	Type	Notes	See Also
		A possible subtype to refine the meaning of the connector	
SupplierEnd	<a href="#">ConnectorEnd</a> <sup>[193]</sup>	Read only A pointer to the <i>ConnectorEnd</i> object representing the target end of the relationship	
SupplierID	Long	Read/Write <i>ElementID</i> of the element at the target end of this connector	
TaggedValues	Collection	Read only Collection of <i>ConnectorTag</i> objects	
TransitionAction	String	Read/Write See the <i>Transition</i> topic for appropriate values	<a href="#">Transition</a> <sup>[1015]</sup>
TransitionEvent	String	Read/Write See the <i>Transition</i> topic for appropriate values	<a href="#">Transition</a> <sup>[1015]</sup>
TransitionGuard	String	Read/Write See the <i>Transition</i> topic for appropriate values	<a href="#">Transition</a> <sup>[1015]</sup>
Type	String	Read/Write Connector type; valid types are held in the <i>t_connectortypes</i> table in the .EAP file	
VirtualInheritance	String	Read/Write For <i>Generalization</i> , indicates if inheritance is virtual	
Width	Long	Read/Write Specifies the width of the connector	

#### Connector Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object  This function is rarely used, as an exception is thrown when an error occurs
Update ()	Boolean	Update the current <i>ConnectorObject</i> after modification or appending a new item  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information

#### 18.2.2.7.2 ConnectorConstraint Class

A *ConnectorConstraint* holds information about special conditions that apply to a connector. It is accessed through the Connector *Constraints* collection.

Associated table in .EAP file: *t\_connectorconstraints*

ConnectorConstraint Attributes

Attribute	Type	Notes
ConnectorID	Long	Read/Write. A local ID value (long) - system generated.
Name	String	Read/Write. The constraint name.
Notes	String	Read/Write. Notes about this constraint.
ObjectType	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
Type	String	Read/Write. The constraint type.

ConnectorConstraint Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current <i>ConnectorConstraint</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.7.3 ConnectorEnd Class**

A *ConnectorEnd* contains information about a single end of a connector. A *ConnectorEnd* is accessed from the connector as either the *ClientEnd* or *SupplierEnd*.

Associated table in .EAP file: derived from *t\_connector*

ConnectorEnd Attributes

Attribute	Type	Notes	See Also
Aggregation	Long	Read/Write. Aggregation as it applies to this end. Valid values are:  <b>0</b> = None <b>1</b> = Shared <b>2</b> = Composite.	
Alias	String	Read/Write. An optional alias for this connector end.	
AllowDuplicat es	Boolean	Read/Write. For multiplicities greater than 1, indicates that duplicate entries are possible.	
Cardinality	String	Read/Write. Cardinality associated with this end.	
Constraint	String	Read/Write. A constraint that can be applied to this connector end.	
Containment	String	Read/Write. Containment type applied to this connector	

Attribute	Type	Notes	See Also
		end.	
<b>Derived</b>	<i>Boolean</i>	Read/Write. Indicates that the value of this end is derived.	
<b>DerivedUnion</b>	<i>Boolean</i>	Read/Write. Indicates the value of this role derived from the union of all roles that subset this.	
<b>End</b>	<i>String</i>	Read only. The end this <i>ConnectorEnd</i> object applies to: <i>Client</i> or <i>Supplier</i> .	
<b>IsChangeable</b>	<i>String</i>	Read/Write. Flag indicating whether this end is changeable or not. Values: <b>frozen</b> , <b>addOnly</b> or <b>none</b> .	
<b>IsNavigable</b>	<i>Boolean</i>	Read/Write. Flag indicating this end is navigable from the other end.	
<b>Navigable</b>	<i>String</i>	Read/Write. Indicates whether this role of an association is navigable from the opposite classifier. Three values are valid: <i>Navigable</i> , <i>Non-Navigable</i> and <i>Unspecified</i> .	
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.	
<b>Ordering</b>	<i>Long</i>	Read/Write. Ordering for this connector end.	
<b>OwnedByClassifier</b>	<i>Boolean</i>	Read/Write. Indicates this Association end corresponds to an attribute on the opposite end of the Association.	
<b>Qualifier</b>	<i>String</i>	Read/Write. A qualifier that can apply to connector end.	
<b>Role</b>	<i>String</i>	Read/Write. The connector end role.	
<b>RoleNote</b>	<i>String</i>	Read/Write. Notes associated with the role of this connector end.	
<b>RoleType</b>	<i>String</i>	Read/Write. The role type applied to this end of the connector.	
<b>Stereotype</b>	<i>String</i>	Read/Write. Sets or gets the stereotype for this connector end.	
<b>StereotypeEx</b>	<i>String</i>	Read/Write. All the applied stereotypes of the connector end in a comma-separated list.	
<b>TaggedValues</b>	<i>Private</i>	Read only. Collection of <b>RoleTag</b> objects.	<a href="#">RoleTag Class</a> <small>[1934]</small>
<b>Visibility</b>	<i>String</i>	Read/Write. Scope associated with this connector end. Valid types are: <i>Public</i> , <i>Private</i> , <i>Protected</i> and <i>Package</i> .	

#### ConnectorEnd Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error

Method	Type	Notes
		occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ConnectorEnd</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

#### 18.2.2.7.4 ConnectorTag Class

A *ConnectorTag* is a Tagged Value for a connector and is accessed through the Connector *TaggedValues* collection.

Associated table in .EAP file: *t\_connectortag*

#### ConnectorTag Attributes

Attribute	Type	Notes
<b>ConnectorID</b>	<i>Long</i>	Read/Write. The local ID of the associated connector.
<b>FQName</b>	<i>String</i>	Read only. The fully qualified name of the tag.
<b>Name</b>	<i>String</i>	Read/Write. The tag or name.
<b>Notes</b>	<i>String</i>	Read/Write. Further descriptive notes about this tag. If <b>Value</b> (below) is set to " <b>&lt;memo&gt;</b> ", then <b>Notes</b> should contain the actual Tagged Value content.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>TagGUID</b>	<i>String</i>	Read/Write. A globally unique ID for this Tagged Value.
<b>TagID</b>	<i>Long</i>	Read only. A local ID to identify the Tagged Value.
<b>Value</b>	<i>String</i>	Read/Write. The value assigned to this tag. This field has a 255 character limit. If the value is greater than 255 characters long, set the value to " <b>&lt;memo&gt;</b> " and insert the body of text in the <b>Notes</b> attribute (above). When reading existing Tagged Values, if <b>Value</b> = " <b>&lt;memo&gt;</b> " then the developer should read the actual body of text from the <b>Notes</b> attribute.

#### ConnectorTag Methods

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object. This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the current <i>ConnectorTag</i> object after modification or appending a new item. If <b>false</b> is returned, check the <i>GetLastError</i>

Method	Type	Notes
		function for more information.

### 18.2.2.7.5 RoleTag Class

#### Reference:

Topic	Detail	See also
<b>General Usage</b>	<p>This interface provides access to the association Role Tagged Values. Each connector end has a RoleTag collection that can be accessed to add, delete and access the RoleTags.</p> <p>In code you create something that resembles the following (where con is a Connector Object):</p> <p>Code fragment for accessing a RoleTag in VB.NET:</p> <pre> client = con.ClientEnd client.Role = "m_client" client.Update() tag = client.TaggedValues.AddNew ("tag", "value") tag.Update() tag = client.TaggedValues.AddNew ("tag2", "value2") tag.Update() client.TaggedValues.Refresh() For idx = 0 To client.TaggedValues. Count - 1 (idx)    tag = client.TaggedValues.Get At         Console.WriteLine(tag.Tag) client.TaggedValues.DeleteAt (idx, False) Next tag = Nothing </pre>	

#### RoleTag Attributes

Attribute	Type	Notes
<b>BaseClass</b>	<i>String</i>	Read/Write. Indicates the role end; set to <b>ASSOCIATION_SOURCE</b> or <b>ASSOCIATION_TARGET</b> .
<b>ElementGUID</b>	<i>String</i>	Read/Write. GUID of the connector with which this role tag is associated.
<b>FQName</b>	<i>String</i>	Read only. The fully qualified name of the tag.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>PropertyGUID</b>	<i>String</i>	Read/Write. A system generated GUID to identify the Tagged Value.
<b>Tag</b>	<i>String</i>	Read/Write. The actual tag name.
<b>Value</b>	<i>String</i>	Read/Write. The value associated with this tag.

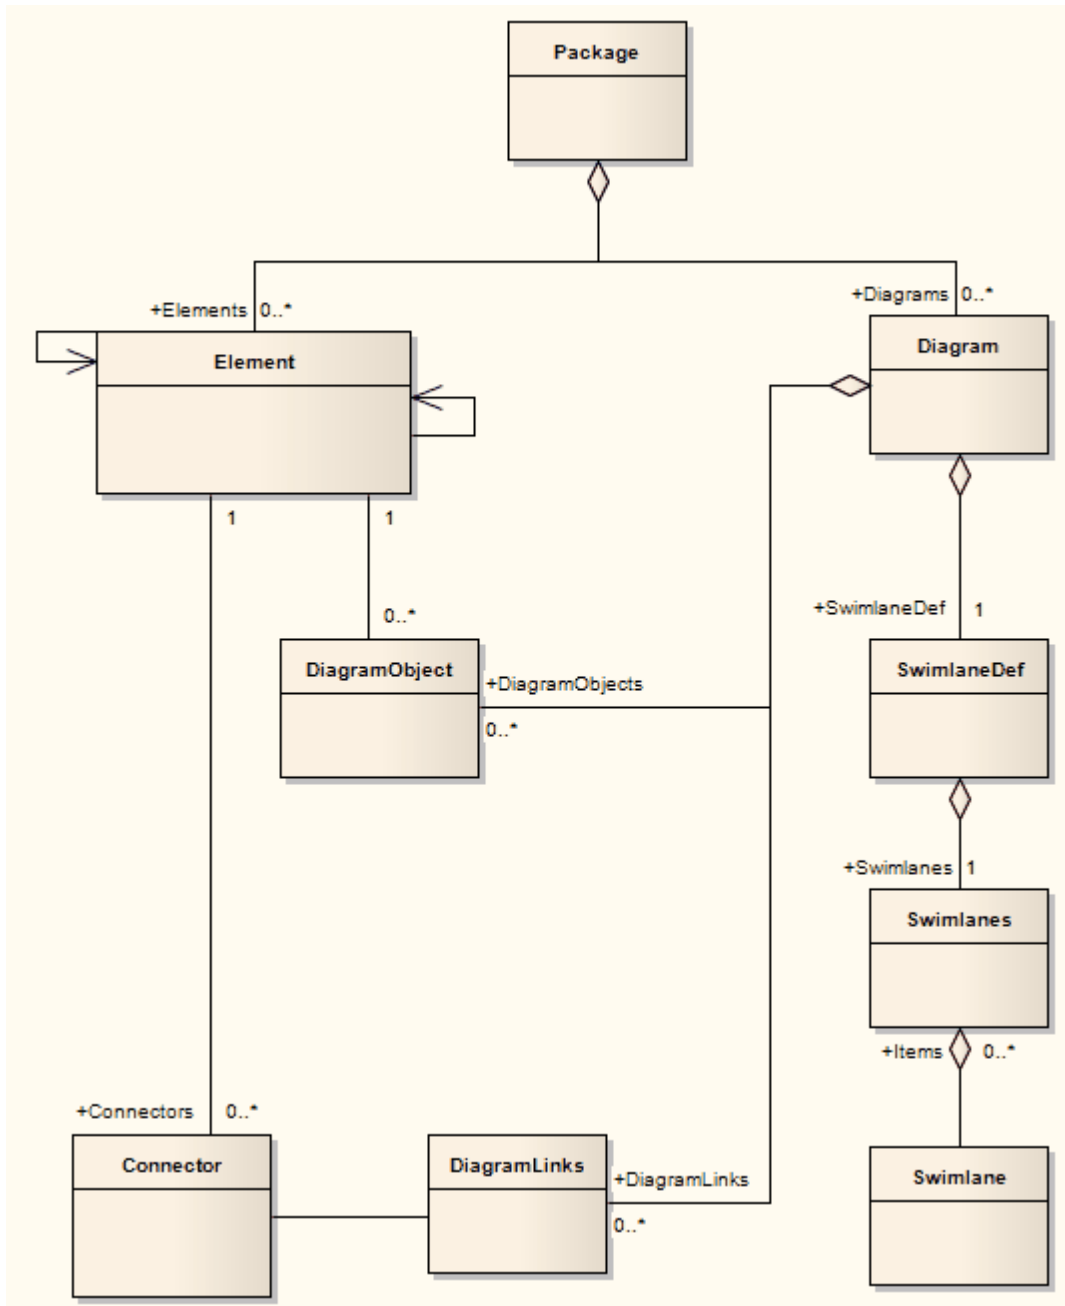

**RoleTag Methods**

Method	Type	Notes
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
<b>Update ()</b>	<i>Boolean</i>	Update the RoleTag after changes or on initial creation. If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

**18.2.2.8 Diagram Package**

The *Diagram* package has information on a diagram and on *DiagramObject* and *DiagramLink*, which are the instances of elements within a diagram.

**Example:**

18.2.2.8.1 Diagram Class

Topics:

Topic	Detail	See also
General Usage	A <i>Diagram</i> corresponds to a single Enterprise Architect diagram. It is accessed through the Package Diagrams collection and in turn contains a collection of diagram objects and diagram connectors. Adding to the <i>Diagram Object</i> Class adds an element to the diagram (the element must already exist). When adding a new diagram, you must set the diagram type to a valid type; these are:	

Topic	Detail	See also
	<ul style="list-style-type: none"> <li>• Activity</li> <li>• Analysis</li> <li>• Component</li> <li>• Custom</li> <li>• Deployment</li> <li>• Logical</li> <li>• Sequence</li> <li>• Statechart</li> <li>• Use Case</li> </ul> <p>Use the Analysis type for a Collaboration Diagram.</p> <p>Associated table in .EAP file: <i>t_diagram</i></p>	

### Diagram Attributes

Attribute	Type	Notes	See Also
<b>Author</b>	<i>String</i>	Read/Write. The author.	
<b>CreatedDate</b>	<i>Date</i>	Read/Write. The date the diagram was created.	
<b>cx</b>	<i>Long</i>	Read/Write. The X dimension of the diagram (default is 800).	
<b>cy</b>	<i>Long</i>	Read/Write. The Y dimension of the diagram (default is 1100).	
<b>DiagramGUID</b>	<i>Variant</i>	Read/Write. A globally unique ID for this diagram.	
<b>DiagramID</b>	<i>Long</i>	Read only. A local ID for the diagram.	
<b>DiagramLinks</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. A list of <b>DiagramLink</b> objects, each containing information about the display characteristics of a connector in a diagram.  A <b>DiagramLink</b> is only created once a user modifies a connector in a diagram in some way. Until this condition has been met default values are used and the <b>DiagramLink</b> is not in use.	<a href="#">DiagramLink Class</a> <small>[1939]</small>
<b>DiagramObjects</b>	<a href="#">Collection</a> <small>[1856]</small>	Read only. A collection of references to <b>DiagramObjects</b> . A <b>DiagramObject</b> is an instance of an element in a diagram, and includes size and display characteristics.	<a href="#">DiagramObject Class</a> <small>[1940]</small>
<b>ExtendedStyle</b>	<i>String</i>	Read/Write. An extended style attribute.	
<b>HighlightImports</b>	<i>Boolean</i>	Read/Write. Flag to indicate elements from other packages should be highlighted.	
<b>IsLocked</b>	<i>Boolean</i>	Read/Write. Flag indicating whether this diagram is locked or not.	
<b>MetaType</b>	<i>String</i>	Read only. The diagram's domain-specific meta type, as defined by an MDG Technology.	
<b>ModifiedDate</b>	<i>Variant</i>	Read/Write. The date the diagram was last modified.	

Attribute	Type	Notes	See Also
Name	String	Read/Write. The diagram name.	
Notes	String	Read/Write. Set/retrieve notes for this diagram.	
ObjectType	<a href="#">ObjectTy pe</a> <sup>[1850]</sup>	Read only. Distinguishes objects referenced through a Dispatch interface.	
Orientation	String	Read/Write. Page orientation: <b>P</b> for Portrait or <b>L</b> for Landscape.	
PackageID	Long	Read/Write. An ID of the package that this diagram belongs to.	
ParentID	Long	Read/Write. An optional ID of an element that 'owns' this diagram; for example, a Sequence diagram owned by a Use Case.	
Scale	Long	Read/Write. The zoom scale (default is 100).	
SelectedConnector	<a href="#">Connect or</a> <sup>[1926]</sup>	Read/Write. The currently selected connector on this diagram. Null if there is no currently selected diagram.	
SelectedObjects	<a href="#">Collectio n</a> <sup>[1856]</sup>	Read only. Gets a collection representing the currently selected elements on the diagram. Can remove objects from this collection to deselect them, and add elements to the collection by passing the Object ID as a name to select them.	
ShowDetails	Long	Read/Write. Flag to indicate Diagram Details text should be shown. <b>1</b> = Show, <b>0</b> = Hide.	
ShowPackageContents	Boolean	Read/Write. Flag to indicate package contents should be shown in the current diagram.	
ShowPrivate	Boolean	Read/Write. Flag to show or hide Private features.	
ShowProtected	Boolean	Read/Write. Flag to show or hide Protected features.	
ShowPublic	Boolean	Read/Write. Flag to show or hide Public features.	
Stereotype	String	Read/Write. Sets or gets the stereotype for this diagram.	
StyleEx	String	Read/Write. Advanced style settings. Reserved for the use of Sparx Systems.	
Swimlanes	String	Read/Write. Information on swimlanes contained in the diagram. Please note that this property is superseded by <b>SwimlaneDef</b> .	<a href="#">SwimlaneDef Class</a> <sup>[1942]</sup>
SwimlaneDef	<a href="#">Swimlan eDef</a> <sup>[1942]</sup>	Read/Write. Information on swimlanes contained in the diagram.	
Type	String	Read only. The diagram type. See the <i>t_diagramtypes</i> table in the .EAP file for more information.	
Version	String	Read/Write. The version of the diagram.	

### Diagram Methods

Method	Type	Notes	See Also
<b>ApplyGroupLock (string aGroupName)</b>	<i>Boolean</i>	Applies a group lock to this diagram object, for the specified group, on behalf of the current user.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.  Parameter: <ul style="list-style-type: none"> <li>aGroupName: String - the name of the user group for which to set the group lock</li> </ul>	
<b>ApplyUserLock ()</b>	<i>Boolean</i>	Applies a user lock to this diagram object, for the current user.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.	
<b>GetLastError ()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.	
<b>ReleaseUserLock ()</b>	<i>Boolean</i>	Releases a group lock or user lock on this diagram object.  Throws an exception if the operation fails. Use <i>GetLastError()</i> to retrieve error information.	
<b>ReorderMessages ()</b>	<i>Void</i>	Resets the display order of Sequence and Collaboration messages. Typically used after inserting or deleting messages in the diagram.	
<b>ShowAsElement List (bool ShowAsList, bool Persist)</b>	<i>Boolean</i>	Toggles the diagram display between diagram format and <b>Diagram List</b> depending on the value of <i>ShowAsList</i> .  If <i>Persist</i> is set, the display format is written to the database so the diagram always opens in that format (diagram or list). Otherwise, the display format falls back to the default (diagram) once the display is closed.  Parameters: <ul style="list-style-type: none"> <li>ShowAsList: Boolean - indicates diagram or <b>Diagram List</b></li> <li>Persist: Boolean - indicates set (maintain <i>ShowAsList</i> value) or not (revert to default)</li> </ul>	<a href="#">Diagram List</a> [464]
<b>Update ()</b>	<i>Boolean</i>	Updates this diagram object after modification or appending a new item.  If <b>false</b> is returned, use <i>GetLastError()</i> to retrieve error information.	

### 18.2.2.8.2 DiagramLinks Class

A *DiagramLink* is an object that holds display information about a connector between two elements in a specific diagram. It includes, for example, the custom points and display appearance. It can be accessed from the Diagram **DiagramLinks** collection.

Associated table in .EAP file: *t\_diagramlinks*

#### DiagramLinks Attributes

Attribute	Type	Notes
ConnectorID	Long	Read/Write. The ID of the associated connector.
DiagramID	Long	Read/Write. The local ID for the associated diagram.
Geometry	String	Read/Write. The geometry associated with the current connector in this diagram.
InstanceID	Long	Read only. Holds the connector identifier for the current model.
IsHidden	Boolean	Read/Write. Flag to indicate if this item is hidden or not.
ObjectType	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.
Path	String	Read/Write. The path of the connector in this diagram.
Style	String	Read/Write. Additional style information; for example, color, thickness.

#### DiagramLinks Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.
Update ()	Boolean	Update the current <i>DiagramLink</i> object after modification or appending a new item.  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information.

- [DiagramLinks](#) [1937]

#### **18.2.2.8.3 DiagramObject Class**

The *DiagramObject* Class stores presentation information that indicates what is displayed in a diagram and how it is shown.

Associated table in .EAP file: *t\_diagramobjects*

#### DiagramObject Attributes

Attribute	Type	Notes	See Also
Bottom	Long	Read/Write; the bottom position of the element	
DiagramID	Long	Read/Write; the ID of the associated diagram (long)	
ElementID	Long	Read/Write; the <i>ElementID</i> of the object instance in this diagram	
InstanceID	Long	Read/Write; read only attribute that holds the connector	

Attribute	Type	Notes	See Also
		identifier for the current model	
Left	Long	Read/Write; the left position of the element	
ObjectType	<a href="#">ObjectTyp</a> <small>e<sup>[1850]</sup></small>	Read only; distinguishes objects referenced through a Dispatch interface	
Right	Long	Read/Write; the right position of the element	
Sequence	Long	Read/Write; the sequence position when loading into diagram (affects Z order)  The Z-order is one-based and the lowest value is in the foreground	
Style	Variants	Write only (reading this value gives undefined results); style information for this object	<a href="#">Setting the Style</a> <small>[1941]</small>
Top	Long	Read/Write; the top position of the element	

#### DiagramObject Methods

Method	Type	Notes
GetLastError ()	String	Returns a string value describing the most recent error that occurred in relation to this object  This function is rarely used as an exception is thrown when an error occurs
Update ()	Boolean	Update the current <i>Diagram Object</i> after modification or appending a new item  If <b>false</b> is returned, check the <i>GetLastError</i> function for more information

#### Topics:

Topic	Detail	See also
Setting The Style	<p>The <i>Style</i> attribute is used for setting the appearance of a <i>DiagramObject</i>; it is set with a string value in the format:</p> <p>BCol =n; BFol =n; LCol =n; LWth =n;</p> <p>where:</p> <ul style="list-style-type: none"> <li>• <i>BCol</i> = Background Color</li> <li>• <i>BFol</i> = Font Color</li> <li>• <i>LCol</i> = Line Color</li> <li>• <i>LWth</i> = Line Width</li> </ul> <p>The color value is a decimal representation of the hex RGB value, where Red=FF, Green=FF00 and Blue=FF0000; for example:</p> <p>DiagramObject.Style = " BCol =35723; BFol =9342520; LCol =9342520; LWth =1; "</p>

	<p>The following code snippet shows how you might change the style settings for all of the objects in the current diagram, in this case changing everything to red:</p> <pre> For Each aDiagramObj In aDiagram.DiagramObjects     aDiagramObj.Style = "BColor=255; BFColor=9342520; LColor=9342520; LWidth=1;"     aDiagramObj.Update aRepos.ReloadDiagram aDiagramObj.  DiagramL D Next </pre>	

#### 18.2.2.8.4 SwimlaneDef Class

A *SwimlaneDef* object makes available attributes relating to a single row or column in a list of swimlanes.

Attribute	Type	Notes
<b>Bold</b>	<i>Boolean</i>	Read/Write. Show the title text in bold.
<b>FontColor</b>	<i>Long</i>	Read/Write. RGB color used to draw the titles.
<b>HideClassifier</b>	<i>Boolean</i>	Read/Write. Removes any classifier from title display.
<b>HideNames</b>	<i>Boolean</i>	Read/Write. Set to true to hide the swimlane titles.
<b>LineColor</b>	<i>Long</i>	Read/Write. RGB color used to draw swimlane borders.
<b>LineWidth</b>	<i>Long</i>	Read/Write. Width of line, in pixels, used to draw swimlanes. Valid values: <b>1</b> , <b>2</b> or <b>3</b> .
<b>Locked</b>	<i>Boolean</i>	Read/Write. If set to true, disables user modification of the swimlanes via the diagram.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.
<b>Orientation</b>	<i>String</i>	Read/Write. Indication of whether the swimlanes are vertical or horizontal.
<b>ShowInTitleBar</b>	<i>Boolean</i>	Read/Write. Enables vertical swimlane titles to be shown in title bar.
<b>Swimlanes</b>	<a href="#">Swimlanes</a> [1942]	Read/Write. A list of individual swimlanes.

#### 18.2.2.8.5 Swimlanes Class

A *Swimlanes* object is attached to a diagram's **SwimlaneDef** object and provides a mechanism to access individual swimlanes.

##### Swimlanes Attributes

Attribute	Type	Notes
<b>Count</b>	<i>Long</i>	Read/Write. Gives the number of swimlanes.
<b>ObjectType</b>	<a href="#">ObjectType</a> [1850]	Read only. Distinguishes objects referenced through a Dispatch interface.

Swimlanes Methods

Method	Type	Notes
<b>Add (string Title, long Width)</b>	<a href="#">Swimlane</a> <small>[1943]</small>	Adds a new swimlane to the end of the list. Returns a swimlane object representing the newly added entry.  Parameters: <ul style="list-style-type: none"> <li>Title: String - The title text that appears at the top of the swimlane. Can be the same as an existing swimlane title.</li> <li>Width: Long - The width of the swimlane in pixels.</li> </ul>
<b>Delete (object Index)</b>	<i>Void</i>	Deletes a selected swimlane.  If the string matches more than one entry, only the first entry is deleted.  Parameter: <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to delete.</li> </ul>
<b>DeleteAll ()</b>	<i>Void</i>	Removes all swimlanes.
<b>Insert (long Index, string Title, long Width)</b>	<a href="#">Swimlane</a> <small>[1943]</small>	Inserts a swimlane at a specific position. Returns a swimlane object representing the newly added entry.  Parameters: <ul style="list-style-type: none"> <li>Index: Long - The zero-based index of the existing Swimlane before which this new entry is inserted.</li> <li>Title: String - The title text which appears at the top of the swimlane. Can be the same as an existing swimlane title.</li> <li>Width: Long - The width of the swimlane in pixels.</li> </ul>
<b>Items (object Index)</b>	<a href="#">Swimlane</a> <small>[1943]</small> <i>collection</i>	Accesses an individual swimlane.  If the string matches more than one swimlane title, the first matching swimlane is returned.  Parameter: <ul style="list-style-type: none"> <li>Index: Object - Either a string representing the title text or an integer representing the zero-based index of the swimlane to get.</li> </ul>

Learn More:

- [SwimlaneDef Class](#) [1942]

**18.2.2.8.6 Swimlane Class**

A *Swimlane* object makes available attributes relating to a single row or column in a list of **swimlanes**.

Attribute	Type	Notes
<b>BackColor</b>	<i>Long</i>	Read/Write. The swimlane is filled with this RGB color.
<b>ClassifiedGuid</b>	<i>String</i>	Read/Write. The GUID of the classifier Class. This can be obtained from the corresponding Element object via the <i>ElementGUID</i> property.
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

Attribute	Type	Notes
<b>Title</b>	<i>String</i>	Read/Write. Text at the head of the swimlane.
<b>Width</b>	<i>Long</i>	Read/Write. The width of the swimlane in pixels.

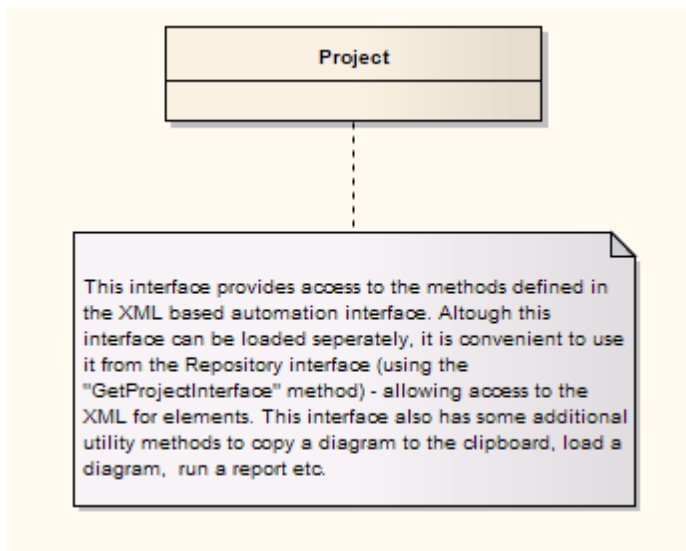

Learn More:

- [Swimlane Class](#) [1942]

### 18.2.2.9 Project Interface Package

The *Enterprise Architect.Project* interface. This is the XML-based interface to Enterprise Architect elements; it also includes some utility functions. You can get a pointer to this interface using the *Repository*. *GetProjectInterface* method.

Example:

#### 18.2.2.9.1 Project Class

The Project interface can be accessed from the Repository using *GetProjectInterface()*. The returned interface provides access to the XML-based Enterprise Architect Automation Interface. Use this interface to get XML for the various internal elements and to run some utility functions to perform tasks such as load diagrams or run reports.

Project Attributes

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">ObjectType</a> <small>[1850]</small>	Read only Distinguishes objects referenced through a Dispatch interface

Project Methods

Method	Type	Notes	See Also
<b>CreateBaseline</b> (string PackageGUID, string Version, string Notes)	<i>Boolean</i>	Creates a Baseline of a specified package Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to Baseline</li> <li>Version: String - the version of the Baseline</li> <li>Notes: String - any notes concerning the Baseline</li> </ul>	
<b>CreateBaselineEx</b> (string PackageGUID, string Version, string Notes, EA.CreateBaselineFlag Flags)	<i>Boolean</i>	Creates a Baseline of a specified package, with a flag to <b>exclude package contents</b> below the first level Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to Baseline</li> <li>Version: String - the version of the Baseline</li> <li>Notes: String - any notes concerning the Baseline</li> <li>Flags: <b>EA.CreateBaselineFlag</b> - whether or not to exclude package contents below the first level</li> </ul>	<a href="#">Create Baselines</a> <sup>[314]</sup> <a href="#">EA.CreateBaselineFlag</a> <sup>[1847]</sup>
<b>DefineRule</b> (string CategoryID, EA.EnumMVErrortype ErrorType, string ErrorMessage)	<i>String</i>	Defines the individual rules that can be performed during model validation. It must be called once for each rule from the <b>EA_OnInitializeUserRules</b> broadcast handler.  The return value is a <i>RuleId</i> , which can be used for reference purposes when an individual rule is executed by Enterprise Architect during model validation.  See <b>Model Validation Example</b> for a detailed example of use of this method. Parameters: <ul style="list-style-type: none"> <li>CategoryId: String - should be passed the return value from the <b>DefineRuleCategory</b> method.</li> <li>ErrorType: EA.EnumMVErrortype - depending on the severity of the error being validated, can be: <ul style="list-style-type: none"> <li><b>mvErrorCritical</b></li> <li><b>mvError</b></li> <li><b>mvWarning</b>, or</li> <li><b>mvInformation.</b></li> </ul> </li> <li>ErrorMessage: String - can contain a default error string, although this is probably overridden by the</li> </ul>	<a href="#">EA_OnInitializeUserRules</a> <sup>[2015]</sup> <a href="#">Model Validation Example</a> <sup>[2021]</sup> <a href="#">DefineRuleCategory</a> <sup>[1946]</sup> <a href="#">PublishResult</a> <sup>[1958]</sup>

Method	Type	Notes	See Also
		<b>PublishResult</b> call.	
<b>DefineRuleCategory</b> (string CategoryName)	String	<p>Defines a category of rules that can be performed during model validation (there is typically one category per Add-In). It must be called once <i>from the</i> <b>EA_OnInitializeUserRules</b> broadcast handler.</p> <p>The return value is a CategoryId that must to be passed to the <b>DefineRule</b> method.</p> <p>See <b>Model Validation Example</b> for a detailed example of use of this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• CategoryName: String - a text string that is visible in the <b>Model Validation Configuration</b> dialog.</li> </ul>	<a href="#">EA_OnInitializeUserRules</a> <sup>[2015]</sup> <a href="#">DefineRule</a> <sup>[1945]</sup> <a href="#">Model Validation Example</a> <sup>[2021]</sup>
<b>DeleteBaseline</b> (string BaselineGUID)	Boolean	<p>Deletes a Baseline, identified by the BaselineGUID, from the repository.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• BaselineGUID: String - the GUID (in XML format) of the Baseline to delete.</li> </ul>	
<b>DoBaselineCompare</b> (string PackageGUID, string Baseline, string ConnectString)	String	<p>Performs a Baseline comparison using the supplied package GUID and Baseline GUID (obtained in the result list <i>from</i> <b>GetBaselines</b>).</p> <p>Optionally you can include the connection string required to find the Baseline if it exists in a different model file.</p> <p>This method returns a log file of the status of all elements found and compared in the difference procedure. You can use this log information as input to <b>DoBaselineMerge</b> - automatically merging information from the Baseline.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package to run the comparison on.</li> <li>• Baseline: String - the GUID (in XML format) of the Baseline to run the comparison on.</li> <li>• ConnectString: String - the location of the external .EAP file or DBMS to extract the Baseline from.</li> </ul>	<a href="#">GetBaselines</a> <sup>[1952]</sup> <a href="#">DoBaselineMerge</a> <sup>[1946]</sup>
<b>DoBaselineMerge</b> (string PackageGUID, string Baseline, string MergeInstructions, string ConnectString)	String	<p>Performs a batch merge based on instructions contained in an XML file (<i>MergeInstructions</i>). You can supply an optional connection string if the Baseline is located in another model.</p> <p>In the <i>MergeInstructions</i> file, each</p>	<a href="#">DoBaselineCompare()</a> <sup>[1946]</sup>

Method	Type	Notes	See Also
		<p><i>MergeItem</i> node supplies the GUID of a differenced item from the XML difference log. As the merge is uni-directional and actioned in only one possible way, no additional arguments are required. Enterprise Architect chooses the correct procedure based on the Difference results.</p> <pre>&lt;Merge&gt;   &lt;MergeItem guid="{XXXXXXXX}" /&gt;   &lt;MergeItem guid="{XXXXXXXX}" /&gt; &lt;/Merge&gt;</pre> <p>Alternatively, you can supply a single <i>MergeItem</i> with a GUID of <i>RestoreAll</i>. In this case, Enterprise Architect batch-processes ALL differences.</p> <pre>&lt;Merge&gt;   &lt;MergeItem guid="RestoreAll"   changed="true"   baselineOnly="true"   modelOnly="true"   moved="true" fullRestore="false" / &gt; &lt;/Merge&gt;</pre> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to merge the Baseline into.</li> <li>Baseline: String - the GUID of the Baseline (in XML format) to merge into the package.</li> <li>MergeInstructions: String - the file containing the GUID of each differenced item from the XML difference log returned by <b>DoBaselineCompare()</b>.</li> <li>ConnectionString: String - the location of the EAP file or DBMS to get the Baseline from, if not in the same model as the package.</li> </ul>	
<b>EnumDiagramElements (string DiagramGUID)</b>	protected abstract: <i>String</i>	<p>Gets an XML list of all elements in a diagram.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to get elements for.</li> </ul>	
<b>EnumDiagrams (string PackageGUID)</b>	protected abstract: <i>String</i>	<p>Gets an XML list of all diagrams in a specified package.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in</li> </ul>	

Method	Type	Notes	See Also
		XML format) of the package to list diagrams for.	
<b>EnumElements (string PackageGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of elements in a specified package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to get a list of elements for.</li> </ul>	
<b>EnumLinks (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of connectors for a specified element. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element to get all associated connectors for.</li> </ul>	
<b>EnumPackages (string PackageGUID)</b>	protected abstract: <i>String</i>	Gets an XML list of child packages inside a parent package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the parent package.</li> </ul>	
<b>EnumProjects ()</b>	protected abstract: <i>String</i>	Gets a list of projects in the current file; corresponds to <b>Models</b> in <i>Repository</i> .	<a href="#">Models</a> <small>f1871</small>
<b>EnumViews ()</b>	protected abstract: <i>String</i>	Enumerates the Views for a project. Returned as an XML document.	
<b>EnumViewEx (string ProjectGUID)</b>	protected abstract: <i>String</i>	Gets a list of Views in the current project. Parameters: <ul style="list-style-type: none"> <li>ProjectGUID: String - the GUID (in XML format) of the project to get views for.</li> </ul>	
<b>Exit ()</b>	protected abstract: <i>String</i>	Exits the current instance of Enterprise Architect; this function is maintained for backward compatibility and should never be called.  Enterprise Architect automatically exits when you are no longer using any of the provided objects.	
<b>ExportPackageXML (string PackageGUID, enumXMIMType XMIMType, long DiagramXML, long DiagramImage, long FormatXML, long UseDTD, string FileName)</b>	protected abstract: <i>String</i>	Exports XMI for a specified package. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to be exported.</li> <li>XMIMType: EnumXMIMType - specifies the XMI type and version information; see <b>XMIMType Enum</b> for accepted values.</li> <li>DiagramXML: Long - <b>true</b> if XML for</li> </ul>	<a href="#">XMIMType Enum</a> <small>f1853</small>

<b>GenerateClass</b> (string ElementGUID, string ExtraOptions)	<i>Boolean</i>	<p>Generates the code for a single Class.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>ElementGUID</b>: String - the GUID (in XML format) of the element to generate.</li> <li>• <b>ExtraOptions</b>: String - enables extra options to be given to the command; currently unused.</li> </ul>	
<b>GenerateDiagramFromScenario</b> (string ElementGUID, EnumScenarioDiagramType DiagramType, long OverwriteExistingDiagram)	<i>Boolean</i>	<p>Generates various diagrams from the Structured Specification of an element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>ElementGUID</b>: String - the GUID (in XML format) of the element containing the Structured Specification.</li> <li>• <b>DiagramType</b>: EnumScenarioDiagramType - the type of diagram to generate; see <b>ScenarioDiagramType Enum</b> for accepted values</li> <li>• <b>OverwriteExistingDiagram</b>: Long - determines whether to overwrite the existing diagram or synchronize the existing elements with the scenario steps <ul style="list-style-type: none"> <li><b>0</b> = Delete existing diagram and elements, and create new diagram and elements</li> <li><b>1</b> = Synchronize existing elements with scenario steps and preserve diagram layout</li> <li><b>2</b> = Synchronize existing elements with scenario steps and re-cast diagram layout</li> <li><b>3</b> = Do not generate diagram if one already exists.</li> </ul> </li> </ul>	<a href="#">ScenarioDiagramType Enum</a> <sup>[1852]</sup>
<b>GenerateElementDDL</b> (string ElementGUID, string FileName, string ExtraOptions)	<i>Boolean</i>	<p>Generates DDL for an element</p> <p>For example:</p> <pre>owner = true; pkfkconstraints = true; comment level = 3;</pre> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• <b>ElementGUID</b>: String – the GUID (in XML</li> </ul>	

Method	Type	Notes	See Also
		<p>format) of the element to generate DDL for</p> <ul style="list-style-type: none"> <li>• FileName: String – the target file path to which to write the generated DDL</li> <li>• ExtraOptions: String – enables extra options to be given to the command; currently enables: <ul style="list-style-type: none"> <li>• Generate Owner (<i>owner</i>)</li> <li>• Generate PK/FK Key Constraints (<i>pkfkconstraints</i>)</li> <li>• Generate Comments (<b>0</b> – None, <b>1</b> - Table, <b>2</b> - Column, <b>3</b> - All)</li> </ul> </li> </ul>	
<b>GeneratePackage (string PackageGUID, string ExtraOptions)</b>	<i>Boolean</i>	<p>Generates the code for all Classes within a package.</p> <p>For example:</p> <pre>recurse=1; overwrite=1; dir=C:\</pre> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package to generate code for</li> <li>• ExtraOptions: String - enables extra options to be given to the command; currently enables: <ul style="list-style-type: none"> <li>• Generation of all subpackages (<i>recurse</i>)</li> <li>• Force overwrite of all files (<i>overwrite</i>) and</li> <li>• Specification to auto generate all paths (<i>dir</i>).</li> </ul> </li> </ul>	
<b>GeneratePackageDDL (string PackageGUID, string FileName, string ExtraOptions)</b>	<i>Boolean</i>	<p>Generates DDL for a package.</p> <p>For example:</p> <pre>owner=true; pkfkconstraints=true; commentlevel=3; singlefile=true; includechild=true;</pre> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String – the GUID (in XML format) of the package to generate DDL for</li> <li>• FileName: String – the target file path to which to write the generated DDL</li> <li>• ExtraOptions: String – enables extra options to be given to the command; currently enables: <ul style="list-style-type: none"> <li>• Generate DDL for child packages (</li> </ul> </li> </ul>	

Method	Type	Notes	See Also
		<p><i>includechild</i>)</p> <ul style="list-style-type: none"> <li>• Generate Owner (<i>owner</i>)</li> <li>• Generate PK/FK Key Constraints (<i>pkfkconstraints</i>)</li> <li>• Generate Comments (<b>0</b> - None, <b>1</b> - Table, <b>2</b> - Column, <b>3</b> - All)</li> <li>• Generate in SingleFile (<i>singlefile</i>)</li> </ul>	
<b>GenerateTestFromScenario</b> (string ElementGUID, EnumScenarioTestType TestType)	<i>Boolean</i>	<p>Generates either an <b>Internal test</b> or an <b>External test</b> from the Structured Specification of an element.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• ElementGUID: String - the GUID (in XML format) of the element containing the Structured Specification</li> <li>• TestType: EnumScenarioTestType - the type of test to generate; see <b>ScenarioTestType Enum</b> for accepted values</li> </ul>	<p><a href="#">Generate Test Cases</a> <sup>[687]</sup></p> <p><a href="#">ScenarioTestType Enum</a> <sup>[1853]</sup></p>
<b>GenerateXSD</b> (string PackageGUID, string FileName, string Encoding, string Options)	<i>Boolean</i>	<p>Creates an XML schema for this GenerateXSD. Returns <b>true</b> on success.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package.</li> <li>• FileName: String - target filepath.</li> <li>• Encoding: String - the XML encoding for the code page instruction.</li> <li>• Options: String - enables extra options to be given to the command; currently enables: <ul style="list-style-type: none"> <li>• <i>GenGlobalElement</i> - turn the generation of global elements for all global <i>ComplexTypes</i> <b>On</b> or <b>Off</b>; for example: - GenGlobalElement = 1.</li> </ul> </li> </ul>	
<b>GetBaselines</b> (string PackageGUID, string ConnectString)	<i>String</i>	<p>Returns a list (in XML format) of Baselines associated with the supplied package GUID. Optionally, you can provide a connection string to get Baselines from the same package, but located in a different model file (or DBMS).</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package to get Baselines for.</li> <li>• ConnectString: String - the location of the EAP file or DBMS to get the Baselines from, if not in the same model as the package.</li> </ul>	

Method	Type	Notes	See Also
<b>GetDiagram (string DiagramGUID)</b>	protected abstract: <i>String</i>	Gets diagram details, in XML format. Parameters: <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to get details for.</li> </ul>	
<b>GetElement (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets XML for the specified element. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element to retrieve XML for.</li> </ul>	
<b>GetElementConstraints (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets constraints for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementEffort (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets efforts for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementFiles (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets metrics for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementMetrics (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets files for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementProblems (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of issues (problems) associated with an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementProperties (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets Tagged values for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementRequirements (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of requirements for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementResources (string ElementGUID)</b>	protected abstract:	Gets a list of resources for an element, in XML format.	

Method	Type	Notes	See Also
	<i>String</i>	Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementRisks (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of risks associated with an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementScenarios (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of scenarios for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetElementTests (string ElementGUID)</b>	protected abstract: <i>String</i>	Gets a list of tests for an element, in XML format. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element.</li> </ul>	
<b>GetLastError ()</b>	protected abstract: <i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.  This function is rarely used as an exception is thrown when an error occurs.	
<b>GetLink (string LinkGUID)</b>	protected abstract: <i>String</i>	Gets connector details, in XML format. Parameters: <ul style="list-style-type: none"> <li>LinkGUID: String - the GUID (in XML format) of the connector to get details of.</li> </ul>	
<b>GUIDtoXML (string GUID)</b>	<i>String</i>	Changes an internal GUID to the form used in XML. Parameters: <ul style="list-style-type: none"> <li>GUID: String - the Enterprise Architect style GUID to convert to XML format.</li> </ul>	
<b>ImportDirectory (string PackageGUID, string Language, string DirectoryPath, string ExtraOptions)</b>	<i>Boolean</i>	Imports a source code directory into the model. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to reverse engineer code into.</li> <li>Language: String - specifies the language of the code to be imported.</li> <li>DirectoryPath: String - specifies the path where the code is found on the computer.</li> <li>ExtraOptions: String - enables extra</li> </ul>	

Method	Type	Notes	See Also
		options to be given to the command; currently enables import of source from all child directories ( <i>recurse</i> ) - for example: <i>recurse=1</i> .	
<b>ImportFile</b> (string PackageGUID, string Language, string FileName, string ExtraOptions)	<i>Boolean</i>	Imports an individual file or binary module into the model, in a package per namespace style import. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to reverse engineer code into; this is expected to be a namespace root package.</li> <li>Language: String - specifies the language of the code to be imported.</li> </ul> Use the value " <b>DNPE</b> " to import a binary module. This imports a .Net assembly or Java .class file, but <b>not</b> a .jar file. <ul style="list-style-type: none"> <li>Filename: String - specifies the path where the code or module is found on the computer.</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently unused.</li> </ul>	
<b>ImportPackageXML</b> (string PackageGUID, string Filename, long ImportDiagrams, long StripGUID)	<i>String</i>	Imports an XML file at a point in the tree. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the target package to import the XML file into (or overwrite with the XML file).</li> <li>Filename or XMLText: String - the name of the XML file</li> </ul> If the String is of type <i>filename</i> it is interpreted as a source file, otherwise the String is imported as XML text. <ul style="list-style-type: none"> <li>ImportDiagrams: Long.</li> <li>StripGUID: Long - boolean value to indicate whether to replace the element UniqueIDs on import; if stripped, then a package could be imported twice into Enterprise Architect, as two different versions.</li> </ul>	
<b>LayoutDiagram</b> (string DiagramGUID, long LayoutStyle)	<i>Boolean</i>	<b>Deprecated.</b> it is recommended that <i>LayoutDiagramEx</i> is used instead. Calls the function to automatically layout a diagram in hierarchical fashion. It is only recommended for Class and Object diagrams.	

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to lay out.</li> <li>LayoutStyle: Long - always ignored.</li> </ul>	
<b>LayoutDiagramEx (string DiagramGUID, long LayoutStyle, long Iterations, long LayerSpacing, long ColumnSpacing, boolean SaveToDiagram)</b>	<i>Boolean</i>	Calls the function to automatically layout a diagram in hierarchical fashion. It is only recommended for Class and Object diagrams.  <i>LayoutStyle</i> accepts the following options <ul style="list-style-type: none"> <li>Default Options:               <ul style="list-style-type: none"> <li>IsDiagramDefault</li> <li>IsProgramDefault.</li> </ul> </li> <li>Cycle Removal Options:               <ul style="list-style-type: none"> <li>IsCycleRemoveGreedy</li> <li>IsCycleRemoveDFS.</li> </ul> </li> <li>Layering Options:               <ul style="list-style-type: none"> <li>IsLayeringLongestPathSink</li> <li>IsLayeringLongestPathSource</li> <li>IsLayeringOptimalLinkLength.</li> </ul> </li> <li>Initialize Options:               <ul style="list-style-type: none"> <li>IsInitializeNaive</li> <li>IsInitializeDFSOut</li> <li>IsInitializeDFSIn.</li> </ul> </li> <li>Crossing Reduction Option:               <ul style="list-style-type: none"> <li>IsCrossReduceAggressive.</li> </ul> </li> <li>Layout Options - Direction               <ul style="list-style-type: none"> <li>IsLayoutDirectionUp</li> <li>IsLayoutDirectionDown</li> <li>IsLayoutDirectionLeft</li> <li>IsLayoutDirectionRight.</li> </ul> </li> </ul> Parameters: <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to lay out.</li> <li>LayoutStyle: Long - the layout style.</li> <li>Iterations: Long - the number of layout iterations the Layout process should take to perform cross reduction (Default value = 4).</li> <li>LayerSpacing: Long - the per-element layer spacing the Layout process shall use (Default value = 20).</li> <li>ColumnSpacing: Long - the per-element column spacing the Layout process shall use (Default value = 20).</li> <li>SaveToDiagram: Boolean - specifies whether or not Enterprise Architect should save the supplied layout options as default to the</li> </ul>	<a href="#">ConstLayoutStyles Enum</a> <sup>[1847]</sup>

Method	Type	Notes	See Also
		diagram in question.	
<b>LoadControlledPackage</b> (string PackageGUID)	String	Loads a package that has been marked and configured as controlled. The filename details are stored in the package control data.  Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to load.</li> </ul>	
<b>LoadDiagram</b> (string DiagramGUID)	protected abstract: Boolean	Loads a diagram by its GUID.  Parameter: <ul style="list-style-type: none"> <li>DiagramGUID: String - the GUID (in XML format) of the diagram to load; if you retrieve the GUID using the Diagram interface, use the <b>GUIDtoXML</b> function to convert it to XML format.</li> </ul>	<a href="#">GUIDtoXML</a> 
<b>LoadProject</b> (string FileName)	protected abstract: Boolean	Loads an Enterprise Architect project file  Do not use this method if you have accessed the Project interface from the Repository, which has already loaded a file  Parameters: <ul style="list-style-type: none"> <li>FileName: String - the name of the project file to load</li> </ul>	
<b>Migrate</b> (string GUID, string SourceType, string DestinationType)	Void	Migrates a model (or part of a model) from one BPMN or SysML format to an upgraded format  Parameters: <ul style="list-style-type: none"> <li>GUID: String - the GUID of the package or element for which the contents are to be migrated</li> <li>SourceType: String - the type of model to be upgraded; accepted values: <ul style="list-style-type: none"> <li><b>BPMN</b></li> <li><b>BPMN1.1</b></li> <li><b>SysML1.1</b></li> </ul> </li> <li>DestinationType: String - the type of model to upgrade to; accepted values: <ul style="list-style-type: none"> <li><b>BPMN1.1</b></li> <li><b>BPMN1.1::BPEL</b></li> <li><b>BPMN2.0</b></li> <li><b>SysML1.2</b></li> </ul> </li> </ul>	
<b>MigrateToBPMN11</b> (string GUID, string Type)	Void	Migrates every BPMN 1.0 construct in a package or an element (including elements, attributes, diagrams and connectors) to BPMN 1.1.  Parameters <ul style="list-style-type: none"> <li>GUID: String - the GUID of the</li> </ul>	

Method	Type	Notes	See Also
		<p>package or element for which the contents are to be migrated to BPMN 1.1</p> <ul style="list-style-type: none"> <li>Type: String - the type of upgrade, either just to BPMN 1.1 or to BPMN 1.1 and BPEL. Accepted values:</li> </ul> <p><b>BPMN</b> = migrate to BPMN 1.1  <b>BPEL</b> = migrate to BPMN 1.1 and update:</p> <ul style="list-style-type: none"> <li>any diagram with stereotype <i>BPMN</i> to <i>BPEL</i></li> <li>any element with stereotype <i>BusinessProcess</i> to <i>BPELProcess</i>.</li> </ul> <p>Migrating to BPEL is possible only in the Ultimate or Business and Software Engineering editions of Enterprise Architect.</p>	
<b>ProjectTransfer</b> (string SourceFilePath, string TargetFilePath, string LogFilePath)	<i>Boolean</i>	<p>Transfers the project from a .EAP file or DBMS to a .EAP file.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>SourceFilePath: String - the path of the source file to transfer.</li> <li>TargetFilePath: String - the path of the target file; Enterprise Architect creates a new Base project in this location.</li> <li>LogFilePath: String - the path of the log file where the status of the transfer process is updated.</li> </ul> <p>In automation, the target file does not have to exist. The file path is enough; Enterprise Architect creates a new, empty Base.EAP file and transfers the source project into it.</p>	
<b>PublishResult</b> (string CategoryID, EA.EnumMVErrorType ErrorType, string ErrorMessage)	<i>String</i>	<p>Returns the results of each rule that can be performed during model validation. It must be called once for each rule from the <b>EA_OnInitializeUserRules</b> broadcast handler.</p> <p>The return value is a <i>RuleId</i>, which can be used for reference purposes when an individual rule is executed by Enterprise Architect during model validation.</p> <p>See <b>Model Validation Example</b> for a detailed example of use of this method.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>CategoryId: String - should be passed the return value from the <b>DefineRuleCategory</b> method.</li> <li>ErrorType: EA.EnumMVErrorType -</li> </ul>	<p><a href="#">EA_OnInitializeUserRules</a> <sup>[2015]</sup></p> <p><a href="#">Model Validation Example</a> <sup>[2021]</sup></p> <p><a href="#">DefineRuleCategory</a> <sup>[1946]</sup></p>

Method	Type	Notes	See Also
		<p>depending on the severity of the error being validated, can be:</p> <ul style="list-style-type: none"> <li>• <b>mvErrorCritical</b></li> <li>• <b>mvError</b></li> <li>• <b>mvWarning</b>, or</li> <li>• <b>mvInformation</b>.</li> </ul> <ul style="list-style-type: none"> <li>• ErrorMessage: String - contains an error string.</li> </ul>	
<b>PutDiagramImageOnClipboard (string DiagramGUID, long Type)</b>	protected abstract: <i>Boolean</i>	<p>Copies an image of the specified diagram to the clipboard.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• DiagramGUID: String - the GUID (in XML format) of the diagram to copy.</li> <li>• Type: Long - the file type.</li> <li>• If Type = <b>0</b> then it is a metafile</li> <li>• If Type = <b>1</b> then it is a Device Independent Bitmap.</li> </ul>	
<b>PutDiagramImageToFile (string Diagram GUID, string FileName, long Type)</b>	protected abstract: <i>Boolean</i>	<p>Saves an image of the specified diagram to file.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• DiagramGUID: String - the GUID (in XML format) of the diagram to save.</li> <li>• FileName: String - the name of the file to save the diagram into.</li> <li>• Type: Long - the file type.</li> <li>• If type = <b>0</b> then it is a metafile</li> <li>• If type = <b>1</b> then it uses the file type from the name extension (that is, .bmp, .jpg, .gif, .png, .tga)</li> </ul>	
<b>ReloadProject ()</b>	protected abstract: <i>Boolean</i>	<p>Reloads the current project. This is a convenient method to refresh the current loaded project (in case of outside changes to the .EAP file).</p>	
<b>RunReport (string PackageGUID, string TemplateName, string Filename)</b>	protected abstract: <i>Void</i>	<p>Runs a named RTF report.</p> <p>Parameters:</p> <ul style="list-style-type: none"> <li>• PackageGUID: String - the GUID (in XML format) of the package to run the report on.</li> <li>• TemplateName: String - the RTF report template to use. If the PackageGUID has a stereotype of <i>MasterDocument</i>, the template is not required.</li> <li>• FileName: String - the file name to store the generated report in.</li> </ul>	
<b>RunHTMLReport (string PackageGUID, string ExportPath, string ImageFormat, string Style, string Extension)</b>	<i>String</i>	<p>Runs an HTML report (same as <b>Documentation   HTML Documentation</b> when you right-click on a package in the <b>Project Browser</b>).</p>	

Method	Type	Notes	See Also
		Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to run the report on.</li> <li>ExportPath: String - the file name to store the generated report in.</li> <li>ImageFormat: String.</li> <li>Style: String.</li> <li>Extension: String.</li> </ul>	
<b>SaveControlledPackage (string PackageGUID)</b>	<i>String</i>	Saves a package that has been configured as a controlled package, to XML. Only the package GUID is required, Enterprise Architect picks the rest up from the package control information. Parameter: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package to save.</li> </ul>	
<b>SaveDiagramImageToFile (string Filename)</b>	protected abstract: <i>String</i>	Saves a diagram image of the current diagram to file. Parameters: <ul style="list-style-type: none"> <li>FileName: String - the filename of the image to save.</li> </ul>	
<b>ShowWindow (long Show)</b>	protected abstract: <i>Void</i>	Shows or hides the Enterprise Architect User Interface. Parameters: <ul style="list-style-type: none"> <li>Show: Long.</li> </ul>	
<b>SynchronizeClass (string ElementGUID, string ExtraOptions)</b>	<i>Boolean</i>	Synchronizes a Class with the latest source code. Parameters: <ul style="list-style-type: none"> <li>ElementGUID: String - the GUID (in XML format) of the element to update from code.</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently unused.</li> </ul>	
<b>SynchronizePackage (string PackageGUID, string ExtraOptions)</b>	<i>Boolean</i>	Synchronizes each Class in a package with the latest source code. Parameters: <ul style="list-style-type: none"> <li>PackageGUID: String - the GUID (in XML format) of the package containing the elements to update from code.</li> <li>ExtraOptions: String - enables extra options to be given to the command; currently enables synchronization of all child packages (children) - for example: <i>children=1</i>.</li> </ul>	

Method	Type	Notes	See Also
<b>TransformElement</b> (string TransformName, string ElementGUID, string TargetPackage, string ExtraOptions)	<i>Boolean</i>	Transforms an element into a package. Parameters: <ul style="list-style-type: none"> <li>• TransformName: String - specifies the transformation that should be executed.</li> <li>• ElementGUID: String - the GUID (in XML format) of the element to transform.</li> <li>• TargetPackageGUID: String - the GUID (in XML format) of the package to transform into.</li> <li>• ExtraOptions: String - enables extra options to be given to the command: <ul style="list-style-type: none"> <li>• GenCode=True/False - articulate code generation from the transformed elements; this option supercedes the current model setting.</li> </ul> </li> </ul>	
<b>TransformPackage</b> (string TransformName, string SourcePackage, string TargetPackage, string ExtraOptions)	<i>Boolean</i>	Runs a transformation on the contents of a package. Parameters: <ul style="list-style-type: none"> <li>• TransformName: String - specifies the transformation that should be executed.</li> <li>• SourcePackageGUID: String - the GUID (in XML format) of the package to transform.</li> <li>• TargetPackageGUID: String - the GUID (in XML format) of the package to transform into.</li> <li>• ExtraOptions: String - enables extra options to be given to the command: <ul style="list-style-type: none"> <li>• GenCode=true/false - articulate code generation from the transformed elements; this option supercedes the current model setting.</li> <li>• SubPackages=true/false - specify if the child packages are to be included whilst transforming a package.</li> </ul> </li> </ul>	
<b>XMLtoGUID</b> (string GUID)	<i>String</i>	Changes a GUID in XML format to the form used inside Enterprise Architect. Parameters: <ul style="list-style-type: none"> <li>• GUID: String - the XML style GUID to convert to Enterprise Architect internal format.</li> </ul>	

**Notes:**

- These methods all require input GUIDs in XML format; use **GUIDtoXML** to change the Enterprise Architect GUID to an XML GUID

**Learn More:**

### 18.2.2.10 Document Generator Interface Package

The *Enterprise Architect.DocumentGenerator* interface. This is the XML-based interface to Enterprise Architect RTF and HTML reporting. You can get a pointer to this interface using the *Repository*. *CreateDocumentGenerator* method.

The following diagram illustrates how you might apply this interface in generating a report through the Automation Interface.

**Example:**

#### 18.2.2.10.1 DocumentGenerator Class

The *DocumentGenerator* Class can be accessed from the *Repository* using *CreateProjectGenerator()*. The returned interface provides access to the XML-based Enterprise Architect Automation Interface. Use this interface to get XML for the various internal elements and to run some utility functions to perform tasks such as load diagrams or run reports.

**DocumentGenerator Attributes:**

Attribute	Type	Notes
ObjectType	<a href="#">ObjectType</a> <small>I1850</small>	Read only. Distinguishes objects referenced through a Dispatch interface.

Document Generator Methods:

Method	Type	Notes
<b>DocumentDiagram (long DiagramID, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a diagram. Parameters: <ul style="list-style-type: none"> <li>DiagramId: Long - the ID of the diagram.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting diagrams; can be blank.</li> </ul>
<b>DocumentElement (long ElementID, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents an element. Parameters: <ul style="list-style-type: none"> <li>ElementId: Long - the ID of the element.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting elements; can be blank.</li> </ul>
<b>DocumentModelAuthor (string name, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a model author. Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the author.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model authors; can be blank.</li> </ul>
<b>DocumentModelClient (string name, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a single model client. Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the client.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model clients; can be blank.</li> </ul>
<b>DocumentModelGlossary (long id, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a single model glossary term. Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the term.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model glossary terms; can be blank.</li> </ul>
<b>DocumentModelIssue (long id, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a single model issue. Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the issue.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model issues; can be blank.</li> </ul>
<b>DocumentModelResource (string name, long nDepth, string templateName)</b>	<i>Boolean</i>	Documents a single model resource. Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the resource.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model resources; can be blank.</li> </ul>

Method	Type	Notes
<b>DocumentModelRole</b> (string name, long nDepth, string templateName)	<i>Boolean</i>	Documents a single model role. Parameters: <ul style="list-style-type: none"> <li>Name: String - the name of the role.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model roles; can be blank.</li> </ul>
<b>DocumentModelTask</b> (long id, long nDepth, string templateName)	<i>Boolean</i>	Documents a single model task. Parameters: <ul style="list-style-type: none"> <li>id: Long - the ID of the the task.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting model tasks; can be blank.</li> </ul>
<b>DocumentPackage</b> (long PackageID, long nDepth, string templateName)	<i>Boolean</i>	Documents a package. Parameters: <ul style="list-style-type: none"> <li>PackageId: Long - the ID of the package.</li> <li>nDepth: Long - adjust the heading level by nDepth.</li> <li>templateName: String - a template to use when documenting packages; can be blank.</li> </ul>
<b>GetLastError()</b>	<i>String</i>	Returns a string value describing the most recent error that occurred in relation to this object.
<b>InsertBreak</b> (enum breakType)	<i>Boolean</i>	Inserts a break into the report at the current location. Parameters: <ul style="list-style-type: none"> <li>breakType: enum - <b>0</b> = page break, <b>1</b> = section break.</li> </ul>
<b>InsertLinkedDocument</b> (string guid)	<i>Boolean</i>	Inserts a linked document into the report at the current location.  A linked document can used to set the header and footer of the report. These are taken from the first linked document added to the report. Parameters: <ul style="list-style-type: none"> <li>guid: String - the GUID of the element that has a linked document.</li> </ul>
<b>InsertTableOfContents</b>	<i>Boolean</i>	Inserts a Table of Contents at the current position.
<b>InsertTeamReviewPost</b> (string path)	<i>Boolean</i>	Inserts a Team Review posting into the report at the current location. Parameters: <ul style="list-style-type: none"> <li>path: String - the path of the Team Review post.</li> </ul>
<b>InsertText</b> (string Text, string style)	<i>Boolean</i>	Inserts some static text into the report at the current location.  No carriage return is added, so remember to add one if required. Parameters: <ul style="list-style-type: none"> <li>Text: String - the static text to be inserted.</li> <li>Style: String - the name of the style in the template; defaults to <i>Normal</i> style.</li> </ul>

Method	Type	Notes
<b>NewDocument (string templateName)</b>	<i>Boolean</i>	Starts a new document; must be called before attempting to document anything else.  Parameters: <ul style="list-style-type: none"> <li>templateName: String - a template to use when documenting elements. Can be blank.</li> </ul>
<b>ReplaceField (string fieldname, string fieldvalue)</b>	<i>Boolean</i>	Updates the fieldname with the value given.  If you call this function more than once with the same fieldname, the field only has the last value set.  Parameters: <ul style="list-style-type: none"> <li>fieldname: String - the fieldname to find.</li> <li>fieldvalue: String - the value to insert into the field.</li> </ul>
<b>SaveDocument (string filename, enum nDocType)</b>	<i>Boolean</i>	Saves the document to disk.  Parameters: <ul style="list-style-type: none"> <li>filename: String - the filename to save the file to.</li> <li>nDocType: Enum - <b>0</b> = RTF, <b>1</b> = HTML.</li> </ul>

### 18.2.2.11 Mail Interface Package

The Enterprise Architect *MailInterface* package contains:

- A function to retrieve a pointer to the interface
- Functions to create and send a mail message within the current mode
- Utility functions for creating hyperlinks to selected model elements

You can get a pointer to this interface using the method **Repository.GetMailInterface**.

#### Learn more:

- [Repository Package](#) <sup>[1853]</sup>
- [MailInterface Class](#) <sup>[1965]</sup>

#### 18.2.2.11.1 MailInterface Class

The *MailInterface* interface can be accessed from the Repository using **GetMailInterface()**. The returned interface provides access to the Enterprise Architect Model Mail Interface. Use this interface to automate the process of creating and sending messages using Enterprise Architect's Model Mail system.

#### MailInterface Attributes:

Attribute	Type	Notes
<b>ObjectType</b>	<a href="#">ObjectType</a> <sup>[1850]</sup>	Read Only  Distinguishes objects referenced through a dispatch interface
<b>MessagingEnabled</b>	Boolean	Read Only  Advises whether messaging is enabled on the current model

#### MailInterface Methods:

Method	Type	Notes
<b>GetLastError ( )</b>	<i>String</i>	Returns the last error message set for the MailInterface
<b>GetRecipientGUID (string UserName)</b>	<i>String</i>	Returns the GUID of the specified Enterprise Architect user Parameters: <ul style="list-style-type: none"> <li>• UserName: String - The name of a user defined in the current model</li> </ul>
<b>GetElementHyperlink (string ElementGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the element specified by the input parameter ElementGUID Parameters: <ul style="list-style-type: none"> <li>• ElementGUID: String - The GUID of the element for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the element name)</li> </ul>
<b>GetAttributeHyperlink (string AttributeGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the attribute specified by the input parameter AttributeGUID Parameters: <ul style="list-style-type: none"> <li>• AttributeGUID: String - The GUID of the attribute for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the attribute name)</li> </ul>
<b>GetMethodHyperlink (string MethodGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the method specified by the input parameter MethodGUID Parameters: <ul style="list-style-type: none"> <li>• MethodGUID: String - The GUID of the method for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the method name)</li> </ul>
<b>GetDiagramHyperlink (string DiagramGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the diagram specified by the input parameter DiagramGUID Parameters: <ul style="list-style-type: none"> <li>• DiagramGUID: String - The GUID of the diagram for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the diagram name)</li> </ul>
<b>GetPackageHyperlink (string PackageGUID, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the package specified by the input parameter PackageGUID Parameters: <ul style="list-style-type: none"> <li>• PackageGUID: String - The GUID of the package for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. the package name)</li> </ul>
<b>GetFileHyperlink (string FilePath, string LinkText)</b>	<i>String</i>	Returns a string containing a hyperlink to the file specified by the input parameter FilePath Parameters: <ul style="list-style-type: none"> <li>• FilePath: String - The path name of the file for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink (e.g. The</li> </ul>

Method	Type	Notes
		file's name)
<b>GetWebHyperlink</b> (string URL, string LinkText)	String	Returns a string containing a hyperlink to the URL specified by the input parameter URL  Parameters: <ul style="list-style-type: none"> <li>• URL: String - The URL of the item for which a hyperlink is required</li> <li>• LinkText: String - The text to display for the hyperlink</li> </ul>
<b>ComposeMailMessage</b> (string InitialRecipientGUID, string InitialSubject, messageflag InitialFlag, string InitialMessageText)	Boolean	Creates a new mail message using the values specified in the input parameters; the message is displayed in the composition window, ready for sending  This method does NOT send the message  Parameters: <ul style="list-style-type: none"> <li>• InitialRecipientGUID: String - Initial value for the GUID of the addressee user (an Enterprise Architect user defined in the current model)</li> <li>• InitialSubject: String - Initial value for the Subject text to display for this message</li> <li>• InitialFlag: MessageFlag - Initial value for the flag type/color to attach to this message</li> <li>• InitialMessageText: String - Initial value for the text that is the body of the message</li> </ul>
<b>SendMailMessage</b> (string RecipientGUID, string Subject, messageflag Flag, string MessageText)	Boolean	Creates and sends a new mail message using the values specified in the input parameters  Parameters: <ul style="list-style-type: none"> <li>• RecipientGUID: String - The GUID of the addressee user (an Enterprise Architect user defined in the current model)</li> <li>• Subject: String - The Subject text to display for this message</li> <li>• Flag: MessageFlag - The flag type/color to attach to this message</li> <li>• MessageText: String - The text that is the body of the message</li> </ul>

### 18.2.2.12 Code Samples

This topic contains various code examples indicating how to use the Automation Interface, written in VB.Net:

## 18.3 Enterprise Architect Add-In Model

### Topics:

Topic	Detail	See Also
<p><b>Introduction</b></p>	<p>Add-Ins enable you to add functionality to Enterprise Architect. The Enterprise Architect Add-In model builds on the features provided by the <b>Automation Interface</b> to enable you to extend the Enterprise Architect user interface.</p> <p>Add-Ins are ActiveX COM objects that expose public Dispatch methods. They have several advantages over stand-alone automation clients:</p> <ul style="list-style-type: none"> <li>• Add-Ins can define Enterprise Architect menus and sub-menus</li> <li>• Add-Ins receive notifications about various Enterprise Architect user-interface events including menu clicks and file changes</li> <li>• Add-Ins can (and should) be written as in-process (DLL) components. This provides lower call overhead and better integration into the Enterprise Architect environment</li> <li>• Because a current version of Enterprise Architect is already running there is no requirement to start a second copy of Enterprise Architect via the automation interface</li> <li>• Because the Add-In receives object handles associated with the currently running copy of Enterprise Architect, more information is available about the current user's activity; for example, which diagram objects are selected</li> <li>• You are not required to do anything other than to install the Add-In to make it usable; that is, you do not have to configure Add-Ins to run on your systems</li> <li>• Because Enterprise Architect is constantly evolving in response to customer requests, the Add-In interface is flexible:</li> <li>• The Add-In interface does not have its own version, rather it is identified by the version of Enterprise Architect it first appeared in; for example, the current version of the Enterprise Architect Add-In interface is version 2.1</li> <li>• When creating your Add-In, you do not have to subscribe to a type-library</li> </ul> <p>From Enterprise Architect release 7.0 Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the Addn_Tmpl.tlb interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p> <ul style="list-style-type: none"> <li>• Add-Ins do not have to implement methods that they never use</li> <li>• Add-Ins prompt users via context menus in the tree view and the diagram</li> <li>• Menu check and disable states can be controlled by the Add-In</li> </ul> <p>Add-Ins enhance the existing functionality of Enterprise Architect through a variety of mechanisms such as <b>Scripts</b>, <b>UML Profiles</b> and the <b>Automation Interface</b>. Once an <b>Add-In</b> is registered, it can be</p>	<p><a href="#">Automation Interface</a> <sup>[1837]</sup></p> <p><a href="#">Scripts</a> <sup>[1832]</sup></p> <p><a href="#">UML Profiles</a> <sup>[1047]</sup></p> <p><a href="#">Registered Add-in</a> <sup>[2116]</sup></p> <p><a href="#">Add-In Manager</a> <sup>[1989]</sup></p>

#### **18.3.1.1 Create Add-Ins**

Before you start you must have an application development tool that is capable of creating ActiveX COM objects supporting the IDispatch interface, such as:

- Borland Delphi
- Microsoft Visual Basic
- Microsoft Visual Studio .Net.

You should consider how to **define menu items**. To help with this, you could review some **examples of Automation Interfaces** (this web page provides examples of code used to create Add-Ins for Enterprise Architect).

**How to:**

An Enterprise Architect Add-In can be created in four steps:

Step	Action	See also
1	Use a development tool to create an ActiveX COM DLL project. Visual Basic users, for example, choose <i>File&gt;Create New Project-ActiveX DLL</i> .	
2	Connect to the interface using the syntax appropriate to the language as detailed in the <b>Connect to the Interface</b> topic.	<a href="#">Connect to the Interface</a> <sup>[1838]</sup>
3	Create a COM Class and implement each of the <b>general Add-In Events</b> applicable to your Add-In. You only have to define methods for events to respond to.	<a href="#">Add-In Events</a> <sup>[1991]</sup>
4	Add a registry key that identifies your Add-In to Enterprise Architect, as described in the <b>Deploy Add-Ins</b> topic.	<a href="#">Deploy Add-Ins</a> <sup>[1985]</sup>

**Learn More:**

- [Examples of Automation Interfaces](#) (Online Resource)

**18.3.1.1.1 Define Menu Items****Topics:**

Topic	Detail
<b>Defining Menu Items</b>	<p>Menu items are defined by responding to the <i>GetMenuItems</i> event.</p> <p>The first time this event is called, <i>MenuName</i> is an empty string, representing the top-level menu. For a simple Add-In with just a single menu option you can return a string; for example:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     EA_GetMenuItems = "&amp;Joe's Add-In" End Function</pre>
<b>Defining Sub-Menus</b>	<p>To define sub-menus, prefix a parent menu with a dash. Parent and sub-items are defined as follows:</p> <pre>Function EA_GetMenuItems(Repository as EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             ' Parent Menu Item             EA_GetMenuItems = "- &amp;Joe's Add-In"         Case "- &amp;Joe's Add-In"             ' Define Sub-Menu Items using the Array notation.             ' In this example, "Diagram" and "Treeview"             compose the "Joe's Add-In" sub-menu.             EA_GetMenuItems = Array("&amp;Diagram", "&amp;Treeview")         Case Else             MsgBox "Invalid Menu", vbCritical     End Select End Function</pre>

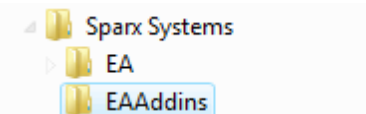

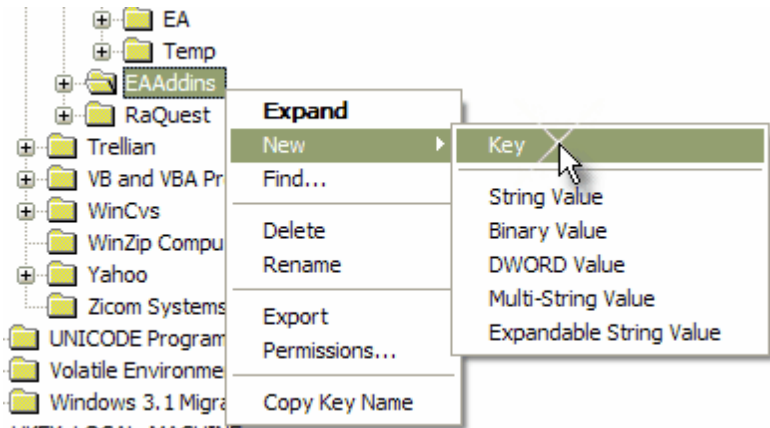

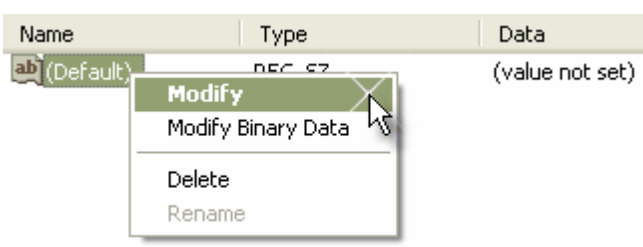

Topic	Detail
<b>Defining further Sub-Menus</b>	<p>Similarly, you can define further sub-items:</p> <pre> Function EA_GetMenuItems(Repository As EA.Repository, MenuLocation As String, MenuName As String) As Variant     Select Case MenuName         Case ""             EA_GetMenuItems = "- Joe's Add-In"         Case "- Joe's Add-In"             EA_GetMenuItems = Array("- &amp;Diagram", "&amp;Tree View")         Case "- &amp;Diagram"             EA_GetMenuItems = "&amp;Properties"         Case Else             MsgBox "Invalid Menu", vbCritical         End Select     End Function </pre>
<b>Enabling/Disabling menu options</b>	<p>To enable or disable menu options by default, you can use this method to show particular items to the user:</p> <pre> Sub EA_GetMenuState(Repository As EA.Repository, Location As String, MenuName As String, ItemName As String, IsEnabled As Boolean, IsChecked As Boolean)     Select Case Location         Case "Tree View"             ' Always enable         Case "Diagram"             ' Always enable         Case "MainMenu"             Select Case ItemName                 Case "&amp;Translate", "Save &amp;Project"                     If GetIsProjectSelected() Then                         IsEnabled = False                     End If             End Select         End Select     End Select     IsChecked = GetIsCurrentSelection() End Sub </pre>

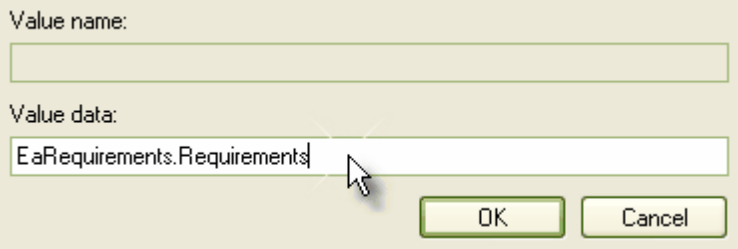

### 18.3.1.1.2 Deploy Add-Ins

#### How to:

To deploy Add-Ins to users' sites, follow the steps below

Step	Action	See also
1	Add the Add-In DLL file to an appropriate directory on the user's computer; that is, C:\Program Files\ ( new dir ) .	
2	<p>Register the DLL as appropriate to your platform:</p> <ul style="list-style-type: none"> <li>If compiled as a native Win32 DDL, such as VB6 or C++, register the DDL using the <b>regsvr32</b> command from the command prompt; for example: <pre>regsvr32 "C:\Program Files\MyCompany\EAAAddIn\EAAAddIn.dll"</pre> </li> <li>If compiled as a .NET DLL, such as C# or VB.NET, register the DLL using the <b>RegAsm</b> command from the command prompt; for example:</li> </ul>	

Step	Action	See also
	<pre>C:\WINDOWS\Microsoft.NET\Framework\v2.0.50727\RegAsm.exe "C:\Program Files\MyCompany\EAAddin\EAAddin.dll" / codebase</pre>	
3	Place a new entry into the registry using the registry editor (run <b>regedit</b> ) so that Enterprise Architect recognizes the presence of your Add-In.	
4	<p>1. Add a new key value <b>EAAddins</b> under the location:</p> <ul style="list-style-type: none"> <li>• <i>HKEY_CURRENT_USER\Software\Sparx Systems</i> for single users</li> <li>• <i>HKEY_LOCAL_MACHINE\Software\Sparx Systems</i> for multiple users on a machine</li> </ul> 	
5	<p>Add a new key under this key with the project name.</p>  <p>( ProjectName ) is not necessarily the name of your DLL, but the name of the Project; in Visual Basic, this is the value for the property <b>Name</b> corresponding to the project file</p>	
6	<p>Specify the default value by modifying the default value of the key.</p> 	
7	<p>Enter the value of the key by typing in the ( project name ) . ( class name ) ; for example, EaRequirements. Requirements, where <i>EaRequirements</i> is the project name, as shown in the example below.</p>

### 18.3.1.1.3 Tricks and Traps

#### Topics:

Topic	Detail	See Also
<b>Visual Basic 5/6 Users Note</b>	<p>Visual Basic 5/6 users should note that the version number of the Enterprise Architect interface is stored in the VBP project file in a form similar to the following:</p> <pre>Reference=* \ G{ 64FB2BF4- 9EFA- 11 D2- 8307- C4558600000} #2. 2#0# . . . \ . . . \ . . . \ Program Files\ Sparx Systems\ EA\ EA. TLB#Enterprise Architect Object Model 2. 02</pre> <p>If you experience problems moving from one version of Enterprise Architect to another, open the VBP file in a text editor and remove this line. Then open the project in Visual Basic and use <i>Project-References</i> to create a new reference to the Enterprise Architect Object model.</p>	
<b>Add-In Fails to Load</b>	<p>From Enterprise Architect release 7.0, Add-Ins created before 2004 are no longer supported. If an Add-In subscribes to the <code>Addn_TmpI . t l b</code> interface (2003 style), it fails on load. In this event, contact the vendor or author of the Add-In and request an upgrade.</p>	
<b>Holding State Information</b>	<p>It is possible for an Add-In to hold state information, meaning that data can be stored in member variables in response to one event and retrieved in another. There are some dangers in doing this:</p> <ul style="list-style-type: none"> <li>• Enterprise Architect Automation Objects do not update themselves in response to user activity, to activity on other workstations, or even to the actions of other objects in the same automation client. Retaining handles to such objects between calls can result in the second event querying objects that have no relationship with the current state of Enterprise Architect</li> <li>• When you close Enterprise Architect, all Add-Ins are asked to shut down. If there are any external automation clients Enterprise Architect must stay active, in which case all the Add-Ins are reloaded, losing all the data</li> <li>• Enterprise Architect acting as an automation client</li> </ul>	

Topic	Detail	See Also
	<p>does not close if an Add-In still holds a reference to it (releasing all references in the <code>Disconnect()</code> event avoids this problem)</p> <p>It is recommended that unless there is a specific reason for doing so, the Add-In should use the repository parameter and its method and properties to provide the necessary data.</p>	
<p><b>Enterprise Architect Not Closing</b></p>	<p><b>.Net Specific Issues</b></p> <p>Automation checks the use of objects and won't enable any of them to be destroyed until they are no longer being used.</p> <p>As noted in the <b>Automation Interface</b> topic, if your automation controller was written using the .NET framework, Enterprise Architect does not close even after you release all your references to it. To force the release of the COM pointers, call the memory management functions as shown below:</p> <pre>GC. Collect(); GC. WaitForPendingFinalizers();</pre> <p>Additionally, because automation clients hook into Enterprise Architect, which creates Add-Ins which in turn hook back into Enterprise Architect, it is possible to get into a deadlock situation where Enterprise Architect and the Add-Ins won't let go of one another and keep each other active. An Add-In might retain hooks into Enterprise Architect because:</p> <ul style="list-style-type: none"> <li>• It keeps a private reference to an Enterprise Architect object (see <b>Holding State Information</b> above), or</li> <li>• It has been created by .NET and the GC mechanism hasn't got around to releasing it.</li> </ul> <p>There are two actions required to avoid deadlock situations:</p> <ul style="list-style-type: none"> <li>• Automation controllers must call <code>Repository.CloseAddIns()</code> at some point (presumably at the end of processing).</li> <li>• Add-Ins must release all references to Enterprise Architect in the <code>Disconnect()</code> event. See the <b>Add-In Events</b> topic for details.</li> </ul> <p>It is possible that your Automation client controls a running instance of Enterprise Architect where the Add-Ins have not complied with the rule above. In this case you could call <code>Repository.Exit()</code> to terminate Enterprise Architect.</p> <p><b>Miscellaneous</b></p> <p>In developing Add-Ins using the .Net framework you must select COM Interoperability in the project's properties in order for it to be recognized as an Add-In.</p> <p>Some development environments do not automatically register COM DLLs on creation. You might have to do that manually before Enterprise Architect recognizes the Add-In.</p> <p>You can use your private Add-In key (as required for Add-In deployment) to store configuration information pertinent to your Add-In.</p>	<p><a href="#">Automation Interface</a><sup>[184]</sup></p> <p><a href="#">Holding State Information</a><sup>[1987]</sup></p> <p><a href="#">Add-In Events</a><sup>[1997]</sup></p>
<p><b>Concurrent Calls</b></p>	<p>In Enterprise Architect releases up to release 7.0, there is a possibility that Enterprise Architect could call two Add-In methods concurrently if the Add-In calls:</p>	

Topic	Detail	See Also
	<ul style="list-style-type: none"> <li>• A message box</li> <li>• A modal dialog</li> <li>• VB DoEvents, .NET Application DoEvents or the equivalent in other languages</li> </ul> <p>In such cases, Enterprise Architect could initiate a second Add-In method before the first returns (re-entrancy). In release 7.0. and subsequent releases, Enterprise Architect cannot make such concurrent calls</p> <p>If developing Add-Ins, ensure that the Add-In users are running Enterprise Architect release 7.0 or a later release to avoid any risk of concurrent method calls.</p>	

### 18.3.2 The Add-In Manager

#### Topics:

Topic	Detail									
<b>General Usage</b>	<p>You can use the Add-In Manager to view what Add-Ins are available and to disable those not to be used.</p> <p>Access the <b>Manage Add-Ins</b> dialog by selecting the <b>Add-Ins   Manage Add-Ins</b> menu option.</p> <table border="1" data-bbox="477 1099 1425 1429"> <thead> <tr> <th>Available Add-Ins</th> <th>Status</th> <th>Load on Startup</th> </tr> </thead> <tbody> <tr> <td>DoDAF-MODAF</td> <td>Enabled</td> <td><input checked="" type="checkbox"/></td> </tr> <tr> <td>Zachman Framework</td> <td>Enabled</td> <td><input checked="" type="checkbox"/></td> </tr> </tbody> </table> <p>To enable an Add-In for use, select the <b>Load on Startup</b> check box. To disable an Add-In, deselect the checkbox.</p>	Available Add-Ins	Status	Load on Startup	DoDAF-MODAF	Enabled	<input checked="" type="checkbox"/>	Zachman Framework	Enabled	<input checked="" type="checkbox"/>
Available Add-Ins	Status	Load on Startup								
DoDAF-MODAF	Enabled	<input checked="" type="checkbox"/>								
Zachman Framework	Enabled	<input checked="" type="checkbox"/>								

#### Notes:

- Enterprise Architect must be restarted for changes to take effect

### 18.3.3 Add-In Search

#### Topics:

Topic	Detail	See Also
<b>General Usage</b>	Enterprise Architect enables Add-Ins to integrate with the <b>Model Search</b> . Searches can be defined that execute a method within your Add-In and display your results in an integrated way.	<a href="#">Model Search</a> <sup>[477]</sup> <a href="#">Search Data Format</a> <sup>[1990]</sup>

Topic	Detail	See Also								
	<p>The method that runs the search must be structured in the following way:</p> <p>variant &lt;method name&gt; (Rep as Repository, SearchText as String, XMLResults as String)</p> <table border="1"> <thead> <tr> <th>Parameter</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Rep</td> <td>The currently open repository.</td> </tr> <tr> <td>SearchText</td> <td>An optional field that you can fill in through the M</td> </tr> <tr> <td>XMLResults</td> <td>At completion of the method, this should contain should be an XML String that conforms to the Se</td> </tr> </tbody> </table>	Parameter	Description	Rep	The currently open repository.	SearchText	An optional field that you can fill in through the M	XMLResults	At completion of the method, this should contain should be an XML String that conforms to the Se	
Parameter	Description									
Rep	The currently open repository.									
SearchText	An optional field that you can fill in through the M									
XMLResults	At completion of the method, this should contain should be an XML String that conforms to the Se									
<b>Return</b>	The method must return a value for the results to be displayed.									
<b>Advanced Usage</b>	<p>In addition to the displayed results, two additional hidden fields can be passed into the XML that provide special functionality.</p> <p><b>CLASSTYPE</b></p> <p>Returning a field of CLASSTYPE, containing the Object_Type value from the t_object table, displays the appropriate icon in the column you place the field.</p> <p><b>CLASSGUID</b></p> <p>Returning a field of CLASSGUID, containing an ea_guid value, enables the <b>Model Search</b> to track the object in the <b>Project Browser</b> and open the <b>Properties</b> window for the element by double-clicking in the <b>Model Search</b>.</p>									

### 18.3.3.1 XML Format (Search Data)

#### Topics:

Topic	Detail	See Also
<b>General Usage</b>	The XML below provides the format for the sSearchData parameter of the RunModelSearch method. See the <b>Repository</b> topic for more information.	<a href="#">Repository</a> 118831
<b>Example Code</b>	<pre>&lt;Report ViewData UID=\ " My Search ID \ " &gt;   &lt;!--     //The UID attribute enables XML type searches     to persist column information. That is, if you     run the search, group by column or adjust column     widths, then close the window and run the search     again, the format/organization changes are     retained. To avoid persisting column     arrangements, leave the attribute value blank or     remove it altogether.     // Use this section to declare all possible     fields - columns that appear in Enterprise     Architect's search window - that are used below     in &lt;Rows/&gt;.     // The order of the columns of information to     be appended here must match the order that the     search run in Enterprise Architect would     normally display.     // Furthermore, if you append results onto a     custom SQL Search, then the order used in your</pre>	

Topic	Detail	See Also
	<p>Custom SQL must match the order used below.</p> <pre>--&gt; &lt;Fields&gt;   &lt;Field name="" /&gt;   &lt;Field name="" /&gt;   &lt;Field name="" /&gt;   &lt;Field name="" /&gt; &lt;/Fields&gt;  &lt;Rows&gt;   &lt;Row&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;   &lt;/Row&gt;   &lt;Row&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;   &lt;/Row&gt;   &lt;Row&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;     &lt;Field name="" value="" /&gt;   &lt;/Row&gt; &lt;/Rows&gt; &lt;/ReportViewData&gt;</pre>	

### 18.3.4 Add-In Events

All Enterprise Architect Add-Ins can choose to respond to the following general Add-In events:

Topic	Link
EA_Connect	<a href="#">EA_Connect</a> <sup>[1992]</sup>
EA_Disconnect	<a href="#">EA_Disconnect</a> <sup>[1992]</sup>
EA_GetMenuItems	<a href="#">EA_GetMenuItems</a> <sup>[1993]</sup>
EA_MenuClick	<a href="#">EA_MenuClick</a> <sup>[1995]</sup>
EA_GetMenuState	<a href="#">EA_GetMenuState</a> <sup>[1994]</sup>
EA_ShowHelp	<a href="#">EA_ShowHelp</a> <sup>[1998]</sup>
EA_OnOutputItemClicked	<a href="#">EA_OnOutputItemClicked</a> <sup>[1996]</sup>
EA_OnOutputItemDoubleClicked	<a href="#">EA_OnOutputItemDoubleClicked</a> <sup>[1997]</sup>

### 18.3.4.1 EA\_Connect

#### Topics:

Topic	Detail	See Also
Details	<p>EA_Connect events enable Add-Ins to identify their type and to respond to Enterprise Architect start up.</p> <p>This event occurs when Enterprise Architect first loads your Add-In. Enterprise Architect itself is loading at this time so that while a Repository object is supplied, there is limited information that you can extract from it.</p> <p>The chief uses for EA_Connect are in initializing global Add-In data and for identifying the Add-In as an <b>MDG Add-In</b>.</p> <p>Also look at <b>EA_Disconnect</b>.</p>	<p><a href="#">MDG Add-In</a> <sup>[2057]</sup></p> <p><a href="#">EA_Disconnect</a> <sup>[1992]</sup></p>

#### Syntax

*Function EA\_Connect(Repository As EA.Repository) As String*

The *EA\_Connect* function syntax has the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

String identifying a specialized type of Add-In:

Type	Details
"MDG"	MDG Add-Ins receive <a href="#">MDG Events</a> <sup>[2057]</sup> and extra menu options.
""	None-specialized Add-In.

### 18.3.4.2 EA\_Disconnect

#### Topics:

Topic	Detail	See Also
Details	<p>The <i>EA_Disconnect</i> event enables the Add-In to respond to user requests to disconnect the model branch from an external project.</p> <p>This function is called when the Enterprise Architect closes. If you have stored references to Enterprise</p>	<p><a href="#">EA_Connect</a> <sup>[1992]</sup></p>

Topic	Detail	See Also
	<p>Architect objects (not particularly recommended anyway), you must release them here.</p> <p>In addition, .NET users must call memory management functions as shown below:</p> <pre>GC. Collect (); GC. Wait For Pending Finalizers ();</pre> <p>Also look at <b>EA_Connect</b>.</p>	

**Syntax**

*Sub* EA\_Disconnect()

**Return Value**

None.

**18.3.4.3 EA\_GetMenuItems****Topics:**

Topic	Detail	See Also
<b>Details</b>	<p>The <i>EA_GetMenuItems</i> event enables the Add-In to provide the Enterprise Architect user interface with additional Add-In menu options in various context and main menus. When a user selects an Add-In menu option, an event is raised and passed back to the Add-In that originally defined that menu option.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user, and its use is described in the <b>Define Menu Items</b> topic.</p>	<p><a href="#">Define Menu Items</a> [1984]</p> <p><a href="#">EA_MenuClick</a> [1995]</p> <p><a href="#">EA_GetMenuState</a> [1994]</p>

**Syntax**

*Function* EA\_GetMenuItems(*Repository As EA.Repository, MenuLocation As String, MenuName As String*) *As Variant*

The *EA\_GetMenuItems* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>MenuLocation</b>	<i>String</i>		String representing the part of the user interface that brought up the menu. Can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> [1870]	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

One of the following types:

- A string indicating the label for a single menu option.
- An array of strings indicating a multiple menu options.
- Empty (Visual Basic/VB.NET) or null (C#) to indicate that no menu should be displayed

In the case of the top-level menu it should be a single string or an array containing only one item, or Empty/null.

### 18.3.4.4 EA\_GetMenuState

#### Topics:

Topic	Detail	See Also
Details	<p>The <i>EA_GetMenuState</i> event enables the Add-In to set a particular menu option to either enabled or disabled. This is useful when dealing with locked packages and other situations where it is convenient to show a menu option, but not enable it for use.</p> <p>This event is raised just before Enterprise Architect has to show particular menu options to the user. Its use is described in the <b>Define Menu Items</b> topic.</p> <p>Also look at <b>EA_GetMenuItems</b>.</p>	<p><a href="#">Define Menu Items</a> [1984]</p> <p><a href="#">EA_GetMenuItems</a> [1993]</p>

#### Syntax

*Sub EA\_GetMenuState(Repository as EA.Repository, MenuLocation As String, MenuName as String, ItemName as String, IsEnabled as Boolean, IsChecked as Boolean)*

The *EA\_GetMenuState* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>IsChecked</b>	<i>Boolean</i>		Boolean. Set to <b>True</b> to check this particular menu option.
<b>IsEnabled</b>	<i>Boolean</i>		Boolean. Set to <b>False</b> to disable this particular menu option.
<b>ItemName</b>	<i>String</i>		The name of the option actually clicked, for example, <i>Create a New Invoice</i> .
<b>MenuLocation</b>	<i>String</i>		String representing the part of the user interface that brought up the menu. Can be <i>TreeView</i> , <i>MainMenu</i> or <i>Diagram</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items must be defined. In the case of the top-level menu it is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

None.

### 18.3.4.5 EA\_MenuClick

#### Topics:

Topic	Detail	See Also
Details	<p><i>EA_MenuClick</i> events are received by an Add-In in response to user selection of a menu option.</p> <p>The event is raised when the user clicks on a particular menu option. When a user clicks on one of your non-parent menu options, your Add-In receives a <i>MenuClick</i> event, defined as follows:</p> <pre>Sub EA_MenuClick(Repository As EA.Repository, ByVal MenuName As String, ByVal ItemName As String)</pre> <p>The code below illustrates an example of use:</p> <pre>    If MenuName = "- &amp;Diagram" And     ItemName = "&amp;Properties" then         MsgBox Repository.     Get Current Diagram Name, vbInformation     Else         MsgBox "Not Implemented",         vbCritical     End If</pre> <p>Notice that your code can directly access Enterprise Architect data and UI elements using <b>Repository</b> methods.</p> <p>Also look at <b>EA_GetMenuItems</b>.</p>	<p><a href="#">Repository</a><sup>[1870]</sup></p> <p><a href="#">EA_GetMenuItems</a><sup>[1993]</sup></p>

#### Syntax

**Sub EA\_MenuClick(Repository As EA.Repository, MenuLocation As String, MenuName As String, ItemName As String)**

The *EA\_GetMenuClick* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>ItemName</b>	<i>String</i>		The name of the option actually clicked, for example, <i>Create a New Invoice</i> .
<b>MenuName</b>	<i>String</i>		The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.4.6 EA\_OnOutputItemClicked

#### Topics:

Topic	Detail	See Also
Details	<p><i>EA_OnOutputItemClicked</i> events inform Add-Ins that the user has clicked on a list entry in the system tab or one of the user defined output tabs.</p> <p>Usually an Add-In responds to this event in order to capture activity on an output tab they had previously created through a call to <i>Repository.AddTab()</i>.</p> <p>Note that every loaded Add-In receives this event for every click on an output tab in Enterprise Architect - irrespective of whether the Add-In created that tab. Add-Ins should therefore check the <b>TabName</b> parameter supplied by this event to ensure that they are not responding to other Add-Ins' events.</p> <p>Also look at <b>EA_OnOutputItemDoubleClicked</b>.</p>	<a href="#">EA_OnOutputItemDoubleClicked</a> <a href="#">Clicked</a> <sup>[1997]</sup>

#### Syntax

**EA\_OnOutputItemClicked**(*Repository As EA.Repository, TabName As String, LineText As String, ID As Long*)

The *EA\_OnOutputItemClicked* function syntax has the following elements:

Parameter	Type	Direction	Description
<b>ID</b>	<i>Long</i>	IN	The ID value specified in the original call to <i>Repository.WriteOutput()</i> .
<b>LineText</b>	<i>String</i>	IN	The text that had been supplied as the String parameter in the original call to <i>Repository.WriteOutput()</i> .
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>TabName</b>	<i>String</i>	IN	The name of the tab that the click occurred in. Usually this would have been created through <i>Repository.AddTab()</i> .

#### Return Value

None.

### 18.3.4.7 EA\_OnOutputItemDoubleClicked

#### Topics:

Topic	Detail	See Also
Details	<p><i>EA_OnOutputItemDoubleClicked</i> events informs Add-Ins that the user has used the mouse to double-click on a list entry in one of the user-defined output tabs.</p> <p>Usually an Add-In responds to this event in order to capture activity on an output tab they had previously created through a call to <i>Repository.AddTab()</i>.</p> <p>Note that every loaded Add-In receives this event for every double-click on an output tab in Enterprise Architect - irrespective of whether the Add-In created that tab. Add-Ins should therefore check the <b>TabName</b> parameter supplied by this event to ensure that they are not responding to other Add-Ins' events.</p> <p>Also look at <b>EA_OnOutputItemClicked</b>.</p>	<a href="#">EA_OnOutputItemClicked</a> <small>[1996]</small>

#### Syntax

**EA\_OnOutputItemDoubleClicked**(*Repository As EA.Repository, TabName As String, LineText As String, ID As Long*)

The *EA\_OnOutputItemClicked* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>ID</b>	<i>Long</i>	IN	The ID value specified in the original call to <i>Repository.WriteOutput()</i> .
<b>LineText</b>	<i>String</i>	IN	The text that had been supplied as the String parameter in the original call to <i>Repository.WriteOutput()</i> .
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>TabName</b>	<i>String</i>	IN	The name of the tab that the click occurred in. Usually this would have been created through <i>Repository.AddTab()</i> .

#### Return Value

None.

### 18.3.4.8 EA\_ShowHelp

#### Topics:

Topic	Detail	See Also
Details	<p>The <i>EA_ShowHelp</i> event enables the Add-In to show a help topic for a particular menu option. When the user has an Add-In menu option selected, pressing ( <b>F1</b> ) can be delegated to the required Help topic by the Add-In and a suitable help message shown.</p> <p>This event is raised when the user presses ( <b>F1</b> ) on a menu option that is not a parent menu.</p> <p>Also look at <i>EA_GetMenuItems</i>.</p>	<a href="#">EA_GetMenuItem</a> <a href="#">s</a> <sup>[1993]</sup>

#### Syntax

*Sub EA\_ShowHelp(Repository as EA.Repository, MenuLocation As String, MenuName as String, ItemName as String)*

The *EA\_ShowHelp* function syntax contains the following elements:

Parameter	Type	Direction	Description
ItemName	String		The name of the option actually clicked, for example, <b>Create a New Invoice</b> .
MenuLocation	String		String representing the part of the user interface that brought up the menu. Can be <b>Treeview</b> , <b>MainMenu</b> or <b>Diagram</b> .
MenuName	String		The name of the parent menu for which sub-items are to be defined. In the case of the top-level menu it is an empty string.
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5 Broadcast Events

#### Overview

The following general Broadcast events are sent to all loaded Add-Ins. For an Add-In to receive the event, they must first implement the required automation event interface. If Enterprise Architect detects that the Add-In has the required interface, the event is dispatched to the Add-In.

Topic	Link
Add-In Licence Management Events	<a href="#">Add-In Licence Management Events</a> <sup>[1993]</sup>

Topic	Link
Compartment Events	<a href="#">Compartment Events</a> <sup>[2007]</sup>
Context Item Events	<a href="#">Context Item Events</a> <sup>[2007]</sup>

Technology Events	<a href="#">Technology Events</a> <sup>[2049]</sup>
Transformation Event	<a href="#">Transformation Event</a> <sup>[2012]</sup>

**MDG Events** add quite a number of additional events, but the Add-In must first have registered as an MDG-style Add-In, rather than as a generic Add-In.

**Learn More:**

- [MDG Events](#)<sup>[2057]</sup>

### 18.3.5.1 Add-In License Management Events

Enterprise Architect Add-ins can respond to the following events associated with Add-in License Management:

Topic	Link
EA_AddinLicenseValidate	<a href="#">EA_AddinLicenseValidate</a> <sup>[2000]</sup>
EA_AddinLicenseGetDescription	<a href="#">EA_AddinLicenseGetDescription</a> <sup>[2007]</sup>

### 18.3.5.1.1 EA\_AddinLicenseValidate

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_AddinLicenseValidate</b> is broadcast to all Add-Ins, providing them with a chance to use the Add-In key to determine the level of functionality to provide. The event is broadcast in response to a non-standard Enterprise Architect key being entered into the <b>License Management</b> dialog.</p> <p>For the Add-In to validate itself against this key, the Add-In's <b>EA_AddinLicenseValidate</b> handler should return <b>true</b> to advise Enterprise Architect that the license has been validated. The <b>EA_AddinLicenseValidate</b> event is broadcast to all Add-Ins, therefore one license can validate many Add-Ins.</p> <p>If an Add-In elects to handle a license key by returning true to <b>EA_AddinLicenseValidate</b>, it is called upon to provide a description of the license key through the <b>EA_AddinLicenseGetDescription</b> event. If more than one Add-In elects to handle a license key, the first Add-In that returns <b>true</b> to <b>EA_AddinLicenseValidate</b> is queried for the license key description.</p>	<a href="#">EA_AddinLicenseGetDescription</a> <sup>[2001]</sup>

#### Syntax

**Function** EA\_AddinLicenseValidate(*Repository As EA.Repository, AddinKey As String*) As Boolean

The *EA\_AddinLicenseValidate* function syntax contains the following elements.

Parameter	Type	Direction	Description
AddinKey	String	IN	The Add-in license key that has been entered in Enterprise Architect's <b>License Management</b> dialog.
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

For the Add-in to validate against this key it should return **true** to indicate to Enterprise Architect that the key is valid and has been handled.

### 18.3.5.1.2 EA\_AddinLicenseGetDescription

#### Topics:

Topic	Detail	See Also
Details	Before Enterprise Architect's <b>License Management</b> dialog is displayed, <b>EA_AddinLicenseGetDescription</b> is sent once for each Add-In key to the first Add-In that elected to handle that key. The value returned by <b>EA_AddinLicenseGetDescription</b> is used by Enterprise Architect as the key's plain text description.	

#### Syntax

**Function** EA\_AddinLicenseGetDescription (*Repository as EA.Repository, AddinKey as String*) As String

The *EA\_OnPostInitialized* function syntax contains the following elements.

Parameter	Type	Direction	Description
AddinKey	String	IN	The Add-In license key that Enterprise Architect requires a description for.
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An EA.Repository object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

A String containing a plain text description of the provided AddinKey.

### 18.3.5.2 Compartment Events

Enterprise Architect Add-Ins can respond to the following events associated with user-generated element compartments:

Topic	Link
EA_QueryAvailableCompartments	<a href="#">EA_QueryAvailableCompartments</a> <sup>[2001]</sup>
EA_GetCompartmentData	<a href="#">EA_GetCompartmentData</a> <sup>[2002]</sup>

#### 18.3.5.2.1 EA\_QueryAvailableCompartments

#### Topics:

Topic	Detail	See Also
Details	This event occurs when Enterprise Architect's diagrams are	<a href="#">EA_GetCompartmentDat</a>

Topic	Detail	See Also
	refreshed. It is a request for the Add-In to provide a list of user-defined compartments. The <b>EA_GetCompartmentData</b> event then queries each object for the data to display in each user-defined compartment.	<a href="#">a<sup>[2002]</sup></a>

### Syntax

#### Function EA\_QueryAvailableCompartments(*Repository As EA.Repository*) As Variant

The *EA\_QueryAvailableCompartments* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

A *String* containing a comma-separated list of user-defined compartments.

### Example

```
Function EA_QueryAvailableCompartments(Repository As EA.Repository) As Variant
    Dim sReturn As String
    sReturn = ""
    If m_FirstCompartmentVisible = True Then
        sReturn = sReturn + "first,"
    End If
    If m_SecondCompartmentVisible = True Then
        sReturn = sReturn + "second,"
    End If
    If m_ThirdCompartmentVisible = True Then
        sReturn = sReturn + "third,"
    End If

    If Len(sReturn) > 0 Then
        sReturn = Left(sReturn, Len(sReturn) - 1)
    End If

    EA_QueryAvailableCompartments = sReturn
End Function
```

#### 18.3.5.2.2 EA\_GetCompartmentData

### Topics:

Topic	Detail	See Also
Details	This event occurs when Enterprise Architect is instructed to redraw an element. It requests that the Add-In provide the data to populate the element's	

Topic	Detail	See Also
	compartment.	

### Syntax

**Function EA\_GetCompartmentData(Repository As EA.Repository, sCompartment As String, sGUID As String, oType As EA.ObjectType) As Variant**

The *EA\_QueryAvailableCompartments* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>oType</b>	<i>ObjectType</i>	IN	The type of the element for which data is being requested.
<b>Repository</b>	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>sCompartment</b>	<i>String</i>	IN	The name of the compartment for which data is being requested.
<b>sGUID</b>	<i>String</i>	IN	The GUID of the element for which data is being requested.

### Return Value

Variant containing a formatted string. See the example below to understand the format.

### Example

```
Function EA_GetCompartmentData(Repository As EA.Repository, sCompartment As String, sGUID As String, oType As EA.ObjectType) As Variant
```

```
    If Repository Is Nothing Then
        Exit Function
    End If
```

```
    Dim sCompartmentData As String
    Dim oXML As MSXML2.DOMDocument
    Dim Nodes As MSXML2.IXMLDOMNodeList
    Dim Node1 As MSXML2.IXMLDOMNode
    Dim Node As MSXML2.IXMLDOMNode
    Dim sData As String
```

```
    sCompartmentData = ""
    Set oXML = New MSXML2.DOMDocument
    sData = ""
```

```
    On Error GoTo ERR_GetCompartmentData
```

```
    oXML.LoadXML (Repository.GetTreeXMLByGUID(sGUID))
    Set Node1 = oXML.selectSingleNode("//ModelItem")
```

```
    If Node1 Is Nothing Then
        Exit Function
    End If
```

```
    sCompartmentData = sCompartmentData + " Name=" + sCompartment + ";"
```

```

sCompartmentData = sCompartmentData + " Owner GUID=" + sGUID + "; "
sCompartmentData = sCompartmentData +
" Options=SkipIfOnDiagram&_eq_^1&_sc_^"

Select Case sCompartment
Case "parts"
    Set Nodes = Node1.selectNodes(" ModelItem( @Metatype=" " Part " ) ")
    For Each Node In Nodes
        sData = sData + "Data&_eq_^" + Node.Attributes.getNamedItem
(" Name").nodeValue + "&_sc_^"
        sData = sData + "GUID&_eq_^" + Node.Attributes.getNamedItem
(" GUID").nodeValue + "&_sc_^,"
    Next

Case "ports"
    Set Nodes = Node1.selectNodes(" ModelItem( @Metatype=" " Port " ) ")
    For Each Node In Nodes
        sData = sData + "Data&_eq_^" + Node.Attributes.getNamedItem
(" Name").nodeValue + "&_sc_^"
        sData = sData + "GUID&_eq_^" + Node.Attributes.getNamedItem
(" GUID").nodeValue + "&_sc_^,"
    Next

End Select

' If there's no data to display, then don't return any compartment
data
If sData <> "" Then
    sCompartmentData = sCompartmentData + " Compartment Data=" + sData +
"; "
Else
    sCompartmentData = ""
End If

EA_GetCompartmentData = sCompartmentData
Exit Function

ERR_GetCompartmentData:
EA_GetCompartmentData = ""

End Function

```

### 18.3.5.3 Context Item Events

Enterprise Architect Add-Ins can respond to the following events associated with changing context:

Topic	Link
EA_OnContextItemChanged	<a href="#">EA_OnContextItemChanged</a> [2006]
EA_OnContextItemDoubleClicked	<a href="#">EA_OnContextItemDoubleClic</a> ked [2006]
EA_OnNotifyContextItemModified	<a href="#">EA_OnNotifyContextItem Modifi</a> ed [2007]

### 18.3.5.3.1 EA\_OnContextItemChanged

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnContextItemChanged</b> notifies Add-Ins that a different item is now in context.</p> <p>This event occurs after a user has selected an item anywhere in the Enterprise Architect GUI. Add-Ins that require knowledge of the current item in context can subscribe to this broadcast function. If <b>ot = otRepository</b>, then this function behaves the same as <b>EA_FileOpen</b>.</p> <p>Also look at <b>EA_OnContextItemDoubleClicked</b> and <b>EA_OnNotifyContextItemModified</b>.</p>	<p><a href="#">EA_FileOpen</a> <sup>[2009]</sup></p> <p><a href="#">EA_OnContextItemDoubleClicked</a> <sup>[2006]</sup></p> <p><a href="#">EA_OnNotifyContextItemModified</a> <sup>[2007]</sup></p>

#### Syntax

**Sub EA\_OnContextItemChanged(Repository As EA.Repository, GUID As String, ot as EA.ObjectType)**

The *EA\_OnContextItemChanged* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	<i>String</i>	IN	<p>Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:</p> <p><i>ot (ObjectType)</i> - GUID value</p> <p><i>otElement</i> - <i>Element.ElementGUID</i></p> <p><i>otPackage</i> - <i>Package.PackageGUID</i></p> <p><i>otDiagram</i> - <i>Diagram.DiagramGUID</i></p> <p><i>otAttribute</i> - <i>Attribute.AttributeGUID</i></p> <p><i>otMethod</i> - <i>Method.MethodGUID</i></p> <p><i>otConnector</i> - <i>Connector.ConnectorGUID</i></p> <p><i>otRepository</i> - NOT APPLICABLE, GUID is an empty string</p>
<b>ot</b>	<i>EA.ObjectType</i>	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.3.2 EA\_OnContextItemDoubleClicked

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnContextItemDoubleClicked</b> notifies Add-Ins that the user has double-clicked the item currently in context.</p> <p>This event occurs when a user has double-clicked (or pressed ( <b>Enter</b> ) ) on the item in context, either in a diagram or in the <b>Project Browser</b>. Add-Ins to handle events can subscribe to this broadcast function.</p> <p>Also look at <b>EA_OnContextItemChanged</b> and <b>EA_OnNotifyContextItemModified</b></p>	<p><a href="#">EA_OnContextItemChanged</a><sup>[2005]</sup></p> <p><a href="#">EA_OnNotifyContextItemModified</a><sup>[2007]</sup></p>

#### Syntax

Function **EA\_OnContextItemDoubleClicked**(Repository As EA.Repository, GUID As String, ot as EA.ObjectType)

The *EA\_OnContextItemDoubleClicked* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	String	IN	<p>Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:</p> <p><i>ot</i> (ObjectType) - GUID value</p> <p><i>otElement</i> - Element.ElementGUID</p> <p><i>otPackage</i> - Package.PackageGUID</p> <p><i>otDiagram</i> - Diagram.DiagramGUID</p> <p><i>otAttribute</i> - Attribute.AttributeGUID</p> <p><i>otMethod</i> - Method.MethodGUID</p> <p><i>otConnector</i> - Connector.ConnectorGUID</p>
<b>ot</b>	EA.ObjectType	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return **True** to notify Enterprise Architect that the double-click event has been handled by an Add-In. Return **False** to enable Enterprise Architect to continue processing the event.

### 18.3.5.3.3 EA\_OnNotifyContextItemModified

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnNotifyContextItemModified</b> notifies Add-Ins that the current context item has been modified.</p> <p>This event occurs when a user has modified the context item. Add-Ins that require knowledge of when an item has been modified can subscribe to this broadcast function.</p> <p>Also look at <b>EA_OnContextItemChanged</b> and <b>EA_OnContextItemDoubleClicked</b>.</p>	<p><a href="#">EA_OnContextItemChanged</a><sup>[2005]</sup></p> <p><a href="#">EA_OnContextItemDoubleClicked</a><sup>[2005]</sup></p>

#### Syntax

**Sub EA\_OnNotifyContextItemModified(Repository As EA.Repository, GUID As String, ot as EA.ObjectType)**

The *EA\_OnNotifyContextItemModified* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>GUID</b>	<i>String</i>	IN	<p>Contains the GUID of the new context item. This value corresponds to the following properties, depending on the value of the <b>ot</b> parameter:</p> <ul style="list-style-type: none"> <li>• <i>ot(ObjectType)</i> - GUID value</li> <li>• <i>otElement</i> - <i>Element.ElementGUID</i></li> <li>• <i>otPackage</i> - <i>Package.PackageGUID</i></li> <li>• <i>otDiagram</i> - <i>Diagram.DiagramGUID</i></li> <li>• <i>otAttribute</i> - <i>Attribute.AttributeGUID</i></li> <li>• <i>otMethod</i> - <i>Method.MethodGUID</i></li> <li>• <i>otConnector</i> - <i>Connector.ConnectorGUID</i></li> </ul>
<b>ot</b>	<i>EA.ObjectType</i>	IN	Specifies the type of the new context item.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.4 EA\_FileClose

#### Topics:

Topic	Detail	See Also
Details	<p>The EA_FileClose event enables the Add-In to respond to a File Close event. When Enterprise Architect closes an opened Model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>This event occurs when the model currently opened within Enterprise Architect is about to be closed (when another model is about to be opened or when Enterprise Architect is about to shutdown).</p> <p>Also look at <b>EA_FileOpen</b> and <b>EA_FileNew</b>.</p>	<a href="#">EA_FileOpen</a> [2009]  <a href="#">EA_FileNew</a> [2008]

#### Syntax

##### Sub EA\_FileClose(Repository As EA.Repository)

The EA\_FileClose function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An EA.Repository object representing the Enterprise Architect model about to be closed. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.5 EA\_FileNew

#### Topics:

Topic	Detail	See Also
Details	<p>The EA_FileNew event enables the Add-In to respond to a File New event. When Enterprise Architect creates a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p>	<a href="#">EA_FileClose</a> [2008]  <a href="#">EA_FileOpen</a> [2009]

#### Syntax

##### Sub EA\_FileNew(Repository As EA.Repository)

The *EA\_FileNew* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.6 *EA\_FileOpen*

#### Topics:

Topic	Detail	See Also
Details	<p>The <i>EA_FileOpen</i> event enables the Add-In to respond to a <i>File Open</i> event. When Enterprise Architect opens a new model file, this event is raised and passed to all Add-Ins implementing this method.</p> <p>The event occurs when the model being viewed by the Enterprise Architect user changes, for whatever reason (through user interaction or Add-In activity).</p> <p>Also look at <b>EA_FileClose</b> and <b>EA_FileNew</b>.</p>	<p><a href="#">EA_FileClose</a> [2008]</p> <p><a href="#">EA_FileNew</a> [2008]</p>

#### Syntax

##### *Sub EA\_FileOpen(Repository As EA.Repository)*

The *EA\_FileOpen* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.7 EA\_OnPostCloseDiagram

#### Topics:

Topic	Detail	See Also
Details	<i>EA_OnPostCloseDiagram</i> notifies Add-Ins that a diagram has been closed. Also look at <i>EA_OnPostOpenDiagram</i> .	<a href="#">EA_OnPostOpenDiagram</a> <sup>[2011]</sup>

#### Syntax

Function *EA\_OnPostCloseDiagram(Repository As EA.Repository, DiagramID As Integer)*

The *EA\_OnPostCloseDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
DiagramID	<i>Integer</i>	IN	Contains the Diagram ID of the diagram that was closed.
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the Enterprise Architect model about to be closed. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

### 18.3.5.8 EA\_OnPostInitialized

#### Topics:

Topic	Detail	See Also
Details	<i>EA_OnPostInitialized</i> notifies Add-Ins that the Repository object has finished loading and any necessary initialization steps can now be performed on the object  For example, the Add-In can create an Output tab using <i>Repository.CreateOutputTab</i>	<a href="#">Repository.CreateOutputTab</a> <sup>[1875]</sup>

#### Syntax

Sub *EA\_OnPostInitialized(Repository As EA.Repository)*

The *EA\_OnPostInitialized* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open

Parameter	Type	Direction	Description
			Enterprise Architect model Poll its members to retrieve model data and user interface status information

**Return Value**

None

**18.3.5.9 EA\_OnPostOpenDiagram****Topics:**

Topic	Detail	See Also
Details	<b>EA_OnPostOpenDiagram</b> notifies Add-Ins that a diagram has been opened. Also look at <b>EA_OnPostCloseDiagram</b> .	<a href="#">EA_OnPostCloseDiagram</a> <sup>[2010]</sup>

**Syntax**

**Function** EA\_OnPostOpenDiagram(*Repository As EA.Repository, DiagramID As Integer*)

The *EA\_OnPostOpenDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>DiagramID</b>	<i>Integer</i>	IN	Contains the Diagram ID of the diagram that was opened.
<b>Repository</b>	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value**

None.

### 18.3.5.10 EA\_OnPostTransform

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPostTransform</b> notifies Add-Ins that an MDG transformation has taken place with the output in the specified target package</p> <p>This event occurs when a user runs an MDG transform on one or more target packages; the notification is provided for each transform/target package immediately after all transform processes have completed</p>	

#### Syntax

**Function** EA\_OnPostTransform(*Repository As EA.Repository, Info As EA.EventProperties*) *As Boolean*

The *EA\_OnPostTransform* function syntax contains the following elements:

Parameter	Type	Direction	Description
Info	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	<p>Contains the following <i>EventProperty Objects</i> for the transform performed:</p> <ul style="list-style-type: none"> <li><i>Transform</i>: A string value corresponding to the name of the transform used</li> <li><i>PackageID</i>: A long value corresponding to <i>Package.PackageID</i> of the destination package</li> </ul>
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	<p>An EA.Repository object representing the currently open Enterprise Architect model</p> <p>Poll its members to retrieve model data and user interface status information</p>

#### Return Value

Reserved for future use.

### 18.3.5.11 EA\_OnPreExitInstance

#### Details:

*EA\_OnPreExitInstance* is not currently used.

#### Syntax:

**Sub** EA\_OnPreExitInstance(*Repository As EA.Repository*)

The *EA\_OnPreExitInstance* function syntax contains the following element:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value:**

None.

**18.3.5.12 EA\_OnRetrieveModelTemplate****Topics:**

Topic	Detail	See Also
Details	<b>EA_OnRetrieveModelTemplate</b> requests that an Add-In pass a model template to Enterprise Architect  This event occurs when a user executes the <b>Add a New Model Using Wizard</b> command to add a model that has been defined by an MDG Technology	<a href="#">Incorporate Model Templates</a> <small>[1089]</small>

**Syntax**

*Function EA\_OnRetrieveModelTemplate(Repository As EA.Repository,sLocation As String) As String*

The *EA\_OnRetrieveModelTemplate* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model  Poll its members to retrieve model data and user interface status information
sLocation	<i>String</i>	IN	The name of the template requested; this should match the <i>location</i> attribute in the <i>&lt;ModelTemplates&gt;</i> section of an MDG Technology File

**Return Value**

Return a string containing the XML export of the model that is being used as a template

**Example**

```
Public Function EA_OnRetrieveModelTemplate(ByRef Rep As EA.Repository,
ByRef sLocation As String) As String
    Dim sTemplate As String
    Select Case sLocation
        Case "Templates\ Template1.xml "
            sTemplate = My.Resources.Template1
```

```

Case " Templates\ Template2.xml "
  sTemplate = My.Resources.Template2
Case " Templates\ Template3.xml "
  sTemplate = My.Resources.Template3
Case Else
  MsgBox(" Path for " & sLocation & " not found")
  sTemplate = ""
End Select
EA_OnRetrieveModelTemplate = sTemplate
End Function

```

### 18.3.5.13 Model Validation Broadcasts

#### Perform Model Validation from an Add-In

Using Enterprise Architect broadcasts, it is possible to define a set of rules that are evaluated when the user instructs Enterprise Architect to perform model validation. An Add-In that performs model validation would involve the following broadcast events:

Topic	Detail	Link
EA_OnInitializeUserRules	EA_OnInitializeUserRules is intercepted in order to define rule categories and rules	<a href="#">EA_OnInitializeUserRules</a> <sup>[2015]</sup>
EA_OnStartValidation	EA_OnStartValidation can be intercepted to perform any required processing prior to validation	<a href="#">EA_OnStartValidation</a> <sup>[2015]</sup>
Validate Request	The following functions intercept each request to validate an individual element, package, diagram, connector, attribute and method	
	EA_OnRunElementRule	<a href="#">EA_OnRunElementRule</a> <sup>[2016]</sup>
	EA_OnRunPackageRule	<a href="#">EA_OnRunPackageRule</a> <sup>[2017]</sup>
	EA_OnRunDiagramRule	<a href="#">EA_OnRunDiagramRule</a> <sup>[2017]</sup>
	EA_OnRunConnectorRule	<a href="#">EA_OnRunConnectorRule</a> <sup>[2018]</sup>
	EA_OnRunAttributeRule	<a href="#">EA_OnRunAttributeRule</a> <sup>[2019]</sup>
	EA_OnRunMethodRule	<a href="#">EA_OnRunMethodRule</a> <sup>[2020]</sup>
EA_OnEndValidation	can be intercepted to perform any required clean-up after validation has completed	<a href="#">EA_OnEndValidation</a> <sup>[2016]</sup>

#### Learn More:

#### Syntax

##### Sub EA\_OnStartValidation(Repository As EA.Repository, ParamArray Args() as Variant)

The *EA\_OnStartValidation* function syntax contains the following elements:

Parameter	Type	Direction	Description
Args	<i>ParamArray of Variant</i>	IN	Contains a list of Rule Categories that are active for the current invocation of model validation.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to

Parameter	Type	Direction	Description
			retrieve model data and user interface status information.

### 18.3.5.13.3 EA\_OnEndValidation

#### Topics:

Topic	Detail	See Also
Details	<b>EA_OnEndValidation</b> notifies Add-Ins that model validation has completed. Use this event to arrange any clean-up operations arising from the validation.	

#### Syntax

**Sub EA\_OnEndValidation(Repository As EA.Repository, ParamArray Args() as Variant)**

The *EA\_OnEndValidation* function syntax contains the following elements:

Parameter	Type	Direction	Description
Args	<i>ParamArray of Variant</i>	IN	Contains a list of Rule Categories that were active for the invocation of model validation that has just completed.
Repository	<a href="#">EA.Repository</a> <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### 18.3.5.13.4 EA\_OnRunElementRule

#### Topics:

Topic	Detail	See Also
Details	This event is triggered once for each rule defined in <b>EA_OnInitializeUserRules</b> to be performed on each element in the selection being validated. If you don't want to perform the rule defined by <b>RuleID</b> on the given element, then simply return without performing any action. On performing any validation, if a validation error is found, use the <b>Repository.ProjectInterface.PublishResult</b> method to notify Enterprise Architect. Also look at <b>EA_OnInitializeUserRules</b> .	<a href="#">EA_OnInitializeUserRule</a> <sup>[2015]</sup>

#### Syntax

**Sub EA\_OnRunElementRule(Repository As EA.Repository, RuleID As String, Element As EA.Element)**

The *EA\_OnRunElementRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
Element	<i>EA.Element</i>	IN	The element to potentially perform validation on.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
RuleID	<i>String</i>	IN	The ID that was passed into the <i>Project.DefineRule</i> command.

### 18.3.5.13.5 EA\_OnRunPackageRule

Topics:

Topic	Detail	See Also
Details	This event is triggered once for each rule defined in <b>EA_OnInitializeUserRules</b> to be performed on each package in the selection being validated. If you don't want to perform the rule defined by <b>RuleID</b> on the given package, then simply return without performing any action. On performing any validation, if a validation error is found, use the <i>Repository.ProjectInterface.PublishResult</i> method to notify Enterprise Architect.	<a href="#">EA_OnInitializeUserRule</a> <small>S [2015]</small>

Syntax

**Sub EA\_OnRunPackageRule(Repository As EA.Repository, RuleID As String, PackageID As Long)**

The *EA\_OnRunElementRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
PackageID	<i>Long</i>	IN	The ID of the package to potentially perform validation on. Use the <i>Repository.GetPackageByID</i> method to retrieve the package object.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
RuleID	<i>String</i>	IN	The ID that was passed into the <i>Project.DefineRule</i> method.

The *EA\_OnRunMethodRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
MethodGUID	String	IN	The GUID of the method to potentially perform validation on. Use the <i>Repository.GetMethodByGuid</i> method to retrieve the method object.
ObjectID	Long	IN	The ID of the object that owns the given method. Use the <i>Repository.GetObjectByID</i> method to retrieve the object.
Repository	<a href="#">EA.Repository</a> S <sup>[1870]</sup>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
RuleID	String	IN	The ID that was passed into the <i>Project.DefineRule</i> command.

### 18.3.5.13.10 EA\_OnRunParameterRule

#### Topics:

Topic	Detail	See Also
Details	This event is triggered once for each rule defined in <b>EA_OnInitializeUserRules</b> to be performed on each parameter in the selection being validated. If you don't want to perform the rule defined by <b>RuleID</b> on the given parameter, then simply return without performing any action. On performing any validation, if a validation error is found, use the <i>Repository.ProjectInterface.PublishResult</i> method to notify Enterprise Architect.	<a href="#">EA_OnInitializeUserRule</a> S <sup>[2015]</sup>

#### Syntax

**Sub EA\_OnRunParameterRule(Repository As EA.Repository, RuleID As String, ParameterGUID As String, MethodGUID As String, ObjectID As Long)**

The *EA\_OnRunMethodRule* function syntax contains the following elements:

Parameter	Type	Direction	Description
MethodGUID	String	IN	The GUID of the method that owns the given parameter. Use the <i>Repository.GetMethodByGuid</i> method to retrieve the method object.
ObjectID	Long	IN	The ID of the object that owns the given parameter. Use the <i>Repository.GetObjectByID</i> method to retrieve the object.
ParameterGUID	String	IN	The GUID of the parameter to potentially perform validation on. Use it to retrieve the parameter by iterating through the <i>Method.Parameters</i> collection.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
RuleID	String	IN	The ID that was passed into the <i>Project.DefineRule</i> command.

### 18.3.5.13.11 Model Validation Example

The following example code is written in C# and provides a skeleton model validation implementation that you might like to use as a starting point in writing your own model validation rules.

#### Main.cs

```
using System;

namespace myAddIn
{
    public class Main
    {
        public Rules theRules;

        public Main()
        {
            theRules = new Rules();
        }

        public string EA_Connect(EA.Repository Repository)
        {
            return "";
        }

        public void EA_Disconnect()
        {
            GC.Collect();
            GC.WaitForPendingFinalizers();
        }

        private bool IsProjectOpen(EA.Repository Repository)
        {
            try
            {
                EA.Collection c = Repository.Models;
                return true;
            }
        }
    }
}
```

```

        catch
        {
            return false;
        }
    }

    public object EA_GetMenuItems(EA.Repository Repository, string
MenuLocation, string MenuName)
    {
        switch (MenuName)
        {
            case "":
                return "- &myAddin";
            case "- &myAddin":
                string( ) ar = { "&Test" };
                return ar;
        }
        return "";
    }

    public void EA_GetMenuState(EA.Repository Repository, string
MenuLocation, string MenuName, string ItemName, ref bool IsEnabled, ref
bool IsChecked)
    {
        // if no open project, disable all menu options
        if (IsProjectOpen(Repository))
            IsEnabled = true;
        else
            IsEnabled = false;
    }

    public void EA_MenuClick(EA.Repository Repository, string
MenuLocation, string MenuName, string ItemName)
    {
        switch (ItemName)
        {
            case "&Test";
                DoTest(Repository);
                break;
        }
    }

    public void EA_OnInitializeUserRules(EA.Repository Repository)
    {

EA_OnPreDeleteTechnology (Deprecated)	<a href="#">EA_OnPreDeleteTechnology</a> [2052]

#### 18.3.5.15.1 EA\_OnPreDeleteElement

##### Topics:

Topic	Detail	See Also
<b>Details</b>	<p><b>EA_OnPreDeleteElement</b> notifies Add-Ins that an element is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the element.</p> <p>This event occurs when a user deletes an element from the <b>Project Browser</b> or on a diagram. The notification is provided immediately before the element is deleted, so that the Add-In can disable deletion of the element.</p>	

### Syntax

**Function** *EA\_OnPreDeleteElement(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreDeleteElement* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the element to be deleted: <ul style="list-style-type: none"> <li><i>ElementID</i>: A long value corresponding to <i>Element.ElementID</i>.</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

Return **True** to enable deletion of the element from the model. Return **False** to disable deletion of the element.

#### 18.3.5.15.2 EA\_OnPreDeleteAttribute

### Topics:

Topic	Detail	See Also
<b>Details</b>	<p><b>EA_OnPreDeleteAttribute</b> notifies Add-Ins that an attribute is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the attribute.</p> <p>This event occurs when a user attempts to permanently delete an attribute from the <b>Project Browser</b>. The notification is provided immediately before the attribute is deleted, so that the Add-In can disable deletion of the attribute.</p>	

### Syntax

**Function** *EA\_OnPreDeleteAttribute(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreDeleteAttribute* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the attribute to be deleted: <ul style="list-style-type: none"> <li><i>AttributeID</i>: A long value corresponding to <i>Attribute.AttributeID</i>.</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open

Parameter	Type	Direction	Description
			Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return **True** to enable deletion of the attribute from the model. Return **False** to disable deletion of the attribute.

### 18.3.5.15.3 EA\_OnPreDeleteMethod

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPreDeleteMethod</b> notifies Add-Ins that a method (operation) is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the method.</p> <p>This event occurs when a user attempts to permanently delete a method from the <b>Project Browser</b>. The notification is provided immediately before the method is deleted, so that the Add-In can disable deletion of the method.</p>	

#### Syntax

**Function** EA\_OnPreDeleteMethod(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPreDeleteMethod* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the method to be deleted: <ul style="list-style-type: none"> <li><i>MethodID</i>: A long value corresponding to <i>Method.MethodID</i>.</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return **True** to enable deletion of the method from the model. Return **False** to disable deletion of the method.

#### 18.3.5.15.4 EA\_OnPreDeleteConnector

##### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPreDeleteConnector</b> notifies Add-Ins that a connector is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the connector.</p> <p>This event occurs when a user attempts to permanently delete a connector on a diagram. The notification is provided immediately before the connector is deleted, so that the Add-In can disable deletion of the connector.</p>	

##### Syntax

**Function** EA\_OnPreDeleteConnector(*Repository As EA.Repository, Info As EA.EventProperties*) As Boolean

The *EA\_OnPreDeleteConnector* function syntax contains the following elements:

Parameter	Type	Direction	Description
Info	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the connector to be deleted: <ul style="list-style-type: none"> <li><i>ConnectorID</i>: A long value corresponding to <i>Connector.ConnectorID</i>.</li> </ul>
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

##### Return Value

Return **True** to enable deletion of the connector from the model. Return **False** to disable deletion of the connector.

#### 18.3.5.15.5 EA\_OnPreDeleteDiagram

##### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPreDeleteDiagram</b> notifies Add-Ins that a diagram is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the diagram.</p> <p>This event occurs when a user attempts to permanently delete a diagram from the <b>Project Browser</b>. The notification is provided immediately before the diagram is deleted, so that the Add-In can disable deletion of the diagram.</p>	

**Syntax**

**Function** *EA\_OnPreDeleteDiagram(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreDeleteDiagram* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the diagram to be deleted: <ul style="list-style-type: none"> <li><i>DiagramID</i>: A long value corresponding to <i>Diagram.DiagramID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently-open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

**Return Value**

Return **True** to enable deletion of the diagram from the model. Return **False** to disable deletion of the diagram.

**18.3.5.15.6 EA\_OnPreDeleteDiagramObject****Topics:**

Topic	Detail	See Also
<b>Details</b>	<p><b><i>EA_OnPreDeleteDiagramObject</i></b> notifies Add-Ins that a diagram object is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the element.</p> <p>This event occurs when a user attempts to permanently delete an element from a diagram. The notification is provided immediately before the element is deleted, so that the Add-In can disable deletion of the element.</p>	

**Syntax**

**Function** *EA\_OnPreDeleteDiagramObject(Repository As EA.Repository, Info As EA.EventProperties) As Boolean*

The *EA\_OnPreDeleteDiagramObject* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> objects for the element to be deleted: <ul style="list-style-type: none"> <li><i>ID</i>: A long value corresponding to <i>DiagramObject.ElementID</i></li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a>	IN	An <i>EA.Repository</i> object representing the currently-open

Parameter	Type	Direction	Description
y			Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

Return **True** to enable deletion of the element from the model. Return **False** to disable deletion of the element.

### 18.3.5.15.7 EA\_OnPreDeletePackage

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPreDeletePackage</b> notifies Add-Ins that a package is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the package.</p> <p>This event occurs when a user attempts to permanently delete a package from the <b>Project Browser</b>. The notification is provided immediately before the package is deleted, so that the Add-In can disable deletion of the package.</p>	

#### Syntax

**Function** EA\_OnPreDeletePackage(*Repository As EA.Repository, Info As EA.EventProperties*) **As Boolean**

The *EA\_OnPreDeletePackage* function syntax contains the following elements:

Parameter	Type	Direction	Description
Info	<a href="#">EA.EventProperties</a> 	IN	Contains the following <i>EventProperty</i> objects for the package to be deleted: <ul style="list-style-type: none"> <li><i>PackageID</i>: A long value corresponding to <i>Package.PackageID</i>.</li> </ul>
Repository	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

Return **True** to enable deletion of the package from the model. Return **False** to disable deletion of the package.

### 18.3.5.15.8 EA\_OnPreDeleteGlossaryTerm

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnPreDeleteGlossaryTerm</b> notifies Add-Ins that a glossary term is to be deleted from the model. It enables Add-Ins to permit or deny deletion of the glossary term.</p> <p>The notification is provided immediately before the glossary term is deleted, so that the Add-In can disable deletion of the glossary term.</p>	

#### Syntax

**Function** EA\_OnPreDeleteGlossaryTerm(*Repository As EA.Repository, Info As EA.EventProperties*) As Boolean

The *EA\_OnPreDeleteGlossaryTerm* function syntax contains the following elements:

Parameter	Type	Direction	Description
Info	<a href="#">EA.EventProperties</a> [1859]	IN	Contains the following <i>EventProperty</i> objects for the glossary term to be deleted: <ul style="list-style-type: none"> <li><i>TermID</i>: A long value corresponding to <i>Term.TermID</i>.</li> </ul>
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return **True** to enable deletion of the glossary term from the model. Return **False** to disable deletion of the glossary term.

### 18.3.5.16 Pre-New Events

Enterprise Architect Add-Ins can respond to requests to create new elements, connectors, objects, attributes, methods and packages using the following broadcast events:

The *EA\_OnPreNewGlossaryTerm* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Info</b>	<a href="#">EA.EventProperties</a> <small>[1859]</small>	IN	Contains the following <i>EventProperty</i> object for the glossary term to be created: <ul style="list-style-type: none"> <li><i>Type</i>: A string value corresponding to <i>Term.TermID</i>.</li> </ul>
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

Return **True** to enable addition of the new glossary term to the model. Return **False** to disable addition of the new glossary term.

### 18.3.5.17 Tagged Value Broadcasts

Enterprise Architect includes the *Addin Broadcast* Tagged Value type that allows an Add-In to respond to attempts to edit it. The function that is called depends on the type of object the Tagged Value is on.

### 18.3.5.18.1 EA\_OnInitializeTechnologies

#### Topics:

Topic	Detail	See Also
Details	<p><b>EA_OnInitializeTechnologies</b> requests that an Add-In pass an MDG Technology to Enterprise Architect for loading.</p> <p>This event occurs on Enterprise Architect startup. Return your technology XML to this function and Enterprise Architect loads and enables it.</p>	

#### Syntax

**Function** EA\_OnInitializeTechnologies(*Repository As EA.Repository*) As Object

The *EA\_OnInitializeTechnologies* function syntax contains the following element:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a>  [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return the MDG Technology as a single XML string.

#### Example

```
Public Function EA_OnInitializeTechnologies(ByVal Repository As EA.
Repository) As Object
    EA_OnInitializeTechnologies = My.Resources.MyTechnology
End Function
```

None.

## 18.3.6 Custom Views

### Topics:

Topic	Detail	See Also
General Usage	<p>Enterprise Architect enables custom windows to be inserted as tabs in the <b>Diagram View</b> that appears at the center of the Enterprise Architect frame.</p> <p><b>Creating a custom view</b> enables you to easily and quickly tab between a custom interface and diagrams and other views normally provided by Enterprise Architect.</p> <p>Uses for this facility include:</p> <ul style="list-style-type: none"> <li>• Reports and graphs showing summary data of the model</li> <li>• Alternative views of a diagram</li> <li>• Alternative views of the model</li> <li>• Views of external data related to model data</li> <li>• Documentation tools</li> </ul>	<a href="#">Creating a custom view</a> <small>[2056]</small>

### 18.3.6.1 Create a Custom View

#### Topics:

Topic	Detail	See Also
<b>How to create a Custom View</b>	<p>A custom view must be designed as an ActiveX custom control and inserted through the automation interface.</p> <p>ActiveX custom controls can be created using most well-known programming tools including Microsoft Visual Studio.NET. See the documentation provided by the relevant vendor on how to create a custom control to produce an OCX file.</p> <p>Once the custom control has been created and registered on the target system, it can be added through the <b>AddTab()</b> method of the <b>Repository</b> object.</p> <p>While it is possible to call <b>AddTab()</b> from any automation client, it is likely that you would call it from an Add-In, and that Add-In is defined in the same OCX that provides the custom view.</p> <p>Example C# code is shown below:</p> <pre> public class AddIn {     UserControl1 m_MyControl;      public void EA_Connect ( EA.Repository Rep)     {         public object EA_GetMenuItems( EA. Repository Repository, string Location, string MenuName)         {             if ( MenuName == "" )                 return "- &amp;C# Control Demo";             else             {                 String( ) ret = {"&amp;Create", "&amp;Show Button"};                 return ret;             }         }          public void EA_MenuClick( EA.Repository Rep, string Location, string MenuName, string ItemName)         {             if ( ItemName == "&amp;Create" )                 m_MyControl = (UserControl1) Rep.AddTab(" C# Demo", "Cont Demo. UserControl1");             else                 m_MyControl.ShowButton();         }     } } </pre>	<a href="#">Repository Class</a> <small>[1870]</small>

### 18.3.7 Custom Docked Window

#### Topics:

Topic	Detail	See Also
<b>Abstract</b>	<p>Enterprise Architect enables a custom docked window to be added to Enterprise Architect and shown and docked in the same way as other Enterprise Architect docked windows.</p> <p>A custom docked window must be designed as an ActiveX custom control and inserted through the automation interface.</p> <p>ActiveX custom controls can be created using most well-known programming tools including Microsoft Visual Studio.NET. See the documentation provided by the relevant vendor on how to create a custom control to produce an OCX file.</p> <p>Once the custom control has been created and registered on the target system, it can be added through the <b>AddWindow()</b> method of the <b>Repository</b> object.</p> <p>While it is possible to call <b>AddWindow()</b> from any automation client, it is likely that you would call it from an Add-In, and that Add-In is defined in the same OCX that provides the custom view.</p>	<a href="#">Repository Class</a> <sup>[1870]</sup>

### 18.3.8 MDG Add-Ins

#### Topics:

Topic	Detail	See Also
<b>Abstract</b>	<p>MDG Add-Ins are specialized types of Add-Ins that have additional features and extra requirements for Add-In authors who want to contribute to Enterprise Architect's goal of Model Driven Generation</p> <p>Unlike general Add-In events, MDG Add-In events are only sent to the Add-In that has taken ownership of an Enterprise Architect model branch on a particular PC</p> <p>One of the additional responsibilities of an MDG Add-In is to take ownership of a branch of an Enterprise Architect model, which is done through the <i>MDG_Connect</i> event</p> <p>MDG Add-Ins identify themselves as such during <i>EA_Connect</i> by returning the string <b>MDG</b></p> <p>Unlike ordinary Add-Ins, responding to <i>MDG Add-In</i> events is not optional, and methods must be published for each of the <i>MDG Events</i></p> <p>Two examples of MDG Add-Ins are the commercially available MDG Link for Eclipse and MDG Link for Visual Studio, published by <i>Sparx Systems</i></p>	<a href="#">MDG_Connect</a> <sup>[2059]</sup> <a href="#">EA_Connect</a> <sup>[1992]</sup> <a href="#">MDG Events</a> <sup>[2057]</sup> <a href="#">Sparx Systems</a> (Online Resource)

#### 18.3.8.1 MDG Events

An MDG Add-In must respond to all MDG Events. These events usually identify processes such as Build, Run, Synchronize, PreMerge and PostMerge, amongst others.

An MDG Link Add-In is expected to implement some form of forward and reverse engineering capability within Enterprise Architect, and as such requires access to a specific set of events, all to do with generation,

synchronization and general processes concerned with converting models to code and code to models.

### 18.3.8.1.1 MDGBuild Project

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_BuildProject</b> enables the Add-In to handle file changes caused by generation. This function is called in response to a user selecting the <b>Add-Ins   Build Project</b> menu option.</p> <p>Respond to this event by compiling the project source files into a running application.</p> <p>Also look at <b>MDG_RunExe</b>.</p>	<a href="#">MDG_RunExe</a> <sup>[2069]</sup>

#### Syntax

**Sub MDG\_BuildProject(Repository As EA.Repository, PackageGuid As String)**

The *MDG\_BuildProject* function syntax contains the following elements:

Parameter	Type	Direction	Description
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-

Parameter	Type	Direction	Description
			tree that is controlled by the Add-In.
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

None.

#### 18.3.8.1.2 MDGConnect

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_Connect</b> enables the Add-In to handle user driven request to connect a model branch to an external application. This function is called when the user attempts to connect a particular Enterprise Architect package to an as yet unspecified external project. This event enables the Add-In to interact with the user to specify such a project.</p> <p>The Add-In is responsible for retaining the connection details, which should be stored on a per-user or per-workstation basis. That is, users who share a common Enterprise Architect model over a network should be able to connect and disconnect to external projects independently of one another.</p> <p>The Add-In should therefore not store connection details in an Enterprise Architect repository. A suitable place to store such details would be:</p> <pre>SHGet Folder Path ( . . CSI DL_APPDATA. . ) \ Addi nName.</pre> <p>The <i>PackageGuid</i> parameter is the same identifier as required for most events relating to the MDG Add-In. Therefore it is recommended that the connection details be indexed using the <i>PackageGuid</i> value.</p> <p>The <i>PackageID</i> parameter is provided to aid fast retrieval of package details from Enterprise Architect, should this be required.</p> <p>Also look at <b>MDG_Disconnect</b>.</p>	<p><a href="#">MDG_Disconnect</a> [2060]</p>

#### Syntax

**Function** *MDG\_Connect*(*Repository As EA.Repository, PackageID as Long, PackageGuid As String*) *As Long*

The *MDG\_Connect* function syntax contains the following elements:

Parameter	Type	Direction	Description
PackageGuid	String	IN	The unique ID identifying the project provided by the Add-In when a connection to a project branch of an Enterprise Architect model was first established.
PackageID	Long	IN	The <i>PackageID</i> of the Enterprise Architect package the user has requested to have connected to an external project.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Returns a non-zero to indicate that a connection has been made; a zero indicates that the user has not nominated a project and connection should not proceed.

#### 18.3.8.1.3 MDGDisconnect

##### Topics:

Topic	Detail	See Also
Details	<b>MDG_Disconnect</b> enables the Add-In to respond to user requests to disconnect the model branch from an external project. This function is called when the user attempts to disconnect an associated external project. The Add-In is required to delete the details of the connection.  Also look at <b>MDG_Connect</b> .	<a href="#">MDG_Connect</a> <sup>[2059]</sup>

##### Syntax

**Function MDG\_Disconnect(Repository As EA.Repository, PackageGuid As String) As Long**

The *MDG\_Disconnect* function syntax contains the following elements:

Parameter	Type	Direction	Description
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
Repository	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

##### Return Value

Returns a non-zero to indicate that a disconnection has occurred enabling Enterprise Architect to update the user interface. A zero indicates that the user has not disconnected from an external project.

### 18.3.8.1.4 MDGGetConnectedPackages

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_GetConnectedPackages</b> enables the Add-In to return a list of current connection between Enterprise Architect and an external application. This function is called when the Add-In is first loaded, and is expected to return a list of the available connections to external projects for this Add-In.</p> <p>Also look at <b>MDG_Connect</b>.</p>	<a href="#">MDG_Connect</a> 

#### Syntax

#### Function MDG\_GetConnectedPackages(*Repository As EA.Repository*) As Variant

The *MDG\_GetConnectedPackages* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> 	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Returns an array of GUID strings representing individual Enterprise Architect packages.

### 18.3.8.1.5 MDGGetProperty

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_GetProperty</b> provides miscellaneous Add-In details to Enterprise Architect. This function is called by Enterprise Architect to poll the Add-In for information relating to the <i>PropertyName</i>. This event should occur in as short a duration as possible as Enterprise Architect does not cache the information provided by the function.</p> <p>Values corresponding to the following <i>PropertyNames</i> must be provided:</p> <ul style="list-style-type: none"> <li><b>IconID</b> - Return the name of a DLL and a resource identifier in the format <i>#ResID</i>, where the resource ID indicates an Icon; for example, <i>c:\program files\myapp\myapp.dll#101</i></li> <li><b>Language</b> - Return the default language that Classes should be assigned when they are created in Enterprise Architect</li> <li><b>HiddenMenus</b> - Return one or more values from the</li> </ul>	

Topic	Detail	See Also
	<p><i>MDGMenu</i> enumeration to hide menus that do not apply to your Add-In. For example:</p> <pre>if ( PropertyName == "HiddenMenus" )     return mgBuildProject + mgRun;</pre>	

### Syntax

**Function** *MDG\_GetProperty*(*Repository As EA.Repository, PackageGuid As String, PropertyName As String*) *As Variant*

The *MDG\_GetProperty* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>PropertyName</b>	<i>String</i>	IN	The name of the property that is used by Enterprise Architect. See <i>Details</i> for the possible values.
<b>Repository</b>	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently-open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

See *Details*, above.

#### 18.3.8.1.6 MDGMerge

### Topics:

Topic	Detail	See Also
<b>Details</b>	<p><b>MDG_Merge</b> enables the Add-In to jointly handle changes to both the model branch and the code project that the model branch is connected to. This event should be called whenever the user has asked to merge their model branch with its connected code project, or whenever the user has established a new connection to a code project. The purpose of this event is to enable the Add-In to interact with the user to perform a merge between the model branch and the connected project.</p>	<p><a href="#">MDG_Connect</a> [2059]</p> <p><a href="#">MDG_PreMerge</a> [2067]</p> <p><a href="#">MDG_PostMerge</a> [2069]</p>

### Syntax

**Function** *MDG\_Merge*(*Repository As EA.Repository, PackageGuid As String, SynchObjects As Variant, SynchType As String, ExportObjects As Variant, ExportFiles As Variant, ImportFiles As Variant, IgnoreLocked As String, Language As String*) *As Long*

The *MDG\_Merge* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>ExportFiles</b>	<i>Variant</i>	OUT	A string array containing the list of files for each model object chosen for export by the Add-In. Each entry in this array must have a corresponding entry in the <i>ExportObjects</i> parameter at the same array index, so <i>ExportFiles(2)</i> must contain the filename of the object by <i>ExportObjects(2)</i> .
<b>ExportObjects</b>	<i>Variant</i>	OUT	The string array containing the list of new model objects (in <i>Object ID</i> format) to be exported by Enterprise Architect to the code project.
<b>IgnoreLocked</b>	<i>String</i>	OUT	A value indicating whether to ignore any files locked by the code project (that is, "TRUE" or "FALSE").
<b>ImportFiles</b>	<i>Variant</i>	OUT	A string array containing the list of code files made available to the code project to be newly imported to the model. Enterprise Architect imports each file listed in this array for import into the connected model branch.
<b>Language</b>	<i>String</i>	OUT	The string value containing the name of the code language supported by the code project connected to the model branch.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>SynchObjects</b>	<i>Variant</i>	OUT	A string array containing a list of objects ( <i>Object ID</i> format) to be jointly synchronized between the model branch and the project. See <a href="#">below</a> <sup>[2064]</sup> for the format of the Object IDs.
<b>SynchType</b>	<i>String</i>	OUT	The value determining the user-selected type of synchronization to take place. See <a href="#">below</a> <sup>[2063]</sup> for a list of valid values.

### Return Value

Return a non-zero if the merge operation completed successfully and a zero value when the operation has been unsuccessful.

### Merge

A merge consists of three major operations:

- **Export:** Where newly created model objects are exported into code and made available to the code project.
- **Import:** Where newly created code objects, Classes and such things are imported into the model.
- **Synchronize:** Where objects available both to the model and in code are jointly updated to reflect changes made in either the model, code project or both

### Synchronize Type

The *Synchronize* operation can take place in one of four different ways. Each of these ways corresponds to a value returned by *SynchType*:

- None: (*SynchType* = 0) No synchronization is to be performed
- Forward: (*SynchType* = 1) Forward synchronization, between the model branch and the code project is

to occur

- Reverse: (*SynchType* = 2) Reverse synchronization, between the code project and the model branch is to occur
- Both: (*SynchType* = 3) Reverse, then Forward synchronization's are to occur

### Object ID Format

Each of the Object IDs listed in the string arrays described above should be composed in the following format:

```
( @namespace ) * ( #class ) * ( $attribute | %operation | : property ) *
```

#### 18.3.8.1.7 MDGNewClass

### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_NewClass</b> enables the Add-In to alter details of a Class before it is created.</p> <p>This method is called when Enterprise Architect generates a new Class, and requires information relating to assigning the language and file path. The file path should be passed back as a return value and the language should be passed back via the language parameter.</p>	<a href="#">MDG_PreGenerate</a> [2068]

### Syntax

**Function** *MDG\_NewClass(Repository As EA.Repository, PackageGuid As String, CodeID As String, Language As String) As String*

The *MDG\_NewClass* function syntax contains the following elements:

Parameter	Type	Direction	Description
CodeID	String	IN	A string used to identify the code element before it is created, for more information see <a href="#">MDG_View</a> [2068].
Language	String	OUT	A string used to identify the programming language for the new Class. The language must be supported by Enterprise Architect.
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
Repository	<a href="#">EA.Repository</a> [1878]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

### Return Value

Returns a string containing the file path that should be assigned to the Class.

### 18.3.8.1.8 MDGPostGenerate

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_PostGenerate</b> enables the Add-In to handle file changes caused by generation.</p> <p>This event is called after Enterprise Architect has prepared text to replace the existing contents of a file. Responding to this event enables the Add-In to write to the linked application's user interface rather than modify the file directly.</p> <p>When the contents of a file are changed, Enterprise Architect passes <i>FileContents</i> as a non-empty string. New files created as a result of code generation are also sent through this mechanism, enabling Add-Ins to add new files to the linked project's file list.</p> <p>When new files are created Enterprise Architect passes <i>FileContents</i> as an empty string. When a non-zero is returned by this function, the Add-In has successfully written the contents of the file. A zero value for the return indicates to Enterprise Architect that the file must be saved.</p>	<a href="#">MDG_PreGenerate</a> <small>[2066]</small>

#### Syntax

**Function** `MDG_PostGenerate(Repository As EA.Repository, PackageGuid As String, FilePath As String, FileContents As String) As Long`

The `MDG_PostGenerate` function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>FileContents</b>	<i>String</i>	IN	A string containing the proposed contents of the file.
<b>FilePath</b>	<i>String</i>	IN	The path of the file Enterprise Architect intends to overwrite.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>Repository</b>	<a href="#">EA.Repository</a> <small>[1870]</small>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

#### Return Value

Return value depends on the type of event that this function is responding to (see **Details**, above). This function is required to handle two separate and distinct cases.

### 18.3.8.1.9 MDGPostMerge

#### Topics:

Topic	Detail	See Also
Details	<p>MDG_PostMerge is called after a merge process has been completed.</p> <p>This function is called by Enterprise Architect after the merge process has been completed.</p> <p>File save checking should not be performed with this function, but should be handled by <b>MDG_PreGenerate</b>, <b>MDG_PostGenerate</b> and <b>MDG_PreReverse</b>.</p>	<p><a href="#">MDG_PreGenerate</a> [2066]</p> <p><a href="#">MDG_PostGenerate</a> [2065]</p> <p><a href="#">MDG_PreReverse</a> [2068]</p> <p><a href="#">MDG_PreMerge</a> [2067]</p> <p><a href="#">MDG_Merge</a> [2062]</p>

#### Syntax

*Function MDG\_PostMerge(Repository As EA.Repository, PackageGuid As String) As Long*

The *MDG\_PostMerge* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

#### Return Value

Return a zero value if the post-merge process has failed, a non-zero return indicates that the post-merge has been successful. Enterprise Architect assumes a non-zero return if this method is not implemented

### 18.3.8.1.10 MDGPreGenerate

#### Topics:

Topic	Detail	See Also
Details	<p><b>MDG_PreGenerate</b> enables the Add-In to deal with unsaved changes. This function is called immediately before Enterprise Architect attempts to generate files from the model. A possible use of this function would be to prompt the user to save unsaved source files.</p>	<p><a href="#">MDG_PostGenerate</a> [2065]</p>

#### Syntax

**Function MDG\_PreGenerate(Repository As EA.Repository, PackageGuid As String) As Long**

The *MDG\_PreGenerate* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

**Return Value**

Return a zero value to abort generation. Any other value enables the generation to continue.

**18.3.8.1.11 MDGPreMerge****Topics:**

Topic	Detail	See Also
Details	<p><b>MDG_PreMerge</b> is called after a merge process has been initiated by the user and before Enterprise Architect performs the merge process.</p> <p>This event is called after a user has performed their interactions with the merge screen and has confirmed the merge with the OK button, but before Enterprise Architect performs the merge process using the data provided by the <i>MDG_Merge</i> call, before any changes have been made to the model or the connected project.</p> <p>This event is made available to provide the Add-In with the opportunity to generally set internal Add-In flags to augment the <i>MDG_PreGenerate</i>, <i>MDG_PostGenerate</i> and <i>MDG_PreReverse</i> events.</p> <p>File save checking should not be performed with this function, but should be handled by <b>MDG_PreGenerate</b>, <b>MDG_PostGenerate</b> and <b>MDG_PreReverse</b>.</p> <p>Also look at <b>MDG_Merge</b> and <b>MDG_PostMerge</b>.</p>	<p><a href="#">MDG_PreGenerate</a> [2066]</p> <p><a href="#">MDG_PostGenerate</a> [2065]</p> <p><a href="#">MDG_PreReverse</a> [2068]</p> <p><a href="#">MDG_Merge</a> [2062]</p> <p><a href="#">MDG_PostMerge</a> [2066]</p>

**Syntax****Function MDG\_PreMerge(Repository As EA.Repository, PackageGuid As String) As Long**

The *MDG\_PreMerge* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.

Parameter	Type	Direction	Description
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

### Return Value

A return value of zero indicates that the merge process can not occur. If the value is not zero the merge process proceeds. If this method is not implemented then it is assumed that a merge process is used.

### 18.3.8.1.12 MDGPreReverse

#### Topics:

Topic	Detail	See Also
Details	<p>MDG_PreReverse enables the Add-In to save file changes before being imported into Enterprise Architect.</p> <p>This function operates on a list of files that are about to be reverse-engineered into Enterprise Architect. If the user is working on unsaved versions of these files in an editor, you could either prompt the user or save automatically.</p>	<p><a href="#">MDG_PostGenerate</a> [2065]</p> <p><a href="#">MDG_PreGenerate</a> [2066]</p>

### Syntax

**Sub MDG\_PreReverse(Repository As EA.Repository, PackageGuid As String, FilePaths As Variant)**

The *MDG\_PreReverse* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
FilePaths	String array	IN	An array of filepaths pointed to the files that are to be reverse engineered.

### Return Value

None.

### 18.3.8.1.13 MDGRunExe

#### Topics:

Topic	Detail	See Also
Details	<b>MDG_RunExe</b> enables the Add-In to run the target application. This function is called when the user selects the <b>Add-Ins   Run Exe</b> menu option. Respond to this event by launching the compiled application.	<a href="#">MDG_BuildProject</a> [2058]

#### Syntax

**Sub MDG\_RunExe(Repository As EA.Repository, PackageGuid As String)**

The *MDG\_RunExe* function syntax contains the following elements:

Parameter	Type	Direction	Description
Repository	<a href="#">EA.Repository</a> [1870]	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
PackageGuid	String	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.

#### Return Value

None.

### 18.3.8.1.14 MDGView

#### Topics:

Topic	Detail	See Also
Details	<b>MDG_View</b> enables the Add-In to display user specified code elements. This function is called by Enterprise Architect when the user asks to view a particular code element. This enables the Add-In to present that element in its own way, usually in a code editor.	

#### Syntax

**Function MDG\_View(Repository As EA.Repository, PackageGuid As String, CodeID as String) As Long**

The *MDG\_View* function syntax contains the following elements:

Parameter	Type	Direction	Description
<b>Repository</b>	<i>EA.Repository</i>	IN	An <i>EA.Repository</i> object representing the currently open Enterprise Architect model. Poll its members to retrieve model data and user interface status information.
<b>PackageGuid</b>	<i>String</i>	IN	The GUID identifying the Enterprise Architect package sub-tree that is controlled by the Add-In.
<b>CodeID</b>	<i>String</i>	IN	Identifies the code element in the following format: <code>&lt;type&gt;ElementPart&lt;type&gt;ElementPart..</code> where each element is preceded with a token identifying its type: @ - namespace # - Class \$ - attribute % - operation For example if a user has selected the <i>m_Name</i> attribute of <i>Class1</i> located in <i>namespace Name1</i> , the <i>class ID</i> would be passed through in the following format: <code>@Name1#Class1%m_Name</code>

#### Return Value

Return a non-zero value to indicate that the Add-In has processed the request. Returning a zero value results in Enterprise Architect employing the standard viewing process which is to launch the associated source file.

**Part**

## 19 Glossary

This topic provides a detailed glossary for Enterprise Architect.

## 19.1 A

Name	Detail	See also
<b>Abstract Class</b>	A Class that cannot be directly instantiated.	Concrete Class
<b>Abstraction</b>	The essential characteristics of an entity that distinguish it from all other kinds of entities. An abstraction defines a boundary relative to the perspective of the viewer.	
<b>Action</b>	The specification of an executable statement that forms an abstraction of a computation procedure. An action typically results in a change in the state of the system, and can be realized by sending a message to an object or modifying a connector or a value of an attribute.	
<b>Action Sequence</b>	An expression that resolves to a sequence of actions.	
<b>Action State</b>	A state that represents the execution of an atomic action, typically the invocation of an operation.	
<b>Activation</b>	The execution of an action.	
<b>Active Class</b>	A Class whose instances are active objects. When instantiated, an active Class controls its execution. Rather than being invoked or activated by other objects, it can operate standalone, and define its own thread of behavior.	Active Object
<b>Active Object</b>	An object that owns a thread and can initiate control activity. An instance of active Class.	Active Class, Thread
<b>Activity</b>	Defines the bounds for the structural organization that contains a set of basic or fundamental behaviors. It can be used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.	
<b>Activity Diagram</b>	A diagram used to model procedural type application development for system design through to modeling business processes in organizational structures and work flow.	
<b>Activity Graph</b>	A special case of a State Machine that is used to model processes involving one or more classifiers.	State Chart Diagram
<b>Actor ( Class )</b>	A coherent set of roles that users of Use Cases play when interacting with these Use Cases. An Actor has one role for each Use Case with which it communicates.	
<b>Actual Parameter</b>	A binding for a parameter that resolves to a run-time instance.	Argument, (Formal) Parameter
<b>Aggregate ( Class )</b>	A Class that represents the 'whole' in an Aggregation (whole-part) relationship.	Aggregation
<b>Aggregation</b>	A special form of Association that specifies a whole-part relationship between the Aggregate (whole) and a component part.	Composition
<b>Analysis</b>	The part of the software development process whose primary purpose is to formulate a model of the problem domain. Analysis focuses on what to do, design focuses	Design

Name	Detail	See also
	on how to do it.	
<b>Analysis Diagram</b>	A diagram used to capture high level business processes and early models of system behavior and elements. It is less formal than some other diagrams, but provides a good means of capturing the essential business characteristics and requirements.	
<b>Analysis Time</b>	Refers to something that occurs during an analysis phase of the software development process.	Modeling Time, Run Time, Compile Time, Design Time
<b>Architecture</b>	The organizational structure and associated behavior of a system. An architecture can be recursively decomposed into parts that interact through interfaces, relationships that connect parts, and constraints for assembling parts. Parts that interact through interfaces include Classes, Components and subsystems.	
<b>Argument</b>	A binding for a parameter that resolves to a run-time instance.	Actual Parameter (Formal) Parameter
<b>Artifact</b>	A physical piece of information that is used or produced by a business or development process. Examples of Artifacts include models, source files, scripts, and binary executable files. An Artifact can constitute the implementation of a deployable component.	Product, Component
<b>Assembly</b>	A connector that bridges the required interface of a component with the provided interface of a second component.	
<b>Association</b>	The semantic relationship between two or more classifiers that specifies connections among their instances.	Link
<b>Association Class</b>	A model element that has both Association and Class properties. An Association Class can be seen as an Association that also has Class properties, or as a Class that also has Association properties.	Class
<b>Association End</b>	The endpoint of an Association, which connects the Association to a classifier.	Classifier, Link End
<b>Attribute</b>	A feature within a classifier that describes a range of values that instances of the classifier can hold.	
<b>Auxiliary Class</b>	A stereotyped Class that supports another more central or fundamental Class, typically by implementing secondary logic or control flow. Auxiliary Classes are typically used together with focus Classes, and are particularly useful for specifying the secondary business logic or control flow of components during design.	Focus Class

## 19.2 B

Name	Detail	See also
<b>Behavior</b>	The observable effects of an operation or event, including its results.	
<b>Behavioral Diagram</b>	A diagram that depicts the behavioral features of a system or business process. Behavioral diagrams include Activity diagrams, State Machine diagrams, Communication diagrams, Interaction Overview diagrams, Sequence diagrams, Timing diagrams and Use Case diagrams.	
<b>Behavioral Feature</b>	A dynamic feature of a model element, such as an operation or method.	
<b>Behavioral Model aspect</b>	A model aspect that emphasizes the behavior of the instances in a system, including their methods, collaborations, and state histories.	
<b>Binary Association</b>	An Association between two Classes. A special case of an N-ary Association.	N-ary Association
<b>Binding</b>	The creation of a model element from a template by supplying arguments for the parameters of the template.	
<b>Bookmark</b>	A marker in a Rich Text Format document that enables you to link inner sections of a document into a master document (using the Word 'Insert File' function).	
<b>Boolean</b>	An enumeration whose values are true and false.	
<b>Boolean Expression</b>	An expression that evaluates to a boolean value.	
<b>Boundary</b>	<ol style="list-style-type: none"> <li>1. A stereotyped Class that models some system boundary – typically a user interface screen. It is used in the conceptual phase to capture user interaction with the system at a screen level (or some other boundary interface type). It is often used in Sequence and Robustness (Analysis) diagrams. It is the View in the Model-View-Controller pattern.</li> <li>2. A System Boundary element is used to delineate a particular part of the system.</li> </ol>	

## 19.3 C

Name	Detail	See also
<b>C++</b>	An object-oriented programming language based on the earlier 'C' language.	
<b>Call</b>	An action state that invokes an operation on a classifier.	
<b>Cardinality</b>	The number of elements in a set.	Multiplicity
<b>CASE</b>	Computer Aided Software Engineering. A tool designed for the purpose of modeling and building software systems.	
<b>Child</b>	In a Generalization relationship, the specialization of another element, the parent.	Subclass,Subtype,Parent
<b>Choice</b>	A pseudo-state used to compose complex transitional paths, where the outgoing transition path is decided by dynamic, run-time conditions determined by the actions performed by the State Machine on the path leading to the choice.	
<b>Class</b>	A description of a set of objects that share the same attributes, operations, methods, relationships and semantics. A Class can use a set of interfaces to specify collections of operations it provides to its environment.	Interface, Object
<b>Class Diagram</b>	A diagram that shows a collection of declarative (static) model elements, such as Classes, types, and their contents and relationships.	Object Diagram
<b>Classification</b>	The assignment of an object to a classifier.	Dynamic Classification, Multiple Classification, Static Classification.
<b>Classifier</b>	A mechanism that describes behavioral and structural features. Classifiers include Interfaces, Classes, datatypes, and components.	
<b>Client</b>	A classifier that requests a service from another classifier.	Supplier
<b>Collaboration</b>	The specification of how an operation or classifier, such as a Use Case, is realized by a set of classifiers and Associations playing specific roles used in a specific way. The Collaboration defines an interaction.	Interaction
<b>Collaboration Diagram</b>	Used pre-UML 2.0. Now called a Communication diagram.	
<b>Collaboration Use</b>	Uses an occurrence to apply a pattern defined by a Collaboration to a specific situation.	
<b>Combined Fragment</b>	A combined fragment reflects a piece or pieces of interaction (called interaction operands) controlled by an interaction operator, whose corresponding boolean conditions are known as interaction constraints. It appears graphically as a transparent window, divided by horizontal dashed lines for each operand.	
<b>Comment</b>	An annotation attached to an element or a collection of	Constraint

Name	Detail	See also
	elements. A comment, or note, has no semantics.	
<b>Communication Diagram</b>	A diagram that shows the interactions between elements at run-time in much the same manner as a Sequence diagram. However, Communication diagrams are used to visualize inter-object relationships, while Sequence diagrams are more effective at visualizing processing over time.	Collaboration Diagram, Object Diagram
<b>Compile Time</b>	Refers to something that occurs during the compilation of a software module.	Modeling Time, Run Time, Analysis Time, Design Time
<b>Component</b>	A modular, deployable, and replaceable part of a system that encapsulates implementation and exposes a set of interfaces. A Component is typically specified by one or more classifiers (such as implementation Classes) that reside on it, and can be implemented by one or more artifacts (such as binary, executable, or script files).	Module Artifact, Product
<b>Component Diagram</b>	A diagram that shows the organizations and dependencies among Components.	
<b>Composite ( Class )</b>	A Class that is related to one or more Classes by a Composition relationship.	Composition
<b>Composite State</b>	A State that consists of either concurrent (orthogonal) substates or sequential (disjoint) substates.	Substate, Concurrent Substate, Disjoint Substate
<b>Composite Structure Diagram</b>	A diagram that reflects the internal collaboration of Classes, Interfaces, or Components to describe a functionality. Composite Structure diagrams are similar to Class diagrams, except that they model a specific usage of the structure.	
<b>Composition</b>	A form of Aggregation that requires that a part instance be included in at most one Composite at a time, and that the Composite object is responsible for the creation and destruction of the parts. Composition can be recursive.	Composite Aggregation
<b>Concrete Class</b>	A Class that can be directly instantiated.	Abstract Class
<b>Concurrency</b>	The occurrence of two or more activities during the same time interval. Concurrency can be achieved by interleaving or simultaneously executing two or more threads.	Thread
<b>Concurrent Substate</b>	A substate that can be held simultaneously with other substates contained in the same composite State.	Composite State Disjoint Substate
<b>Connector</b>	A logical link between model elements. Can be structural, dynamic or possessive.	
<b>Constraint</b>	<ol style="list-style-type: none"> <li>1. A semantic condition or restriction. Certain constraints are predefined in the UML, others can be user defined. Constraints are one of three extensibility mechanisms in UML.</li> <li>2. A rule or condition that applies to some element. It is often modeled as a pre- or post- condition.</li> </ol>	Tagged Value, Stereotype Comment

Name	Detail	See also
<b>Container</b>	1. An instance that exists to contain other instances, and that provides operations to access or iterate over its contents.(for example, arrays, lists, sets). 2. A component that exists to contain other components.	
<b>Containment Hierarchy</b>	A namespace hierarchy consisting of model elements, and the containment relationships that exist between them. A containment hierarchy forms a graph.	
<b>Context</b>	A view of a set of related modeling elements for a particular purpose, such as specifying an operation.	
<b>Continuation</b>	A Continuation is used in seq and alt combined fragments, to indicate the branches of continuation an operand follows.	
<b>Control</b>	A stereotyped Class that represents a controlling entity or manager. A Control organizes and schedules other activities and elements. It is the controller of the Model-View-Controller pattern.	
<b>Control Flow</b>	A connector linking two nodes in an activity diagram. Control Flow connectors start a node's activity when the preceding node's action is finished.	

## 19.4 D

Name	Detail	See also
<b>Database Schema</b>	The description of a database structure. It defines tables and fields and the relationship between them.	
<b>Datastore</b>	An element used to define permanently stored data. A token of data that is stored in the Datastore is stored permanently. A token of data that comes out of the Datastore is a copy of the original data. The tokens imported are kept for the life of the Activity in which it exists.	
<b>Datatype</b>	A descriptor of a set of values that lack identity and whose operations do not have side effects. Datatypes include primitive pre-defined types and user-definable types. Pre-defined types include numbers, string and time. User-definable types include enumerations.	
<b>Decision</b>	An element of an Activity diagram that indicates a point of conditional progression: if a condition is true, then processing continues one way, if not, then another.	
<b>Defining Model ( MOF )</b>	The model on which a repository is based. Any number of repositories can have the same defining model.	
<b>Delegate</b>	A connector that defines the internal assembly of a component's external ports and interfaces. Using a Delegate connector wires the internal workings of the system to the outside world, by a delegation of the external interfaces' connections.	
<b>Delegation</b>	The ability of an object to issue a message to another object in response to a message. Delegation can be used as an alternative to inheritance.  Contrast: inheritance	
<b>Dependency</b>	A relationship between two modeling elements, in which a change to one modeling element (the independent element) affects the other modeling element (the dependent element).	
<b>Deployment</b>	A type of Dependency relationship that indicates the deployment of an artifact onto a node or executable target.	
<b>Deployment Diagram</b>	A diagram that shows the configuration of run-time processing nodes and the components, processes, and objects that live on them. Components represent run-time manifestations of code units.	Component Diagrams
<b>Deployment Specification</b>	Specifies parameters guiding deployment of an artifact, as is common with most hardware and software technologies.	
<b>Derived Element</b>	A model element that can be computed from another element, but that is shown for clarity or that is included for design purposes even though it adds no semantic information.	
<b>Design</b>	The part of the software development process whose primary purpose is to decide how the system is to be	Analysis

Name	Detail	See also
	implemented. During design, strategic and tactical decisions are made to meet the required functional and quality requirements of a system.	
<b>Design Time</b>	Refers to something that occurs during a design phase of the software development process.	Modeling Time, Run Time, Compile Time, Analysis Time
<b>Development Process</b>	A set of partially ordered steps performed for a given purpose during software development, such as constructing models or implementing models.	
<b>Diagram</b>	A graphical presentation of a collection of model elements, most often rendered as a connected graph of arcs (relationships) and vertices (other model elements). UML supports 14 diagram types, and Enterprise Architect extends these with seven more. Add-Ins, technologies and profiles can provide further diagram types.	
<b>Diagram Gate</b>	A simple graphical way to indicate the point at which messages can be transmitted into and out of Interaction Fragments.	
<b>Diagram View</b>	The Enterprise Architect workspace area where the UML diagrams are displayed.	
<b>Disjoint Substate</b>	A substate that cannot be held simultaneously with other substates contained in the same composite State.	Composite State, Substate, Concurrent Substate
<b>Distribution Unit</b>	A set of objects or components that are allocated to a process or a processor as a group. A distribution unit can be represented by a run-time composite or an Aggregate.	
<b>Domain</b>	An area of knowledge or activity characterized by a set of concepts and terminology understood by practitioners in that area.	
<b>Dynamic Classification</b>	A semantic variation of Generalization in which an object can change its classifier.	Multiple Classification, Static Classification

Name	Detail	See also
<b>Element</b>	<ol style="list-style-type: none"> <li>1. An atomic constituent of a model.</li> <li>2. A model object of any type, such as Class, Component, Node or Object.</li> </ol>	
<b>Endpoint</b>	Used in Interaction diagrams to reflect a lost message in sequence.	
<b>Entity</b>	A store or persistence mechanism that captures the information or knowledge in a system. It is the Model in the Model-View-Controller pattern.	
<b>Entry Action</b>	An action executed upon entering a state in a State Machine regardless of the transition taken to reach that state.	
<b>Entry Point</b>	Used to define where external states can enter a Sub Machine.	
<b>Enumeration</b>	A list of named values used as the range of a particular attribute type. For example, RGBColor = {red, green, blue}. Boolean is a predefined enumeration with values from the set {false, true}.	
<b>Event</b>	The specification of a significant occurrence that has a location in time and space. In the context of State diagrams, an event is an occurrence that can trigger a transition.	
<b>Exception Handler</b>	An element that defines the group of operations to carry out when an exception occurs.	
<b>Exit Action</b>	An action executed upon exiting a State in a State Machine regardless of the transition taken to exit that State.	
<b>Exit Point</b>	Used in Sub Machine states and State Machines to denote the point where the machine is exited and the transition sourcing this exit point, for Sub Machines, is triggered. Exit points are a type of pseudo-state used in the State Machine diagram.	
<b>Export</b>	In the context of packages, to make an element visible outside its enclosing namespace.	Visibility , Import
<b>Expose Interface</b>	A toolbox icon that is a graphical way to depict the required and supplied interfaces of a Component, Class or Part.	
<b>Expression</b>	A string that evaluates to a value of a particular type. For example, the expression $(7 + 5 * 3)$ evaluates to a value of type number. A relationship from an extension Use Case to a base Use Case, specifying how the behavior defined for the extension Use Case augments (subject to conditions specified in the extension) the behavior defined for the base Use Case. The behavior is inserted at the location defined by the extension point in the base Use Case. The base Use Case does not depend on performing the behavior of the extension Use Case.	Extend , Include

Name	Detail	See also
<b>Extend</b>	A connector used to indicate that an element extends the behavior of another. Extensions are used in Use Case models to indicate one Use Case (optionally) extends the behavior of another.	Expression , Include

## 19.6 F

Name	Detail	See also
<b>Facade</b>	A stereotyped package containing only references to model elements owned by another package. It is used to provide a 'public view' of some of the contents of a package.	
<b>Feature</b>	A property, like operation or attribute, that is encapsulated within a classifier, such as an Interface, a Class, or a Datatype.	
<b>Final</b>	A pseudo-state that indicates an end.	
<b>Final State</b>	A special kind of State signifying that the enclosing composite State or the entire State Machine is completed.	
<b>Fire</b>	To execute a State transition.	Transition
<b>Flow Final</b>	An element that depicts an exit from the system, as opposed to the Activity Final, which represents the completion of the activity.	
<b>Focus Class</b>	A stereotyped Class that defines the core logic or control flow for one or more auxiliary Classes that support it. Focus Classes are typically used together with one or more auxiliary Classes, and are particularly useful for specifying the core business logic or control flow of components during design.	Auxiliary Class
<b>Focus of Control</b>	A symbol on a Sequence diagram that shows the period of time during which an object is performing an action, either directly or through a subordinate procedure.	
<b>Forward Engineering</b>	The process of generating source code from the UML model.	
<b>Fork</b>	Used in State Machine diagrams as pseudo-states. With respect to State Machine diagrams, a Fork pseudo-state signifies that its incoming transition comes from a single State, and it has multiple outgoing transitions.	Join
<b>Framework</b>	A stereotyped package containing model elements that specify a reusable architecture for all or part of a system. Frameworks typically include Classes, Patterns or templates. When frameworks are specialized for an application domain, they are sometimes referred to as Application frameworks.	Pattern

## 19.7 G

Name	Detail	See also
<b>Generalizable Element</b>	A model element that can participate in a Generalization relationship.	Generalization
<b>Generalization</b>	A taxonomic relationship between a more general element and a more specific element. The more specific element is fully consistent with the more general element and contains additional information. An instance of the more specific element can be used where the more general element is allowed.	Generalizable Element, Inheritance
<b>Guard Condition</b>	A condition that must be satisfied in order to enable an associated transition to fire.	

## 19.8 H

Name	Detail	See also
<b>History State</b>	There are two types of History pseudo-states defined in UML: shallow History and deep History. A shallow History sub-state is used to represent the most recently active sub-state of a composite State. A deep History sub-state, in contrast, reflects the most recent active configuration of the composite State.	

## 19.9 I

Name	Detail	See also
<b>Implementation</b>	A definition of how something is constructed or computed. For example, a Class is an implementation of a type, a method is an implementation of an operation.	
<b>Implementation Class</b>	A stereotyped Class that specifies the implementation of a Class in some programming language (for example, C++, Smalltalk, Java) in which an instance can not have more than one Class. An Implementation Class is said to realize a type if it provides all of the operations defined for the type with the same behavior as specified for the type's operations.	Type
<b>Implementation Inheritance</b>	The inheritance of the implementation of a more general element. Includes inheritance of the interface.	Interface Inheritance
<b>Import</b>	In the context of packages, a dependency that shows the packages whose Classes can be referenced within a given package (including packages recursively embedded within it).	Visibility , Export
<b>Include</b>	A relationship from a base Use Case to an inclusion Use Case, specifying how the behavior for the base Use Case contains the behavior of the inclusion Use Case. The behavior is included at the location that is defined in the base Use Case. The base Use Case depends on performing the behavior of the inclusion Use Case, but not on its structure (that is, attributes or operations).	Extend, Expression
<b>Inheritance</b>	The mechanism by which more specific elements incorporate the structure and behavior of more general elements related by behavior.	Generalization, Delegation
<b>Initial State</b>	A pseudo-state used to denote the default state of a composite State; there can be one initial vertex in each region of the composite State.	
<b>Instance</b>	An entity that has a unique identity, a set of operations that can be applied to it, and a state that stores the effects of the operations.	Object
<b>Interaction</b>	A specification of how stimuli are sent between instances to perform a specific task. The interaction is defined in the context of a collaboration.	Collaboration
<b>Interaction Diagram</b>	A generic term that applies to several types of diagrams that emphasize object interactions. These include Timing diagrams, Sequence diagrams, Interaction Overview diagrams and Communication diagrams.	
<b>Interaction Occurrence</b>	A reference to an existing interaction element. Interaction occurrences are visually represented by a frame, with ref in the frame's title space. The diagram name is indicated in the frame contents.	
<b>Interaction Overview Diagram</b>	A diagram that visualizes the cooperation between other Interaction diagrams to illustrate a control flow serving an encompassing purpose. As Interaction Overview diagrams are a variant of Activity diagrams, most of the	

Name	Detail	See also
	diagram notation is similar, as is the process in constructing the diagram.	
<b>Interface</b>	A named set of operations that characterize the behavior of an element.	Class , Type
<b>Interface Inheritance</b>	The inheritance of the interface of a more general element. Does not include inheritance of the implementation.	Implementation Inheritance
<b>Internal Transition</b>	A transition signifying a response to an event without changing the state of an object.	
<b>Interrupt Flow</b>	An Enterprise Architect-defined toolbox icon used to define the exception handler and interruptible activity region concepts.	

**19.10 J**

Name	Detail	See also
<b>Java</b>	A fully object-oriented, cross platform language based on elements from Smalltalk, C++ and other OO languages.	
<b>Join</b>	Used in State Machine diagrams and in Activity diagrams to synchronize multiple flows.	Fork
<b>Junction</b>	Junction pseudo-states are used to design complex transitional paths. A Junction can be used to combine, or merge, multiple paths into a shared transition path or to split an incoming path into multiple paths.	

**19.11 L**

<b>Name</b>	<b>Detail</b>	<b>See also</b>
<b>Layer</b>	The organization of classifiers or packages at the same level of abstraction. A layer represents a horizontal slice through an architecture, whereas a partition represents a vertical slice.	Partition
<b>Lifeline</b>	An individual participant in an interaction (that is, Lifelines cannot have multiplicity). A Lifeline represents a distinct connectable element.	
<b>Link</b>	A semantic connector among a tuple of objects. An instance of an Association.	Association
<b>Link End</b>	An instance of an Association end.	Association End, Classifier
<b>Local Path</b>	A relative path on a local machine, enabling developers to store shared source code in machine specific directories, but still generate and synchronize code.	

## 19.12 M

Name	Detail	See also
<b>Maintenance</b>	The support of a software system after it is deployed.	
<b>Manifest</b>	A relationship that indicates that the artifact source embodies the target model element. Stereotypes can be added to Enterprise Architect to classify the type of manifestation of the model element.	
<b>Message</b>	Messages indicate a flow of information, or transition of control, between elements. Messages are used by Communication diagrams, Sequence diagrams, Interaction Overview diagrams and Timing diagrams.	
<b>Message Endpoint</b>	An element that defines an endpoint of a Lifeline, such as a State or Value Lifeline in a Timing diagram.	
<b>Message Label</b>	Used for messages sent between Lifelines to make the diagram appear less cluttered. Labels with the same name indicate that a message can be interrupted.	
<b>Metaclass</b>	A Class whose instances are Classes. Metaclasses are typically used to construct metamodels	
<b>Metafile</b>	A vector-based image format native to Windows. Supports high detail and excellent scaling. Typically used for saving diagram images for placement in documents. Comes in Placeable (an older format) and Enhanced (current standard format).	
<b>Meta-Metamodel</b>	A model that defines the language for expressing a metamodel. The relationship between a meta-metamodel and a metamodel is analogous to the relationship between a metamodel and a model.	
<b>Metamodel</b>	A model that defines the language for expressing a model.	
<b>Meta-Object</b>	A generic term for all meta-entities in a meta-modeling language. For example, meta-types, meta-classes, meta-attributes, and meta-associations.	
<b>Meta-Object Facility (MOF)</b>	An Object Management Group (OMG) standard. MOF originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture.	
<b>Method</b>	The implementation of an operation. It specifies the algorithm or procedure associated with an operation.	
<b>Model ( MOF )</b>	An abstraction of a physical system with a certain purpose.Usage note: In the context of the MOF specification, which describes a meta-metamodel, the meta-metamodel is for brevity frequently referred to simply as the model.	Physical System
<b>Model Aspect</b>	A dimension of modeling that emphasizes particular qualities of the metamodel. For example, the structural model aspect emphasizes the structural qualities of the metamodel.	

Name	Detail	See also
<b>Model Elaboration</b>	The process of generating a repository type from a published model. Includes the generation of interfaces and implementations which enables repositories to be instantiated and populated based on, and in compliance with, the model elaborated.	
<b>Model Element ( MOF )</b>	An element that is an abstraction drawn from the system being modeled. In the MOF specification model elements are considered to be meta-objects.	View Element;
<b>Model Library</b>	A stereotyped package containing model elements that are intended to be reused by other packages. A model library differs from a profile in that a model library does not extend the metamodel using stereotypes and tagged definitions. A model library is analogous to a Class library in some programming languages.	
<b>Modeling Time</b>	Refers to something that occurs during the modeling phase of the software development process. It includes analysis time and design time. Usage note: When discussing object systems, it is often important to distinguish between modeling-time and run-time concerns.	Analysis Time, Design Time, Compile time, Run time
<b>Module</b>	A software unit of storage and manipulation. Modules include source code modules, binary code modules and executable code modules.	Component
<b>MOF</b>	Meta-Object Facility, an Object Management Group (OMG) standard. MOF originated in the UML, when the OMG required a Meta-Modeling architecture to define the UML. MOF is designed as a four-layered architecture.	
<b>Multiple Classification</b>	A semantic variation of Generalization in which an object can belong directly to more than one classifier.	Static Classification, Dynamic Classification
<b>Multiple Inheritance</b>	A semantic variation of Generalization in which a type can have more than one supertype.	Single Inheritance
<b>Multiplicity</b>	A specification of the range of enableable cardinalities that a set can assume. Multiplicity specifications can be given for roles within Associations, Parts within Composites, repetitions and other purposes. Essentially a multiplicity is a (possibly infinite) subset of the non-negative integers.	Cardinality
<b>Multi-Valued ( MOF )</b>	A model element with multiplicity defined whose Multiplicity Type:: upper attribute is set to a number greater than one. The term multi-valued does not pertain to the number of values held by, for example, an attribute or parameter, at any point in time.	Single-Valued

**19.13 N**

<b>Name</b>	<b>Detail</b>	<b>See also</b>
<b>Name</b>	A string used to identify a model element.	
<b>Namespace</b>	A part of the model in which the names can be defined and used. Within a namespace, each name has a unique meaning.	Name
<b>N-ary Association</b>	An Association among three or more Classes. Each instance of the Association is an n-tuple of values from the respective Classes.	Binary Association
<b>Nesting</b>	A connector used as an alternative membership notation to indicate nested members within an element; for example, a package that has nested members. The nested members of a package could also be shown inside the package rather than linked by the Nesting connector.	
<b>Node</b>	A classifier that represents a run-time computation resource, which generally has at least a memory and often processing capability. Run-time objects and components can reside on nodes.	

**19.14 O**

Name	Detail	See also
<b>Object</b>	An entity with a well-defined boundary and identity that encapsulates state and behavior. State is represented by attributes and relationships, behavior is represented by operations, methods and State Machines. An Object is an instance of a Class.	Class, Instance
<b>Object Diagram</b>	A diagram that encompasses objects and their relationships at a point in time. An Object diagram can be considered as a special case of a Class diagram or Communication diagram.	Class Diagram, Communication Diagram
<b>Object Flow</b>	A sub type of the State flow or transition. It implies the passing of an object instance between elements at run-time.	
<b>Object Flow State</b>	A state in an Activity graph that represents the passing of an object from the output of actions in one State to the input of actions in another State.	
<b>Object Lifeline</b>	A line in a Sequence diagram that represents the existence of an object over a period of time.	Sequence Diagram
<b>Object Management Group (OMG)</b>	The standards body responsible for the UML specification and management.	Their website is <a href="http://www.omg.org">www.omg.org</a> - follow the links to the UML pages.
<b>Occurrence</b>	A relationship that indicates that a Collaboration represents a classifier. An Occurrence connector is drawn from the collaboration to the classifier.	
<b>Operation</b>	A service that can be requested from an object to effect behavior. An operation has a signature, which could restrict the actual parameters that are possible.	

## 19.15 P

Name	Detail	See also
<b>Package</b>	<p>1. A namespace, as well as an element that can be contained in other packages' namespaces. Packages can own or merge with other packages, and their elements can be imported into a package's namespace.</p> <p>2. A logical container of model elements. It groups elements and can also contain other packages.</p> <p>The OMG UML specification (UML Superstructure Specification, v2.1.1, p. 109) states:</p> <p>A package is used to group elements, and provides a namespace for the grouped elements.</p> <p>A package is a namespace for its members, and can contain other packages. Only packageable elements can be owned members of a package. By virtue of being a namespace, a package can import either individual members of other packages, or all the members of other packages.</p> <p>In addition a package can be merged with other packages.</p> <p>Note that packages own model elements and are the basis for configuration control, storage and access control. Each element can be directly owned by a single package, so the package hierarchy is a strict tree. However, packages can reference other packages, modeled by using one of the stereotypes «import» and «access» of Permission dependency, so the usage network is a graph. Other kinds of dependencies between packages usually imply that one or more dependencies among the elements exist.</p> <p>A package is represented by the common folder icon - a large rectangle with a small rectangle (a 'tab') attached to the left side on top.</p>	
<b>Package Diagram</b>	Used to reflect the organization of packages and their elements, and provide a visualization of their corresponding namespaces.	
<b>Package Import</b>	A package import relationship is drawn from a source package to a package whose contents are imported. Private members of a target package cannot be imported.	
<b>Package Merge</b>	Indicates a relationship between two packages whereby the contents of the target package are merged with those of the source package. Private contents of a target package are not merged.	
<b>Parameter</b>	The specification of a variable that can be changed, passed, or returned. A parameter can include a name, type, and direction. Parameters are used for operations, messages and events.	Formal Parameter , Argument , Actual parameter
<b>Parameterized</b>	The descriptor for a Class with one or more unbound	Template, Parameterized

Name	Detail	See also
<b>element</b>	parameters.	class
<b>Parent</b>	In a generalization relationship, the generalization of another element, the child.	Subclass, Subtype, Child
<b>Part</b>	A run-time instance of a Class or Interface.	
<b>Participate</b>	The connection of a model element to a relationship or to a reified relationship. For example, a Class participates in an Association, an Actor participates in a Use Case.	
<b>Partition</b>	<ol style="list-style-type: none"> <li>1. activity graphs: A portion of an activity graph that organizes the responsibilities for actions.</li> <li>2. architecture: A set of related classifiers or packages at the same level of abstraction or across layers in a layered architecture. A partition represents a vertical slice through an architecture, whereas a layer represents a horizontal slice.</li> </ol>	Layer , Swim Lane
<b>Pattern</b>	A template collaboration.	Framework
<b>Persistent Object</b>	An object that exists after the process or thread that created it has ceased to exist.	
<b>Physical System</b>	<ol style="list-style-type: none"> <li>1. The subject of a model.</li> <li>2. A collection of connected physical units, which can include software, hardware and people, that are organized to accomplish a specific purpose. A physical system can be described by one or more models, possibly from different viewpoints.</li> </ol>	Model (MOF) , System
<b>Port</b>	Defines the interaction between a classifier and its environment. Interfaces controlling this interaction can be depicted using the 'Expose Interface' toolbox icon.	
<b>Postcondition</b>	A constraint that must be true at the completion of an operation.	
<b>Precondition</b>	A constraint that must be true when an operation is invoked.	
<b>Primitive Type</b>	A pre-defined basic datatype without any substructure, such as an integer or a string.	
<b>Process</b>	<ol style="list-style-type: none"> <li>1. A heavyweight unit of concurrency and execution in an operating system. Thread, which includes heavyweight and lightweight processes. If necessary, an implementation distinction can be made using stereotypes.</li> <li>2. A software development process - the steps and guidelines by which to develop a system.</li> <li>3. To execute an algorithm or otherwise handle something dynamically.</li> </ol>	Thread
<b>Product</b>	A physical piece of information that is produced by a business or development process. Examples of products include models, source files, scripts, and binary executable files. An product can constitute the	Artifact , Component

Name	Detail	See also
	implementation of a deployable component.	
<b>Profile</b>	A stereotyped package that contains model elements that have been customized for a specific domain or purpose using extension mechanisms, such as stereotypes, tagged definitions and constraints. A profile can also specify model libraries on which it depends and the metamodel subset that it extends.	
<b>Project Browser</b>	The workspace window where the model contents are displayed in 'tree' format. Displays structures such as packages, diagrams and model elements.	
<b>Projection</b>	A mapping from a set to its subset.	
<b>Property</b>	A named value denoting a characteristic of an element. A property has semantic impact. Certain properties are predefined in the UML; others can be user defined.	Tagged Value
<b>Pseudo-State</b>	A vertex in a State Machine that has the form of a State, but doesn't behave as a State. Pseudo-states include initial and history vertices.	
<b>Published Model (MOF)</b>	A model that has been frozen, and that becomes available for instantiating repositories and for support in defining other models. A frozen model's model elements cannot be changed.	

**19.16 Q**

Name	Detail	See also
<b>Qualifier</b>	An Association attribute or tuple of attributes whose values partition the set of objects related to an object across an Association.	

## 19.17 R

Name	Detail	See also
<b>Realize</b>	A source object realizes the destination object. Realize is used to express traceability and completeness in the model – a business process or requirement is realized by one or more Use Cases which are in turn realized by some Classes which in turn are realized by a Component, and so on.	
<b>Receive ( A message )</b>	The handling of a stimulus passed from a sender instance.	Sender, Receiver
<b>Receive</b>	An element used to define the acceptance or receipt of a request. Movement on to the next action occurs until it has received what is defined.	
<b>Receiver ( Object )</b>	The object handling a stimulus passed from a sender object.	Sender
<b>Reception</b>	A declaration that a classifier is prepared to react to the receipt of a signal.	
<b>Recursion</b>	A type of message used in Sequence diagrams to indicate a recursive function.	
<b>Reference</b>	<ol style="list-style-type: none"> <li>1. A denotation of a model element.</li> <li>2. A named slot within a classifier that facilitates navigation to other classifiers.</li> </ol>	Pointer
<b>Region</b>	UML 2.x supports both Expansion Regions and Interruptible Activity Regions. An Expansion Region defines the bounds of a region consisting of one or more sets of input collections, where an input collection is a set of elements of the same type. An Interruptible Activity Region contains Activity nodes - when a token leaves an interruptible region, this terminates all of the region's tokens and behaviors.	
<b>Refinement</b>	A relationship that represents a fuller specification of something that has already been specified at a certain level of detail. For example, a design Class is a refinement of an analysis Class.	
<b>Relationship</b>	A semantic connection among model elements. Examples of relationships include Associations and Generalizations.	
<b>Repository</b>	A facility for storing object models, interfaces and implementations.	
<b>Represents</b>	A connector that indicates a Collaboration Use is used in a classifier. The connector is drawn from the Collaboration Use to its owning classifier.	
<b>Requirement</b>	A required feature, property or behavior of a system (external requirement).	
<b>Responsibility</b>	A contract or obligation of a classifier (internal requirement).	

Name	Detail	See also
<b>Reuse</b>	The use of a pre-existing artifact.	
<b>Reverse Engineering</b>	The process of importing source code into the model as standard UML model objects (such as Classes, attributes and operations).	
<b>Rich Text Format</b>	A standard mark-up language for creating word processor documents, frequently associated with Microsoft Word.	
<b>Robustness Diagram</b>	Enterprise Architect supports business process modeling extensions from the UML business process model profile. Robustness diagrams are used in ICONIX.	You can read more about this at <a href="http://www.sparxsystems.com/iconix/iconixsw.htm">www.sparxsystems.com/iconix/iconixsw.htm</a> .
<b>Role</b>	<ol style="list-style-type: none"> <li>1. The named detail and rules associated with one end of an association. Can indicate name, constraints, multiplicity and collection details.</li> <li>2. The named specific behavior of an entity participating in a particular context. A role can be static (such as an Association end) or dynamic (such as a Collaboration role).</li> </ol>	
<b>Role Binding</b>	The mapping between a Collaboration Use's internal roles and the respective parts required to implement a specific situation. The associated parts can have properties defined to enable the binding to occur, and the collaboration to take place.	
<b>Run Time</b>	The period of time during which a computer program executes.	Analysis Time, Compile Time, Design Time, Modeling Time

## 19.18 S

Name	Detail	See also
<b>Scenario</b>	<p>1. A specific sequence of actions that illustrates behaviors. A scenario can be used to illustrate an interaction or the execution of a Use Case instance.</p> <p>2. A sequence of operations carried out in some order to produce a known result. Can apply to Use Cases where it is the equivalent of a Sequence diagram, or to other objects to describe how they are used at run-time.</p>	Interaction
<b>Schema ( MOF )</b>	In the context of the MOF, analogous to a package that is a container of model elements. Schema corresponds to a MOF package.	Metamodel, Package
<b>Self-Message</b>	Reflects a new process or method invoked within the calling Lifeline's operation. It is a specification of a message.	
<b>Semantic Variation Point</b>	A point of variation in the semantics of a metamodel. It provides an intentional degree of freedom for the interpretation of the metamodel semantics.	
<b>Send ( A message )</b>	The passing of a stimulus from a sender instance to a receiver instance.	Sender, Receiver
<b>Sender ( Object )</b>	The object passing a stimulus to a receiver object.	Receiver
<b>Sequence Diagram</b>	A diagram that shows object interactions arranged in time sequence. In particular, it shows the objects participating in the interaction and the sequence of messages exchanged. Unlike a Communication (Collaboration) diagram, a Sequence diagram includes time sequences but does not include object relationships. A Sequence diagram can exist in a generic form (describes all possible scenarios) and in an instance form (describes one actual scenario). Sequence diagrams and Communication diagrams express similar information, but show it in different ways.	Communication Diagram, Object Lifeline
<b>Signal</b>	The specification of an asynchronous stimulus communicated between instances. Signals can have parameters.	
<b>Signature</b>	The name and parameters of a behavioral feature. A signature can include an optional returned parameter.	
<b>Single Inheritance</b>	A semantic variation of Generalization in which a type can have only one supertype.	Multiple Inheritance
<b>Single Valued ( MOF )</b>	A model element with multiplicity defined is single valued when its Multiplicity Type: upper attribute is set to 1. The term single-valued does not pertain to the number of values held by, for example, an attribute or parameter at any point in time, since a single-valued attribute (for instance, with a multiplicity lower bound of zero) could have no value.	Multi-Valued
<b>Specification</b>	A declarative description of what something is or does.	Implementation

Name	Detail	See also
<b>State</b>	A condition or situation during the life of an object during which it satisfies some condition, performs some activity, or waits for some event.	State ( OMA )
<b>State Invariant</b>	A condition applied to a Lifeline that must be fulfilled for the Lifeline to exist.	
<b>State Machine</b>	A behavior that specifies the sequences of States that an object or an interaction goes through during its life in response to events, together with its responses and actions.	
<b>State Machine Diagram</b>	A diagram that illustrates how an element, often a Class, can move between States classifying its behavior, according to transition triggers, constraining guards and other aspects of State Machine diagrams that depict and explain movement and behavior.	
<b>State Chart</b>	A diagram that shows a State Machine.	State Machine , Activity Graph
<b>State Continuation</b>	A symbol that serves two different purposes for Interaction diagrams - as State Invariants and as Continuations. A State Invariant is a condition applied to a Lifeline that must be fulfilled for the Lifeline to exist. A Continuation is used in seq and alt combined fragments to indicate the branches of continuation that an operand follows.	
<b>State Lifeline</b>	A State Lifeline follows discrete transitions between States, which are defined along the y-axis of the timeline. Any transition has optional attributes of timing constraints, duration constraints and observations.	
<b>Static Classification</b>	A semantic variation of Generalization in which an object can not change classifier.	Multiple Classification , Dynamic Classification
<b>Stereotype</b>	A new type of modeling element that extends the semantics of the metamodel. Stereotypes must be based on certain existing types or Classes in the metamodel. Stereotypes can extend the semantics, but not the structure of pre-existing types and Classes. Certain stereotypes are predefined in the UML, others can be user defined. Stereotypes are one of three extensibility mechanisms in UML.	Constraint , Tagged value
<b>Stimulus</b>	The passing of information from one instance to another, such as raising a signal or invoking an operation. The receipt of a signal is normally considered an event.	Message
<b>String</b>	A sequence of text characters. The details of string representation depend on implementation, and can include character sets that support international characters and graphics.	
<b>Structural Diagram</b>	A diagram that depicts the structural elements composing a system or function. These diagrams can reflect the static relationships of a structure, as do Class or Package diagrams, or run-time architectures, such as Object or Composite Structure diagrams. Structural diagrams include Class diagrams, Composite Structure diagrams,	

Name	Detail	See also
	Component diagrams, Deployment diagrams, Object diagrams and Package diagrams.	
<b>Structural Feature</b>	A static feature of a model element, such as an attribute.	
<b>Structural Model Aspect</b>	A model aspect that emphasizes the structure of the objects in a system, including their types, Classes, relationships, attributes and operations.	
<b>Subactivity State</b>	A State in an activity graph that represents the execution of a non-atomic sequence of steps that has some duration.	
<b>Subclass</b>	In a Generalization relationship, the specialization of another Class; the superclass.	Generalization, Child , Parent Superclass
<b>Submachine State</b>	A State in a State Machine that is equivalent to a composite State but its contents are described by another State Machine.	
<b>Subpackage</b>	A package that is contained in another package.	
<b>Substate</b>	A State that is part of a composite State.	Composite State , Concurrent Substate , Disjoint Substate
<b>Subsystem</b>	A grouping of model elements that represents a behavioral unit in a physical system. A subsystem offers interfaces and has operations. In addition, the model elements of a subsystem can be partitioned into specification and realization elements.	Package, Physical System
<b>Subtype</b>	In a Generalization relationship, the specialization of another type; the supertype.	Generalization , Child , Parent Supertype
<b>Superclass</b>	In a Generalization relationship, the generalization of another Class; the subclass.	Generalization Subclass
<b>Supertype</b>	In a Generalization relationship, the generalization of another type; the subtype.	Generalization Subtype
<b>Supplier</b>	A classifier that provides services that can be invoked by others.	Client
<b>Swimlane</b>	A partition on an Activity diagram for organizing the responsibilities for actions. Swimlanes typically correspond to organizational units in a business model.	Partition
<b>Synch</b>	A State used for indicating that concurrent paths of a State Machine are synchronized. After bringing the paths to a synch state, the emerging transition indicates unison.	
<b>Synchronize Code</b>	The process of importing and exporting code changes to ensure the model and source code match.	
<b>System</b>	A top-level subsystem in a model.	Physical System
<b>System Boundary</b>	An element used to delineate a particular part of the system.	

## 19.19 T

Name	Detail	See also
<b>Table</b>	A relational table (composed of columns).	
<b>Tagged Value</b>	The explicit definition of a property as a name-value pair. In a Tagged Value, the name is referred to as the tag. Certain tags are predefined in the UML; others can be user defined. Tagged Values are one of three extensibility mechanisms in UML.	Constraint, Property, Stereotype
<b>Template</b>	The descriptor for a Class with one or more unbound parameters.	Parameterized Element, Parameterized Class
<b>Terminate</b>	A pseudostate indicating that upon entry of its pseudostate, the State Machine's execution ends.	
<b>Thread ( of Control )</b>	A single path of execution through a program, a dynamic model, or some other representation of control flow. Also, a stereotype for the implementation of an active object as a lightweight process.	Active Object, Process, Concurrency
<b>Time Event</b>	An event that denotes the time elapsed since the current state was entered.	Event
<b>Time Expression</b>	An expression that resolves to an absolute or relative value of time.	
<b>Timing Diagram</b>	A diagram that defines the behavior of different objects within a time-scale, with visual depictions of those objects changing state and interacting over time.	
<b>Toolbox</b>	The main toolbar running down the center of Enterprise Architect, from which you can select model elements to insert into diagrams. This is also known as the Toolbox and the Object toolbar.	
<b>Top Level</b>	A stereotype of package denoting the top-most package in a containment hierarchy. The topLevel stereotype defines the outer limit for looking up names, as namespaces 'see' outwards. For example, opTopLevelSubsystem represents the top of the subsystem containment hierarchy.	
<b>Trace</b>	A dependency that indicates a historical or process relationship between two elements that represent the same concept without specific rules for deriving one from the other.	
<b>Transient Object</b>	An object that exists only during the execution of the process or thread that created it.	
<b>Transition</b>	A relationship between two States indicating that an object in the first State performs certain specified actions and enters the second State when a specified event occurs and specified conditions are satisfied. On such a change of State, the transition is said to fire.	Fire, Object Flow
<b>Type</b>	A stereotyped Class that specifies a domain of objects together with the operations applicable to the objects, without defining the physical implementation of those	Implementation Class, Interface

Name	Detail	See also
	objects. A type can not contain any methods, maintain its own thread of control, or be nested. However, it can have attributes and associations. Although an object can have at most one implementation Class, it can conform to multiple different types.	
<b>Type Expression</b>	An expression that evaluates to a reference to one or more types.	

## 19.20 U

Name	Detail	See also
<b>UML</b>	The Unified Modeling Language, a notation and specification for modeling software systems in an Object-Oriented manner. You can read more about UML at the OMG home page or at our UML Tutorial.	
<b>UML Diagrams</b>	Diagrams used to model different aspects of the system under development. They include various elements and connectors, all of which have their own meanings and purposes. UML 2.3 includes 14 diagrams: Use Case diagram, Activity diagram, State Machine diagram, Timing diagram, Sequence diagram, Interaction Overview diagram, Communication diagram, Package diagram, Class diagram, Object diagram, Composite Structure diagram, Component diagram and Deployment diagram.	
<b>UML Toolbox</b>	The main toolbar running down the center of Enterprise Architect from which you can select model elements to insert into diagrams. This is also known as the Toolbox and the Object toolbar.	
<b>Uninterpreted</b>	A placeholder for a type or types whose implementation is not specified by the UML. Every uninterpreted value has a corresponding string representation.	Any ( CORBA )
<b>Usage</b>	A dependency in which one element (the client) requires the presence of another element (the supplier) for its correct functioning or implementation.	
<b>Use</b>	A connector that indicates that one element requires another to perform some interaction. The Usage relationship does not specify how the target supplier is used, other than that the source client uses it in definition or implementation.	
<b>Use Case ( Class )</b>	A UML model element that describes how a user of the proposed system interacts with the system to perform a discrete unit of work. It describes and signifies a single interaction over time that has meaning for the end user (person, machine or other system), and is required to leave the system in a complete state: either the interaction completed or was rolled back to the initial state.	Use Case Instance
<b>Use Case Diagram</b>	A diagram that captures Use Cases and Actor interactions. It describes the functional requirements of the system, the manner in which outside things (Actors) interact at the system boundary, and the response of the system.	
<b>Use Case Estimation</b>	The technique of estimating project size and complexity based on the number of Use Cases and their difficulty.	
<b>Use Case Instance</b>	The performance of a sequence of actions being specified in a Use Case. An instance of a Use Case.	Use Case Class
<b>Use Case Model</b>	A model that describes a system's functional requirements in terms of Use Cases.	
<b>Utility</b>	A stereotype that groups global variables and procedures	

Name	Detail	See also
	in the form of a Class declaration. The utility attributes and operations become global variables and global procedures, respectively. A utility is not a fundamental modeling construct, but a programming convenience.	

**19.21 V**

<b>Name</b>	<b>Detail</b>	<b>See also</b>
<b>Value</b>	An element of a type domain.	
<b>Value Lifeline</b>	A Lifeline that shows the Lifeline's state across the diagram, within parallel lines indicating a steady state. A cross between the lines indicates a transition or change in state.	
<b>Vertex</b>	A source or a target for a transition in a State Machine. A vertex can be either a State or a pseudo-state.	State, Pseudo-State
<b>View</b>	A projection of a model, which is seen from a given perspective or vantage point and omits entities that are not relevant to this perspective.	
<b>View Element</b>	An element that is a textual and/or graphical projection of a collection of model elements.	Model Element (MOF)
<b>View Projection</b>	A projection of model elements onto view elements. A view projection provides a location and a style for each view element.	
<b>Visibility</b>	An enumeration whose value (public, protected, package or private) denotes how the model element to which it refers can be seen outside its enclosing namespace	Export, Import
<b>Visual Basic</b>	A rapid application development programming language. Windows' only scripting language based on COM.

## 20 License Management

The License Management dialog in Enterprise Architect enables you to upgrade Enterprise Architect and to register Add-Ins. The dialog lists:

- The currently-registered keys
- The product each key applies to
- When each private key expires
- When each shared key is to be reactivated in the keystore for issue to another user

**Access:** [Help | Register and Manage License Key\(s\)](#)

### Reference:

The options on the License Management dialog are explained in the following table:

Option	Action	See also
<b>Add Key</b>	Display the Add Registration Key dialog, which enables you to: <ul style="list-style-type: none"> <li>• Register your new Enterprise Architect license</li> <li>• Obtain a shared key from the Sparx Systems Key Store (available for version 4.51 and above)</li> <li>• Add a new key to update to a higher version of Enterprise Architect or to register an Add-In</li> </ul>	<a href="#">Register a Full License</a> <sup>[29]</sup> <a href="#">Add License Key</a> <sup>[2117]</sup> <a href="#">Upgrade an Existing License</a> <sup>[2114]</sup> <a href="#">Register Add-In</a> <sup>[2116]</sup>
<b>Remove Key</b> <b>Release Key</b>	<ul style="list-style-type: none"> <li>• (Private Key) Make the Add-In or current version of Enterprise Architect inoperable</li> <li>• (Shared Key) Release the key to the keystore; however, the Keystore Manager is normally configured to release keys automatically when the user logs off</li> </ul>	
<b>Copy</b>	Place the highlighted key into the clipboard	
<b>Close</b>	Close the dialog	
<b>Help</b>	Display the help for this topic	

### Learn More:

- [Upgrade an Existing License](#)<sup>[2114]</sup>
- [Register an Add-In](#)<sup>[2116]</sup>

## 20.1 *Finding Your License Information*

You can find information on your Enterprise Architect license in the About Enterprise Architect dialog.

**Access:** [Help](#) | [About EA](#)

## 20.2 Adding License Keys

Two types of license key can be used in conjunction with Enterprise Architect: Private and Shared.

### Reference:

Topic	Detail	See also
<b>Private Keys</b>	<p>Private keys enable you to register, indefinitely, on the machine and user account that you are currently using:</p> <ul style="list-style-type: none"> <li>An Enterprise Architect license for the edition of Enterprise Architect you have purchased, or</li> <li>An Add-In product license (such as for MDG Link for Eclipse or MDG Link for Visual Studio.NET)</li> </ul>	<a href="#">Enterprise Architect Editions</a> <sup>[13]</sup>
<b>Shared Keys</b>	<p>Shared keys are obtained from a central shared key store, to give you temporary access to the installed 'suite' edition of Enterprise Architect</p> <p>Shared Keys are available with the purchase of a floating license, and require Enterprise Architect version 4.51 or higher</p> <p>Shared Keys require a shared license key store to be configured by your license administrator; the key store can be either file-based or network based (preferred)</p> <p>Only the Key Administrator is required to install the Sparx Enterprise Key Store application; end users simply connect to the configured key file - advised by the administrator - as described below</p> <p>No additional software is required to be installed</p>	<a href="#">Enterprise Architect Floating License.</a>
<b>Notes on Keys</b>	<p>Some license keys can override and remove others; for example:</p> <ul style="list-style-type: none"> <li>The key for a more advanced edition of Enterprise Architect replaces the key for a simpler edition</li> <li>The key for MDG Integration for Visual Studio replaces the key for MDG Link for Visual Studio</li> </ul> <p>Shared keys and Private keys have different formats and cannot be used interchangeably</p>	

**Access:** [Help](#) | [Register and Manage License Key\(s\)](#) > [License Management: Add Key](#) > [Add Registration Key](#)

### How to:

To add a private key, follow the steps below:

Step	Action	See also
1	Click on the Enter Private Key tab	<a href="#">License Management</a> <sup>[2109]</sup>
2	In the <b>Name</b> and <b>Company</b> fields, type your user name and company name	

Step	Action	See also
3	In the <b>Copy registration key into space below...</b> field, copy the registration key (including any parentheses around the key)	
4	Click on the <b>OK</b> button to confirm the key selection	

To add a shared key, follow the steps below:

Step	Action	See also
1	Click on the Get Shared Key tab	<a href="#">License Management</a> [2109]
2	In the <b>Name</b> and <b>Company</b> fields, type your user name and company name	
3	In the <b>Shared Keystore</b> field, click on the ( ... ) (Browse) button The Shared Keystore Selection dialog displays	
4	If your keystore is file-based: <ul style="list-style-type: none"> <li>• Select the <b>File Based Keystore</b> radio button</li> <li>• Click on the <b>Browse</b> button, and</li> <li>• Locate and select the keystore file</li> </ul> Go to step 7	
5	If the keystore is network-based: <ul style="list-style-type: none"> <li>• Click on the <b>Sparx Keystore Server</b> radio button</li> <li>• In the <b>Server Address</b> field, type the server address of the keystore</li> </ul>	
6	If necessary, type in the password (advised by your administrator) and/or click on the <b>Test</b> button to ensure that you have a connection to the keystore	
7	Click on the <b>OK</b> button to return to the Get Shared Key tab This now shows the name of the keystore in the <b>Shared Keystore</b> field	
8	In the <b>Select a Product</b> field, click on the appropriate product name	
9	Click on the <b>OK</b> button The License Management dialog redisplay, indicating that the shared key is registered for the selected product until the key expiry date	
10	Click on the <b>Close</b> button	

## 20.3 Keystore Troubleshooting

Message Displayed:	Explanation
<i>Error reading Key Store file: (Access is denied)</i>	<p>All users who are to use the shared key facility require <b>Read, Write and Modify</b> access to the <i>sskeys.dat</i> file containing the shared keys</p> <p>Please verify that all required users have sufficient permissions to the file and try again</p> <p>Review the effective permissions calculated at the location of the key file for the user account reporting the problem - you should closely examine the permissions for both the Network Share and the File System; it is possible that these permissions have been overwritten at some point</p> <p>If the problem continues, contact Sparx Support</p>
<i>Error reading Key Store file: (Key File has been moved)</i>	<p>In the key store, as a security measure the hard drive serial number is recorded when the file is created; the file then cannot be moved from the original location in which it was created</p> <p>If the key store has to be re-located for any reason, the administrator should re-create the key store in the new location using the original license keys</p> <p>This issue is commonly seen after a file server has undergone a hardware upgrade in which the physical hard drives have been replaced; problems could also occur if the drive used is part of a RAID configuration</p> <p>The message can also appear where the key store exists on a Novell-based file system - when creating the key store, the administrator is prompted to confirm that the key store is to be located on a Novell Netware file server; if they click on the <b>Yes</b> button, the key store instead records the logical path used to create it, and all users must connect to the key store using this same path</p> <p>The recorded path is case-sensitive and must be an exact match</p>

## 20.4 Upgrade an Existing License

This topic explains how to upgrade your installation of Enterprise Architect to a more powerful edition.

Topic	Detail	See also
<b>Editions</b>	<p>There are six Enterprise Architect editions:</p> <ul style="list-style-type: none"> <li>• Desktop</li> <li>• Professional</li> <li>• Corporate</li> <li>• Business and Software Engineering</li> <li>• Systems Engineering</li> <li>• Ultimate</li> </ul> <p>The installation file provides the facilities of all editions; your registration key gives access to the facilities of the edition you have purchased</p>	<a href="#">Editions Available</a> <sup>[14]</sup>
<b>Upgrade</b>	<p>If you have purchased a less powerful edition, such as Professional or Desktop, you can subsequently upgrade your existing license to a more powerful edition by purchasing a special upgrade key from Sparx Systems</p> <p>Once you have purchased and received the appropriate key, use the procedure below to gain access to the additional features</p>	<a href="#">Enterprise Architect Purchase Details</a>
<b>Trial and Lite Editions</b>	<p>The Lite edition and the Trial version cannot be registered or upgraded</p> <p>If you have used either of these versions and then purchased Enterprise Architect, you must download the registered version from:</p> <p style="text-align: center;"><i>www.sparxsystems.com/securedownloads/easetupfull.exe</i></p> <p>Then you can enter your registration key</p>	<a href="#">The Trial Version</a> <sup>[13]</sup> <a href="#">The Read-only 'Lite' Edition</a> <sup>[18]</sup> <a href="#">Registered User software download site</a>
<b>Application</b>	<p>This topic is mainly applicable to users with private keys</p> <p>If you are an end-user with a shared key, you would simply be allocated the relevant key next time you requested one</p> <p>If, however, you want to upgrade while using a shared key on a long lease, you would simply click on the <b>Release Key</b> button and then the <b>Add Key</b> button</p>	<a href="#">Adding License Keys</a> <sup>[211]</sup>

**Access:** [Help | Register and Manage License Key\(s\)](#) > **License Management: Add Key**

### How to:

To upgrade from one license edition to another, follow the steps below:

Step	Action	See also
1	Make sure you have a valid upgrade key purchased from Sparx Systems; you typically receive this in an email or PDF format	
2	On the Add Registration Key dialog, in the <b>Name</b> and <b>Company</b> fields, type your name and company name	<a href="#">License Management</a> <sup>[2109]</sup>

Step	Action	See also
3	Copy the key you received for the upgraded edition of Enterprise Architect - including the { and } bracket characters - from the email	
4	Paste the key into the <b>Copy registration key</b> field	
5	Click on the <b>OK</b> button Enterprise Architect displays the message: <i>Registration succeeded – Thank you for purchasing Enterprise Architect xxxx Edition</i>	
6	Click on the <b>OK</b> button, and then on the <b>Close</b> button to continue working in Enterprise Architect	
7	Select the <b>Help   About EA</b> menu option Copy the registration key shown and store it somewhere safe; this is a key to the full license of the edition you have upgraded to If you ever have to reinstall Enterprise Architect, you can register it with this key, so you won't have to go through the upgrade process again	

## 20.5 Register Add-In

Apart from registering Enterprise Architect, you must also register any Add-Ins you purchase to use with the application

This topic explains how to register a private key; if you have purchased a floating licence (shared key) for the Add-In, follow the *Add a Shared Key* section of the *Adding License Keys* topic.

**Access:** [Help | Register and Manage License Key\(s\) Add-Ins | Enter License Key for <Add-In name>](#)

### How To:

To register Add-Ins for Enterprise Architect, follow the steps below:

Step	Action	See Also
1	Purchase one or more licenses for the Add-In from your Add-In provider Once you have paid for a licensed version of the Add-In, you receive (via email or other suitable means) a license key for the product	
2	Save the license key and the latest full version of the Add-In	
3	Run the Add-In's setup program to install the Add-In	
4	In Enterprise Architect, select either of the menu options: <ul style="list-style-type: none"> <li>Register and Manage License Key(s)</li> <li>Add-Ins   Enter License Key for &lt;Add-In name&gt;</li> </ul> The License Management dialog displays	<a href="#">License Management</a> <small>t<sup>[2109]</sup></small>
5	Click on the <b>Add Key</b> button The Add Registration Key dialog displays, showing the Enter Private Key tab	
6	Type or copy-and-paste in the key you received with the Add-In, including the { and } characters	
7	Click on the <b>OK</b> button	
8	When the Add-In has been added successfully, close down Enterprise Architect and restart it to apply the integration changes imposed by the Add-In
